Deficit	\$1,379,782	\$1,249,136	†\$2,056,724

*Deficit. †Balance.

Based on the quarterly reports the company for the year ended Dec. 31 last, shows net after taxes of \$2,624,697, compared with \$21,924,650 in 1920 and with \$19,345,840 in 1919. After depreciation reserve there was a deficit of \$5,313,513, contrasted with a balance of \$12,371,298, equal to \$6.18 per share in 1920, and with \$10,387,418, equal to \$5.19 per share in 1919. Comparisons follow:

	1921	1920	1919
Net after taxes.....	\$2,624,697	\$21,924,650	\$19,345,840

†Balance.

Report of Newton Steel Co.

Gross sales of the Newton Steel Co., Youngstown, Ohio, in 1921, were \$2,872,866, according to the annual report submitted Feb. 1 to stockholders. Present unfilled orders are sufficient to enable normal production for 60 days, coming principally from the automobile industry. The company showed a gross profit last year of \$365,837 and a net profit of \$29,647 after all reserve charges, taxes and miscellaneous claims. After paying the annual 7 per cent dividend on \$705,000 of outstanding preferred stock the company reported a deficit of \$18,444. Average operations last year were at 60 per cent. For two months the company's plant was wholly suspended. Directors, who were re-elected, are Edward F. Clark, H. M. Steele, J. H. Fitch, Jr., W. H. B. Ward, H. A. Taylor, J. H. Ford and George T. Fithus. Officers are Edward F.

Clark, president and general manager; H. M. Steele, vice-president in charge of operations; J. H. Fitch, Jr., vice-president in charge of sales, and R. A. Kenworthy, secretary and treasurer.

The company's plant, located on a 150-acre tract at Newton Falls, Trumbull county, consists of eight stands of roughing mills and eight stands of finishing mills. It is entirely electrically driven and so built that extensions may be efficiently made when required. The company manufactures special high grade sheets for the automobile, metal furniture and Pullman trades. It has capacity for 50,000 tons of finished product annually.

Lake Erie Bolt & Nut Co. Plans

In order to provide additional working capital stockholders of the Lake Erie Bolt & Nut Co., Cleveland, are being advised of a refinancing plan to permit the company to take advantage of a new lease on the present plant and to supply it with funds for operating purposes. It is proposed to change the present company from a Delaware to an Ohio corporation and to make the authorized capital stock 70,000 shares of new par stock, \$0.000 of which will be issued at this time. Present stockholders will receive four shares of the new stock for one share of the present preferred stock and the payment of \$42. With no cash payment the exchange will be made share for share. Holders of common stock will receive one share of new stock for each 100 shares of present common stock. A meeting of the stockholders will be held Feb. 9 to vote on the refinancing plans.

Industrial Finance

Between 98 and 99 per cent of the stockholders of the American Brass Co. have turned in their stock for the merger with the Anaconda Copper Co.

The directors of the Saco Lowell Shops, Boston, textile machinery, have recommended an increase of \$1,762,500 in the common share capitalization for the purpose of paying a stock dividend of 50 per cent to owners of common shares. Stockholders will act on the recommendation Feb. 15.

Edmund Wolfe, president First Bridgeport National Bank, and Elmer Havens, president Locomobile Co., Bridgeport, Conn., automobiles, have been made temporary receivers for the Locomobile Co.

The Kerite Insulated Wire & Cable Co., Seymour, Conn., has issued \$150,000 additional stock, bringing the capitalization up to \$350,000. The new capital will be used to raise money for working capital and to reduce current indebtedness.

The directors of the American Rolling Mill Co., Middletown, Ohio, at their January meeting took no action on the stock dividend that it has been customary to declare. Members of the board expressed the opinion that it would be inadvisable to increase the stock of the company by such a dividend at this time in view of the general unsettlement in industrial and financial conditions.

The Folsom Miller Co., Markesan, Wis., manufacturer of washing machines, has filed a voluntary petition in bankruptcy. Schedules claim assets of \$32,533 and admit liabilities of \$132,966.67, of which \$66,315 is due Guy Miller, treasurer, and \$59,153 to S. P. Folsom, president, for payment of corporation debts and money advances.

Articles of dissolution have been filed by the Oshkosh Tractor Co., Oshkosh, Wis., a Wisconsin corporation with \$1,206,000 capital stock organized a year ago to take over the business of the LaCrosse, Wis., Tractor Co.

The Brazil Trust Co., Brazil, Ind., has been appointed receiver for the Union Steel Mfg. Co., which moved its plant to Brazil from Chicago about a year ago and manufactures tools and automobile parts.

The Truscon Steel Co., Youngstown, Ohio, is now paying 17 1/2% per share quarterly on its common stock, or at the annual rate of 7 per cent, as compared with 40c, or a yearly dividend rate of 16 per cent.

Business of the William P. Pollock Co., fabricating interest of Youngstown, Ohio, was in excess of 50 per cent of capacity last year, according to statement at the annual meeting. At present the company's capacity is idle. Directors re-elected are: Porter Pollock, W. G. Wilson, John Kirby, J. H. Warne, Alexander Best, Harry Payne and Edgar J. Reilly. Directors elected these officers: President and treasurer W. G. Wilson; vice-president and general manager, J. H. Warne; vice-president and general superintendent, John Kirby and secretary, Alexander Best.

The Struthers Furnace Co., Cleveland, Ohio, operating a merchant blast furnace at Struthers, Mahoning County, Ohio, paid its quarterly preferred dividend Feb. 1 of \$1.75 per share. The company was founded in 1869 and has been under the same management for upwards of 35 years. It has no bonded debt and has never defaulted on its preferred dividend.

Current Metal Prices

On Small-Lots, Delivered from Merchants' Stocks, New York City

The following quotations are made by New York City warehouses.

As there are many consumers whose requirements are not sufficiently heavy to warrant their placing orders with manufacturers for shipment in carload lots from mills, these prices are given for their convenience.

On a number of articles the base price only is given it being impossible to name every size.

The wholesale prices at which large lots are given by manufacturers for direct shipment from mills are given in the market reports appearing in a preceding part of THE IRON AGE under the general heading of "Iron and Steel Markets" and "Non-ferrous Metals."

Iron and Soft Steel Bars and Shapes

Bars:	Per Lb
Refined bars, base price	2.53c.
Swedish bars, base price	10.00c.

VOL. 109, No. 7

Over-all Cost of Heat-Treated Parts

Electric Current or Fuel Cost Is But a Portion of Total Cost
Percentage of Rejection Important - Cost of
Subsequent Operations an Item

BY C. I. IPSEN*

IN the development of the art of steel treating the advance has been associated with a progressive change from one type of heat source to another. It has passed from the early hand forge, burning wood or charcoal, successively through the coal and coke furnace, and finally to the electric furnace. It is especially noteworthy that each change in the development has been to a fuel or heat source having a higher cost. While these progressive changes have not been univer-

sally adopted, it is believed that they have been made on a sound economic basis, since there have been no backward tendencies. As the higher priced, improved heat source has successfully withstood the competition of existing fuels, it is evident that there are other factors of greater importance in the heat treatment of steel than furnace operating costs, a fact not commonly recognized by the average furnace user. Most prominent among these other factors are reduced cost of subsequent operations, reduction in the number of rejections, increased life of products, with more satisfactory service.

To determine to what extent these factors will over-

Electric Resistance Furnace, with Panel and Instrument for Automatic Temperature Control

sally adopted, it is believed that they have been made on a sound economic basis, since there have been no backward tendencies.

As the higher priced, improved heat source has successfully withstood the competition of existing fuels, it is evident that there are other factors of greater importance in the heat treatment of steel than furnace operating costs, a fact not commonly recognized by the average furnace user. Most prominent among these other factors are reduced cost of subsequent operations, reduction in the number of rejections, increased life of products, with more satisfactory service.

To determine to what extent these factors will over-

plays in the ultimate cost. The electric power rate for all items is taken at 12c. per kw-hr.

The various dies, items 1 to 6, were heated in the resistance furnace shown. A similar furnace is used for preheating, and an electrically heated oil bath is used for drawing. These furnaces, and the oil tempering bath, are maintained at constant temperature throughout the day, and the cost of the electricity thus used is apportioned among the dies treated over a certain period. If the furnaces could be operated at full capacity constantly, the cost of the electricity would be far below the values given.

This furnace has been run constantly for 25 months at a temperature of 1500 deg. Fahr. For the first nine months of the time it was run 24 hr. per day,

Interior of Electric Carbonizing Furnace 36 In. Wide 29 In. High and 19 In. Deep. This furnace requires 60 kw. 3 phase at 229 volts, to maintain a temperature of 1700 deg. Fahr.

days a week. Since that time it has been run from 4 a. m. to 4 p. m., an automatic time clock being used

Cost Figures for Hardening and Drawing

Item	Part	Factory Cost of Parts	Cost of Heat Treating	Cost of Electricity for Heat Treating	Electricity in Per Cent of Total Cost
1	Segment combination die	\$1,380	\$13.50	\$4.16	0.3
2	Segment combination die	1,138	12.00	3.70	0.32
3	Round blanking die	638	4.03	1.50	0.23
4	Segment blanking die	782	9.15	2.92	0.37
5	Die	795	10.53	3.43	0.43
6	Die	875	8.66	2.67	0.3
7	Gear	234	13.00	3.70	1.5
8	Gear	273	15.00	4.44	1.7
9	Gear	338	21.00	6.25	1.8
10	Gear	391	26.00	7.60	1.9
11	Gear	455	30.00	9.06	2.0
12	Die block	110	1.75	0.65	0.6
13	Gear*	51	...	0.03	0.6
Totals of all above:		\$7,404	\$165.92	\$50.11	0.68

*Hardening only, without drawing. Estimated.

to throw the power on in the morning and off in the afternoon.

During the 25 months of operation there has been no interruption of service, and the only expense incurred has been the replacement of a relay coil on the

control panel, at a cost of less than one dollar. A metallic resistor heating element is used, of the construction shown in the interior view. No deterioration in this resistor is apparent after the 25 months' continuous service. The only attendance necessary is occasional oiling of the automatic control instrument, and putting in a roll of record paper; the controlling of the temperature, and the throwing on and off of the power, being entirely automatic. Thus the electric cost, as indicated in the table, is the only expense incurred; there is no continuous repair bill.

Thus the total cost of electricity in heat treating these dies amounts to 2/3 of 1 per cent of the ultimate cost of the dies. Subtracting from this the cost of other kinds of fuel will give the amount that must be offset by the other factors, such as the reduction of rejections, etc. In the case of this die heating furnace, the cost of electricity is practically the same as the cost of oil. Extensive tests were run on similarly constructed oil and electric furnaces to determine the policy of the General Electric Co. on future tool treating furnace installations. The cost of operating the oil furnace was 23c. per hr. with oil at 13c., and the electric furnace 10c. per hr. With oil at its present level, the costs are about equal.

In certain localities this would not be the case, and we must then look to the other features to justify the use of electric furnaces. In the case of these dies the most prominent of the factors are the reduction of rejections, lower cost of subsequent operations, and

Temperature Record from Electric Resistance Furnace Operating at 1400 Deg. Fahr., Photographed from Tape, Showing Drop When Current Is Shut Off

longer life of the dies. Unfortunately, accurate data are not available on these factors, but in the opinion of the foreman in charge of the work they amount to several per cent, the reduction in rejections alone being over 1 per cent, or more than the total cost of electricity.

Items 7 to 12 inclusive are at present treated in an oil furnace, the cost of the electricity having been calculated on the basis of experience with electric furnaces handling similar work. Electric furnaces are contemplated for these parts, as a cost analysis indicates that the increased cost of electricity will be more than offset by the improvement in quality.

A furnace with a rotating annular ring hearth, shown in one illustration, is used for heating gears, item 13 of the table. The cost of electricity for heating these gears is based on 30 days' operation, 9510 gears, weighing 39,107 lb., being heated in that time. The cost of oil used in heating this same gear is approximately $\frac{1}{2}$ ¢, or about one-fifth the cost for electricity. This increased cost of electricity is offset by the reduction of rejections and lower cost of subsequent operations.

While the number of gears rejected due to warping has been greatly reduced, definite figures are not available; but it has been possible to treat the gears in an

Rotary Annular Electric Furnaces Designed for Maintaining a Temperature of 1650 Deg. Fahr. The hearth is 16 in. wide, the door opening 12 x 16 in., the furnace diameter 79 in. Three-phase current at 220 volts is used, the power requirements being 60 kw.

electric furnace, so as to have an eccentricity of approximately half the limits set for oil furnace practice, and limits which it is found difficult to meet with oil-treated gears. The cost of subsequent operations was reduced approximately 5¢ per gear, or an amount nearly twice the total cost of electricity for heating.

Thus the higher cost of the improved heat source, in every case cited, has been justified on the basis of the quality of the finished product. It is reflected in the reduction of rejections, lower cost of subsequent operations, and longer life of the product, any one of which will, in most cases, many times offset the increased cost of the improved heat source.

Features of the electrically heated furnace, of the metallic resistor type, which make possible this improvement in quality, are:

- (1) Low temperature of heat source.
- (2) Accurate and reliable automatic temperature control.
- (3) Uniform and unvarying temperature distribution.
- (4) Absence of severe oxidizing and corroding action, common to some fuel-fired furnaces.

The large area of the heat source permits it to operate at a temperature only slightly higher than that of the parts being heated, and renders overheating of any part impossible. In the fuel-fired furnace, ex-

cept where a muffle is used, the heat source or flame is several hundred degrees hotter than the work; consequently there is always the danger of overheating portions of the charge, especially parts having thin

Heating of Ring Gear in Rotary Electric Furnace

sections. This overheating results in distortion and excessive scaling.

Automatic control of temperature insures constant conditions in the furnace, and makes possible the duplication of results from day to day. A typical tempera-

Test Data of Heat Uniformity of Electric Furnace

Time	Thermocouple Temperature, Deg. Cent.					Average Temp.	Maximum Deviation from Average, Per Cent		Rate of Change, Deg. Per Hr.
	1	2	3	4	5		Above	Below

11:30	777	782	756	766	750	1.07	1.3	27	
2:30	858	861	851	849	851	0.16	1.3	21	
7:30	860	865	862	862	863	0.35	0.23	0	
11:30	925	934	930	926	928	0.13	0.21	17	
3:30	923	932	927	925	927	0.61	0.42	0	
1:30	950	950	952	952	952	0.71	0.21	23	

ture control chart is shown, which indicates a maximum temperature variation of about 5 deg. Fahr., plus or minus, in the air of the furnace. This is the variation of the air temperature, and since the air changes temperature much more rapidly than the charge, it will be apparent how accurately the temperature of the charge is maintained.

Another chart shows the time temperature curve of gears treated in a rotary furnace similar to that illus-

Locations of the Five Thermocouples Whose Indications Are Recorded in Table

trated. Sensitive thermocouples were attached to a test gear, which was placed in the furnace among the others in regular production. The "gear" thermocouple was embedded in the body of the gear itself, and the "air" couple was located a few inches above the gear. The curve is copied direct from the chart made by recording instruments. It will be observed how accurately the temperature of the gear is held at 1400 deg. Fahr. up to the time it reaches the discharge door—also that fairly wide changes of air temperature, caused by throwing the power on and off, caused no appreciable change in the temperature of the gear.

This curve also illustrates another point, the uniform

temperature that it is possible to obtain in a furnace of the metallic resistor type. In this furnace the windings are all on one circuit, and yet it is possible to maintain, by a proper distribution of the windings, a uniform temperature up to a point directly in front of the discharge door.

This feature of the metallic resistor type of electric furnace is also shown clearly in the second table. The heating of the charge under these conditions insures uniform heating, reduce distortion and internal stresses to a minimum, and improves the quality of the heat-treated part. In the electric furnace ideal atmospheric conditions exist, that result in the heat treated parts being practically free from pitting and scaling. This reduces the cost of the subsequent operations, in cleaning the dies and gears.

MAKES COMPARISON

Chart Show Averages of Production of Various Products and of Unfilled Tonnage

WASHINGTON, Feb. 14. The American Railway Association in its bulletin on revenue freight loaded for the week ended Jan. 21 presents a chart showing the monthly averages by years from 1913 through 1919 and the monthly total through 1920 and 1921 of production of steel ingots, production of pig iron, and the United States Steel Corporation, unfilled orders, production of bituminous coal and stocks of bituminous coal and shows the relation between these movements. The production of steel ingots and of pig iron, it is pointed out, is usually accepted as a barometer of business activity throughout the country.

It is observed that in the years 1913 to 1919, inclusive, the trend of these two items of production followed in a fairly close way the unfilled orders of the Steel Corporation and was followed in turn by the production of bituminous coal. The bituminous production also quite generally followed the trend of production of ingots and pig iron in the first half of 1920, but the tremendous increase in bituminous production in the last half of 1920 did not follow any like trend of steel and iron production, but on the contrary was in the face of a declining tendency in that production and in the unfilled orders of the Steel Corporation. This, it is stated, may be mentioned as contributing to the heavy stocks of bituminous coal on hand in January, 1921.

Again, following April, 1921, and through October, there was a general tendency to increase in the production of bituminous coal, not, however, marked by any contemporaneous increase of consequence in the production of steel ingots and pig iron, and with the orders of the Steel Corporation still declining. Quite naturally, therefore, it is pointed out, the (then) latest figure of bituminous stocks, that for November, 1921, showed an increase that carried the total even beyond that of the previous Jan. 1. A survey prepared by the Department of Commerce shows that the total commercial stock of bituminous coal on Jan. 1, 1922, was estimated at 47,000,000 tons as against 48,000,000 tons on Nov. 1, 1921.

Work Stopped at Armor Plate Plant

CHARLESTON, W. VA., Feb. 13.—An echo of the disarmament conference is heard in an order received recently by Capt. F. J. Hellweg, commandant, from Secretary of the Navy Denby, to close the naval ordnance plant here and put employees on leave without pay. The order affects not only men engaged in the operation of the plant, but those doing construction work on the gun plant. Captain Hellweg was instructed to retain only enough men for the maintenance and protection of the plant. The plant was engaged in manufacturing material, some of which would have been used on ships which are to be scrapped under the holiday program.

This plant, located at South Charleston, and work on which began April 6, 1917, consists of a steel works

While these are by no means all the varieties of electric furnaces, and do not include all the processes to which such furnaces lend themselves, they are sufficiently representative to give a good idea of what can be accomplished by the electric furnace in this field.

The problem of choice of steel treating furnaces is chiefly the problem of determining the effect of the various furnaces on the overall cost of the heat-treated part. A careful analysis along the lines outlined may in many cases reveal that furnace operating costs are of secondary importance. After three years' experience in the use of electric furnaces for steel treating, it is predicted that, in the majority of cases where a high-grade product is required, the lowest overall costs will be obtained through the use of electric furnaces.

and three finishing units; a projectile plant, an armor plant and a gun plant. The projectile plant was completed and put in operation in June, 1918. The armor plant is 90 per cent finished, and the gun plant 70 per cent. In recent months about 2000 tons of ordnance steel were turned out daily. About 2200 men were employed, including nearly 1000 on construction work. The estimated monthly payroll was \$300,000.

Testing Materials Meeting

Greater prominence to technical papers is planned to mark the annual meeting of the American Society for Testing Materials to be held at Chalfonte-Haddon Hall, Atlantic City, N. J., in the week of June 26. Among the topics which are expected to be given prominence are the following: "Effect of Sulphur in Rivet Steel," "Physical Properties and Tests of Steel Castings," "Impact Testing of Materials," "Fatigue of Materials," "Specifications for Coal," "Thermometry."

The committee on corrosion of iron and steel is undergoing some reorganization. J. H. Gibboney, vice-chairman of the committee, is acting chairman in place of S. S. Voorhees, deceased. Dr. G. K. Burgess, chairman of the subcommittee on preservative metallic coatings, has resigned, and H. S. Rawdon now represents the metallurgical division of the Bureau of Standards and has been appointed chairman pro tem of the sub-committee.

In Memory of Henry H. Stambaugh

In memory of Henry H. Stambaugh, one of the founders of the Brier Hill Steel Co., Youngstown, Ohio, a large bronze tablet in bas relief has been installed in the McKinley Memorial Building at Niles, which houses an imposing collection of tablets and busts of industrial and financial leaders, as well as statesmen. Unlike other tablets which represent a likeness of the man they honor, the Stambaugh memorial shows a woman's figure, in classic robes, invoking a blessing upon a man kneeling before it, typifying Labor. The figure of a dog in the foreground depicts Mr. Stambaugh's love of nature. The replicas were largely gathered through the instrumentality of Joseph G. Butler, Jr., of Youngstown, who conceived the idea of the Memorial and carried it to fruition.

The Aragain Steel, Ltd., has been incorporated with a capital stock of \$15,000,000 to acquire and take over the plan and business of the Carbon & Alloy Steel Co., Ltd., at Niagara Falls, Ont., and to enter into the manufacture of iron, steel, metals, alloys, etc. Among the provisional directors of the new concern are Francis W. Griffiths, Arthur L. Reid, John L. Vanstone of Niagara Falls, Ont.

The Lima, Ohio, plant of the Ohio Steel Foundry Co., reopened on Jan. 16, giving employment to about 500 workers. The company has booked orders for castings for railroad equipment for the Argentine Republic and it is expected that the foundry will be kept running full time for some months.

Using Molding Machine in Job Foundry

Marked Gain in Efficiency in Making Cylinder and Piston Molds—Speed and Economy Both Served

BY PAUL R. RAMP

(Continued from page 339, Feb. 29)

FIGURE 6 is the drag half of a steam cylinder pattern, located on the pattern board. The dowel pins can be seen at *BBB*. The "center" pin is located off center, to avoid the danger of placing patterns wrongly on the board. Figure 7 is the cope half of the same pattern, located on the same pattern board, with dowel pins at *BBB*. This pattern was used for many years to produce cylinder castings by hand, at the rate of six to eight per day.

The only work connected with making an emergency molding machine job out of it was putting dowel pin plates in the cope and drag halves, and giving them a coat of shellac. On the machine, 60 castings were

FIG. 6. Drag Half of Steam Cylinder Pattern on Pattern Board

produced daily by one finisher and two helpers, one of the helpers acting as machine operator. The quality of the castings produced by the machine was in every way superior to those made by hand, by skilled workmen.

In such cases, the advantage of the pattern board and the loose patterns can be appreciated. As the pattern board is bolted to the machine, it requires no more attention than brushing or blowing off after each mold is rammed. All patterns being loose, they must be placed on the board every time a new mold is made, hence the shape of the pattern does not matter. It requires only a moment to pick it up and drop it over the dowel pins on the board, and proceed.

This plan enabled us to make a decided saving in the cost of molding, when it was thought impossible to

FIG. 7. Cope Half of Same Pattern on Same Pattern Board

do so, on account of the small number of parts to be made, and the very poor condition of the patterns. I believe that there are many foundries to-day that could adopt this plan, and secure very gratifying results.

The plan here described develops many unusual stunts in molding and core making. The fact that a standard size flask must be used, thus limiting the size of the pattern to be molded, makes it necessary for the foundryman to devise ways and means for molding pieces in these flasks, that in the past were molded in much larger flasks.

An illustration of this development is shown in Figure 8, which is a cross section of a mold for three

10-in. pistons. Owing to the use of the standard flask, only one 10-in. and one 8-in. piston could be molded together in the regular way. As it was desired to confine the production to one size of casting for each mold, the plan illustrated worked out very satisfactorily. The standard flask, while not having great enough length, did have an excess of depth, which was utilized by molding the pistons on edge, three in a flask, as shown in the sketch, at a 66 2/3 per cent increase in production per hour. The quality of the new castings was superior to those made in the old way.

Figure 8 shows the method used in gate these molds with a gate core. The core was placed on the pattern, and rammed up in the flask when the drag was being made. The gate proved very efficient, and produced

FIG. 8. Cross Section of Mold for Three 10-in. Pistons

castings free from sand and slag holes. The idea was to arrange the gate so the metal would enter the molds directly under the main cores, and thus act as a safeguard, by providing that, in case any objectionable matter should enter the mold with the metal, it would be carried up to the core and would lodge where it would do no harm.

There was a question as to whether or not the upper edge of the piston, that represented the highest point of the mold in the cope, would shrink. To help reduce this danger, the grooves for the piston rings were par-

FIG. 9. Drag Mold for Three Pistons with Core in Place

tially formed in the rough castings; but it was found later that this precaution was not necessary, as all of the castings came out solid at this point. Figure 9 is

•Battle Creek, Mich.

another view of the 10-in. piston mold, with the main core in place. This sketch shows also the locations of the gate core and of the skim gate.

One complete core is all that was required to produce three castings. The slab parts of the core, marked *DD*, represent the division between pistons No. 1 and No. 2, and the division between No. 2 and No. 3. As the slabs also act as supports for the main cores, they make chaplets unnecessary. Only two holes on either

side of these pistons were formed, in providing the vent passages, instead of the three, necessary when the pistons are molded with the flat surface up. These holes must be drilled, tapped and plugged. The gas escaped from the core through the passages marked *EEEE*.

This job worked very smoothly on the jolt roll-over molding machine, in the standard flasks, and no delay was experienced in changing from other jobs to this one.

Figure 10 is a cross section of the gang core used to make the three pistons. This core was made in halves and pasted together. The time required was not more than one-fifth greater than that required to produce a core for a single piston. In this case, as in many others, the very fact that something radically

Fig. 11. Cross Section of 12-In. Piston Mold on Standard Pattern Board

different had to be done, to enable the foundryman to use his equipment, developed a decided saving.

Figure 11 is a cross section of a 12-in. piston mold, made on the standard pattern board with a jolt roll-over machine. In this case the piston was molded in the usual manner, instead of being molded on edge. The main objection to making this casting on the machine was the fact that, in order to carry off the vents from the main core, it had been the practice to place the main core in the mold and place the cope on the drag, thus securing on the cope an impression that could be used as a guide, to locate the vent passages through the cope after it was lifted off again.

This plan made it necessary to try on every cope, and interfered very materially with progress in molding machine work. To overcome this objection, the part of the core that normally came flush with the joint, and was touched when the cope was tried on, was made longer, so it would extend into the cope. Three extra pin holes were properly located in the standard pattern board, to take care of the core prints when the

cofes were rammed. These three prints were located directly in line with the corresponding core prints on the drag side of the pattern.

When either the cope or the drag was rammed, a small ring core was dropped over the core prints, to insure against crushes, etc. Figure 11 shows the ring core in place in both the cope and the drag. The special gate core mentioned before was also used, as shown in the sketch, being placed on the pattern and rammed up with the mold, the same as the ring cores. When the drag was made, the pattern, being provided with the three standard dowel pin hole plates, was very nicely located on the board in its proper place. When the cope was rammed, the three small prints were located on the pattern board by the three special dowel pin holes. This arrangement insured a perfect match, so far as the cope and drag core prints were concerned.

The next important question was to locate the print part of both sides of the core, so they would match the prints in the mold. Figure 12 gives two views of this

Fig. 12. Notch Method of Making Two Halves of Core Register in Mold

Fig. 13. Piston Casting, Left Half Rough, Right Half Machined

core, which was made in halves and joined at the center. The plan used to make the prints register correctly is shown here. The three notches marked *AAA*, opposite each print part of the core, were provided in each half of the box, and acted as the guide when the cores were pasted. With the core made in this manner, and the old pattern provided with three extra core prints for the cope, the old piston pattern was converted into a molding machine job. It was not necessary to try the cope on the drag in order to find the proper place to produce the vent passage; the prints in the cope did this. This job was run at the rate of 10 to 20 per day, with other work, very successfully both as to quality and quantity.

Figure 13 is a cross section of the casting described here, showing one-half rough and the other machined. These two piston jobs are instances where something a little out of the regular plan had to be done to machine mold with the old patterns. But even the cost of the extra core prints for the cope, the three notches in the core box and the three small pin holes in the board, would not in any way compare with the cost of rigging this job up in the best manner for the best production on a machine.

This kind of molding machine practice is not recommended except in such cases as mentioned above; but I know that there are numerous places where this plan can be worked very successfully, though the operators may now consider it impossible.

The Erie railroad has awarded a contract to the Youngstown Equipment Co. for operation of the car shops at Brier Hill in Youngstown, Ohio, and the locomotive roundhouses at Brier Hill and Kent. This company, formed by Youngstown capital, recently took over operation of the Erie car shops at Kent, Ohio.

Leaves from a Steel Melter's Note Book—III

Experiences in Casting Steel Ingots in Cans—How Cracks Were Prevented—Causes of Hard Spots in Forging Ingots

BY HENRY D. HIBBARD

AT the first steel works at which I was employed, in New England, steel ingots for forging purposes larger than 12 x 12 in. square were generally cast in cans made of wrought iron sheets. This included all the tire ingots or "cheeses," as they were called, for tires for locomotive drivers which were short cylinders, as well as cylindrical ingots varying from 16 to 28 in. or even more in diameter, and weighing from 2000 to 28,000 lb. each. We had a 10-ton hammer, as large as any in the country in those days. It had a 10-ton tup and was double-acting that is, steam was admitted on top of the piston to increase the downward velocity of the ram and so the power of the hammer. The anvil weighed but 90 tons, which was far too light for such a hammer. The die block was broken and patched. This hammer was employed in breaking down tire ingots as well as in making all the largest forgings, but we had smaller hammers for the lighter ones. The largest forgings made were of 10 tons weight finished, which called for the largest size of ingots that we could make, taking a whole extra large heat of 28,000 lb. from our 10-ton open-hearth furnace.

Preparing the "Cheese" Containers

For each cheese a can was made of a single sheet of iron of No. 22 gage rolled into a cylinder with the joint riveted with five or six rivets about 3/16 in. in diameter. The edges at both ends were bent inward so as to give a rounded edge to the cheese of about 1/2 in. radius. The bent edges also helped to preserve the true cylindrical shape of the can in handling and setting for casting. These tire ingots were bottom cast in groups of four on one bottom plate provided with a central runner from which the steel was distributed to the molds through runner bricks in the usual manner. A can was placed over each runner opening and around it was set a cylinder of boiler iron 1/2 in. thick, about 4 in. larger in diameter and 3 or 4 in. taller than the can. The space between the can and surrounding cylinder was filled with dry sand level with the top of the can. On each can was placed a heavy cast iron disc having a rising conical central hub containing a riser cavity about 10 in. high, which served also as an air vent. These discs were clamped down to resist the upward pressure of the steel against them.

We knew little of pipes and nothing at all of segregation at that time but the method of subsequent manufacture practiced—the punching out of a cake of metal from the center—removed some of the unsound central metal around the pipe which each ingot must have had, and the remainder, lying in use against the wheel center where it was not subjected to wear, did no particular harm. The best metal was on the outside where it was wanted to take the wear on the tread of the wheel. The riser cast on had a thickness of 2 in. tapering to 1 in. which was not large enough to feed the solidifying ingot as it settled. It was broken off by a blow with a sledge and thrown into the scrap for remelting.

Flexibility in Ingot Weights

The great advantage of this method was that ingots of any weight could be made as desired, which was important because one ingot made one tire. They weighed from 900 to 1200 lb. each. The size of the can was made to suit, while everything else about the casting apparatus was unchanged. In those days iron was cheaper than steel, so the can in being wasted in heating and forging replaced so much steel without adding to the cost. The fusion point of the iron can being higher than that of steel, the can would remain solid after being filled with molten steel which welded

to it nearly all over. At that time, at one other plant located in the West, cast iron cylindrical molds were used for casting single tire ingots. Several sizes of different diameters were kept on hand with top plates to suit. The exact weights were obtained by adjusting the height of the cast iron top plate, which was of a size to fit loosely inside the mold.

For general forging purposes long cylindrical ingots were made, the cans in which they were cast being made of sheet iron of No. 16 gage. Such ingots under 18 in. in diameter had no visible structural defects and were smooth and satisfactory, though of course it is now clear that they had concealed pipes. In the larger sizes, with diameters of from 24 to 28 in. and lengths of from 10 to 12 ft., the cans wrinkled longitudinally but irregularly in casting and the ingots were likely to develop cracks under and along some of the wrinkles in the forging operation. The wrinkles were formed by the expansion of the can itself when heated by the molten steel, as it could not enlarge, its circumference being firmly imbedded in the incompressible sand and therefore forced to buckle, so that the wrinkles resulted. Why a crack should develop under and along a wrinkle was not understood, but the fact of their presence was indisputable.

Preventing Wrinkles and Cracks

The can-maker was an ingenious man and he one day conceived the idea of making a can with a longitudinal slip joint to take up the expansion of the can and so prevent the formation of wrinkles. The first ingot cast in such a can had fewer and shallower wrinkles than any previously made and showed that the cure had been found, as in ingots without wrinkles there were no cracks. A number of kinds of slip joints were tried and one finally adopted as standard. In that joint the usual rivets of the longitudinal joint were replaced by short stove bolts which could be tightened as much as was desired to hold the parts by friction and yet allow them to slip past one another when expansion took place. These bolts were spaced about 3 in. apart. In one edge of the joint horizontal slotted holes were cut in the sheet, which allowed a motion of 1 1/2 in. The other edge was punched to receive the stove bolts, registering of course with the slots. Then on this other edge from end to end of the can a cover strip or plate of the same sheet iron was riveted on to keep the sand out of the opening between the edges 1 1/2 in. wide as well as the slots, the slotted edge lying between the two. This cover strip was hammered into a shallow Z cross-section to allow space between it and the can for the slotted edge to slide. That strip was about 5 in. wide and was of course punched for the stove bolts to pass through. All this was expensive but nevertheless it paid because of the time it saved at the hammer where in former practice each crack had to be cut out after having been isolated on a raised lump by hammering down the metal around it. Some smaller cracks were only removed by rough-turning the forging. The cans were later fitted with an expansion joint at the top end made on the same principle to take up the longitudinal or vertical expansion of the can. Ingots so cast were beautifully smooth and gave full satisfaction in the forge as far as cracks were concerned.

Method for Forging Ingots

As in the case of the tire ingots a forging can was placed within a strong cylinder and the space between the two was filled with dry sand. For the larger sizes old boiler shells which came in the scrap were used for outer casings. For smaller sizes we had a lot of heavy

wrought iron rings which had been reinforcing rings around the breeches of Parrott rifled guns in the Civil War. Small forging ingots were bottom cast and large ones, weighing 10 tons or more, were partly filled from the bottom and the remainder from the top. If wholly top-poured the can would be in danger of being cut or washed away, somewhere, as the force of the stream of steel falling 20 ft. in extreme cases was very great. In fact, we lost one 12-ton ingot in that way, the can being cut through and the sand mixing with the steel. The method of first bottom-pouring and then top-pouring in sequence is still followed in teeming large ingots.

To handle the ingots we had a jib hydraulic crane rated at 15 tons capacity, but the accumulator did not give enough pressure to lift a 28,000-lb. ingot. To lift such a weight the accumulator was shut off and the pump made to discharge directly into the crane line, which gave the pressure required. Hauling such an ingot to the forge shop was quite a feat, requiring a team of eight heavy draft horses. On the snow in the winter time a heavy sled, built for the purpose, was used, but when the ground was bare of snow the ingot was carried on a heavy truck. No railroad track could be used, though there were tracks in the yard.

The great advantage of this method of casting in cans lies in its adaptability for making any weight or shape of ingot desired by the use of a can of the proper size. Otherwise an assortment of large cast iron molds would have been needed.

Little Knowledge of Pipe Prevention

Many large forgings for those days were made from ingots cast as described. Though they were readily made, they were not always satisfactory in use because of inadequate knowledge, at that plant at least, of piping and means for dealing with it, segregation, annealing and heat treatment and particularly because of faulty design on the part of the customers. A riser was cast on the upper end of each of the larger ingots to afford means of clamping on the porter bar and handles for manipulating the ingot during forging, giving the ingot the shape of a bottle. This riser was much too small to feed properly the settling steel and every one of the ingots must have had a large pipe cavity and unsound region at the top under the riser. I remember one short ingot about 3 ft. in diameter for a gun jacket for the Government. The machinist who bored it (there were no hollow forgings in those days) told me that a lot of the steel had fallen out in pieces from the center, which in my ignorance of pipe and gas holes I found hard to believe. I was chemist of the works at the time and naturally thought that I knew much more than I did. He spoke truly, however, for the ingot must have had a large pipe with surrounding unsound metal which in forging must have been broken up. The silicon was not high enough to cause a perfect pipe to be formed.

Our forging steel was usually of a grade which would stand, neither rising nor settling much. When we put in as much as 0.15 per cent of silicon, as we did for some special work, we called the product silicon steel. We never did anything to obliterate or lessen pipe. However, at that time we made most of the large steel forgings for this country and perhaps knew as much about making them as any plant this side of the ocean, though in Europe, I believe, from what I have since learned, they knew much more than we did.

Still, one might say the whole art of making good large forgings has been learned since then. Pieces in stock cut off the bottoms of large forgings made from ingots which were too large for the purpose were perfectly clean and sound, with no seams or other defects, and excited the admiration and curiosity of a visiting friend employed in one of the great plants of the country where "tonnage" steel was made. To his inquiry as to how we did it, I could only mention the great pressure under which it was cast due to the head of metal above it, casually adding that of course the steel was properly made.

Cracks in Ingots Cast in Iron Molds

When large cylindrical ingots were made in cast iron molds they were very liable to be cracked lengthwise,

particularly near the bottom. This was due to the ferrostatic pressure which forced the first skin of steel to freeze as solidification began, out against the heating and consequently expanding mold. The frozen skin, of course, was cooling and contracting at the same time. Now, freezing steel passes through a mushy stage at which it has but slight coherence, and at that stage the freezing skin was liable to be torn apart in places, the tears forming cracks. Clean, well-made steels will crack less than impure, dirty, underdone steels but any steel is liable to be cracked when cast in a large cylindrical cast iron mold. A cylinder does not admit of increase of volume without stretching its circumference. Because of this tendency to crack, other cross-sections of ingots were adopted in after years varying from polygons to coarsely corrugated contours. The polygons now usually made have slightly concaved sides and rounded corners. Any of these newer shapes allowed the frozen skin of the still fluid ingot to follow and adapt itself to the mold without being torn apart or cracked. Ingots cast in cans are not liable to have cracks due to pressure, as the mold does not expand but tends rather to contract, due to the expansion of the sand as it is heated.

There is another great advantage beyond that of preventing cracks, from having an ingot polygonal, six or eight-sided. A cylindrical ingot, unless hammered or forged with grooved dies, which prevent undue lateral spreading of the metal, is likely to be torn apart within, along or near the central axis, which defect is sometimes called a pipe, though it is of quite different origin from the pipe caused in casting by the settling of the freezing metal. The two kinds of pipe, when greatly drawn out by forging or rolling, may be much alike and justify the designation by the same name. The central tearing may be done to a perfectly sound ingot. The danger of it is greatly lessened if the ingot is polygonal, as the flat surfaces enable the metal to be worked more uniformly and to the center. A round ingot should be forged first into a polygonal shape, four, six or eight-sided for this reason, but it is advantageous to start with the ingot polygonal.

Hard Spots in Forgings

Another trouble that we had with our large forgings was that occasionally in turning them in the lathe hard spots in the metal were encountered which sometimes would break or crush the cutting edge of the turning tool. The machinist would stop his machine and cut them out with a cold or cape chisel, losing, of course, considerable time. The cause and cure of these hard spots we never learned, at least while I was there. Sometimes there were a few in a scattered group and in other cases dozens in a larger group, extending perhaps 2 or 3 ft. along the forging. They occurred in steel which had been thoroughly melted and in which no pieces of unmelted charge could have remained. Others who have found hard spots to be higher in carbon and manganese than the remainder of the metal have ascribed them to unmelted spiegel, which of course is extremely hard, but ours were certainly not due to that cause. One thing I noticed was that in forgings which had been worked by the hammer less than usual, say to one-half of the diameter or one-quarter of the area of cross-section, many of the hard spots adjoined and formed a part of the wall of gas holes not wholly closed by the hot-working given the piece. This indicated that they were formed by a sort of local segregation, as were the gas holes. Since then further knowledge of the structure of ingot steel leads one to suppose that there may be local segregation between the pine tree crystals or dendrites which form in slowly freezing steel. In those days we knew little about casting temperature, simply aiming to have the steel hot enough to cast cleanly into the molds. The steel-making methods used (pig and scrap bath with hot blooms added) automatically regulated the degree of heat, so that no precautions were taken to prevent the charge temperature rising too high. Since working by other methods where the charge temperature required to be carefully controlled, I have imagined that those hard spots were perhaps in steel cast too hot, which in a can surrounded by sand cooled so slowly that there was

excessive segregation of nonferrous elements between the crystals. This explanation does not account, however, for the occurrence of hard spots in groups, and not over the whole ingot, or even over the whole horizon or level when they did occur.

As a cast iron ingot mold usually weighs as much as the ingot it will hold or more, a steel plant making large forging ingots has necessarily a large investment in its assortments of molds, which require great space for their storage. Casting in cans obviates most of the expenditure and space required.

In recent years the method has been reinvented, sheet iron being used in forming the risers on large ingots, some of them many times greater than the largest we made at the old New England plant. When the mold for the riser or hot top of such an ingot is

formed of loam, sand or other refractory, the heating by the inflowing steel will cause its inner surface material to expand, which may make it crack and spall off in places, the loose pieces falling into the liquid steel below. This the sheet iron casing prevents.

The method of casting ingots in cans was patented by W. Dougherty, of Philadelphia, in 1873 (Patent No. 139778), the single claim of his patent reading: "The method of casting steel in wrought iron or other metallic cases when the latter is of such thickness as to admit of the heat of the melted steel completely welding the case to it, substantially as and for the purpose above set forth."

The patent was not well drawn and did not cover the case very well, as the welding of the can to the ingot was never complete

1918 to 1922 Course of Metal Workers' Wages

Pay Envelopes of Iron and Steel Workers, Car Repair Shops and Automobile Plant Operatives

DURING the past three years there have been numerous changes in rates of wages of men employed in metal-working plants. Figures of the United States Bureau of Labor Statistics show that in October, 1918, the average semi-monthly wage in iron and steel plants averaged \$71.67 per man. This figure dropped grad-

Course of Wages in Steel Mills, Automobile Factories and Car Building and Repairing Shops

ually until in July, 1919, it was \$60.35. After this a more or less steady increase brought the figure for October, 1920, to \$80.24. Since that date the decline has been well sustained, reaching low points in July and September, 1921, with a slight recovery to \$42.56 in November.

The course of these changes in average wage, month by month, is shown on the chart.

Similar figures for men engaged in the building and repairing of railroad cars show a trend quite different from that of iron and steel workers. This is due to the fact that many of these men, being employed directly by the railroads, have come within the wage scales and other regulations put forward by the Government, and hence have not felt to the same extent either the law of supply and demand or the contraction of business of the past year.

In October, 1918, these men were receiving an average of \$66.56 per half month, which figure dropped gradually until in August, 1919, it was \$51.05. After that there was a well sustained rise so that, during the early months of 1920, the figure was between \$62 and \$63. There was a sudden rise from the \$62.43 of July to \$72.85 in August, due, of course, to the heavy wage increase allowed by the Railroad Labor Board at that time. The figure held between \$70 and \$75 per half

month through January, 1921, after which date it has fallen, due partly to the cutting out of some of the so-called national agreements, until in November it stood at \$60.26. This figure is 42 per cent higher than the pay of the iron and steel workers.

Changes in the pay of automobile workers have followed to some extent the corresponding figures for iron and steel men, reaching a maximum in the same month and responding more closely to the law of supply and demand than in the case of the car builders. Automobile workers are paid by the week, but the figures, translated into semi-monthly totals by multiplying by 2 1/6, are as follows:

In October, 1918, the amount was \$61.45, which is substantially lower than either the iron and steel worker or the car builder was receiving. With minor fluctuations this figure was maintained until the summer of 1919, being \$63.85 during August. A higher range of pay then set in, fluctuating with conditions, but being consistently more than \$65 per half month, until finally it reached \$79.51 in October, 1920. With the collapse of the automobile market at that time, wages fell heavily, going as low as \$51.78 in February, 1921. They have since gone up again, reaching \$72.62 in May, but have again fallen to \$60.45 in November. This is also 42 per cent higher than the steel worker's November wage.

In all the foregoing it is to be remembered that the unit figures are the quotients of total payrolls divided by the number of men employed. They, therefore, take into account overtime employment in some periods and short time employment in others, being thus not direct indications of wage rates at different times.

The proceedings of a conference of the National Association of Office Managers held in October has been printed for distribution at \$1 per copy. Among other things the booklet describes at length the methods of increasing office production through standardization, and there is a detailed analysis of the office manager's job. A copy of the pamphlet, which has 56 pages, may be obtained by applying to the secretary of the association, F. L. Rowland, Gilbert & Barker Mfg. Co., Springfield, Mass.

Business is picking up in Bridgeport Conn. The Challenge Cutlery Co. is to double its working force, the Union Metallic Cartridge Co. is to go on a five day per week schedule, the Bridgeport Metal Goods Co. on a five and one-half days schedule, and other industries other than the machine tool report better business. The Bridgeport Metal Goods Co. received more business in January than it did during the first six months of 1921.

Welding Rods for Oxy-Acetylene Welding

Their Selection and Composition as a Factor in Successful Results on Steel—Welding Cast Iron—Copper and Brass Welding

BY J. R. DAWSON

UNTIL very recent years little scientific welding research has been done and, although much has of late been accomplished toward improvement in welding rods and the welding art, there remains great opportunity for advancement, especially in the direction of the design of rods best suited to various requirements.

It has been my privilege to conduct in collaboration with my associates and to closely observe a considerable number of tests in connection with certain investigations of standard commercial welding rods, as well as of experimental rods of various compositions, and this paper is based on information thus obtained.

Fig. 1—A Macrograph Shows Filled in Weld Metal, and its Junction with the Original Steel Plate. Humphrey's cupric chloride etching reagent was used, and the weld metal was made darker by this treatment.

Great strides have been made in perfecting the apparatus used in this industry and in improving the quality of the gases and the facilities for their economical distribution. These higher quality welding materials enable the operator to obtain correct mixtures of the gases and to maintain a close control of the flame. This feature is important, because variations in the intensity of the flame or the use of incorrect gas mixtures lowers the quality of the weld.

It is only recently that the importance of the correct selection of the welding rod has received any considerable share of the recognition that it merits, and that researches have been carried out for the improvement of existing rods and the development of new rods.

Consideration in the Selection of Rods

Unfortunately, in oxy-acetylene welding the practice has too often been to fill a steel weld with whatever steel rod happened to be at hand, or to weld copper with a plain copper wire, the general character of

the metal in each instance determining the most convenient filler at hand, without reference to scientific balance of component elements. The results of such methods have frequently been disappointing.

A better procedure is to use a rod that will produce a joint as good as, or better than, the original or base metal. The metals joined are usually in the rolled or forged condition, while the metal deposited from the welding rod is in the cast condition. Very often a metal is of such composition as to possess excellent properties after forging and heat treatment but in the form of the casting is of little value.

This is well illustrated by the comparison of chrome-vanadium steel. After forging and careful heat treatment these steels have a tensile strength of about 150,000 or even 200,000 lb. per sq. in. and are highly resistant to shocks and alternating stresses. In the cast condition the tensile strength is very little better than that of unalloyed steel of the same carbon content.

The welding operation frequently causes a change in the chemical composition as the metal of the rod is fused into the weld. For example, an 11 to 13 per cent manganese steel is widely used where resistance to wear and shock is required. A welding rod of this composition will yield welded steel containing 9 per cent to 10 per cent manganese, which is so brittle as to be without value. The solution is to use a rod containing at least 14 per cent manganese, which will yield weld metal of the correct 12 per cent manganese content.

Hard to Obtain a High-Grade Weld

To obtain a high grade weld it is necessary to fuse the edges of the base metal and the welding rod at the same time and to obtain an intermingling of the two metals. The product of this mixing may be entirely different from either of the original metals. This may be illustrated by attempts that have been made to weld cast iron with steel rods. The mixture of the metals at the junction is weak, brittle, hard to machine, and lacking in the good qualities of either steel or cast iron. However, when the product is not required to stand severe strains or shocks there are certain instances when steel may be welded to cast iron.

The composition of the rod should be such that during welding the metal is not so liquid as to run easily over the unfused metal, thereby covering up improperly fused and oxidized surfaces, nor should the melted metal be so viscous as to pile up and cause difficulty in obtaining a weld that is homogeneous and smooth at the surface. A satisfactory rod will be sufficiently free from impurities and of such composition that the slag formed by welding will fuse and float readily to the surface of the molten pool. A very thin slag has the advantage of protecting the metal surfaces from oxidation, and when present in small amount is not readily entrapped in the weld.

Manipulation is easier and attended with greater success when the melting points of the rod and the metal being welded are approximately the same. Where there is considerable difference, the low-melting-point metal is overheated and damaged before the higher-melting-point metal is fused.

This rate of fusion also makes important the exercise of care in choosing the size of rod and welding head for a given weld. The heat supplied should be sufficient to keep a small pool of molten metal in the weld and to melt in additional metal from the rod. If the rod is too large it will tend to chill the molten bath and may sufficiently lower the temperature to retard or virtually stop fusion of the rod metal into the weld. On the other hand, if the rod is too small it will not

*From a paper read before the annual convention of the International Acetylene Association in October, 1921. The author is one of the technical staff of the Union Carbide and Research Laboratories, Inc., Long Island City, N. Y.

Fig. 2—This Specimen Contains Less Than 0.5 Per Cent Carbon. The field is made up of ferrite and small inclusions of oxides which are frequently found in very soft steel. ($\times 100$)

Fig. 3 Weld Made from a Very Low Carbon Rod, Containing Large Irregular Ferrite Grains. The scattered black dots are iron oxide. This impurity is less frequently found in welds made from a slightly higher carbon rod. ($\times 100$)

Fig. 4 (Unetched). Show: Impurities in 0.02 Per Cent Carbon Steel Rod. Most of these inclusions are aluminum oxide. Upon welding with this rod a granular appearing slag, formed on the surface of the melted metal, made it difficult to obtain a clean weld. ($\times 100$)

absorb the heat of the flame and pool rapidly enough, and the excess heat which results in the weld will burn the metal.

The usual method of manipulation is to melt a small pool of the base metal and then insert the rod in the molten pool. Then the rod absorbs the heat necessary to melt it down and at the same time prevents the temperature of the molten pool from rising

clean weld, because it keeps the melting metal covered by the pool, prevents any oxidation below the surface, and makes it improbable that any oxidation or foreign matter will be carried to the interior of the weld. Furthermore, the neutral gases, when directed at the weld adjacent to the rod, envelope both the rod and the bath in such a manner as to exclude atmospheric oxygen from the weld, so that excessive oxidation cannot occur

Fig. 5 (Left) Structure of Steel Rod Containing 0.20 Per Cent Carbon. Dark areas are pearlite, the carbon carrying constituent, and light areas ferrite. ($\times 100$)

Fig. 6 (Right) - Weld Made from 0.35 Per Cent Carbon Steel Rod. The Widmanstatten-like structure is characteristic of medium carbon steel that has cooled undisturbed from a high temperature. A weld showing this structure is frequently stronger than the low carbon weld previously shown, but its ductility is seldom as good. ($\times 100$)

far above its melting point. The principle is the same that governs the temperature of water containing ice. It cannot be heated to a temperature higher than that of melting ice until the last of the ice is melted.

The torch is moved gradually along the weld and all slag is floated to the surface. Laps or cold shuts are melted out, the rod being kept constantly in the pool to supply metal for filling.

The covering of unfused surfaces would produce the difficulty commonly called lamination, which is similar to the seams that sometimes occur in the rolling or forging of steel. This method of holding the rod suspended in the molten pool aids in the production of a

when the filling rod and the blowpipe are manipulated properly.

Welding Rod Materials and Their Composition

The most important of the welding rods, if we judge by the quantity consumed, is Norway iron which, though really a steel, approaches closely to pure iron. A weld made properly with this rod will have a tensile strength of over 50,000 lb. per sq. in. and an elongation of from 25 to 30 per cent in 2 in., thus combining high strength and excellent ductility.

The next in importance is the mild steel rod which contains 0.20 per cent carbon and other elements in the

Fig. 7 (Left) - A 0.90 Per Cent Carbon Steel. This eutectoid steel contains just enough carbon so that neither free ferrite nor free cementite is formed. ($\times 100$)

Fig. 8 (Right) - Structure of Weld Made from Rod Shown in Fig. 7. The grains are quite large and the steel in this case is largely sorbitic. This weld is relatively hard and resistant to wear, but is of lower tensile strength than lower carbon steel welds. ($\times 100$)

Fig. 9 (Left) Cold Drawn Nickel Steel Rod. Carbon, 0.24 per cent, nickel, 3.50 per cent. The elongated grains are due to the deformation set up by the reduction during the drawing operation. ($\times 100$)

Fig. 10 (Right) Weld Metal obtained from Nickel Steel Rod. One small slag inclusion is shown, otherwise the weld is quite clean and free from defects. ($\times 100$)

usual percentage. Norway iron and this material may be used interchangeably, depending largely on the operator's preference. The mild steel rod ordinarily gives a weld of higher tensile strength, but of slightly lower ductility.

The following table illustrates the tensile properties of welds made by a properly trained operator using

Welds have been obtained that have a Brinell hardness higher than 400, which is too hard to machine. However, any hardness in the range from a very mild steel of Brinell number below 100 up to the highest value can be obtained by the selection of a rod of suitable chemical composition.

Steel which has been subjected to mechanical work,

Fig. 12 - This Photograph at Two Diameters Shows a Section of Cast Iron as Welded with the Oxy acetylene Torch. The weld is free from blowholes or slag inclusions and a perfect intermingling of the weld metal and plate metal has been obtained

the mild steel filling rod. Note the practical uniformity in the results of the successive welds:

Sample No.	Yield Point, lb. per Sq. In.	Ultimate Tensile Strength, lb. per Sq. In.	Elongation in 2 In., Per Cent	Contraction of Area, Per Cent	Fracture
1	36,000	51,150	13.0	18.6	Fine crystals
2	34,500	51,100	14.0	20.6	Silky
3	36,120	56,700	16.0	16.0	Silky
4	35,150	55,100	12.0	14.4	Fine crystals
5	37,150	53,200	10.0	18.6	Silky
Average	35,800	51,850	12.1	17.6	

These values were obtained in testing welds in ship plate of 60,000 lb. per sq. in. tensile strength. They are merely good average welds. The specimens were machined over all to make it possible to secure accurate measurements.

High carbon welding rods are employed for building up worn shafting and for many other common uses where metal is required of sufficient hardness to resist wear and tough enough to resist shocks and other stresses. The carbon content of these rods may vary over a rather wide range, depending on the requirements of the finished welds.

as in rolling or forging, is strengthened by increasing the carbon content, but an increase of carbon in steel welding rods does not greatly increase the tensile strength of the resulting weld because the weld is essentially a casting, and the weld metal forms in larger and weaker grains as the carbon content is increased, and to the added fact that welders have greater difficulty in obtaining sound welds with the higher carbon steels.

Nickel Steel Rods

There are a few very skillful welders who have obtained excellent success with nickel steel welding rods containing 0.20 to 0.25 per cent carbon and 3.0 to 3.50 per cent nickel. Many other welders obtain poor results with this steel owing to cracks that form in a weld while it is red hot. The tendency to crack is due to the brittleness of nicked steel at high temperature. This property is illustrated by the difficulties so frequently encountered in forging nickel steel and by high temperature tensile tests.

Operators who are sufficiently skilled in handling nickel steel rods can make welds having a tensile strength as high as 60,000 lb. per sq. in. This strength is greater than that of low carbon steel plate, such as

Fig. 11 (Left) - Manganese Steel Rod. Magnification 125 diameters. The small light colored grains are austenite, which is a rather unstable constituent. Relatively low temperature heating will cause it to break down into martensite, which is hard and brittle. Mechanical working as machining or filing has a somewhat similar effect, after the first cut is taken the portion adjacent to the cut becomes unmachinable. ($\times 425$)

Fig. 12 (Right) - Manganese Steel Weld Metal. Here the austenite grains have partially disintegrated and martensitic structure is observed. This material is shown in the welded condition before being heat treated. Surrounding the grains can be observed thin white lines of carbide. This material is present in such small amount as to be without value for strengthening the metal, but serves as a weak binder between the grains. Correct heat treatment will change this metal to the desirable austenitic condition. ($\times 100$)

Fig. 14 (Left) —Gray Cast Iron, Unetched. Large plates of graphite tend to weaken the metal. ($\times 100$)

Fig. 15 (Right) —Gray Cast Iron Weld Metal, Unetched. Here the graphite flakes are of smaller size and the metal is even stronger than the casting, because the continuity of the metal is greater. ($\times 100$)

boiler plate, and, when tensile tests are made, the break does not occur in the weld but generally several inches away in the plate metal.

High-speed steel rods are used rather widely for making tipped tools. The high-speed steel is melted into a slot, cut from the end of a low carbon steel shank. After correct heat treatment the cutting qualities of the high-speed steel deposited by the oxy-acetylene welder are as good as the high grade commercial brands of high-speed steel. The melting causes very little change in the chemical composition, usually a slight reduction of the contained silicon and manganese, so the rods used should have about the same composition as a standard high-speed steel. A wide variety of shapes and sizes of tools are thus made available without tying up an appreciable amount of money in costly material, as is the case when solid high-speed steel is used. The requisite for success here, as with every high-speed steel, is correct heat treatment.

Manganese rods are employed in the repair of machinery used for grinding and for other service where great resistance to abrasion is required. Special precautions are necessary in welding this steel. The part to be welded should be supported so that the heated portion will be under as little strain as possible; it should be preheated to redness before the welding is begun and kept red hot during the operation. In this steel the favorable properties of great resistance to shock and abrasion are brought out by quenching in water from a temperature of about 1800 deg. Fahr. To obtain the best results after welding, the quenching practice employed in manufacture should be followed closely.

Welding Cast Iron

One of the commonest of oxy-acetylene welding operations is the welding of cast iron. The expenditure of a few dollars for welding in this field may easily result in the salvage of a casting worth several hundred dollars.

The composition of the rods used for this work is that of ordinary gray cast iron, the silicon content of which should be relatively high and the percentage of sulphur low. Excepting for certain special uses, gray cast iron is standard. Increasing the silicon content reduces the amount of carbon retained in solution during cooling, resulting in the decomposition of a larger portion of it in thin graphite flakes throughout the cast

iron. It is this structure which gives the fracture of gray iron its characteristic appearance.

When rods of correct composition are used, the weld metal obtained is usually as strong as the original casting. The tensile strength of a cast iron weld is about 18,000 to 20,000 lb. per sq. in. and the transverse test of 1-in. square section, using a 12-in. beam, loaded at the center, is from 2000 to 2500 lb. with a deflection of 0.1 to 0.15 in.

Copper and Brass Welding

Rods used for filling welds in copper are made of copper to which has been added a small amount of phosphorus as a deoxidizer. Very encouraging results are being obtained in the tensile strength of the welded metal. Until recently only about 14,000 lb. per sq. in. tensile strength was obtained in copper welds, but improvements in rods have made possible the production of welds testing over 22,000 lb. per sq. in.

Brass is successfully welded, rods of the usual brass compositions being satisfactory for this use. There is some loss of the zinc content, about 2 or 3 per cent escaping as fumes. A suitable flux is always used in welding on brass or bronze. The flux forms a thin slag, coating over the weld and preventing oxidation and at the same time dissolving impurities and floating them to the surface of the weld. The most popular bronze welding rods are the manganese and Tobin bronzes.

Aluminum welding and soldering by the oxy-acetylene flame has a widespread use both in manufacturing and in the repair of broken parts. The welding of broken crank cases is one of the regular services offered by most up-to-date automobile repair shops. Rods of pure aluminum, as well as special rods of aluminum with zinc or copper additions, are widely used and have met with much success.

Quality of the Rods

Even though they may be of correct chemical composition, experience has shown that some rods are unsuited for welding. Any one of the manufacturing operations of melting, casting, rolling, cold drawing, etc., may not have been correctly handled, resulting in a faulty product.

Investigation of several curious failures of welding materials has focused attention on certain factors that

Fig. 16 (Left) —Gray Cast Iron Weld Junction, with weld metal on left and original cast iron on the right. Much smaller graphite plates in weld metal. Good fusion of the two metals and no impurities or hard spots can be observed. ($\times 50$)

Fig. 17 (Right) —High-Speed Steel Weld Metal. This material has been correctly heat treated and has proved to be an extra good tool as shown by service tests. Most of the carbides have been absorbed during the heat treatment. The ground mass is martensitic with outlines of the original austenitic grains still remaining. ($\times 425$)

as yet remain somewhat obscure. Welding rods are encountered occasionally that are not satisfactory in their welding properties, even though chemical analysis of the material show that the proportions of the elements usually specified are correct. This trouble has not been found alone in rods but in certain lots of sheet metal, as was recently demonstrated in an investigation of sheet metal that did not meet the requirements of a certain manufacturer for welding. The rod was satisfactory, the equipment and welding procedure all that could be desired, and still it was not possible to make a satisfactory weld. Here again even most careful metallographic examination failed to reveal conclusive evidence of the cause of non-weldability. A simple test, in which none of the factors of torch operation or gas fusion entered, proved that it was impossible to melt the given steel and obtain a solid fusion free from blowholes and sponginess.

This example is mentioned to illustrate that as yet we do not know all there is to be known of the physico-chemical reactions taking place when the melting of a welding metal occurs. The steel-maker and foundryman share with the welder some of the responsibility and should work with him in solving the problem of making better welds.

Physical Tests of Welds

Until very recently there was no recognized standard for the testing of welds. Leaders in the industry have recognized the need for a uniform practice in testing, so that a greater knowledge of the properties of welds will be available through the exchange and

assembling of information and test data. This need of standardization has been met by the American Bureau of Welding with carefully prepared specifications for testing welds, such that entirely comparable results will be obtained by experimenters who follow these specified methods of testing. The tests included are tensile, bending, fatigue, impact and metallographic.

Examination by X-rays is a new method of studying welds that of late has received considerable attention. Any slag inclusions, blowholes, or interface in metal, up to 2 in. in thickness, may be detected by this radiographic examination.

Microscopic Examination

The microscope is almost an unfailing aid when a study of the physical properties of a metal is undertaken. The examination of the entire surface of a large metal section at high magnification is very tedious and points of greatest importance might frequently be missed. The study of macrostructure has been developed to help in avoiding these difficulties.

The grains in the weld are coarser than those of the parent metal. There is no undesirable sharp demarcation at the point of junction between the two metals, but by the thorough fusion of the metals a gradual change of structure takes place in passing from the weld to the plate material.

The accompanying photomicrographs have been prepared to illustrate characteristic examples of various welding metals. Some show impurities or defects that should be avoided. All were etched with 5 per cent solution of nitric acid in alcohol.

PRESIDENT FARRELL'S CALL

Ninth National Foreign Trade Convention to Be Held in Philadelphia in May

James A. Farrell, chairman of the National Foreign Trade Council and president of the United States Steel Corporation, has called the foreign traders of the whole country to meet in Philadelphia, on May 10, 11, 12. In issuing the call for this convention Mr. Farrell said:

"Energetic efforts in the past year have been directed towards that restoration of stable economic conditions in international commerce, which must be accomplished if the world is to return to normal activity and prosperity. During the year the foreign trade and the domestic trade of all countries have suffered alike, although in varying degree in different countries.

"The severe and prolonged decline in prices everywhere resulted inevitably in a slowing down of commerce and industry, due to uncertainty as to ultimate values. The continued recession in prices and accompanying reduction in producing costs, has permitted a degree of competition for business in certain commodities in the world's markets, while the approach of prices to pre-war levels, or to the cost of production, has stimulated renewed buying and substantially increased the world's buying power.

"So far as the United States is concerned, the turn of the tide is apparently here, and despite the sharp decrease in values, the volume of our foreign trade is materially greater than before the war, and in many lines has increased notably in recent months. In certain directions, however, the meeting of foreign competition, reinforced by subnormal costs of production arising from depreciated currency, continues an important question for discussion and solution.

"The financial and production problems of Europe, also, are still unsolved and until solved the lessened consuming power of markets which have been large buyers of American products will continue to retard the natural expansion of our trade.

"A general survey of the world's merchant marine now in operation would indicate that ocean freight rates are now below the cost of carrying. The effect of this situation in its various aspects on the American Merchant Marine demands earnest consideration of all interested in the perpetuation of our foreign trade and shipping.

"To study the means of promoting the necessary restoration of the power of production and consumption in all the great markets of the world; to examine the conditions confronting our international commerce; and to obtain the judgment of experienced business men on many matters of vital importance to all the American people, the National Foreign Trade Council will hold the ninth national foreign trade convention in Philadelphia, on Wednesday, Thursday and Friday, May 10, 11 and 12, 1922.

"The Financing and Expanding of Our Foreign Trade" will be the central theme of the Convention.

"Americans engaged in foreign trade and connected with any factor of our international commerce, agricultural, commercial, industrial, financial or transportation; all chambers of commerce, boards of trade, national and State associations and other commercial and industrial organizations, as well as firms and individuals, are cordially invited to participate individually or by appointment of delegates.

"Your co-operation in the effort, through the ninth national foreign trade convention, to make more effective the national services rendered by foreign trade, is earnestly invited."

Mining Exhibit at Brazilian Exposition

The work of the various bureaus of the Interior Department in promoting the mining industry of the United States will be shown at the exhibit of the United States Government at the Brazilian Centennial Exposition at Rio de Janeiro in September of this year. The Secretary of the Interior has designated Thomas T. Read, Chief of the Information Service of the Bureau of Mines, as the representative of the Interior Department on the executive committee which is to cooperate with the Commissioner General, Col. D. C. Collier, in making arrangements for a suitable exposition of the activities of the Government of the United States.

The Greendale Mfg. Co., screens, and the business of John F. Murphy, dies, both of Worcester, Mass., are to be taken over by a new company, the Murphy Die Co., recently incorporated, and will specialize in dies for gaskets. John F. Murphy is president of the new concern, John W. Murphy, vice-president, and W. L. Hubbard, secretary and treasurer.

UNION LABOR ATTITUDE

Extreme Position Taken in Hearing Before Interstate Commerce Commission

WASHINGTON, Feb. 14.—Determination of organized labor to contest strongly reductions in rail labor was made clearly evident by testimony given before the Interstate Commerce Commission last Friday and Saturday, in connection with the general rate investigation, by Frank J. Warne, when he spoke for practically all of the railroad unions, the railway department of the American Federation of Labor, and other organized labor groups. Their counsel, Attorney Glen E. Plumb, conducted the direct examination of Mr. Warne.

In the face of the obvious fact, emphasized not alone by railroad executives, shippers, and the public generally, that general reductions in railroad rates cannot be made unless wages have been deflated, Mr. Warne made the remarkable contention that there is no economic law that establishes any relation whatsoever between rates as such for transportation, and rates of wages for services performed. Employees, said Mr. Warne, "believe this is an economically sound document, the observance of which cannot lead this commission astray from the facts of the situation which now confront it in this hearing."

It was evident that organized labor was pleased that it was given two days to present its views in this important hearing, and the press agent, speaking for Mr. Warne, who in turn claimed to represent labor organizations comprising 1,750,000 employees on all the railroads of the country, declared that "the appearance of Mr. Warne was said to be the first time in the 34 years of the existence of the commission," when these railway labor organizations were a party of a rate case.

"It is considered as significant of a striking tendency in the industrial development of the country as regards the widening gulf between employers and employees and the increasing magnitude of the stage upon which the issues between them are to be fought out."

This belligerent note was sounded throughout the testimony of Mr. Warne and was taken as an indication that organized labor, at least, was prepared to take a militant attitude against reductions in wages, though there are those who believe such an attitude is largely an outward manifestation rather than one that would be carried to extremes.

It was interesting to observe that out of the large list of organizations for which Mr. Warne spoke, the Brotherhood of Railway Trainmen was not included. It was stated that the exclusion of this organization was deliberate. W. G. Lee, president of the Brotherhood of Railway Trainmen, it will be recalled, disagreed with other labor leaders in the threat to strike last October, and apparently there still is a rift between this organization and the others. This has led to the belief that organized labor groups do not possess the solidarity which they pretend, though there is no denying that if they went to the extent of striking before submitting to rail reductions they could at least temporarily paralyze transportation in the United States. Mr. Warne attempted to bring in considerable extraneous matter which was ruled out by the commission.

Unemployment in Pennsylvania

HARRISBURG, PA., Feb. 14.—The metal trades of Pennsylvania are in the most stagnant condition of Pennsylvania industries, according to the semi-monthly report for the last half of January, just submitted on unemployment conditions in the State to Clifford B. Connelley, commissioner of the State Department of Labor and Industry.

Little activity is reported in any of the 10 districts of the State. The Altoona office reports that work is practically at a standstill. Erie declared that at a meeting of the Employment Managers' Association of Erie it was the opinion of those present that their forces would not be increased during February. Mead reported a slight improvement, but Harrisburg, Johnstown and Pittsburgh announced no better-

ment. Philadelphia said that the Baldwin Locomotive Works, which has a total force of about 6000 men at its Spring Garden and Eddystone plants, has cut operations from three to two days a week, while all the machine shop trades are dull.

Unemployment, as a whole, decreased during this period, although Philadelphia, Altoona, Erie and Harrisburg reported an increased number of men out of work. The reports showed a total of 313,835 unemployed in the various districts on Feb. 1 as compared with 315,860 on Jan. 15, and 321,893 on Jan. 1.

Labor Clash at Yorkville Plant

WHEELING, W. VA., Feb. 14.—Although the Wheeling Steel Corporation has succeeded in resuming operations at its Yorkville, Ohio, works, a tin plate plant of 24 hot mills, which has been idle since last June as a result of the refusal of the company to renew its agreement with the Amalgamated Association of Iron, Steel and Tin Workers, the effort is meeting with some resistance, and on the night of Feb. 7, a clash between mill guards and picketing strikers resulted in the death of one of the strikers and the wounding of another. This is the only flareup that has occurred, but the situation still is tense as members of the Amalgamated association, aided by union miners, have formed a cordon of pickets around the plant and are making a strong effort to prevent the return of the plant to its status as an "open shop," as it was prior to the war, and which the management probably would have maintained had it not been for political pressure exerted at the time from Washington.

In explanation for the refusal to renew its agreement with the Amalgamated association last June, the Wheeling Steel Corporation officials claimed that the labor organization, at its annual convention in Hamilton, Ont., had passed a resolution demanding that the Wheeling Steel Corporation sign an agreement as a unit and thus embrace all its units, some of which, notably LaBelle Iron Works, had been "open shop" works. Amalgamated officials denied such a resolution and that they were merely trying to get the Wheeling Steel & Iron Co., one of the Wheeling Steel Corporation subsidiaries, to renew the agreement which they claimed it had previously broken.

None of the companies of the Wheeling Steel Corporation was represented at the wage conference between independent sheet and tin plate manufacturers and the Amalgamated association at Atlantic City last June, nor at Columbus, Ohio, where a fresh conference was held; following the failure to reach an agreement at Atlantic City. The company posted notices of its intention to deal direct with its employees, but since most of them were affiliated with the union they withdrew when the agreement expired by limitation June 30, last, and the Yorkville plant suspended operations.

About 10 days ago the company announced its intention of starting up Feb. 7, and invited former employees to go to work, offering wages somewhat above the current scales in union mills, but upon the basis of dealing direct with the men and the non-recognition of the union. Three mills were started and have since continued in operation.

In the Field of Labor

The Government's curtailment in naval construction work has resulted in 1000 men being laid off at the Fore River Works, Bethlehem Shipbuilding Corporation, Quincy, Mass., leaving 1800 men at work there, contrasted with 6500 a year ago and 18,000 during the war. Work on the superdreadnought Massachusetts and the battle cruiser Lexington has been suspended. The Massachusetts is 11 per cent completed, and the Lexington 35 per cent. Work on two scout cruisers and 16 submarines has not been discontinued.

The Bay State Foundry Co., Katherine Street, Westfield, Mass., closed for more than a year, will shortly resume operations, having secured a large contract from Cleveland manufacturers and others. Heretofore the plant was engaged almost exclusively in work for the Brien Heater Co.

New Socket and Ratchet Wrench Set

The socket and ratchet wrench set shown in the illustration has been placed on the market recently by the Eastern Machine Screw Corporation, New Haven.

There are ten sockets to the set, fitting 7/16 to 1 in. hexagon nuts. The method of manufacturing the sockets is a feature emphasized, the hexagon openings being made by drilling the hole to a diameter corresponding to the diagonals and drawing in the metal to form the hexagon. The result of this process is said to be a compressing and toughening of the metal permitting a reduction of the usual heavy wall to a thinness which permits the socket to fit where a thicker socket could not. It is also said to result in a socket

SOCKET ARE MADE BY DRILLING HOLE AND DRAWING IN THE METAL TO FORM THE HEXAGON

one third stronger than usual. Another improvement featured is the provision of strong hexagon head for the socket, all of the wrench parts fitting over this head for turning. The sockets are heat treated and hardened by three processes which involve carbonizing, refining and final hardening.

The T-handle has a cross bar which is adjustable for use in the central position or in the position for maximum leverage. The ratchet is set for either right or left hand use by raising or reversing the position of a ball-head pin. An extension piece is used between the T-handle and the socket either to turn nuts difficult to reach or to bring the handle into a more favorable position. A universal joint milled from bar stock is provided for turning nuts located at difficult angles.

The set includes two screw driver blades which fit any of the wrench attachments. The box wrench has a hexagon hole to fit any of the sockets and is used to get at nuts when the space above the socket is limited. This is a drop forging and is hardened by the cyanide process. The female part of the wrench attachments is provided with a split screw made from spring steel, which provides the necessary friction to hold the different parts together while in use. The tool box is strongly made of wood.

Fluorspar in Japan

WASHINGTON, Feb. 11.—Fluorspar is produced in small quantities in Ise province and also at Hotatsusan province, Japan, Acting Commercial Attache Halleck A. Butts, Tokyo, says in a report to the Bureau of Foreign and Domestic Commerce, but the domestic product is of such poor quality that the greater part of the demand is supplied from foreign sources. The principal sources of supply are Korea, Manchuria and South China. So far as it was possible to ascertain, none is imported from the United States.

The total amount of fluorspar used in the Japanese steel industry during 1920 amounted to 285 metric tons.

The present open-hearth capacity of Japanese steel works is given as 2471 tons. There are 105 furnaces.

Because of the small amount imported, fluorspar is not listed separately in any of the Japanese trade statistics, the report says, nor has it been possible to secure this information in any other way.

It is pointed out that there do not seem to be encouraging prospects for the importation of the American product. The Japanese steel industry, it is explained, is not in a flourishing condition, and in addition will be still further depressed by the putting into operation of provisions of the Washington conference relating to limitation of armaments. In addition, it is stated, American producers will have to meet the competition of nearby producers who are much more favorably situated with regard to transportation costs.

Navy Yard Workers Laid Off

WASHINGTON, Feb. 14.—The effect of the conference on the limitation of armaments became pronounced upon workers in Government navy yards last Thursday, when, without previous notice, they claimed, they were "furloughed" without pay. The Washington Navy Yard dismissed 1350 employees and several thousand others were "temporarily" laid off at the Philadelphia, Norfolk, and Mare Island, Cal., yards, while the Naval Ordnance plant at South Charleston was ordered by Secretary of the Navy Denby to close at once and to lay off without pay, until June 30, all employees except those necessary to maintain and protect the plant.

The action of the Government has caused the different unions representing the trades affected by the order to organize a campaign to have the Government turn the navy yards over to the production of peacetime material as well as ordnance work being done at private plants. While considerable demonstration is being made in connection with this move, it is evident that it is considered impracticable and that it will not avail anything.

It was stated that most of the steel for naval vessels, which is to be scrapped under the provisions of the conference on the limitation of armaments, has been shipped, except the armor. But contracts for both steel and armor, as well as electric power equipment, etc., intended for the ships, have been held up and ultimately will be cancelled if the treaties are ratified. This will be followed by work of making readjustments with the private contracting firms.

Tool to Prevent Clogging Metal Saw Teeth

Much of the breakage of metal-saw teeth has been caused by chips from the cut clogging the gullets of the teeth, putting strain on the teeth and often causing them to crack and break. An automatic device intended to eliminate this trouble has been placed on

Device to Prevent Breakage of Metal Saw Teeth Caused by Chips Clogging the Gullets of the Teeth

the market by Henry Disston & Sons, Inc., Philadelphia. The tool shown is called the Disston chip remover. It consists of a special sprocket wheel, made to fit any type of saw, and a stud to carry the wheel.

If the saw teeth and gullets are free from chips, the saw will cut easier and smoother, and on this basis it is claimed that a saw equipped with the new chip remover can be run faster and at a little heavier feed. Chips from the cut often stick to the sides and points of the saw teeth, scoring the work and resulting in a rough, uneven cut. In keeping all parts of the saw teeth free from chips the chip remover is said to produce a smoother, cleaner job. These difficulties have been particularly noticeable when cutting soft stock or in the case of unusually large stock.

The European Steel Industry To-day

American Engineer's Comparison with British and German Pre-War Conditions -- Keen Interest in Plant Reconstruction

AN extended study of European steel conditions has just been completed by a prominent American blast furnace engineer. Last July, H. J. Freyn, president Freyn, Brassert & Co., Chicago, left this country for a three-months' business trip to England, Belgium, Holland, Germany and other countries, with which was to be combined a study of the general situation. The field was so large and the opportunities so diversified that the time was extended to seven months. Mr. Freyn returned last Sunday on the George Washington and granted an interview in New York to a representative of THE IRON AGE. Only some of the more important facts which naturally were developed by such a thorough contact with the iron and steel industries of those countries are possible of reproduction here. The value of the knowledge gained may be partly judged by the statement that Mr. Freyn talked, in many cases for hours at a time, with about 300 different persons in the iron and steel industry in the various countries.

Among the results of the business phase of the trip was the establishing of two European branches or connections of this blast furnace engineering firm. A British company has been organized in London under the name of Freyn, Brassert & Co., Ltd. In Germany connections have been established with the German company, Gutehoffnungs Hütte, at Oberhausen. The former branch will cover the British field while the German connection will look after the interests of the Chicago company in continental European and other foreign countries. Not only will the adaptation of American blast furnace and other steel equipment to European practice be a feature of this business but the introduction of the McKune open-hearth furnace will also be advocated. The Chicago company recently secured the American and foreign rights to this Canadian invention.

In commenting on the trip in general, Mr. Freyn stated that his outstanding impression is the "great kindness and truly extraordinary hospitality with which I was received everywhere I went. I made the acquaintance of nearly 300 people engaged in the iron and steel industries of England, Germany, Belgium, Holland, Austria and Czechoslovakia, all of whom showed me the most friendly consideration and facilitated my work by their kindly interest. I owe all these men a debt of deep gratitude which it is a pleasure and privilege to acknowledge."

Keen Interest in American Methods

The interest in American methods of making pig iron and steel was everywhere an outstanding impression of Mr. Freyn—due largely to the changed economic and industrial conditions following the war. In his opinion post-war conditions in Europe are comparable with those which existed in America even before the war; the general plane of living of the working classes has been raised, labor is much more independent and less efficient. The 48-hr., and in certain countries the 45-hr., week has been legally established. "I have met not one person who claims that these conditions are the temporary result of the general upheaval caused by the war and that conditions will come back to the pre-war level." On the contrary, the conviction prevails that a new era is dawning, said Mr. Freyn, and that he who is unable to adjust himself to the new order cannot expect to survive.

About half of Mr. Freyn's journey was in England and the other half on the continent, particularly Germany. Business exigencies necessitated his going back and forth a number of times from one country to another, so that unusual opportunities were afforded to observe the changes which took place from time to time, thus ensuring a more careful study of conditions

and not making it necessary to generalize and possibly create wrong impressions, as is often done by some newspaper and magazine writers.

Conditions in the British Industry

After describing the prostration of the British steel industry in July and later when the price of coke and labor was so high that economic production was impossible and when continental iron was being sold, f.o.b. Antwerp, at prices several pounds sterling below the cost of production in English blast furnaces, Mr. Freyn said that conditions gradually improved so that some furnaces which had been damped down as long as nine months, were again blown in until, at the time of his leaving England early in February, perhaps 25 per cent of the furnaces were in operation. Everywhere he was told that the British industry was in a distressed condition which must continue until the greatly increased cost of raw materials and labor as well as the high taxes and transportation charges are removed.

Much has been accomplished in the last few months in revising wages downward, but Mr. Freyn was told that no steel plant in Great Britain is able to-day to produce at a profit, for iron and steel products are being sold in small volume only and at prices considerably below cost of production, entailing great financial losses which must be covered by reserve funds accumulated during war prosperity.

The Wage Situation in England

"Several British plants are being operated in only one or two departments a few days each week," said Mr. Freyn, "for the following reasons. The managements desire to keep their workmen in food and shelter without abandoning them to the demoralizing effects of becoming recipients of the government unemployment dole. This is a commendable altruistic viewpoint, not dictated by law—as is the case in Germany—but is entirely voluntary. It is thus possible to take full advantage of the opportunity provided by wage agreements with the unions to bring down wages to a reasonable level compatible with the general deflation which has been under way for some time. Wages are paid on a sliding scale based on the ascertained price of certain steel products; when sales are made below manufacturing costs, a readjustment of wages takes place and it is greatly to the credit of the British workmen and to the spirit of fairness, justice and honesty that these reductions are being made almost without opposition."

"That a further curtailment of wages alone will be entirely insufficient to reduce costs to a level where competition will be possible at present world market prices is best shown, pointed out Mr. Freyn, by the statement of one prominent producer that he could not manufacture at a profit even though the entire labor costs in his plant were eliminated. Hence the cry for a quick lowering of taxes and for a radical cut in freight charges which, before the recent small reduction, were said to be three times as high as in the United States.

Future of British Steel Industry

Mr. Freyn, after stating that it was the consensus of opinion that no lasting improvement in the British iron and steel industry can be expected as long as the rate of exchange on continental countries, particularly Germany, remains as unstable and vacillating as it is, said that he heard much speculation concerning the future. There are those who take an extremely pessimistic view of the outlook. Ultimate prosperity is expected, however, though it may be some time in coming. Pointing out that England has wonderful coal and ore

resources and an energetic and fair-minded people with the training and experience of centuries, Mr. Freyn feels that this last asset cannot be over-rated. "It is this political and industrial high level which she has attained that accounts for her success in the past," said Mr. Freyn. "This will undoubtedly be duplicated in the future because the aftermath of the war has begun to break down the one factor which enlightened Englishmen themselves pointed out to me as a serious handicap, i.e. conservatism. There are signs on every hand to prove this assertion; they can be found in every day business and social life as well as in the more specialized field of the iron and steel industry. The British iron and steel master knows exactly where the shoe pinches and it is superfluous to point out to him that some of his plants and especially his blast furnaces are obsolete and inefficient. Plans for reconstruction and modernization are being made everywhere and lack of the necessary capital is the only reason why they are not being carried out. The English steel maker has quickly recognized that a revolutionary change has taken place in economic conditions. I think that no country needs reconstruction of plant as urgently as England. Many existing old hand-filled blast furnaces, some of which date back scores of years and which produce such very small daily tonnages even on rich ores and good coke must either be abandoned or remodeled. The tendency in England, as well as on the continent for that matter, must henceforth be in the direction of larger producing units and the elimination of labor wherever possible."

German Industry Busy

The German steel industry is very busy, said Mr. Freyn, and many changes are apparent. Plants are working day and night on three 8-hr. shifts. It is noticeable that there is small difference in the wages between skilled and unskilled labor which is true of all countries except England, where compensation is on a tonnage basis.

One of the most interesting developments, said Mr. Freyn, is the "Wärmewirtschaft" at Düsseldorf which is an organization engaged in studying fuel economy from every angle. It serves 250 plants and some remarkable results have been attained. Each plant has a heat department or "Wärmestelle" and in one case an expenditure of 10,000,000 marks resulted in the saving of 40,000,000 marks. Electric locomotives in plants and waste heat boilers are more numerous and even gas engines have waste heat boilers installed.

In blast furnaces, Germany is using less and less minette ore, but is smelting larger quantities of Swedish ore, which is now being crushed in Sweden. This has resulted in a larger output, one German furnace having averaged 700 tons per day and one or two days made as high as 811 and 844 tons, the scrap charge being only 12 per cent. In reply to a question, Mr. Freyn said that German steel practice was turning gradually more to open-hearth as compared with basic Bessemer.

In gas producers, Mr. Freyn reported that the rotary kiln was being largely used—a kiln developed during the war to make lubricating oil from tar, based on the principle of the low temperature distillation of coal. There have also been developed 4-cylinder gas engines, having a gas cylinder diameter of 59 in. and 6000 hp.

Electric Cleaning of Furnace Gas

Much interest has developed in both England and Germany in the cleaning of blast furnace gas by electric precipitation. Wet washing in Germany is, however, widely used, particularly where there is plenty of water; the Dorr thickener also excited much interest. Mr. Freyn said that a new German electric precipitation process was mentioned which had a velocity of 13 ft. of gas per second and which was small in size, but details were not available. German regulation of gas pressure has also been widely developed so that constant pressure can be depended upon and the study of powdered coal for metallurgical purposes was being carefully pursued, so poor is Germany in good coal. Mr. Freyn reported also the development of a boiler which efficiently burns brown coal containing 50 per cent of moisture.

Everywhere great interest, both in Germany and England, was awakened in the claims for the McKune furnace of greater steel production at a lower cost.

As an instance of the present state of activity in Germany, Mr. Freyn reported the case of an interview with one German manager at 10:15 p. m., and also the fact that 2000 Germans attended the November meeting of the German Iron and Steel Institute at Düsseldorf, where he witnessed unusual enthusiasm. "Financially, however, Germany is a house of cards and a collapse is expected sooner or later."

Asked as to whether coke-oven gas and tar were being used extensively on British or German open-hearth furnaces, Mr. Freyn replied that this practice was the exception. But he was emphatic in the opinion that American by-product coke practice is far ahead of even German methods. In too many cases in both countries, such plants are located at the collieries instead of at steel plants and the results are not comparable to those in this country. More regularity in operation and uniformity in materials are necessary, he said. The heavy construction of German blast furnaces, their complicated machinery and large ore bins were a striking impression, as contrasted with the simpler construction and mechanism of our larger American furnaces.

Holland's American Blast Furnaces

Holland will have a modern American blast furnace plant in the near future, said Mr. Freyn. His company is building two blast furnaces at Ijmuiden, near Haarlem, Holland, on the coast, one of 250 tons daily capacity and the other of 300 tons. The first will be ready late this year. The name of the Dutch company is Koninklijke Nederlandsche Hoogovens en Staalfabriken, with offices at the Hague. The total cost of the plant will be between \$7,000,000 and \$8,000,000. Imported ores are to be used but fair coking coals from the Limburg province will be coked in the company's own coke-ovens. The pig iron will be exported.

The Belgian and Czechoslovakian Industries

The situation in Czechoslovakia was described by Mr. Freyn as at present hopeless. The industry there consists of about 80 per cent of that of the former Austro-Hungarian Empire and the population of the new country is only 13,000,000 against 40,000,000, for the whole steel industry before the war. With a 30 per cent tax on coke and with a labor element radically inclined, very little could be expected, although the industry is now busier because orders which German mills cannot take are going to Czechoslovakia.

The Belgian industry was not regarded as prosperous or on a sound basis, according to Mr. Freyn. The attitude of labor is a deterrent factor. It is less efficient than in the other countries and is prone to take advantage of the government unemployment compensation and even migrate to France to spend it. Plants generally are not operating as in other countries. In Germany labor is really better off than before the war and although the cost of living may be 25 per cent higher than in 1914, wages are perhaps 30 per cent higher. But in all those countries it is the middle class that is suffering, even to the point of actual destitution in many instances, labor being much better off.

Consolidations of British and of German Companies

Consolidation of interests in Germany and in England is a marked tendency, said Mr. Freyn. In Germany combinations are now becoming horizontal instead of vertical in the steel industry and in England family ownership and the close control of directors are gradually to disappear in his opinion.

That there is a thorough change in the European viewpoint of steel-making operations and conditions, and that there is a broad opportunity for any one to suggest the application of new ideas to present processes, Mr. Freyn is enthusiastically convinced; not that the transference of an American blast furnace or mill to Europe will solve their problems but the adaptation of some of our principles to their problems will be eagerly and respectfully listened to and even sought.

Steel Corporations Unfilled Orders Declined in January

The unfilled business on the books of the United States Steel Corporation as of Jan. 31, last, amounted to 4,241,678 tons, or 26,736 tons less than reported on the books, Dec. 31, 1921. In December, the unfilled tonnage increased 17,872 tons; in November and October, decreased 35,287 and 273,841 tons, respectively, and in September increased 28,744 tons, while from August, 1920, to August, 1921, there was a decrease each succeeding month. A year ago the unfilled business amounted to 7,573,164 tons, or 3,331,486 tons more than on the books Jan. 31, last. The monthly unfilled tonnage since January, 1920, compares as follows:

	1922	1921	1920	1919
Jan. 31	4,241,678	7,573,164	9,285,111	9,681,268
Feb. 28		6,933,867	9,502,081	6,010,787
Mar. 3		6,281,765	9,892,076	5,430,572
Apr. 30		5,816,224	10,359,747	4,800,635
May 31		5,482,487	10,940,465	4,282,310
June 30		5,117,868	10,978,817	4,592,815
July 31		4,830,324	11,118,468	5,578,661
Aug. 31		4,531,326	10,805,038	6,109,193
Sept. 30		4,560,670	10,374,804	6,284,638
Oct. 31		4,286,829	9,836,852	6,172,668
Nov. 30		4,250,542	9,021,481	7,128,330
Dec. 31		4,268,414	8,148,122	8,265,366

The largest total of unfilled orders was on April 30, 1917, when it was 12,183,083 tons. The lowest was on Dec. 31, 1910, at 2,605,747 tons.

Chicago Industrial Engineers Meet

The Chicago chapter of the Society of Industrial Engineers held the second meeting of a series of eight on the "Stabilization of Industry" at the Auditorium Hotel, Chicago, Tuesday evening, Feb. 14. Discussion at this session was confined to "The Wastes of Uneven Production." F. G. Becker, general manager, Hubbard Steel Foundry Co., Chicago, acted as chairman, while the speakers on the program included C. E. Knoepfel, president C. E. Knoepfel & Co., Inc., industrial engineer, New York, and H. S. Gilbertson, secretary market committee, Chicago Federation of Clothing Manufacturers. The third meeting of the series will be held at the same place on March 14, and the subject of discussion will be "Effects of Modern Sales and Advertising Methods Upon Stabilization."

Boiler Makers Meeting

PITTSBURGH, Feb. 13.—The winter meeting of the American Boiler Manufacturers Association, held here to-day in the assembly room of Fort Pitt Hotel, brought together more than two-thirds of the membership of the organization. The program as outlined in THE IRON AGE, Feb. 9, was carried out in full and there was also a brief talk near the conclusion of the session by David J. Champion, president Champion Rivet Co., Cleveland, on the materials situation. A. G. Pratt, Babcock & Wilcox Co., New York, president of the association, presided. Members were asked to send in suggestions as to the place of the spring meeting.

New Ruling in Cost-Reporting Case

WASHINGTON, Feb. 14.—Justice Bailey of the Supreme Court of the District of Columbia, last week announced that a date will be set for argument upon the motion of attorneys representing the Claire Furnace Co., and other iron and steel makers to strike out the amended answer of the Federal Trade Commission in the so-called cost reporting case. The other motion of attorneys for the plaintiff to strike out parts of the amended answer was overruled "without prejudice to the right of the plaintiff on the further hearing on the second motion to raise objections to matters not properly pleaded."

Permits were issued in Chicago in January for 457 buildings, fronting 14,968 ft. and involving a cost of \$7,991,550, as against 166 structures for the same month last year, involving a frontage of 6,215 ft., and a cost of \$4,119,000. Thus there was an increase of 219 buildings, 8,753 ft. of frontage and \$3,872,650.

BRITISH FOREIGN TRADE

Steel Exports Again Increased in December—Imports Declining—Year's Total Small

The upward swing in British steel exports, which has characterized recent months, was continued in December, according to official data just made public. The total was 211,314 gross tons; excluding iron ore and including scrap. This compares with 202,059 tons in November and is second only to January, 1921, with 233,114 tons. A year ago, or in December, 1920, the exports were 191,057 tons.

The total exports for last year were 1,738,616 tons, or less than the 1920 exports by 1,557,231 tons. In 1919 these exports were 2,262,232 tons.

Iron and steel imports in December were 132,463 tons and the total for the year was 1,832,808 tons, which compares with 1,543,299 tons in 1921. The December imports have gradually declined from the peak of 229,391 tons in September. The following table shows comparative data:

British Steel Exports and Imports, Gross Tons

	Exports	Imports
Average per month first quarter, 1921	183,373	186,040
Average per month second quarter, 1921	169,670	96,320
Average per month third quarter, 1921	93,804	160,727
Average per month, fourth quarter, 1921	191,685	168,687
October, 1921	161,683	189,536
November, 1921	202,059	184,064
December, 1921	211,314	132,463
Average per month, 1919	188,519	50,801
Average per month, 1920	274,881	128,685
Average per month, 1921	114,885	132,734
Average per month, 1913	420,757	195,264

The trend of some of the principal exports is shown by the following data:

Principal British Exports, Gross Tons

	Average per Month		December	
	1913	1920	1920	1921
Pig iron	78,771	38,505	15,549	12,251
Steel rails	41,676	11,213	10,827	27,829
Steel plates	11,162	16,571	16,701	4,953
Galvanized sheets ..	63,506	31,244	15,694	45,086
Steel bars	20,921	30,322	19,780	10,863
Tin plates	41,208	29,118	20,910	30,425
Black plates	5,679	3,026	1,144	2,836
Steel sheets			4,717	7,933

Exports of steel rails, galvanized sheets and tin plates have shown the most marked recovery in the above products.

Imports of pig iron in December were 54,767 tons and for the year they were 255,030 tons against only 152,464 tons in 1920. These have been a feature of the 1921 imports.

Iron ore imports in December were 144,669 tons against 528,628 tons in December, 1920. The year's total was only 1,887,574 tons as compared with 6,449,551 tons in 1920. Last year's imports were the smallest in many years.

Manganese ore imports for 1921 were small at 172,856 tons or the lowest in over 10 years. In 1920 they were 452,612 tons.

Ore Rates Hearing

Hearings on upper lake ore rates before an examiner of the Interstate Commerce Commission will be resumed at the Great Northern Hotel, Chicago, in the near future, March 6, being the date tentatively set for the first day's session. These hearings were interrupted owing to the necessity of the railroad witnesses to appear before the commission at Washington during January and February. The taking of testimony has proceeded to the point where practically all that remains is the offering of rebuttal by the shippers.

The first open meeting and informal dinner of the recently organized Pittsburgh Chapter of the Society of Industrial Engineers will be held at the Fort Pitt Hotel, Pittsburgh, Friday evening, Feb. 17. C. E. Knoepfel, president, C. E. Knoepfel & Co., Inc., will be the speaker, his subject being Waste or Wages—Which?"

HOBGING SPROCKET TEETH

New Universal Hob Replaces Sets of Cutters
Formerly Used—Problems Met in Hobbing
Sprocket Teeth

BY G. M. BARTLETT

THE principle of generating the teeth of interchangeable involute gears by reference to a rack with straight sided teeth is well known, and the application of this principle to the hobbing of such teeth is also well established. Sprocket teeth, however, are still cut almost entirely by the ordinary rotary cutter, it being generally supposed that the range of teeth which could be correctly cut by a single hob is necessarily limited, and that a large number of expensive hobs would be required to properly equip a shop for sprocket cutting by this means.

A set of hobs each of which is capable of cutting any number of sprocket teeth of a given pitch and roller diameter has been developed by the engineering department of the Diamond Chain & Mfg. Co., Indianapolis. One of these hobs is shown in Fig. 1. They effect a considerable saving in cutter equipment wherever hobbing machines are in use, since a single hob will do the work that has hitherto required a set of from six to nine cutters. There is also a further saving due to the greater rapidity with which an entire sprocket can be cut on a hobbing machine, and a still further advantage due to the assurance of accurate indexing which is characteristic of such machines.

The hobs are designed to cut sprocket teeth in conformity with the specifications for the new American standard tooth form which has been approved by the principal manufacturers of roller transmissions in chains in the United States, and by the Society of Automotive Engineers, the American Society of Mechanical

number of teeth, and is less than the circular pitch of the sprocket for all under that number. The imaginary circle which rolls upon the theoretical pitch line of the rack is sometimes larger and sometimes smaller than the pitch circle of the sprocket.

The effect of making the pitch of the hob either less or greater than the circular pitch of the sprocket is shown in Figs. 2, 3 and 4. In all three cases, the same hob was used, and the pitch of the sprockets was altered by changing the diameter of the pitch circle. Figs. 3 and 4 show that if the hob pitch is less than the circular pitch of the sprocket the tooth curves tend to be more convex, the angle of the tooth space tends to be greater, and the teeth are more pointed at the ends;

Fig. 1 Universal Hob for Cutting Sprocket Teeth

Fig. 2

Fig. 3

Fig. 4

Figs. 2, 3 and 4 Show Effect of Making the Pitch of the Hob Either Less or Greater Than the Circular Pitch of the Sprocket

Engineers and the American Gear Manufacturers Association. This tooth form is peculiarly adapted to the hobbing method, since it neither requires a constant "space angle," as in the British system, nor a constant tooth angle as in some systems in use in this country. Its space angle gradually decreases as the number of teeth increases, and its tooth angle, and hence its pressure angle, gradually increases. The generating action of a hob tends to produce these same changes, although not at the same rate.

The hobbing of sprocket teeth and of gear teeth presents problems which differ in several respects. With spur gears the circular pitch is constant for all numbers of teeth, but with sprockets the circular pitch decreases as the number of teeth increases. The curvature of the teeth of spur gears becomes sharper as we approach the base circle. With sprockets it is desirable to increase the radius of curvature as we approach the lower, or acting part of the tooth, and finally to change the curve from convex to concave. The pitch of the hob for spur gears is always equal to the circular pitch of the wheel, while with sprockets it is greater than

while if the hob pitch is greater than the circular pitch of the sprocket, the reverse conditions are true.

Where the hob pitch is properly determined and the tooth contour properly designed, the entire range of tooth numbers from size to infinity can be cut without varying from the prescribed shape as much as the various teeth do within the range of any one rotary cutter of the ordinary type.

Hobs made to cut sprocket teeth of the American standard tooth form were supplied by the Brown & Sharpe Mfg. Co., Providence, R. I., the Illinois Tool Works Co., Chicago., and the Union Twist Drill Co., Athol, Mass.

W. C. and Arthur A. Schrage and Clyde P. Crane, of Detroit, have organized the Crane-Schrage Steel Co., of Detroit, to sell cold-finished steel products in that territory. R. L. Linder will be associated with the company as sales representative. All were long identified with the Pittsburgh Shaffing Co.

The Philadelphia and Reading Coal and Iron Co. repair shops in Pottsville, Pa., will be operated five days

Collection of Price Information Is Legal

Correspondence Between Secretaries Hoover and Daugherty Results in Pronouncement as to Activities of Trade Associations

WASHINGTON, Feb. 15.—As a result of prolonged consideration of activities of trade associations as affected by the recent so-called Hardwood decision by the Supreme Court, it has been decided not to issue a formal statement but to publish the correspondence between Secretary of Commerce Hoover and Attorney General Daugherty.

Secretary Hoover, in a long letter dated Feb. 3 wrote to Attorney General Daugherty, discussing trade associations in a general way and expressing the opinion very earnestly that trade associations can have a lawful form of organization and be extremely useful. Without making any reference to the Supreme Court decision, Secretary Hoover expressed a desire for informal expressions as to the following activities on the part of trade associations and their members wherein neither the form of the association nor the activity, which appear perfectly fair and lawful on the surface, is used to hide or conceal some contract, combination, conspiracy, agreement, or understanding, secret or otherwise, on the part of the association, the membership, or any part thereof to actually restrain trade or otherwise violate the Sherman act:

Secretary Hoover's Questions

(1) May a trade association provide for its members a standard or uniform system of cost accounting and recommend its use, provided that the costs so arrived at by the uniform method are not furnished by the members to each other or by the members to the association and by the latter to the individual members?

(2) May a trade association advocate and provide for uniformity in the use of trade phrases and trade names by its respective members for the purpose of ending confusion in trade expressions and for harmony of construction as to the meaning of trade phrases, names, and terms?

(3) May a trade association, in co-operation with its members, advocate and provide for the standardization of quality and grades of product of such members, to the end that the buying public may know what it is to receive when a particular grade or quality is specified; and may such association, after standardizing quality and grade, provide standard form of contract for the purpose of correctly designating the standards of quality and grades of product; and may it standardize technical and scientific terms, its processes in production, and its machinery; and may the association co-operate with its members in determining means for the elimination of wasteful processes in production and distribution and for the raising of ethical standards in trade for the prevention of dishonest practices?

(4) May a trade association collect credit information as to the financial responsibility, business reputation, and standing of those using the products of the industry; and may the association furnish such information to individual members upon request therefor, provided such information is not used by the association or the members for the purpose of unlawfully establishing so-called "blacklists."

(5) May a trade association arrange for the handling of the insurance of its members, including fire, industrial, indemnity, or group insurance. In other words, can the members of an industry, through the agency of a trade association, arrange for or place all of the insurance of the members?

Co-operative Advertising

(6) May a trade association, in co-operation with its members, engage in co-operative advertising for the promotion of trade of the members of that association engaged in the particular industry; and may the asso-

ciation engage in such form of promotion by furnishing trade labels, designs, and trade-marks for the use of its individual members?

(7) May a trade association, for and in behalf of its members, engage in the promotion of welfare work in the plants or organizations of its members, which welfare work includes sick benefits and unemployment insurance for employees, uniform arrangements for apprenticeship in trade education, the prevention of accident and the establishment of an employment department or bureau for co-operation with employees?

(8) May a trade association, in co-operation with its members, and acting for and in behalf of its members, handle all legislative questions that may affect the particular industry, regarding factories, trades, tariff, taxes, transportation, employers' liability and workmen's compensation, as well as the handling of rate litigation and railroad transportation questions?

(9) May a trade association, in co-operation with its members and acting for and in their behalf undertake the promotion of closer relations between the particular industry and the Federal and the State departments of Government which may have administration of laws affecting the particular industry in any form?

(10)-A. May a trade association collect statistics from each member showing his volume of production, his capacity to produce, the wages paid, the consumption of his product in domestic or foreign trade, and his distribution thereof, specifying the volume of distribution by districts, together with his stock, wholesale or retail?

B. And may such trade association, on receipt of the individual reports of each member, compile the information in each report into a consolidated statement which shows the total volume of production of the membership, its capacity to produce by districts of production, which, in some instances, include a state or less area, the wages by districts of production, the consumption in foreign or domestic trade by districts, the volume of distribution by districts, and the stocks on hand, wholesale and retail, by districts?

Filing with Secretary of Commerce

C. And if, after compiling the information as aforesaid, the information received from the members as well as the combined information is not given by the association to any other person, may it then file the combined statement with the Secretary of Commerce for distribution by him to the members of the association through the public press or otherwise and to the public generally and to all persons who may be in any way interested in the product of the industry, it being understood that the individual reports for the members should cover either weekly, monthly, quarterly, or longer periods as may be deemed desirable by the members, and, when a period is adopted, the report for each member shall cover that period, and the combined report shall be for that period?

(11)-A. May a trade association, at the time it collects the production and distribution statistics above outlined, at the same time have its members report the prices they have received for the products they have sold during the period taken, specifying the volume of each grade, brand, size, style, or quality, as the case may be, and the price received for the volume so sold in each of the respective districts where the product is sold?

B. And may the association, without making known to any person the individual price reports of any member, consolidate all of the reports into one, and show the average price received for the total volume of each, grade, brand, size, style, or quality, as the case may be, distributed in each district covered by the distribu-

tion statistics for the period covered by each individual report?

General Distribution

C. And may the association, after making such compilation, send the compiled report as to average price, as aforesaid, to the Secretary of Commerce, to be by him distributed to the public and to any or all persons who may be interested in the particular industry making the reports.

In conclusion, Secretary Hoover said:

"In order to avoid repeating this question in connection with each one of the activities outlined in the eleven preceding questions, may trade associations engage in any or all of the activities named without violating the law, provided the organization and the activity engaged in are not for the purpose of hiding or concealing some agreement, contract, etc., to actually restrain trade or otherwise violate the anti-trust laws?"

"As stated in the beginning, I do not ask you to express your views in a formal opinion, but it is my hope that you may see your way clear to give me the advice that will enable me to adopt the proper administrative action in undertaking the duties imposed upon the Secretary of Commerce by the organic act creating the department. It is unnecessary for me to say that the general, unsettled condition regarding the proper provinces of trade associations justifies as early a reply to these inquiries as your other numerous official duties will permit."

Attorney General's Reply

Attorney General Daugherty's reply is as follows:
Feb. 8, 1922.

My dear Mr. Secretary:

Your communication of the 3rd instant relating to the practices in which trade association may lawfully engage was received. I recognize the force of your able discussion of the subject, and after careful consideration of the several activities which you suggest can be exercised lawfully, I beg to say:

With reference to the first paragraph, there is no apparent objection to a standard system of cost accounting, but I think associations should be warned to guard against uniform cost as to any item of expense. For illustration, a strong effort has been made by some lumber associations to take as a basis for estimating costs of production a uniform charge for stumpage. Of course the cost of the timber in the tree to the different manufacturers who own their timber in the woods greatly varies; and as to each it should be charged at its actual cost. It is as clearly a violation of the law to agree upon the cost of an item that constitutes a substantial part of the total cost price when its cost actually varies, as to agree upon the sales price, because the sales price is substantially affected by such agreement. It has been ascertained that the members of one association go so far as to fix a uniform cost price, leaving to each member to determine what per cent profit he will add, thus eliminating entirely competition in so far as affected by the cost of production.

Furthermore, I have serious doubts about the advisability of the latter part of the sixth paragraph. I can see no objection to co-operative advertising designed to extend the markets of the particular article produced or handled by the members of an association, but when the several producers or dealers use uniform trade labels, designs and trademarks it seems to me the inevitable result would be a uniformity of price. Where two competing articles are advertised in precisely the same way and bear exactly the same label or trademark, it certainly would be difficult for one to be sold at a higher price than the other, although its quality may be superior. In a way this is illustrated in the cement industry. There a standard of quality has been adopted. That is, it is necessary for all cement to comply with a certain standard, but in practice no manufacturer undertakes to make, or at least no one advertises that he does make, a grade of cement superior to that standard. The result is that there is no competition in the sale of cement so far as quality is concerned. It seems to me therefore that it would be well to eliminate the latter clause in paragraph six, to wit, "and may the association engage in such form

of promotion by furnishing trade labels, designs and trade-marks for the use of its individual members?"

I can now see nothing illegal in the exercise of the other activities mentioned, *provided always* that whatever is done is not used as a scheme or device to curtail production or enhance prices, and does not have the effect of suppressing competition. It is impossible to determine in advance just what the effect of a plan when put into actual operation may be. This is especially true with reference to trade associations, whose members are vitally interested in advancing or, as they term it, stabilizing prices, and who through the medium of the associations are brought into personal contact with each other. Therefore the expression of the view that the things enumerated by you, with the exceptions stated, may be done lawfully is only tentative; and if in the actual practice of any of them it shall develop that competition is suppressed or prices are materially enhanced, this department must treat such a practice as it treats any other one which is violative of the anti-trust act.

Yours sincerely,

H. M. DAUGHERTY,
Attorney General.

Hon. Herbert Hoover, Secretary of Commerce, Washington.

Secretary Hoover's Second Letter

The last letter of the series is from Secretary Hoover and is as follows:

Feb. 9, 1922.

My dear Mr. Attorney General:

I have your letter of the eighth instant, in reply to my letter to you of Feb. 3, 1922, in which I made informal inquiry as to the legality of certain activities of trade associations enumerated in 11 questions. It is very pleasing to me to note that our views regarding these matters are in such close harmony.

Your observations regarding the last clause in question (6) in my letter are wholly sound, based on the language of that clause. It was not, however, my idea that each constituent member of a trade association would use a community trade-mark on his product, i. e., the same trade-mark that was used by every other member of the association, and, therefore, the last clause in that question was unhappily worded. The question really relates to trade promotion through co-operative advertising, in which certain trade slogans are used, such as, "Made in Grand Rapids," which was adopted by the furniture manufacturers at that furniture center. Generally, activities covered in question (6) are conducted by a trade association in a given local community. An organization at Chicago advertises for its entire membership, which includes every line of commercial endeavor in Chicago, that the city is the great central market. It is co-operative advertising of this class that tends to promote trade extension in given lines or collected lines of industry. Certain of the trade associations, however, do devise trade-marks, not for use by all members, but for individual members. It is a well-known fact that when some manufacturer or producer is fortunate enough to select a trade-mark that appeals to the public, it becomes a great aid in selling his commodity and, as a result, it is well advertised until it becomes a household word. Other producers or manufacturers of the same kind of an article, in order to take advantage of this situation, will devise a trade-name or trade-mark as near to that of the successful competitor as he thinks he can go and still escape suit under the trade-mark or unfair competition laws. The activities of a trade association regarding trade-marks to which I referred in my letter of the third relate to the straightening out of instances of unfair competition or infringement as between the members, by undertaking to design trade-marks for the individual members of the association making the same product, that would absolutely prevent confusion on the part of the public as to the producer or manufacturer of the given article and, at the same time, remove all claim of infringement or unfair competition. In other words, the trade-mark activity referred to was that of making the trade-marks of each individual member distinctive instead of common. You may, therefore, consider the part of my question (6) referred to in your letter as eliminated from the question, and that the question was really intended to cover the matters stated herein. With this explanation, I feel sure you will agree with me that our views on the matters presented are in complete accord.

Yours faithfully,

HERBERT H. C.

Secretary

Honorable Harry M. Daugherty,
Attorney General, Washington, D. C.

BASING POINT HEARING

Examination of Witnesses by Federal Trade Commission Continues at Milwaukee

MILWAUKEE, Wis., Feb. 14.—At the close of the second week of the Milwaukee hearing, the first of a series of hearings scheduled to be held on the complaint of the Federal Trade Commission against the United States Steel Corporation, seeking the abolition of the alleged Pittsburgh basing point practice, from 12 to 14 witnesses remained to be called, indicating that a third week will be required to complete the Milwaukee hearing before the commission moves on to Minneapolis for the second of the series.

The monotony of the hearings was interrupted on Friday, Feb. 11, when M. W. Torkelson, chief bridge engineer Wisconsin State Highway Commission, and Arthur Peabody, state architect of Wisconsin, were called as witnesses. Their testimony was introduced by the reading into the record of the proceedings of a joint resolution adopted by the Wisconsin Legislature at its biennial session a year ago, seeking the abolition of the Pittsburgh basing point practice and declaring in effect that the State and people of Wisconsin were prevented from receiving the benefits of the close proximity of this state to the vast iron ore deposits of Northern Wisconsin, Upper Michigan and Northern Minnesota, by the alleged discriminatory effect of such practice.

Karl E. Steinhauer, attorney for the Federal Trade Commission, introduced the resolution and called the two State officials as witnesses, he said, to illustrate the attitude of the public toward the alleged discriminatory practice. W. W. Corlett, general solicitor of the Steel Corporation, objected on the ground that public interest was not an issue in the present action, inasmuch as the commission itself had brought the complaint at the instance of a certain group or groups of manufacturers whose interest has not been shown to be the public interest so far. The objection, however, was overruled by John W. Bennett, trial examiner.

Mr. Torkelson testified that he has been for 14 years State bridge engineer of Wisconsin. In the last seven years, he said, 25,087 tons of steel have been consumed in the construction of steel and concrete highway

bridges, while an estimate of the probable consumption in the next 20 years is 200,000 tons, based on the expectancy of the construction of 30,000 highway bridges in the same period.

Mr. Peabody, State architect, testified that 1323 tons of steel have been consumed in the construction of State buildings in the past five years, and that similar work in the next four years as projected would require 1495 tons.

The testimony of Messrs. Torkelson and Peabody agreed on the point that all of this steel had been purchased by contracting companies, numerous officials of which have appeared as witnesses at this hearing, upon whose testimony written into the record they based a belief that public work cost the taxpayers of Wisconsin an excessive amount due to the alleged discriminatory effect of the Pittsburgh basing point.

Testimony of other witnesses called during the past week developed approximately the same evidence as that of witnesses testifying during the first week of the hearing in Milwaukee. In a general way, witnesses invariably admitted that their invoices showed that material was billed to them f.o.b. Milwaukee, but they insisted that analysis of prices showed that the sales were made on a Pittsburgh base and freight from Pittsburgh to Milwaukee was added, regardless of the location of the mill from which the material was actually shipped. THE IRON AGE usually was quoted as authority for quotations upon which fabricators based their contention that they paid a Pittsburgh base price.

Witnesses examined during the past week included the following: Henry M. Merz, vice-president Milwaukee Bridge Co.; Eugene W. Krueger, Worden-Allen Co.; W. D. Johnson, president Milwaukee Boiler Mfg. Co.; John F. Henry, president Milwaukee Structural Steel Co.; C. E. Stone, Chain Belt Co.; O. E. Lindemann and A. T. Fish, of A. J. Lindemann-Hoverson Co.

Witnesses who appeared Monday at the beginning of the third week of the hearing were: A. T. Fish of A. J. Lindemann-Hoverson Co., manufacturer of hot air furnaces, stovepipe and similar goods and Edwin D. Bartlett, secretary and H. H. Marvin, purchasing agent, Milwaukee Stamping Co. Their testimony was largely a reiteration of that by previous witnesses in these lines.

Complaint of Columbia Steel Co. Dismissed

WASHINGTON, Feb. 14.—The Interstate Commerce Commission has dismissed the complaint of the Columbia Steel Co. against the Elgin, Joliet & Eastern Railroad, et. al., holding that rates on fire brick from transcontinental groups A, D, E and J, to San Francisco, Oakland, Emeryville, Pittsburgh and Anderson, Cal., all within the description of California terminals, are not unduly prejudicial against the points named in comparison with northeast terminals, although they are higher and the mileage is about the same. The dismissal also applies to complaints of the Judson Mfg. Co., and the Afterthought Copper Co. The commission, however, orders the transcontinental lines to revise their rates so as to bring them into harmony with the revised fourth section, forbidding rates at intermediate points higher than rates at the more distant points for no greater mileage.

Suits Against Carbon Steel Co. Discontinued

Two suits, filed in United States district court, Pittsburgh, naming the Carbon Steel Co. defendant, were discontinued Feb. 9 after Judge Thomson signed orders dismissing the bills of complaint. One suit was brought by the State of New Jersey to recover \$38,918.66 as taxes, damages and court costs. The taxes, according to the bill, were imposed on the company for the years of 1893, 1894 and 1895, when the Carbon Steel Co. was a corporation operating under the laws of New Jersey. On April 4, 1913, in a suit of the State of New Jersey against the Carbon Steel Co., the New Jersey Supreme Court gave judgment in favor of the

State in the amount of \$38,918.06, representing \$12,000 debt, \$26,880 damages for detention of debt and \$38.66 court costs. The company was later incorporated under the laws of West Virginia and the State of New Jersey attempted to collect the amount through the Federal Court in Pittsburgh. The motion filed by the steel company, Jan. 20, 1919, asked that the bill be dismissed, giving as reasons that the court had no jurisdiction and that the bill on its face was bad for want of equity. The other suit was brought by the Churchward International Steel Co., Wilmington, Del., alleging that the Carbon Steel Co. infringed on a patent regarding the self-hardening of alloy or iron and steel and alloyed steel. Both parties consented to the dismissal of the suit.

Frick Coke Co. Exonerated

UNIONTOWN, PA., Feb. 14.—Coroner's jury investigating the death of 25 miners who lost their lives in the Gates mine disaster at the Gates plant of the H. C. Frick Coke Company found that their deaths were accidental and resulted from a blown out shot, exonerating the Frick company.

A new wire rod, wire and wire nail plant has been practically completed by the Minnesota Steel Co. at Duluth. All the necessary buildings have been erected and most of the equipment has been installed, with the prospect that operations will commence by June 1. The plant will have a capacity of about 300 tons per day, or 100,000 tons per annum of various wire products. The output will be sold by the American Steel & Wire Co.

Conveyors for Painting and Baking

Manual Handling Avoided in Finishing Bulky Sheet Metal Parts in a Cleveland Plant—Overhead Tramrail and Suspended Racks Used

A CONVEYING system has recently been installed in the plant of the E. F. Hauserman Co., Cleveland, which is unique in that two operations, painting the material that is being conveyed and later baking it in an oven, are performed while the work is on the conveyor. Conveying systems that include carrying the work through an oven for baking after enamel or other coating is applied are not uncommon, but using the same conveying equipment in connection

As the tramrail is suspended from the roof, no special construction is required for supporting the hangers that carry the rails. The rack is moved lengthways on a single tramrail track until it reaches the painting department. Here a switch is provided at a 90-deg. turn in the track. The rack, instead of making this right angle turn, passes from the switch on to a double track tramrail with one of its carriers on each track and the position of the rack which had been

Elevator Lowered and Parts Submerged in the Paint Vat

Elevator After Lifting Parts from Paint Vat. Beyond are the dripping platform and loaded racks, the latter ready to go to the baking oven at the extreme right.

with the painting operation is the development of increased usefulness for an overhead shop transportation system and means the reduction of production costs.

The Hauserman company manufactures steel bins, shelving, partitions and kindred steel products that might come under the classification of shop furniture. The work is painted after stamping, either in single parts or after a certain amount of assembling. Some parts are given a second coat of paint after assembling operations. Parts painted range in weight from a few ounces to 80 lb.

The conveying equipment consists of a tramrail system supplied by the Cleveland Crane & Engineering Co., Wickliffe, Ohio, equipped with this company's standard hand-operated carriers to which are attached steel frame racks, each rack being suspended from two carriers. The racks are 80 in. long and 25 in. wide, and are of a special design for handling the work which is suspended on wire hooks from cross-bars on the racks.

The tramrail system is 338 ft. long. It extends in a circuit around the plant from the sheet metal stamping department, through the painting department, the drying oven and on into the assembling department. From here the carriers and racks, after being unloaded, complete their circuit back for reloading.

lengthways in respect to the track becomes crossways.

The double track passes through a steel frame elevator shaft over a paint vat located in the floor. A short connecting section of the track is attached to a 1-ton electric hoist at the top of the elevator frame. After the loaded rack is pushed on the track above the paint tank a button is pressed and the hoist lowers its load into the paint, where it remains a few seconds. Then the elevator automatically reverses itself and raises the load to its former position. Then the carrier is pushed off the elevator and over the dripping pan located back of the elevator. The rack is rotated from the center of a bar that connects the two carriers so that the rack can be swung either way 4 in., giving it a 12-in. incline from one end to the other, this tilting position being desirable for dripping. A locking device is provided for holding the rack in the tilting position.

After dripping, the racks are pushed a short distance into the baking oven, which holds all racks at a time. Near the discharge end of the oven switches are

Carriers Loaded with Unusual Shaped Metal Parts Ready to Go to the Paint Vat

provided similar to those in front of the paint vat and the racks are switched back on to a single tramrail track on which they move to the assembling department. To prevent loss of heat, a door section or cover is suspended from hinges above the oven doors, filling the space from the tramrail track to the top of the oven. When a carrier is pushed out of the oven the wheels lift this cover, which falls back in place when the carrier is out of the way.

The company finds that with the tramrail system it is saving 50 per cent or more in labor costs, now doing with five men work that formerly required 10 or 11 employees. With the old method of loading the oven by hand it took four or five men to carry the work in and out of the oven. Then, owing to the time taken for loading and to the delays in waiting for the oven to cool sufficiently for the men to enter it, only three or four lots were baked in the oven during the day. Now it is possible to bake nine or ten lots during a day. The usual maximum load is about 900 lb., although the conveyor has a 1-ton capacity. It is stated that with the use of the tramrail parts that formerly cost 35c. each to paint now are painted for 14c. and parts that cost 15c. to paint now are painted for 4c.

Opposes Transportation Commissioner

WASHINGTON, Feb. 14.—The National Council of the Chamber of Commerce of the United States at its

meeting here last week went on record as being opposed at this time to the creation of an office of a Federal commissioner general of transportation and to the taking of a referendum on the question of compulsory adoption of the metric system in the United States. Regarding the former subject the council in a resolution held that the time is inopportune for the establishing of a Government agency in charge of a commissioner general of transportation to present to the public interest in railroad questions. A recommendation by the Chamber's railroad committee that such a proposal be submitted to a referendum was disapproved by the council. The council, however, gave its endorsement to the recent action of Secretary of Commerce Hoover in appearing before the Interstate Commerce Commission as the representative of the public.

Hog Island Surplus Steel to Be Sold

WASHINGTON, Feb. 14.—Bids in writing for the purchase at private competitive sale of approximately 105,000 net tons of fabricated steel at Hog Island, Pa., will be received by the United States Shipping Board, Emergency Fleet Corporation, until noon, Feb. 15, at its office in the Navy Building, Washington. This is the last sizable lot of surplus steel the shipping board has to sell. The entire quantity of steel at Hog Island is physically separated by railroad tracks into seven lots, and may be sold either in its entirety or separately by lots as may appear most advantageous.

Tramrail Track Arrangement at Discharge Side of the Oven, illustrating the Way the Carriers Leave the Oven. The racks run at right angles to the two rails that extend through the oven and by means of switches pass on to a single rail track and in doing so change their position in respect to the rail, the rack again moving in a lengthwise position along the rail as it and before being switched to the paint vat.

Duplex Valve Stem Milling Machine

A duplex valve stem milling machine, designed primarily for the quantity slotting of valve stems, has been put on the market by the Dale Machinery Co., Chicago and New York. Slots up to $\frac{1}{2}$ -in. wide by $\frac{1}{2}$ -in. long may be milled in valve stems $\frac{3}{8}$ -in. in diameter and smaller. By changing the work-holding vise, square, hexagonal and other shapes may be slotted and although designed for valve stems, the machine can be adapted to slotting small parts for a wide range of purposes.

In slotting valve stems it is usually the practice first to drill a hole and then to broach out to the desired

Although Designed for Valve Stems, the Machine Can Be Used to Slot a Wide Range of Other Small Parts

shape. The new duplex miller is intended to do this work in one instead of two operations and with greater speed. The work is held on a V-shaped vise as shown in the illustration, so that valve stems of any diameter within the capacity of the machine may be handled without using a different work-holder. The vise rests on a cross-slide which is operated by a connecting rod attached to a crank with an adjustable stroke. The crank is run from a pinion which engages a worm gear operated by pulley from a countershaft. A three-step cone pulley permits operation at three speeds. The length of the travel of the slide is controlled by adjusting the throw of the connecting rod.

The slots in the valve stems are milled out by tools working toward each other from opposite sides of the work slide. The tools are held in collets which are inserted in the ends of spindles, driven by pulley from the same countershaft which drives the gearing operating the work slide. The spindle carriages are driven in opposite directions by cams, the camshaft being operated by a ratchet wheel. The rotation of the ratchet wheel is accomplished by a pawl driven by a crank on a shaft, which in turn is actuated by a cam mounted on the shaft operating the cross-slide connecting rod. Thus the feed of the tools and the travel of the work slide are co-ordinated. At the conclusion of each revolution of the crank driving the cross-slide, the dog engaging the cam is released, thereby disengaging the pawl from the ratchet wheel and stopping the camshaft which controls the travel of the spindle carriages.

Prior to starting the machine, the carriages are set by hand so that the tools barely fail to touch. When the mills are fed into the work by the cams, one carriage is released before the other, one cam being of slightly different contour than the other. This arrangement prevents the mills from striking each other and at the same time permits one tool to complete the cut.

A self-contained oil system is provided. The machine is furnished with countershaft.

Pat Dwyer, associate editor, the *Foundry*, will be the speaker at the regular monthly meeting of the Pittsburgh Foundrymen's Association at the General Forbes Hotel, Pittsburgh, Monday evening, Feb. 20.

Feb. 4 marked the seventieth anniversary of the founding of LaBelle Iron Works, Steubenville, Ohio, and Wheeling, W. Va.

Monolithic Roof for Mill Buildings

To push commercially a new monolithic roof for mill and industrial buildings, H. E. Marks, formerly president of the National Steel Fabric Co., which was taken over a few months ago by the Pittsburgh Steel Co., and previously vice-president and manager of sales of the H. H. Robertson Co. Pittsburgh, has opened offices in the Empire building, Pittsburgh.

The roofing system consists of steel T's supported on roof purlins, gypsum board panels, wire mesh reinforcements and a cast-in-place gypsum or concrete slab. Two sizes of T's are used. The main T's span from purlin to purlin, spaced 2 ft. 8 in. apart. The small or auxiliary T's are all 2 ft. 8 in. long and are simply laid (not fastened) in the main T's, to support the ends of the gypsum board at 3-ft. intervals. As the auxiliary T's are laid, the standard sized 2 ft. 8 in. x 3 ft. gypsum board panels are placed in position. After a row of panels has been placed, the reinforcing fabric of proper width, and cut to the exact length of the roof, is laid over the T's. The forms are then ready for the aggregate, which is poured into place, forming, with the wire fabric, a solid monolithic reinforced slab, of which the gypsum board and T's become an integral part. A light dead load, high load-bearing capacity, heat insulation value and a saving in steel in the trusses and general construction are emphasized as advantages.

Hydraulic Clutch for Heavy Duty

A hydraulic clutch intended to provide a means of applying automotive engine power to driven parts of the transmission with a smoothness of "take-up" closely approximating that of the steam engine has been placed on the market recently by the Williamson Hydraulic Clutch Co. Mt. Vernon, Ohio. This is accomplished through the use of oil as the power-absorbing agent.

The clutch has few bearing surfaces and all such are flooded with lubricant. No small or fragile parts are subjected to load pressure. Any setting of the control lever gives a constant reduction ratio through the clutch and there is effected a gradual absorption of en-

Hydraulic Clutch Attached to Minerva Engine with Dynamometer Shown at the Right

gine power, avoiding a lowering of engine r.p.m. At the same time, it is claimed, the power impulse is delivered steadily and evenly to the gear-reduction unit, rear axle and other driven members. There is no need for devices to prevent a too sudden grip; and lag, it is said, is automatically impossible. From this it may be inferred that the factor of power loss through transmission is materially reduced.

The new clutch is said to have been thoroughly tested over a long period of time and to have proven successful in passenger-car, heavy motor-truck, farm-tractor and machine-tool service.

The Acme Wire Co., New Haven, Conn., has received an order from the Ford Motor Car Co., Detroit, for 150,000 coils of wire. This order will require about six weeks to complete.

of March 3, 1879

Trade Association Activities

The long-expected announcement as to the policy of the Government in regard to trade associations has come in the form of correspondence between Secretary of Commerce Hoover and Attorney-General Daugherty. One of the causes for the delay was probably a desire not to seem to be over officious or discourteous to the Supreme Court in interpreting one of its decisions. This has been averted by not referring to the Hardwood decision or making the pronouncement formal, but the declaration of opinion by the Attorney-General, answering the detailed questions of the Secretary of Commerce, will have much weight and will go far toward clearing up prevailing uncertainties.

Little doubt could have existed as to the legality of many of the activities mentioned by Secretary Hoover in his letter, but the all important question of prices is not dodged. The Secretary asks squarely whether trade associations may collect information as to prices received, specifying volume, grade, brand or quality, as the case may be, without making known individual price reports, and he inquires whether the compiled reports as to prices may be submitted to the Secretary of Commerce and by him distributed to the public, or to all persons interested.

The Attorney-General's reply in the last paragraph of his letter states that he sees nothing illegal in the activities described, provided this privilege is not used as a scheme or device to curtail production or enhance prices, and does not have the effect of suppressing competition. The Attorney-General naturally qualifies his declaration by pointing out the difficulty of determining in advance what the effect of the plan, when put into actual operation, may be, and he says that the expression of the view that the things enumerated may be lawful is only tentative, and if the actual practices result in curtailing competition or materially enhancing prices, the department must treat such practices as it treats any other which is violative of the anti-trust act.

This is a wise reservation, but Attorney-General Daugherty has not been guilty of any reckless proceedings and can be depended upon to act

with deliberation. Both he and the Secretary of Commerce are to be congratulated upon the termination of their many conferences, for they have thrown new light on important questions and it is now possible for many associations to know with reasonable certainty how they can legally carry on their operations.

The Bonus Bill

The proposed soldiers' bonus, whether viewed from the standpoint of patriotism or business, is indefensible. If considered from the economic standpoint, the statement of Secretary Mellon, showing how disastrous the payment of billions of dollars to the soldiers would be to the business interests of the country when it is imperative to do everything that can be done to hasten the return of prosperity, should have had immediate and final effect in stopping the passage of the bill, but politicians are still of the opinion that they will further their own interests by catering to the American Legion, or rather to that part of it which is clamoring for the bill. If further evidence of the folly of enacting the so-called adjusted compensation were needed, it is furnished by the evidence that is being presented that any and all of the forms of taxation or bond issuing proposed to meet the cost will interfere with recovery from the industrial depression.

There is, however, higher ground on which to base the opposition to the plan to compensate the soldiers. If it were possible to compensate them, it would and should be done, no matter how much business might be retarded, but the very thought of paying the soldiers for their great service and sacrifice is repulsive to any one who has the finer feelings about the matter. Probably no one has seen more of the heroism, the courage and all the magnificent record of the soldiers of the great war than has the distinguished war correspondent, Frederick Palmer. He shows the impossibility of adjusting the compensation of the soldier, who had greater reward than did the civilian who worked for a wage and was paid in full. Mr. Palmer says that by far the higher compensation lay in the honor accorded him and we would add that

ever greater comfort is found in the soldier's consciousness of having done his full duty to his country. Mr. Palmer states the whole matter in a nutshell as follows:

The truly patriotic soldier stands on a higher level than the ordinary citizen. The American Legion is proposing to sell that level for cash. Considering the vast difference between the two conditions, it is surprising that they are willing to sell out for so small a price per head. If the bonus bill passes, the button of the American Legion will show not the man who risked his life for his country, but will advertise its wearer as the man who sold his halo.

Opposition to the bonus does not, however, mean that the people of the United States are unwilling to take care of the disabled soldiers and sailors. The people of this country never have failed to be liberal in ministering to those who were wounded or overcome by sickness as a result of service in the army or navy. Although more has been undertaken in the way of vocational training and in the establishing of hospitals than after any other war, the service is yet woefully inadequate, and the nation demands that all the men who are weak in mind or body shall receive the best attention that skill can give them.

Appropriations for the disabled have increased from \$179,287,800 in 1918 to \$330,250,400 this year, and no patriotic citizen begrudges one penny of that amount. A bill passed last Saturday provided \$406,000,000 for 1923 and Senator Borah estimates that \$500,000,000 must be appropriated for every year from now on. Even those great figures do not stagger the country, nor does the statement that within ten years we will be appropriating \$1,500,000,000 a year for the disabled soldiers and sailors, and that the ultimate cost will be \$75,000,000,000. The country will gladly foot the tremendous bill, but it positively objects to putting patriotism on a commercial basis.

There has been all too much of a supine submission to assertions that the bonus measure was certain of passing. In the last few days a backward sweep of the tide seems imminent and if business would properly express its own force in legislative influence the tidal movement would be of no uncertain power. Sometimes it has seemed that business must all but storm Washington to drown the noise of the minority and convince the vote seekers that their proposed legislation would act as a boomerang in the November elections.

At one time constructive substitution, such as writing a law to conscript everybody, non-combatants as well as combatants, in another national emergency, might have been regarded as the way to fight the bonus movement, but the time has arrived to drown it. Every business man--every man who can see the taxes beyond the temporary spending of a bonus distribution--needs to act immediately to convince his political representative that the thinking electorate is now against the bonus.

Although the depression last year was naturally communicated to the American ferromanganese and spiegeleisen industry, an analysis of the out-

put of these alloys, found elsewhere in this issue, shows that the ferromanganese production was only about 21,000 tons under that of 1913. The marked difference between 1921 and 1913 exists in the sharp decline in imports of the British alloy, which last year were only 755 tons per month against 10,672 tons per month in 1913. This would seem to indicate that the foreign alloy is by no means the factor that it used to be. The spiegeleisen production was less than 50 per cent of that of 1913 and the lowest in many years; none indeed was produced in the last half of 1921. While this does not reflect a corresponding decline in Bessemer steel, there was a sharper falling off in this kind of steel than of the open-hearth. Compared with the remarkable showing of the American manganese industry in 1918, the 1921 record looks insignificant, being less than one-fourth of the war stimulated production. The record last year indicates that American producers are able to take care of American needs, for in 1913 over half the consumption was of British origin.

Measuring the Steel Demand

Already definite evidence has appeared supporting the argument made in these columns a fortnight ago that 1922 may reasonably be expected to show a considerably larger production of steel than 1921, even without the aid of any material improvement in the general fundamental conditions of finance and industry. Already at this early date, with the advent of spring more than a month away by the calendar, the rate of steel production is at least equal to that of last autumn.

The particularly small production of steel ingots last year, about 19,500,000 tons, was due in part to liquidation of stocks of steel in the hands of distributors and manufacturing consumers and of various wares made from steel. The most pronounced symptom of such liquidation being in progress was the dip in steel production in July to a rate of only about 11,000,000 tons a year. In well-informed quarters it was held that the liquidation, except in a few cases, was practically completed by Oct. 1, and in October and November the rate of production was all of 23,000,000 tons a year. Then came December with an average rate under 20,000,000 tons and a rate in the last week of probably not more than 16,000,000 or 17,000,000 tons, the dip being incidental to the season.

The January ingot output of the 30 steel companies that report their total through the American Iron and Steel Institute indicates that the steel industry as a whole produced ingots in that month at an average rate of about 23,000,000 tons a year, and when this average rate for a month followed the low rate at the end of December, it is evident that there was a progressive and rapid increase, so that the rate this week is presumably well above 23,000,000 tons and may easily be 25,000,000 tons.

Yet the spring demand cannot be assumed to have worked its way, thus far, into the ingot production rate. The full spring demand has not

yet come, for buyers hold off as long as possible. When they do make up their minds they insist upon prompt shipment and the mills are in position to comply with their wishes. Thus the production of ingots facilely moves up and down according to the demand for mill products.

The reasonable prospect is that the spring demand will bring an ingot production rate between 25,000,000 and 30,000,000 tons a year, comparing with a rate of 23,000,000 tons last autumn and an actual production in 1921 of 19,500,000 tons. The crest of each wave is higher.

The fundamental conditions are without doubt improving continuously, the improvement being plainly seen when comparison is made between dates a few months distant from each other. The ultimate consuming demand for steel and products of steel can be measured closely by observing the rate of steel ingot production, since the liquidation of stocks that characterized last spring and summer is out of the way. No basis can be found for assuming that when we have the plain prospect of a steel demand this spring, such as is mentioned above, there will not be as good a demand, and presumably a better demand still, next autumn. The summer, of course, is likely to be quiet. There is no reason to suspect that those who are buying steel now are making a mistake and will later regret their action, or will not have occasion to repeat their orders from time to time through the year. Capacity operation for the steel mills is not to be thought of for the near future, but it is already reasonably plain that steel production in 1922 will be much better, say one-third or one-half greater, than the production of 1921.

What Were Pre-War Conditions?

Sometimes a question breaks in abruptly and makes us look at things from a new angle—which is never a bad thing. For more than a year we have been talking about "returning to pre-war conditions" and "getting back to normalcy." Now, when we talk along that line, have we any definite conception present in the mind of precisely what the pre-war conditions were? Or are we simply thinking in general terms of "the gold old days" or the flesh pots of Egypt, forgetting the toil of the good old days, as the Israelites apparently forgot about the work that was much more conspicuous in their life in Egypt than the flesh pots?

As a matter of fact, in the twelvemonth and more preceding the outbreak of the world war, we were rather busy discussing business and economic questions, where we were in the business cycle, and whether a panic had been due and had been averted or a crisis had come and had not been recognized.

The best opinion seemed to be that we did not have either a panic or a crisis, but that we did have an industrial depression. Conditions had just begun to improve when the war broke out and the question was left unsettled whether the improvement represented a false start or the beginning of a general movement, for the war changed everything.

Just to give ourselves a little jab so that we

may sit up and pay attention, the production of pig iron by the steel works in July, 1914, the last month before the war, was 45,027 tons a day. Production last month was 42,130 tons a day. The difference is 6 or 7 per cent—not much to have a discussion about.

A strong argument was made in some quarters that conditions were all set for our having a panic or crisis in 1913, in rhythm with those of 1893 and 1873, but that the situation was so well understood and so many warnings had been issued that men set their houses in order and thus the panic or crisis was averted because foreseen, but an industrial depression is a different thing, and can come without a panic preceding. That something did occur is evident from the fact that the rate of pig iron production decreased by 32 per cent from February, 1913, to June, 1914.

It is characteristic of the business cycle that, in what is considered the depressed area, men become content to work harder and business men accept smaller margins of profit. Everything is liquidated and efficiency becomes the rule. By hard work and thrift, a buying power is built up. That was true in 1873-8 and in 1893-8. Those were periods of low prices and low wage rates, but by no means were they throughout periods of work not being done. In 1897 and 1898 men were working hard, and as efficiently as they knew how.

Perhaps there was no major depression due in 1913 or shortly afterward, but certainly no one felt during an entire twelvemonth or more before the outbreak of the war that we were in first-class shape economically and socially. That was by no means the pre-war condition, and we are dissipating our energy when we talk about getting back to pre-war conditions without reflecting just what those conditions were. The best of the pre-war conditions is one thing and the immediate pre-war conditions an entirely different thing.

If we purpose selecting the best of the pre-war times and returning to them, then we must do now what we had done then to obtain those conditions. The periods of good times before the war came as a result of hard work, careful planning, thrift, economy and invention. The war opened up no new road to prosperity and advancement. We must traverse the narrow path decreed by economic laws, just as we have always had to do.

Two impressive facts are emphasized by British steel export data, analyzed elsewhere in this issue. One is the continued expansion until December was second only to January of 1921. The recovery since July has outstripped American exports, which at that time were in excess of the British. The second noteworthy fact is that this recovery is almost exclusively in galvanized sheets, tin plates and rails. In December alone the gain in each of these three products over December, a year ago, was nearly three-fold, while in the case of American exports the December decline from the same month in 1920 was over 50 per cent in tin plate, nearly 70 per cent in rails and about 80 per cent in galvanized sheets. American steel exports fell last year to a figure less than 50 per

cent of the 1920 outgo; British steel exports in 1921 were 52 per cent of those in 1920. In 1913, rails, galvanized sheets and tin plate constituted, next to pig iron, the bulk of the British foreign sales, a business which the British are apparently rapidly regaining.

Relief for the patent office seems near at hand. The Lampert bill passed the House of Representatives by a vote of 305 to 44, and it has been favorably reported to the Senate by that body's patents committee. It may be well, however, for the industrial elements of the country to make its voice heard as strongly as possible by writing to senators. The bill provides more than sufficient funds for the increase of expenditures necessary, by increasing the filing fees for applications for patents by \$5, and it is therefore not dependent for success on any appropriation measure. That the American Engineering Council regards the bill as of fundamental importance should carry weight, seeing that that organization has studied the question and is non-political and non-commercial in its attitudes.

Practicing Engineers to Meet in Chicago

What is called the first annual conference of practicing engineers will be held in Congress Hotel, Chicago, Feb. 22. The program announces the following papers:

"Publicity for Practicing Engineers," by M. W. Lee, vice-president Frank D. Chase, Inc. "How to Uphold the Standards of Services and Fees," by Gardner S. Williams, consulting engineer, Ann Arbor, Mich. "Experiences of the Practicing Engineer with Licensing," by C. S. Hammatt, president National Council of Engineering Examiners. "How to Sell Engineering Services," by Paul E. Green, consulting engineer, Chicago. "Cost Accounting for Engineering Services," by Arthur L. Mullergren, consulting engineer, Kansas City. "Computing the Practicing Engineer's Income Tax," by Clarence W. Hubbell, city engineer, Detroit.

Warren Foundry Company Elects Officers

At a director's meeting of the Warren Foundry & Machine Co., Easton, Pa. last week the following officers and directors of the company were elected: William H. Hulick, president and treasurer; A. D. Chidsey, vice-president and assistant treasurer; directors, E. J. Fox, president Easton Trust Co.; Chester Snyder, president First National Bank, Easton, Pa.; W. Clayton Hackett, president Easton National Bank; Lee S. Clymer, president Riegelsville Bank, Riegelsville, Pa.; and W. H. Walters, attorney, Phillipsburg, Pa.

Francis B. Foley, metallurgist Minneapolis station of the Bureau of Mines, will present a paper on "The Annealing and Hardening of Steel" before the Washington Chapter of the American Society for Steel Treating, at Washington, on Friday evening, Feb. 17. He will discuss his own investigations into the effect of the methods of heat treatment as applied to various materials.

C. A. How, purchasing agent of the Missouri Pacific Railroad, is preparing to place contracts for more than 5000 tons of 90-lb. steel rails. The exact amount or the allocation of the order has not been definitely decided upon, and is being held up pending the return to St. Louis of B. F. Bush, president of the railroad, who is ill in the South.

WHERE IS PROSPERITY?

This and Other Questions Considered at Dinner of New England Iron and Hardware Association

The New England Iron and Hardware Association held its twenty-ninth annual dinner on Tuesday evening, Feb. 7, at Hotel Somerset, Boston, more than 200 members and guests attending. Fred L. Avery, Boston, president, presided. Hon. Samuel L. Powers was toastmaster. The guests of the evening included Hon. Channing Cox, Governor of Massachusetts; Hon. Samuel E. Winslow, Congressman from Massachusetts; W. Irving Bullard, vice president Merchants' National Bank, Boston, and Austin H. Decatur, president National Hardware Association.

Mr. Decatur, in his address, took an entirely different view of the business outlook than he did a year ago when he spoke before the same association. He believes that business and industry have adjusted inventories sufficiently so that we may look forward with confidence. Mr. Decatur characterized business as still on the sick list, but he is confident its 1922 showing will be considerably better than the 1921, and that in succeeding years we may anticipate a gradual recovery of normal or better profits.

The subject of Mr. Bullard's address was, Where Is Prosperity? It took the form of a sketch of a recent trip abroad for the purpose of studying financial and industrial conditions, and the conclusions drawn by him. In Italy he found business and finances on the road to recovery, but in England, France, Belgium, Holland, Germany and in the other European countries visited, business, social and political uncertainty. Paper, he stated, is worth more in Europe as a commodity than as currency, and he returned to the United States convinced that real prosperity is here, where "85 per cent of our textile mills, 75 per cent of our shoe factories and 70 per cent of our steel mill capacity is in operation." Those present took exception to Mr. Bullard's figures on steel mill operations.

Mr. Winslow's remarks were confined largely to the problems confronting all Congressmen in Washington. He is convinced we have been misled by newspapers regarding the so-called agricultural bloc. He stated no such thing existed in the House. The East, he declared, does not realize the West has grown up, and that representatives of Western interests simply are doing no more for and showing no greater interest in those measures looking for the protection of Western business and industry, than Eastern representatives of peoples have been doing for years.

Because of its bearing on industry and business, Mr. Winslow spoke at length on the bonus question. He claimed representatives of the American Legion are threatening Representatives and Senators with political extinction if the bonus bill is not passed. So far as he knows, not one member of the American Legion has advanced even a suggestion as to how money for the bonus can be raised. While not making a direct statement, Mr. Winslow strongly intimated that industry and business cannot sustain any added taxation for the purpose of raising a bonus fund.

The Hanna Furnace Co., Cleveland, is planning to blow in its Dover furnace at Dover, Ohio, this week. This furnace has been out of blast 13 months. During that time, the furnace has undergone extensive repairs. Two new hot blast stoves and a new boiler plant and machine shop have been built and a turbo generator, several pumps and a gas washer have been installed.

The Union Street mill of the Edwards Iron Mills, Columbia, Pa., which has been idle for more than a year, was scheduled to be put in full operation on Feb. 15, according to an announcement of the owner, Edward T. Edwards. The puddling rate will be \$6 per ton. Several hundred men will be employed.

Iron and Steel Markets

OPERATIONS IMPROVED

Increase Slight But Less New Business

Tonnage Traceable to Railroads--Wire Lower Pig Iron Dull Coke Higher

Operations of steel mills have improved slightly following the broadening scale of purchases last week, but fresh buying has fallen off somewhat, as is characteristic of the alternations of a replenishment market. Both consumers and jobbers are freer buyers, but only for immediate needs. The week's bookings have relatively few items of large tonnage.

The potentialities of railroad demand, in the light of recent equipment sales, are again encouraging producers. Meanwhile, new rail business calls for 23,000 tons, including 18,000 tons for the Chesapeake & Ohio, and three roads have bought 10,600 tons of tie plates, with 5000 tons from another pending. Active railroad car inquiries in the West exceed 8000 and an order has been placed by the Reading for 2000, the first of any size in the East in many weeks. The Lackawanna is considering repairs to 985 hopper cars.

The heavy tonnage products are none too steady, but the uninterrupted succession of reports of operating losses sustained by large producers appears to have done much to discourage belief in lower prices. Some observers regard possible freight rate reductions as already discounted. Producers emphasize that plates, shapes and bars, bringing 1.40c., Pittsburgh, to-day, averaged in 1913 1.55c. on bars and 1.50c. on shapes and plates and mills did not have to-day's freight, fuel and labor costs to absorb.

Following the reduction of wire nails to \$2.40 per keg, plain wire is now quoted at \$2.15. Incidentally, this brings THE IRON AGE composite price to 2.005c. per lb., the lowest yet on the receding movement which began in September, 1920.

Leading sellers of foundry, malleable and basic grades of pig iron in the Chicago district are making an attempt to advance the selling price to \$20, but the latest sales were made at \$18 to \$18.50 and the new quotation has not been established. Prices of Bessemer ferrosilicon and silvery irons have been reduced \$2 per ton. In nearly all centers, the pig iron market is extremely quiet and sellers are maintaining recent quotations with difficulty. At Pittsburgh, concessions have been made on foundry and malleable irons.

Makers of cold finished bars and of bolts, nuts and rivets have encountered some liquidating sales. These are taken to indicate the final clearing up of accumulated stocks in purchasers' hands. The Ford Motor Co. bought 10,000,000 nuts at a sharp concession.

The outstanding new item in fabricated steel

is 23,000 tons for a bridge across the Hudson for the New York Central. Outside of that, new projects total barely 10,000 tons and awards amount to about 7000 tons.

Tin plate mills are even more fully engaged than they were last week, independent mills in the Pittsburgh and Valley districts averaging close to 90 per cent of capacity.

Gas companies in Chicago and Milwaukee are in the market for 15,000 and 4000 tons, respectively, of cast-iron pipe.

Exporters look for business in semi-finished steel with Europe, matching low prices here with advancing exchange there. For the Far East, 17,000 tons of rails has been closed.

British producers of ferromanganese have advanced prices to \$62.50, seaboard, and American makers are expected to follow suit. Stocks of the higher grade of spiegeleisen have been exhausted and prices for the lower grades have been advanced \$5 per ton, or to \$30, furnace.

Coke prices have advanced as a result of demand in anticipation of a coal strike, 15 cents a ton, or to \$2.90 on furnace coke and 25 cents or to \$4 on foundry coke.

Pittsburgh

PITTSBURGH, Feb. 14.

The trend of the demand for finished steel products still is in the direction of improvement, and while the gains are seen more in the number than the size of the orders, the aggregate is more satisfying than it has been before this year. It cannot be said that the improvement yet has filtered through to price changes, and it is also a fact that all products do not share alike in the buying. The lighter materials, such as tin plate, sheets, and tubular goods, are doing much better, relatively, than are the heavier tonnage products. As far as prices are concerned, buyers who have fairly substantial tonnages to place have a dominating voice in the terms. At that, however, buyers are having some difficulty in obtaining concessions from 1.40c. on plates, shapes and bars, and the larger producers of sheets continue to refuse business in black and galvanized stock at less than 3c. and 4c., respectively.

The market in wire products is unsettled. Persistent and widely circulated reports of an early reduction of \$5 per ton have seriously restricted orders, as buyers are holding back until convinced that such action is not likely.

Business calling for extended delivery is entirely lacking; indeed, all of the business coming to manufacturers is for prompt shipment and represents only the immediate requirements of buyers. Liquidation has been so complete in practically all products that actual needs are increasing, and this accounts for the improvement in business during the past few weeks. Manufacturers of cold-finished steel bars and of nuts, bolts and rivets still are encountering some liquidating sales, but in all other lines consumers' and jobbers' stocks appear to be down to bare boards. The prices now prevailing seem to be the obstacle in the path of advance business in sheets, as buyers seem to have the idea that because the decline in prices has been relatively less in this line than in several others, current

Pig Iron—It has been another dull week in this market as far as sales are concerned. The only important inquiry which recently has come out is from the Allegheny Steel Co. which is securing 1000 tons of blast and 300 ton of Bessemer iron for immediate delivery. It is probable that this business will be closed this week. Common expectation is that some more resale basic iron will be bought, as a railroad equipment

company still is liquidating its stock, and is understood to have made a quotation of \$17.75, Valley furnace, on the tonnage sought. Producers having any of this grade for sale, however, no longer are willing to consider less than \$18. We note a sale of a fair-sized tonnage of No. 2X foundry iron at \$19.25, Valley furnace, and subtracting the usual differential of 50c. per ton, this would mean \$18.75 for plain No. 2. Carload lots of the latter grade still command \$19, Valley furnace, and the same price is asked for No. 3 and forge iron.

Weight	Valley furnace	Freight	Delivered
100 lb.	100 lb.	100 lb.	100 lb.
Base			\$17.75
Box			19.50
No. 1		3.75 to	19.00
No. 2		8.75 to	19.00
Malleable		8.75 to	19.00

Ferroalloys.—Domestic makers of ferromanganese have followed the advance recently announced by English makers to \$62.50 c.i.f. Atlantic seaboard, for 80 per cent material, and this price probably will be adopted by the Steel Corporation subsidiary making this alloy. So far agents of German makers have had no advices with regard to prices, but the impression prevails that German material also will be advanced. The new quotation as yet is largely on asking price, as the demand is moderate in this district and there have been no important sales recently. The advance in ferromanganese, coupled with the fact that existing supplies are exceedingly small, is reflected in a stiffer market in spiegeleisen. A western Pennsylvania manufacturer several weeks ago disposed of all stocks laying on the furnace yard and stocks of an Eastern producer now are reported to consist of only about 200 tons of 16 to 19 per cent material. The former is out of the market and the latter has put a price of \$30 furnace on the unsold tonnage. A Valley steel maker is seeking 100 tons of 16 to 19 per cent spiegeleisen. Fifty per cent ferrosilicon is inactive with makers asking \$60 furnace, freight allowed, for 50 per cent, but no important sales are being made at that price.

We quote 78 to 82 per cent ferromanganese, \$62.50 c.i.f. Atlantic seaboard for domestic and English and \$58.35 for German. Average 20 per cent spiegeleisen, nominal; \$30 to \$35 delivered Pittsburgh or Allegheny; 50 per cent ferrosilicon, domestic, \$55 to \$60 furnace, freight allowed. Bessemer ferrosilicon is quoted f.o.b. Jackson and New Straitsville, Ohio furnaces as follows: 10 per cent, \$36.50; 11 per cent, \$39.80; 12 per cent, \$43.10; 13 per cent, \$47.10; 14 per cent, \$52.10; silvery iron, 6 per cent, \$25; 7 per cent, \$26; 8 per cent, \$29.50; 9 per cent, \$29.50; 10 per cent, \$31.50; 11 per cent, \$34; 12 per cent, \$36.50. The present freight rate from Jackson and New Straitsville, Ohio, into the Pittsburgh district is \$1.06 per gross ton.

Billets, Sheet Bars and Slabs.—The inquiry for 1500 to 2000 tons of billets from a Pittsburgh district maker of strip steel, referred to a week ago, has been closed with a Valley producer. It is understood that the price was \$28 Youngstown for 4-in. and larger billets and \$29 for the smaller sizes. Since the freight to point of consumption is greater from Youngstown than from Pittsburgh, it is believed there was equalization of freight on this transaction, which also indicates a re-establishment of the pre-war differential of \$1 per ton between large and small billets. There has been no further business in sheet bars since the recent sale of 1000 tons at \$29 Pittsburgh. Slabs are inactive and prices nominal.

We quote 4 x 4-in. soft Bessemer and open-hearth billets at \$28 to \$29; 2 x 2-in. billets, \$29 to \$30; Bessemer and open-hearth sheet bars, \$29 to \$30; slabs, \$29 to \$30; forging billets, ordinary carbons, \$32 to \$33, all f.o.b. Youngstown or Pittsburgh mills.

Wire Rods.—The best demand coming to local makers is for export, Japanese export houses being especially prominent. Domestic demands still are few and for small tonnages. On export business, the market is not quotable above \$35 for the base size of soft rods, but such domestic business as is doing is at \$36 to \$37. Prices are given on page 505.

Steel Skelp.—Makers still are holding to 1.50c. for pipe skelp, but demands are so few and small that this price must be regarded as largely untested. Since skelp usually sells at the same price as plates, and the latter have gone as low as 1.40c., it is probable that a sizable tonnage of skelp could be placed at that price.

Wire Products.—A good many inquiries are coming out for nails and other wire products from jobbers, pre-

paratory to the Spring demand, but only a small percentage of them is going upon makers' books as orders because there is so much uncertainty about prices. A widely circulated report that at an early date nails would be reduced to \$2.25 base per keg, Pittsburgh, with a corresponding reduction in other products, has caused buyers to withhold orders in expectation of some sort of a move in that direction. Meanwhile, makers in this district are trying to maintain the market at \$2.50 base, per keg, for nails and \$2.25 base per 100-lb. for plain wire, but large buyers are getting concessions of \$2 per ton from these prices, and the smaller distributors are trying to buy at the same prices. We make a range of \$2 per ton in the quotations, the lower prices being to large buyers. Export business in nails and wire, including both plain and barbed, notably to Japan, is relatively good.

We quote wire nails at \$2.40 to \$2.50 base per keg, Pittsburgh, and bright basic and Bessemer wire at \$2.15 to \$2.25 base per 100 lb., Pittsburgh.

Steel Rails.—The market for light rails is inactive and inclined toward weakness. Occasional export inquiries, some of them running as much as 300 and 400 tons, are coming out, but most of the domestic demands are for single carloads. The market on these sections, rolled for new steel, still is quoted at 1.50c. base, but more business is being lost than obtained at that price. Light rails rolled from old standard rails, readily are obtainable at 1.45c., and it is believed that a sizable lot of new steel rails could be placed at the same figure.

We quote 25 to 45-lb. sections, rolled from new steel, 1.50c. base, rolled from old rails, 1.45c. base, standard rails, \$10 per gross ton mill for Bessemer and open-hearth sections.

Iron and Steel Bars.—At 1.40c., Pittsburgh, soft steel bars seem to have touched a level which appeals to buyers, and there is not only more business and heavier operations of the mills than before in some time, but a marked tendency on the part of makers to regard that price as an irreducible minimum and not to go that low on ordinary orders. Both consumers and jobbers are freer buyers, although not anticipating their requirements very far ahead. There is a very fair demand from some of the makers of popular priced motor cars and recent export inquiries have included some bars, along with plates and shapes. Not much reinforcing bar business is in sight in this district. Iron bars still are slow of sale.

We quote steel bars rolled from billets at 1.40c. to 1.50c.; reinforcing bars, rolled from billets, 1.40c. to 1.50c. base; reinforcing bars, rolled from old rails, 1.35c. to 1.40c.; refined iron bars, 2c. to 2.10c. in carloads, f.o.b. mill, Pittsburgh.

Structural Material.—The report about this district still is one of fairly numerous inquiries and much activity in the engineering department of the fabricating companies, but only a few awards, and those mostly of tonnages of less than 100. The Mellon-Stuart Co. is reported to have been given the general contract for a new four-story building for the Mellon National Bank, Pittsburgh, but no action has been taken in connection with letting the 1700 tons of steel which will be required. A seven-story building for the Pittsburgh Y. M. C. A., which has been dormant for several months, again is showing life, and a formal inquiry probably will go out shortly. The Pittsburgh-Des Moines Steel Co. will fabricate more than 500 tons of penstock work for a New York State Stock Farm. Plain material business is better in the prospective than in the actual, because mills in this district are not benefiting much by the big jobs which are being placed in other cities. Some export demands for small shapes are filtering in. The going market price on structural beams is 1.40c., Pittsburgh, but this price is not acceptable to the mills except on fairly large tonnages. Prices are given on page 505.

Sheets.—Possibly business is a little better on the whole than it was recently, but the improvement is seen in the number rather than the size of the orders, and there is no tangible evidence of any departure on the part of buyers from their recent policy of merely taking on their actual requirements. In view of the fact that all stock ordered is wanted immediately, it is evident that buyers' stocks are low, but the expectation that the

weakness in other lines of finished steel will eventually force price concessions in sheets is making buyers cautious about placing their future needs. There continues to be remarkably close adherence to 3c. base for black sheets and 4c. base for galvanized on new rollings, but in the heavier gages of blue annealed the plate base is as frequently quoted as the blue annealed base. Concessions on black and galvanized sheets usually refer to stock material or sheets that have been thrown back upon makers' hands because of some defect. Prices are given on page 505.

We quote sheared plates, $\frac{1}{4}$ in. and heavier, tank quality, at 1.50c. f.o.b. Pittsburgh.

Tin Plate.—Mills in this and nearby districts are enjoying a very high rate of operation, but the explanation is found in specifications against old contracts, rather than in new business. Two of the independent plants in this district are running full while three others are running 90 per cent or higher. The leading interest is not doing quite so well as the independents in the matter of operations, but it succeeded in moving so much tonnage during November, December and January that this is an altogether natural condition. Prices do not change much, due to the fact that so little new business is coming out. Export demands are lighter than they were recently.

We quote standard production coke tin plate \$1.75 per base box f.o.b. Pittsburgh for carload lots.

Cold Finished Steel Bars and Shafting.—Makers in this district are experiencing a somewhat better inquiry, but the improvement is in the number rather than in the tonnages involved. Buyers, quite generally, are confining purchases to small lots to round out existing stocks. The common quotation is 2c. base Pittsburgh, but it is frequently necessary for makers to go to 1.90c. base and occasionally even lower, to secure orders in competition with liquidating sales. Ground shafting holds at 2.25c. base, f. o. b. mill for carload lots.

Hoops and Bands.—There is no particular change in the situation either as regards demand or prices. Buyers are extremely cautious and are doing considerable shopping before placing orders. Prices are not very well established. On bands there is a range of from 1.75c. to 1.90c. and on hoops from 1.90c. to 2c., but the higher prices are the exception.

Nuts and Bolts.—No material increase in inquiries or orders can be chronicled, as buyers are merely covering their barest requirements. Prices still lean in buyers' favor. Nothing yet has been reported in connection with the inquiry of the New York Central Lines for 5000 to 8000 kegs of track bolts, bids against which went in Feb. 8. There is much interest in this business and also in the bolt and nut requirements for the new vehicular tunnel, New York. Discounts are given on page 505.

Plates.—Demands upon mills in this and nearby districts still are few and small and there is poorer engagement of capacity than of any other class of finishing mills. Tank builders are fairly busy, but seem to be covered against their orders and railroad equipment companies in this territory are not faring nearly as well as those in other centers, notably in the Chicago district. There is no disposition by mills here or in the Valleys to go below 1.40c. and more is sought on the general run of inquiries, which are for small lots. Stocks everywhere are low, but there being no question as to deliveries, buyers are inclined to order supplies as they are wanted.

Iron and Steel Pipe.—There is a steady, although not particularly active, demand for merchant pipe in both steel and wrought iron, as spring building activities in most parts of the country promise well and jobbers want to be prepared for the demands involved. Some improvement also is noted in the demand for oil country goods, despite the fact that oil prices have declined on some grades in the Western fields. Line pipe inquiries are fairly numerous. The Hope Engineering & Supply Co., Mt. Vernon, Ohio, has asked for prices on 98 miles of 12-in. pipe for a gas line out of the Monroe, La., field. There is also an inquiry for 100 miles of 6-in. pipe. Export demand for oil well pipe is reported to be better, and especially from Mexico and South America.

There is just fair observance of the card discounts, which are given on page 505.

Boiler Tubes.—Expectations of a fairly good spring demand are causing somewhat larger purchases by jobbers. There is still some price cutting in steel tubes, both lap welded and seamless, but prices of iron tubes are fairly well maintained. Discounts are given on page 505.

Hot-Rolled and Cold-Rolled Strips.—There is a fairly good business in both kinds of material, but it is for the replenishment rather than the building up of stocks. On cold-rolled strips makers are holding rather firmly to 3.50c., base, Pittsburgh, but there is pretty frequent departure from the regular or official quotation of 2c., base, on hot-rolled. Makers, however, are not going to recent minimums except to secure orders which are attractive from a rolling standpoint.

Coke and Coal.—The market is considerably firmer on spot tonnages of coke than it was recently, this development being directly due to a better market for coal as a result of purchases in anticipation of a strike of union coal miners on April 1. While coal prices have not advanced, there is a better market and this has induced some producers to put out coke ovens and ship coal. Disappearance of coke offerings by those without regular consuming connections has left the market rather bare, and lately fuel suitable for blast furnaces has not been available at less than \$2.90 per net ton, oven, while some business has been done at \$3. Spot foundry coke also is less freely offered and \$4 per net ton oven has become the minimum price. Blowing out of the furnaces of the Sharon Steel Hoop Co., Lowellville, Ohio, has thrown back upon the market about 11,000 tons of coke a month, but this has had no effect upon the market, as the bulk of the tonnage has been diverted to other consumers. The Hanna Furnace Co., which will blow in a furnace at Dover, Ohio, next week, is negotiating for 14,000 tons a month and is reported to have covered a portion of these requirements.

Old Material.—The market is no more active nor any firmer than it has been despite the fact that the past week or ten days has seen some increase in steel works activities among plants in this and nearby districts. Evidently the steel companies have accumulated fair sized stocks because they are still very sparing buyers of scrap. Even those charging light material have been less eager for supplies in the past week than they had been previously. Two important consumers of machine shop turnings are endeavoring to obtain supplies at \$9.50, but are not getting much material for the reason that dealers are paying that much and in some instances higher against contracts they took at higher prices. Offerings of this grade are moderate and \$10 is probably as low as round lots could be bought. The only demand for heavy melting steel is from dealers who have contracts to cover and they are unwilling to go above \$14. There are occasional sales a little above this price for single carloads for quick shipment.

We quote for delivery to consumers' mills, in the Pittsburgh and other districts taking the Pittsburgh freight rate, as follows:

Heavy melting steel, Steubenville, Follansbee, Brackenridge, Monessen	
Midland and Pittsburgh	\$12.50 to \$14.00
No. 1 case, cupola size	16.00 to 16.50
Re-rolling rails, Newark and Cambridge, Ohio; Cumberland, Md.; Huntington, W. Va., and Franklin, Pa.	15.00 to 15.50
Compressed sheet steel	11.75 to 12.00
Bundled sheets, sides and ends	10.50 to 11.00
Railroad knuckles and couplers	11.00 to 11.50
Railroad coil and leaf springs	11.00 to 14.50
Low phosphorus standard bloom and billet ends	17.00 to 17.50
Low phosphorus plates and other grades	16.50 to 17.00
Railroad malleable	12.50 to 13.00
Iron car axles	23.00 to 24.00
Locomotive axles, steel	21.00 to 22.00
Steel car axles	14.50 to 15.00
Cast iron wheels	14.50 to 15.00
Rolled steel wheels	14.00 to 14.50
Machine shop turnings	9.50 to 10.00
Sheet bar crop ends	13.50 to 14.00
Heavy steel axle turnings	11.00 to 11.50
Short shoveling turnings	11.00 to 11.50
Heavy breakable cast	14.50 to 15.00
Stove plate	12.50 to 13.00
Cast iron borings	11.00 to 11.50
No. 1 railroad wrought	11.50 to 12.00

Chicago

CHICAGO, Feb. 14.

Mill bookings continue to show a gradual but steady increase, one important local producer reporting the best week's sales for a year. While prices on the heavier rolled products are not any too steady, there is a growing disposition on the part of consumers to buy at present levels. The uninterrupted succession of losses shown in the quarterly reports of large steel producers has discouraged the belief that prices can go much lower. Possible freight rate reductions which were taken into consideration by purchasing agents earlier in the year now appear more remote and by some observers are regarded as already discounted by the market. That these or other considerations have removed much of the caution of the trade is evident from the increasing number of orders placed by a great diversity of buyers, being received particularly from the railroads. So far as tonnage buying is concerned, this continues to be traceable directly or indirectly to the carriers. Heavy specifications are being received from car builders and there is still much railroad car business in sight. From the railroads themselves are coming generous orders for track supplies, and while rail buying is not brisk, a few good-sized inquiries are pending. The Inland Steel Co. expects to start its rail mill during the week commencing Feb. 28.

Increased bookings have been reflected in better mill operations. The Illinois Steel Co. has started another blast furnace at Gary, making six active at that plant, four at South Works and one at Joliet, or a total of 11. At the same time, it has increased its steel output to 50 per cent of capacity. The Inland Steel Co. is on practically the same basis as last week.

Pig Iron.—The leading Northern merchant to-day advanced its prices to \$20 base furnace, for foundry, malleable and basic. This action was followed by a steel works furnace which is selling malleable, while the Inland Steel Co., which is employing one furnace on merchant iron, is booked ahead through March. Up until the time the new prices were announced the local market was exceedingly weak. Sales were made at prices ranging from \$18 to \$18.50 base, furnace, with the tendency toward the general establishment of the lower base. As yet the new prices are untested, but it is evident that they constitute an effort on the part of producers to stem a decline which was steadily increasing the red figures on their books. One effect of the advance will be to make it easier for Southern iron to enter this territory. Until recently the delivered price of the Southern product has been so high that any extensive sales were out of the question. In general the market has been somewhat more active during the past week. Shipments from the furnaces represented by the leading local merchant continue to increase, although some iron is still being piled. On the whole, buyers have been more receptive to the efforts of sellers than for some time. Prominent among recent sales may be mentioned 1000 tons of foundry for delivery in Wisconsin over the next three months and 500 tons of malleable for Indiana shipment. Charcoal, low phosphorous and silvery are quiet. Jackson County producers have announced a \$2 reduction on all grades of silvery and Bessemer ferrosilicon.

Quotations on Northern foundry, high phosphorus malleable and basic irons are f.o.b. local furnace and do not include a switching charge averaging 70c. per ton. Other prices are for iron delivered at consumers' yards, or when so indicated, f.o.b. furnace other than local.

Lake Superior charcoal, averaging sil 1.50, delivered at Chicago.....	\$30.50 to \$31.50
Northern coke, No. 1, sil. 2.25 to 2.75.....	18.50 to 19.00
Northern coke, foundry, No. 2, sil. 1.75 to 2.25.....	18.00 to 18.50
Northern high phos.....	18.00 to 18.50
Southern foundry, sil. 1.75 to 2.25.....	21.67
Malleable, not over 2.25 sil.....	18.00 to 18.50
Basic.....	18.00 to 18.50
Low phos., Valley furnace, sil. 1 to 2 per cent copper free.....	29.50
Silvery, sil 8 per cent.....	32.82

Railroad Equipment.—The Burlington has not yet placed the 500 automobile cars remaining on its inquiry, but is expected to do so this week. The Great Northern will probably close on 500 refrigerator cars in the next few days and on the remaining 2600 freight cars on its inquiry next week. Action on its inquiry for

20 passenger coaches has been postponed indefinitely. The St. Paul is in the market for 1000 drop bottom stock cars in addition to the 1000 box reported last week. Additional inquiry reported from this road will probably bring the total up to 4000 cars. The Northern Pacific is inquiring for 500 refrigerator cars, while the Union Pacific wants 18 observation cars and 70 caboose cars. In the East the Philadelphia & Reading has distributed orders for 2500 hopper cars.

Ferroalloys.—Ferromanganese has been advanced to \$62.50, tidewater, or \$70.90 delivered Chicago. There was considerable business closed on the eve of the advance, one local broker having taken orders for 600 tons.

We quote 78 to 82 per cent ferromanganese, \$70.90, delivered; 50 per cent ferrosilicon, \$56 to \$57.50, delivered; spiegeleisen, 18 to 22 per cent, \$36.50 to \$37, delivered.

Bars.—Mills report a gradual increase in bookings as well as a growing diversification in demand for soft steel bars. Miscellaneous manufacturers, including machinery builders and farm implement makers, are commencing to buy in a small way and at the same time orders are being cautiously placed by jobbers. The bulk of current business, however, consists of specifications from car builders and orders for reinforcing steel. One local merchant mill yesterday commenced rolling an order for 4000 tons of deformed bars. A round tonnage of reinforcing has been placed recently for road building purposes, and numerous reinforced concrete building projects are being figured on. The St. Paul, Minnesota, Water Department took bids yesterday on 500 tons for a pumping station. Prices are still weak, with the general market at substantially the same level as last week. Demand for bar iron is light and prices are unchanged. Hard steel bar demand is sufficient to enable local mills to operate single turn. Tonnage booked is largely for bedstead and steel post manufacture and for reinforcing purposes. The ruling market is 1.50c. mill, although attractive tonnages have brought out concessions. A local mill booked 1200 tons for the American Fore building, Chicago, at 1.45c.

Mill prices are: Mild steel bars, 1.55c. to 1.60c., Chicago; common bar iron, 1.60c., Chicago; rail carbon, 1.50c., mill or Chicago.

Jobbers quote 2.53c. for steel bars out of warehouse. The warehouse quotation on cold-rolled steel bars and shafting is 3.10c. for rounds and 3.90c. for flats, squares and hexagons. Jobbers quote hard and medium deformed steel bars at 1.90c. base. Hoops and bands, 3.13c.

Wire Products.—While jobbers are buying a little more freely, they are not yet laying in stocks in the quantities they usually do at this time of the year. The price situation is weaker and large orders for wire nails are being placed at \$2.40, Pittsburgh. Reports that the leading interest will announce a new price of \$2.25 cannot be confirmed here. For mill prices see finished iron and steel, f.o.b. Pittsburgh, page 505.

We quote warehouse prices f.o.b. Chicago: No. 9 and heavier black annealed wire, \$3.13 per 100 lb.; No. 9 and heavier bright basic wire, \$3.28 per 100 lb.; common wire nails, \$3.25 per 100 lb.; cement coated nails, \$2.65 per keg.

Sheets.—Further reports of slight concessions on galvanized and black are circulating, but no general weakness is to be noted, and prices appear to remain fairly firm at the quotations published below. Domestic demand is slightly better, but still light. Export business is good.

Mill quotations are 3c. for No. 28 black, 2.25c. for No. 10 blue annealed and 4c. for No. 28 galvanized, all being Pittsburgh prices, subject to a freight rate to Chicago of 38c. per 100 lb.

Jobbers quote: Chicago delivery out of stock, No. 10 blue annealed, 3.38c.; No. 28 black, 4.15c.; No. 28 galvanized, 5.15c.

Steel Castings.—Orders for the steel castings in the Burlington cars have not yet been placed. The bolsters, side-frames and couplers will be placed by the railroad, while the miscellaneous castings will be bought by the car builders. Covered in each case by protections granted in December, the placing of these orders will not develop changes in prices which might be warranted by present market conditions. On new business the prices and discounts on pages 348 to 350 of THE IRON AGE of Feb. 2 are regarded as the market.

Plates.—Specifications from car builders continue to account for the bulk of the bookings of local plate

mills, but orders from miscellaneous sources are notably more numerous, although individually small. On the other hand, demand from oil storage tank fabricators has fallen off markedly. The price situation is still weak, steel for cars being bought at \$2 to \$3 below the general market.

The ruling mill quotations range from 1.55c. to 1.60c., Chicago. Jobbers quote 2.63c. for plates out of stock.

Structural Material.—Fabricating awards have fallen off during the past week, but a large amount of work is pending. The Chicago sales office of one important fabricator reports that it has submitted bids on 40,000 tons since Jan. 1, as compared with a maximum of 110,000 tons for any previous complete year. One of the largest jobs on which bids have recently been taken is the Bankers' Life building, Des Moines, Iowa, involving 1700 tons. Plain material prices are on about the same basis as described last week. Recent fabricating awards include:

Chicago, Burlington & Quincy Railroad, one 88-foot and two 103-foot through truss spans, 134 tons, to Vening Steel Works and A. Holters Sons.

Bridge over Saint Croix river, Prescott, Wis., 772 tons, to Milwaukee Bridge Co.

Bridge over Missouri River, Boonville, Mo., 1827 tons, to Mount Vernon Bridge Co.

The mill quotation in plain material from 1.55c. to 1.60c., Chicago. Jobbers quote 2.63c. material out of warehouse.

Bolts and Nuts.—The market remains decidedly weak, but the prices and discounts published last week are still representative. The automobile builders and the railroads are the principal buyers. The Ford Motor Co. has closed for 10,000,000 nuts at sharp concessions in prices. Jobbers are buying very cautiously.

Jobbers quote structural bolts, 3/4 in. to 1 in., 10 and 12 per cent off, larger sizes, 60 to 100 off, carriage bolts up to 3/4 x 6 in., 60 and 10 off; larger sizes, 5 and 5 off; hot pressed nuts, square and hexagon tapped, \$3.75 off; blank nuts, \$1 off; coach or lag screws, gimlet points, square in 65 and 5 per cent off. Quantity extras are unchanged.

Old Material.—Sentiment among dealers has improved, but in the absence of any consumptive buying of importance the price situation remains largely unchanged. There are indications, however, pointing to increased speculative buying and it is possible that a strong dealers' market may develop. The only notable purchases by users recently have been for cast scrap. Railroad offerings include: The Great Northern, 6000 tons; the Rock Island, 3000 tons; the Northern Pacific, 3000 tons; the Santa Fe 2500 tons; the Wabash, 1000 tons. The quotation on No. 1 busheling published last week, was in error. It should have been \$8.25 to \$8.75 per net ton.

We quote delivery in consumers' yards Chicago and vicinity, all freight and transfer charges paid, as follows.

Per Gross Ton	
Iron rails	\$16.00 to \$16.50
Relaying rails	20.00 to 20.00
Cast iron car wheels	15.00 to 15.00
Rolled or forged steel car wheel	13.00 to 13.50
Steel rails, rerolling	12.00 to 12.50
Steel rails, less than 3 ft.	12.50 to 13.00
Heavy melting steel	11.25 to 11.75
Frags, switches and guards cut apart	11.25 to 11.75
Shoveling steel	10.75 to 11.25
Low phos., heavy melting steel	13.50 to 14.00
Drop forge flashings	7.50 to 8.00
Hydraulic compressed sheet	7.50 to 8.00
Axle turnings	8.50 to 9.00
Per Net Ton	
Iron angles and splice bars	14.00 to 14.50
Steel angle bars	10.50 to 11.00
Iron arch bars and transoms	15.00 to 15.50
Iron car axles	19.50 to 20.00
Steel car axles	12.50 to 13.00
No. 1 busheling	8.25 to 8.75
No. 2 busheling	6.00 to 6.50
Cut forge	10.00 to 10.50
Pipes and flues	6.50 to 7.00
No. 1 railroad wrought	10.00 to 10.50
No. 2 railroad wrought	10.75 to 11.25
Steel knuckles and couplers	12.50 to 13.00
Coil springs	13.00 to 13.50
No. 1 machinery cast	12.50 to 13.00
No. 1 railroad cast	11.00 to 11.50
Low phos. punchings	9.50 to 10.00
Locomotive tires, smooth	4.50 to 5.00
Machine shop turnings	6.00 to 6.50
Cast borings	12.50 to 13.00
Stove plate	10.50 to 11.00
Grate bars	10.50 to 11.00
Brake shoes	11.25 to 11.75
Railroad malleable	11.25 to 11.75
Agricultural malleable	11.25 to 11.75

Rails and Track Supplies.—The Chesapeake and Ohio is about to place 18,000 tons of rails, a part of which at least is expected to go to local mills. The Minneapolis & St. Louis and the Soo Line recently

ordered 3000 tons and 2000 tons respectively from a Chicago producer. Demand for track materials is more active than for rails. The Great Northern and the Soo Line placed orders in Chicago for 6000 tons and 1000 tons of tie plates respectively. The Louisville & Nashville placed 3600 tons with the Tennessee company and the Michigan Central is in the market for 5000 tons. Demand for light rails is small, with billet steel rails available at from 1.55c. to 1.60c. mill, and re-rolled rails for 1c.

Standard Be	North rails	10 light rails
Standard 100	1.60	1.60
with square nuts	1.60	1.60
1.75c., 1.60 mill	1.60	1.60

Cast-Iron Pipe.—The People's Gas Co., Chicago, is in the market for 15,000 tons of gas pipe and the Milwaukee Gas Co. for 4000 tons. While few new inquiries for water pipe have appeared within the past week, there is much municipal work in a formative stage. Brillion, Wis., has let 375 tons to the American Cast Iron Pipe Co. The same producer is low bidder on 800 tons for Minneapolis. Fort Wayne, Ind., will take bids, Feb. 21, on 190 tons.

We quote per net ton, Chicago, as follows: Water pipe 1-in. \$15.60 to \$16.60, 6-in. and above, \$11.60 to \$12.60; 4-in. and 6-in. pipe 3 extra.

New York

NEW YORK, Feb. 14.

Pig Iron.—The buying by the heater companies last week and the week before, included most of the large tonnages of recent date, although one machinery company has purchased 2000 tons and another melter 800 tons. The failure to open bids on the vehicular tunnel caused some disappointment, but it is expected that consumers of pig iron will be actively figuring this week with contractors successful to-morrow in the tunnel bidding. Reports brought by representatives of selling companies who have been in New England in the past few days indicate an increase of melt and more encouraging conditions generally, but fear that the strike of textile workers will have a depressing effect on the situation.

We quote delivered in the New York district as follows, having added to furnace prices \$1.52 freight from eastern Pennsylvania, \$5.46 from Buffalo and \$6.16 from Virginia: East Pa. No. 1 4dy, sil. 75 to 3.25, \$23.52; East Pa. No. 2 2X 6dy, sil. 2.25 to 2.75, 23.02; East Pa. No. 2 6dy, sil. 1.75 to 2.25, 22.52; East Pa. No. 2 6dy, sil. 1.75 to 2.25, 22.52; Buffalo, sil. 1.75 to 2.25, \$23.46 to 28.16; No. 2 Virginia, sil. 1.75 to 2.25, 28.16.

Ferroalloys.—The quotation of all the sellers of British ferromanganese in this market is now on a basis of \$62.50, seaboard, and it is understood that the leading American producer and the Carnegie Steel Co. are also on the same basis. Before the advance it is understood that sales aggregating about 1000 tons, mostly domestic alloy, were made. Inquiries at present before the market include one of 300 tons and also others for carload lots bringing the total to about 500 tons. A decided change has developed in the spiegeleisen market. No more of the high, or 20 per cent, grade is available and for the lower, or 16 to 19 per cent, grade the price has been advanced to \$30, furnace, as contrasted with \$25 previously. Sales of several hundred tons are reported, some of it at the higher quotation. There have been no developments in the manganese ore situation and quotations continue nominally unchanged. Demand of 50 per cent ferrosilicon is confined to small lots at unchanged prices. Quotations are as follows:

Ferromanganese, domestic, at per ton	\$62.50
Ferromanganese, British, seaboard, per ton	\$62.50
Spiegeleisen, 16 to 19 per cent, furnace, per ton	\$30.00
Ferrosilicon, 50 per cent, delivered, per ton	\$55.00 to \$60.00
Ferrotungsten, per lb. of contained metal	40c to 50c
Ferrobromine, per lb. of contained metal	60 to 70
Ferrocopper, per lb. of contained metal	12c to 14c
Ferrovandium, per lb. of contained vanadium	\$4.00
Manganese ore, foreign, per unit, seaboard	22c to 25c
Tungsten ore, per unit, in 60 per cent concentrates	\$2.00 up
Chromite ore, 40 to 45 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard	\$20.00 to \$25.00
Chromite ore, 45 to 50 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard	\$25.00 to \$27.00
Molybdenum ore, 85 per cent concentrates, per lb. of MoS ₃ , New York	50c to 60c

Finished Iron and Steel.—What improvement has occurred in the broadened replenishment buying has tended to stiffen prices at the 1.40c. Pittsburgh basis. Inquiries of the week have probably not amounted to as much as those of the week preceding, but the situation is regarded as merely a repetition of the up and down movement expected under a market of buying largely for current needs. More is heard of the potentiality of railroad buying. Outstanding in this is the first large purchase in the East for some time of railroad cars, the Reading distributing 2000 steel hopper cars calling for upward of 20,000 tons of steel, equally among four companies, the Pressed Steel Co., Cambria Steel Co., American Car & Foundry Co., and the Standard Steel Co. With the common expectation that better than the going market will be realized on purchases, the car builders are counting on pricing at 1.35c., Pittsburgh, for bars, plates and shapes. The Reading is also interested in securing 50 passenger equipment cars; the Lackawanna is asking for prices on the repair of 985 steel hopper cars and the Pennsylvania is inquiring for prices on box and hopper cars. In the structural field the New York Central proposal to build a bridge across the Hudson River at Closter, involving 23,000 tons, looms large. The Pennsylvania Equipment Co., Philadelphia, is in the market for 15 tank cars of 10,000-gal. capacity. In the export market 7000 tons of 100 lb. rails for South Manchuria have been placed in the United States and 10,000 tons of 60-lb. rails for the Imperial Government Railways of Japan are substantially closed. Exporters look for increasing business in semi-finished steel to Europe, favored by lower prices here and rising exchange there. New fabricated steel projects, beside the New York Central bridge, include 400 tons for small bridges for the Lehigh & New England, 700 tons for a power house at Pittston, Pa., 100 tons for a school at Corning, N. Y., 1000 tons for an office building at Broadway, Seventh Avenue and Fifty-first Street, New York, and 700 tons for public school No. 67, Brooklyn. Bids scheduled to open on Feb. 15 for the vehicular tunnel under the Hudson involve several thousand tons of fabricated steel work. Recent award include the following: Two bridges for the Baltimore & Ohio, 550 tons, one in Delaware to the Fort Pitt Bridge Works and the other in Ohio to the Mount Vernon Bridge Co.; an apartment house at 485 Park Avenue, 700 tons, to the Bethlehem Fabricators; 250 tons for a highway bridge over the Shark River, Monmouth County, N. J., to the Penn Bridge Co.; 700 tons for an apartment in Newark, to the Hay Foundry & Iron Works. 500 tons for the Intervale telephone exchange to Eiditz & Ross, and 1700 tons for two lofts, one on Thirty-seventh Street and the other on Thirty-eighth Street, to the Hinkle Iron Co.

We quote for mill shipments, New York, as follows: Soft steel bars, 1.75c. to 1.85c.; plates, 1.75c. to 1.85c.; structural shapes, 1.75c. to 1.85c.; bar iron, 1.75c. to 1.85c. On export shipments the freight rate is 28.5c. per 100 lb., instead of 38c., the domestic rate.

High Speed Steel.—The situation here is still unchanged. The reduced inventories reported from the automobile business provide some optimism as to future purchases, but on the whole there is no prospect of early return to active selling. Prices are weak, probably caused to a great extent by sales at reduced prices of overstocks of dealers and others. A fair estimate of the present market would be a nominal quotation of 80c. to 90c. per lb. for 18 per cent tungsten high speed steel with special brands of some companies still selling up to \$1.05 per lb.

Cast-Iron Pipe.—The market shows some slight activity and prices are firm. The municipal letting of 600 tons of 8-in. to 12-in. cast-iron pipe for the Department of Water Supply, Gas and Electricity, New York, was awarded to the United States Cast Iron Pipe & Foundry Co., at \$45.80 per ton. The optimism that has prevailed in this market during the past few weeks continues strong and further municipal purchases are expected soon. We quote per net ton, f.o.b. New York, carload lots, as follows: 6-in. and larger, \$47.30; 4-in. and 5-in., \$52.30; 3-in., \$62.30, with \$4 additional for Class A and gas pipe.

Warehouse Business.—There is no notable increase

in activity. While there is still a tendency on the part of some warehouses to look for a reduction in prices, both black and galvanized sheets, which have been rather weak lately, caused by offerings of small dealers, overstocked, have stiffened considerably, and 3.75c. per lb. on No. 28 gage black and 4.75c. per lb. on No. 28 gage galvanized are fairly representative of the market. Bars are not active, but there is some buying of structural material in the metropolitan district. The brass and copper market is unchanged, a slightly quieter tone prevailing. No change is reported by dealers in wrought iron and steel pipe. We quote prices on page 518.

Coke.—The coke market continues active on both beehive and by-product grades, the selling price of the former ranging from \$3.75 to \$4.50 and the latter selling at \$8.59 delivered at New Jersey points, this being on the basis of \$4.25 on Connellsville coke ovens and \$4.34 freight. Orders have been coming in so rapidly that some of the Connellsville producers have not been able to give as prompt delivery as usual. All the activity is attributed to the fear of a strike in the bituminous and anthracite regions April 1.

Old Material.—The market is quiet with no new contracts by mills reported. Heavy melting steel is off 50c., a quotation of \$7.50 to \$8 per ton being representative of the present market. The lower price now prevailing may have been caused partly by the reduction in the offering price of the Bethlehem Steel Co., which has reduced No. 1 heavy melting steel at Bethlehem to \$11 per ton and railroad steel to \$11.50. The recent purchase of heavy melting steel by the Cambria Steel Co. for Johnstown, Pa., also figured back to \$8 per ton. Machine shop turnings have been slightly more active and business has been transacted at a price nearer \$5 per ton than \$4.50. Stove plate shows an advance on actual purchases of about 25c., a fair range being \$10 to \$10.50 per ton.

Buying prices per gross ton, New York, follow:

Heavy melting steel, yard.	\$7.50 to \$8.00
Steel rails, short lengths, or equivalent	8.25 to 8.75
Re-rolling rails	9.25 to 9.75
Relaying rails, nominal	27.00 to 28.00
Steel car axles	10.00 to 10.50
Iron car axles	18.50 to 19.00
No. 1 railroad wrought	10.00 to 10.50
Wrought iron track	8.50 to 9.00
Forge fire	5.00 to 5.50
No. 1 yard wrought, long	9.00 to 9.50
Cast borings (clean)	7.00 to 7.50
Machine-shop turnings	4.50 to 5.00
Mixed borings and turnings	4.50 to 5.00
Iron and steel pipe (1 m. diam. not under 2 ft. long)	7.25 to 7.75
Stove plate	10.00 to 10.50
Locomotive grate bars	9.50 to 10.00
Malleable cast (railroad)	8.00 to 8.50
Cast-iron car wheels	10.50 to 11.00

Prices which dealers in New York and Brooklyn are quoted to local foundries, per gross ton, follow:

No. 1 machinery cast	\$16.50 to \$17.00
No. 1 heavy cast (columns, building materials, etc.), cupola size	15.50 to 16.00
No. 1 heavy cast, not cupola size	14.00 to 14.50
No. 2 cast (radiators, cast boilers, etc.)	10.00 to 10.50

Birmingham

BIRMINGHAM, ALA., Feb. 14.

Pig Iron.—Probably the largest iron business of several weeks was done in that ending last Saturday. One maker booked 2500 to 3000 tons, practically all of which was for prompt shipment and included lots ranging from carloads to 750 tons. The last named order came from the Pacific Coast and was on a \$16 base, which by reason of ocean rates out of Mobile, places the Alabama iron, delivered, under the base of foreign offerings. One concern shipped 1400 tons to the Pacific Coast in January following a like amount in December. The state of the Birmingham market may be judged from sales of 300 tons to a local consumer at \$15.50. The usual price for small lots is \$16. The Sloss-Sheffield company's entrance into river iron business this week is not experimental. It shipped Sheffield iron that way several years ago at a saving of freight rate and with dispatch in delivery. Beginning with an advantage of 40c. to 80c. rail rate over Birmingham, the fur-

ther advantage of transportation by river places Sheffield in that much stronger strategic position. Eastern consumers are again interested in Birmingham iron for delivery by rail and water. Negotiations for considerable tonnage are pending. The manner in which Alabama iron has again entered Northern markets is the outstanding feature of encouragement. The initial movement to metropolis is understood to consist of 1000 tons already contracted for. Barges will hold 300 tons apiece. The Woodward Iron Co. has not resumed at its banked stack, but continues operation of two. Stock showing is considered good. Stocks on Alabama yards Jan. 1 and Feb. 1 were as follows: Foundry, 74,000 and 82,000; machine cast, 35,000 and 46,000; warrants, 4800 and 800 basic, 37,000 and 27,000; total, 152,000 and 157,000. Increased steel production is reflected in decrease of basic iron stocks. Merchant iron holdings are practically confined to three interests. Active stacks are four on basic, six on merchant iron and two on charcoal iron.

We quote per gross ton f.o.b. Birmingham district furnaces as follows:

Foundry, sillon 1 1/2 to 2 1/2	\$15.00 to \$16.00
Basic	11.00 to 15.00
Charcoal, warm blast	32.00

Finishing Mills.—Tennessee company continued 75 to 80 per cent of ingot production this week and operation of all finishing mills except the structural and plate mills at Fairfield. The rail mill is on its second week of 8000-ton production. The American Steel & Wire Co. is at 50 to 60 per cent. The Gulf States Steel Co. is understood to be at about the same. Steel hoop and band mills have been idle for some time. Fabricating steel plants have received a fair business in steel for school buildings in the South.

Cast Iron Pipe.—High pressure pipe makers report improved business on books and are sanguine of the near future. The National Cast Iron Pipe Co. booked 1200 tons for St. Paul and is at 60 to 70 per cent. The rebuilt plant of the Agricola Pipe Co., Gadsden, has resumed. Sanitary pipe makers report the first strong inquiry following recent price reductions, and fairly good orders toward close of week. A turn for the better seems imminent. The high pressure base is \$33 and that of sanitary pipe is \$37. Cuba has placed small orders of sanitary pipe recently.

Coal and Coke.—Standard coke rules at \$5 to \$5.25. Market is stronger and sales embrace larger tonnage owing to increased foundry takings.

Old Material.—The scrap market remains featureless. Dealers are taking in little stock and very little is going out.

We quote per gross ton f.o.b. Birmingham district yard as follows:

Steel rails	\$11.00 to \$13.00
No. 1 steel	10.00 to 11.00
No. 1 cast	14.00 to 15.00
Car wheels	13.00 to 14.00
Tramcar wheels	12.00 to 13.00
No. 1 wrought	12.00 to 13.00
Stove plate	11.00 to 12.00
Cast iron borings	6.00 to 7.00
Machine shop turnings	6.00 to 7.00

Boston

BOSTON, Feb. 14.

Pig Iron.—Fresh weakness has developed in Buffalo and eastern Pennsylvania iron. The probable closing this week on 2000 tons of No. 2X iron by the Gurney Heater Co., Framingham, Mass., has brought out \$19, furnace, eastern Pennsylvania iron, with a possibility of that price being met by Buffalo interests, which would bring the Buffalo furnace price down to around \$17.50. Sales of Buffalo iron in this territory are reported this week at \$18, a new low for this movement, and others of No. 1X iron at \$18.50, furnace, by one interest heretofore holding at \$19. One eastern Pennsylvania furnace interest, heretofore quoting \$20 furnace base, this week sold 300 tons No. 2X at less than \$19.50. On the other hand a Massachusetts stove maker bought 200 tons eastern Pennsylvania No. 2X at \$20, furnace, and another melter in that State 100 tons No. 2X at \$20.50. Sales this week are about evenly divided between eastern Pennsylvania and Buffalo irons,

amounting in the aggregate to approximately 3000 tons. They include 500 tons No. 2X to a textile machinery interest, the largest individual transaction, 200 tons of malleable to a New Hampshire and 100 tons to a Massachusetts foundry at \$18.50, furnace, and car lots of special high manganese irons to Massachusetts melters at \$19.50 and \$20, furnace.

We quote delivered at common New England points as follows, having added to furnace prices: \$1.00 freight from eastern Pennsylvania, \$1.46 from Buffalo, \$0.58 from Virginia and \$1.00 from Andromeda.

East Penn. sd 2 1/2 to 2 3/4	\$23.00 to \$24.00
East Penn. sd 1 1/2 to 2 1/4	23.00 to 24.00
Buffalo, sd 2 1/2 to 2 3/4	23.16 to 23.96
Buffalo, sd 1 1/2 to 2 1/4	23.16 to 23.96
Virginia, sd 2 1/2 to 2 3/4	23.08 to 23.08
Virginia, sd 1 1/2 to 2 1/4	28.80 to 29.58
Alabama, sd 2 1/2 to 2 3/4	27.16
Alabama, sd 1 1/2 to 2 1/4	26.66

Finished Material.—Weakness in prices on structural steel has held up approximately 5000 tons that otherwise would have been closed last week. In the aggregate, some 18,000 tons of structural steel tonnage has strong possibility of developing in this territory within the next month or two. Mill representatives continue to report general order—running well ahead of bookings last month, but below normal. Business on bars, shapes and plates has been closed this week at 1.40c and 1.45c, Pittsburgh. The Bangor & Aroostook Railroad is about to close on 2000 tons of 80 lb. rails and 7100 standard angle joints. The Main Central Railroad is inquiring on 5000 tons of 85 lb. rails. Wire products continue in demand. The Acme Wire Co., New Haven, Conn., has an order for 150,000 coils of wire from the Ford Motor Co., sufficient to keep the plant operating at present capacity five weeks. The American Steel & Wire Co., Worcester, Mass., and other wire plants are not so active as they were last month. Warehouses in this territory report sheets and structural shapes more active than other lines, but bar, band and other small business continues to show slow expansion.

Jobbers now quote: soft steel bars, \$2.50, per 100 lb. bars, \$2.00, corner to bar, stock length, \$2.50, structural angles and beams, 3" x 3", plate, \$2.60, to \$2.85, line steel, \$3.85 to \$4.10, open hearth same steel, \$4.50, crucible spring steel, \$11.00, band, \$11.00, to \$11.30, hoop steel, \$3.10, cold rolled steel, \$3.10 to \$3.20, for cold steel, \$8, refined iron, \$2.50, per 100 lb. base, best refined iron, \$4.20, Wayne iron, \$5.00, Norway iron, \$4.00, No. 10 blue annealed sheet, \$3.18, per 100 lb. base, No. 28 black sheets, \$1.00, No. 28 galvanized sheets, \$1.00.

Coke. The movement of by-product foundry coke from the ovens is freer than it has been before in months, but business is not sufficiently large to warrant increased oven operations. Shipments are made on contract, mainly. Spot business is limited to a car here and there. Both the New England Coal & Coke Co. and the Providence Gas Co. continue to quote by-product foundry coke at \$10.15, delivered, where the local freight does not exceed \$3.40.

Old Material.—The market has been practically at a standstill the past week. Dealers characterize it as a "waiting" market. Pennsylvania mill are inquiring for little, if any, heavy melting steel, offerings by the Government evidently diverting attention from this market. The demand for borings and turnings has slumped since last reports, but prices hold firm. New England foundries, due to the low cost of pig iron, are using more of it and less machinery cast for mixing purposes, which has a tendency to minimize inquiries, according to large dealers. Small dealers, in many cases, are supplying foundries in their immediate neighborhood.

The following prices are for gross ton lots delivered at common points:

No. 1 machinery cast	\$18.00 to \$18.50
No. 2 machinery cast	16.00 to 16.50
Stove plate	15.00
Railroad malleable	13.00 to 14.00

The following prices are offered per gross ton lots f.o.b. Boston late shipping point:

No. 1 heavy melting steel	\$8.00 to \$9.00
No. 1 railroad wrought	10.00 to 11.00
No. 1 yard wrought	9.50 to 10.00
Wrought pipe (1-in. in diam. over 2 ft. long)	7.00 to 7.25
Machine shop turnings	4.00 to 4.50
Cast iron borings, rolling mill	7.00 to 8.00
Cast iron borings, chemical	5.00 to 6.00
Blas furnace boring and turnings	3.50 to 4.50
Forged scrap and bentched skeleton	1.50 to 5.00
Street car axles and shafting	10.00 to 11.00
Car wheels	11.50 to 12.00
Revolving rails	10.00 to 10.50

Philadelphia

PHILADELPHIA, Feb. 14.

The local iron and steel market continues without definite trend. In some lines there appears to be spotty improvement, but on the whole there has not been much change for the better. Prices are weak, almost every commodity except black and galvanized sheets being sold at concessions, and in sheets there is not enough demand of importance to bring out sharp competition.

Pig iron producers have been attempting to hold No. 2 plain at \$20, furnace, and No. 2X at \$20.50, but have not been successful in all instances, especially in territory where the competition of \$18 Buffalo iron has to be met. Concessions on foundry pig iron, however, are infrequent except where a furnace finds it necessary to absorb part of the freight rate in competition with producers having a freight rate advantage.

Pig Iron.—Inquiry for pig iron has dropped off. The local market has been exceedingly quiet in the past week. In the immediate Philadelphia territory there is little interest in foundry iron and inquiries and orders mostly range from a carload to 200 or 300 tons. Two lots of 1000 tons each were sold to pipe makers. One lot of 1000 tons was gray forge iron, which was sold at \$18.50, furnace. Producers of foundry iron are attempting to hold prices, but there are some concessions from the usual quotations of \$20 for No. 2 plain and \$20.50 for No. 2X. Such concessions are usually granted only when it is necessary for the furnace to absorb a part of a freight rate disadvantage in competing with \$18 Buffalo iron in New England and other territory lying between eastern Pennsylvania and Buffalo. Some eastern Pennsylvania producers have gone to \$19.50 for No. 2 plain and to \$20 for No. 2X. We note a sale of 200 tons of malleable iron at \$22.50, delivered. Buffalo malleable costs \$23.96, delivered in this district. Two or three inquiries for standard low phosphorus iron aggregate a few hundred tons, and sales have been made in the past week at \$30, furnace. There is no inquiry for basic iron.

The following quotations are, with the exception of those on low phosphorus iron, for delivery at Philadelphia, and include freight rates varying from 81 cents to \$1.51 per gross ton:

East. Pa. No. 2 plain 1 7/8 to 2 25 s	\$20.84 to \$21.26
East. Pa. No. 2X, 2 3/8 to 2 25 s	21.34 to 21.76
Virginia No. 2 plain, 1 7/8 to 2 25 s	27.24 to 27.74
Virginia No. 2X, 2 3/8 to 2 25 s	27.74 to 28.24
Basic delivery eastern Pa.	19.84
Gray forge	20.50 to 21.50
Malleable	22.50 to 21.00
Standard low phos. (f.o.b. furnace)	30.00
Upper bearing low phos. (f.o.b. furnace)	28.00

Ferroalloys.—British producers of ferromanganese have advanced prices for American shipment to \$62.50, Atlantic seaboard. The reason given is the higher exchange value for the pound sterling. Domestic producers have also advanced their prices to the same figure. An inquiry for 2000 tons of spiegeleisen comes from Belgium, but exporters have little expectation of the business being placed here. Asking prices for spiegeleisen range from \$25 to \$26, furnace.

Billets.—There is little demand for semi-finished steel. Open-hearth rerolling billets are obtainable at \$28 to \$29, Pittsburgh, and forging billets at \$32 to \$33, Pittsburgh.

Rails.—It is expected that the Chesapeake & Ohio Railroad will place orders shortly for 26,000 tons of heavy rails, of which 4000 tons is for the Hocking Valley Railroad.

Plates.—A slight improvement in the volume of plate business is noted by some Eastern mills, but the situation as a whole is still far from healthy. Prices are weak, 1.40c., Pittsburgh, now being generally recognized as the market on attractive lots. Mills are able to obtain 1.45c. and 1.50c., Pittsburgh, only on small lots. An Eastern shipbuilding company, which is bidding on a riveted steel pipe project, is inquiring for 2500 tons of plates for the job. The Philadelphia & Reading Railroad was expected to place orders to-day for 800 tons of tank steel for car repairs. The same road has placed orders for 2000 freight cars and 50 steel passenger coaches, requiring about 25,000 tons of steel. The

passenger cars will be built by the Harlan plant of the Bethlehem Steel Co. at Wilmington, Del., while the passenger cars were divided as follows: Standard Steel Car Co., 500; Pressed Steel Car Co., 500; American Car & Foundry Co., 500, and Cambria Steel Co., 500.

Structural Material.—As soon as a site for the proposed sesqui-centennial World's Fair, to be held in Philadelphia in 1926, shall have been selected, it is expected that two or three hotel projects, which have been informally discussed, will go ahead. Bids will be opened next week on the Philadelphia public library, which will require about 3000 tons of steel. Fabricators are figuring building projects on the basis of 1.40c., Pittsburgh, for plain material.

Bars.—Bar iron is now obtainable at 1.40c., Pittsburgh, from Eastern mills. Steel bars are to be had at the same figure. Business is limited to small orders, but a somewhat better demand for concrete reinforcing bars is expected as soon as spring building work gets under way.

Sheets.—While there is little demand for black and galvanized sheets and therefore little test of prices, it is noted that quotations of 3c. on black and 4c. on galvanized are holding more firmly than are prices on other steel products. Blue annealed sheets are firm at 2.25c., Pittsburgh, except that some plate mills are offering Nos. 10, 11 and 12 gages on the plate basis, with usual extras. The tin plate market appears to have settled to \$4.60 per 100 lb. base box, with occasional lots selling at \$4.50.

Strip Steel.—Quotations on hot rolled strip steel have gone as low as 1.75c., Pittsburgh, though some mills are asking all the way up to 2c. Cold-rolled strip steel is quoted at 3.50c., Pittsburgh, by most makers, but there are occasional deviations in the way of cancelling extras.

Warehouse Business.—A moderate improvement in the volume of buying out of stock is reported. Prices are unchanged and for local delivery are as follows:

Soft steel bars and small shapes, 2.50c.; iron bars (except bands), 2.50c.; round edge iron, 2.50c.; round edge steel, iron finish, 1 1/2 x 1/2 in., 2.95c.; round edge steel planished, 3.70c.; tank steel plates, 3/4-in. and heavier, 2.75c.; tank steel plates, 3/16-in., 2.925c.; blue annealed steel sheets, No. 10 gage, 3.50c.; light black sheets, No. 28 gage, 4c.; galvanized sheets, No. 28 gage, 5c.; square twisted and deformed steel bars, 2.65c.; structural shapes, 2.60c.; diamond pattern plates, 3/4-in., 4.60c.; 3/16-in., 4.785c.; 1/4-in., 4.90c.; spring steel, 4.10c.; round cold-rolled steel, 3.25c.; squares and hexagons, cold-rolled steel, 3.75c.; steel hoops, No. 13 gage and lighter, 3.25c.; steel bands, No. 12 gage to 3/16-in., inclusive, 3.10c.; iron bands, 3.90c.; rails, 2.75c.; tool steel, 8c.; Norway iron, 5c.; toe steel, 4.50c.

Old Material.—There have been no developments of interest in the scrap market within the past week and prices are substantially unchanged. We quote for delivery at consuming points in this district as follows:

No. 1 heavy melting steel	\$12.00 to \$12.50
Scrap rail	12.00 to 12.50
Steel rails, rerolling	15.00 to 15.50
No. 1 low phos., heavy 0.01 and under	18.00 to 19.00
Cast iron car wheels	15.00 to 15.50
No. 1 railroad wrought	14.50 to 15.00
No. 1 yard wrought	12.00 to 12.50
No. 1 forge fire	10.00 to 10.50
Bundled sheets (for steel works)	9.50 to 10.00
No. 1 busheling	11.00 to 12.00
No. 2 busheling	9.00 to 10.00
Turnings (short shoveling grade for blast furnace use)	9.50 to 10.00
Mixed borings and turnings (for blast furnace use)	9.50 to 10.00
Machine-shop turnings (for rolling mill and steel works use)	9.50 to 10.00
Heavy axle turnings (or equivalent)	9.50 to 10.00
Cast borings (for steel works and rolling mills)	12.00 to 12.50
Cast borings (for chemical plants)	13.50 to 14.00
No. 1 cast	16.50 to 17.00
Railroad grade bars	14.00 to 14.50
Stove plate (for steel plant use)	14.00 to 14.50
Railroad malleable	12.50 to 13.50
Wrought iron and soft steel pipes and tubes (new specifications)	12.00 to 12.50
Iron car axles	No market
Steel car axles	17.00 to 18.50

The Electric Controller & Mfg. Co., Cleveland, has received an order for complete electric control equipment for the new plant of the International Nickel Co. at Huntington, W. Va. The order covers 46 pieces of equipment.

St. Louis

St. Louis, Feb. 14.

Pig Iron.—The employment of barge service in the movement of Southern pig iron at a saving of \$1.50 under the all rail rate is interesting to the melters in this district. The barge service will be effective tomorrow. The iron will be moved via the Tennessee River to Metropolis, Ill., thence by rail to St. Louis. Under this arrangement, iron will be delivered at St. Louis at \$19.44 or \$13.70, Birmingham. Shipment will be made from Sheffield, which has a differential of 80c. under the Birmingham freight rate. On the basis of \$16, Birmingham, iron shipped all rail from that point is delivered in St. Louis at \$21.74. With Northern iron at \$18.50, Chicago, plus \$2.80 freight, the St. Louis price is \$21.30, giving the Southern product shipped water and rail an advantage on the present market of \$1.86 a ton. The capacity of these barges is about 400 tons. The first purchaser in St. Louis of a barge load of pig iron for the new service was Bridge & Beach Mfg. Co., manufacturer of stoves. The biggest order of the week, if not for the year, of Northern iron was made by a local melter, being 2000 tons of foundry grade for shipment over March and April. The volume of orders for carloads was fairly large, and these invariably were for immediate shipment. The consumption of iron is a bit stronger, but most melters are content to buy only for their immediate needs. More stove foundries are starting up. The Belleville stove plants have adjusted the wage differences with their men, and they are expected to resume operations soon. An Illinois radiator concern is in the market for 500 tons of foundry iron for March shipment. A northern Illinois steam specialty company wants 200 tons. An Indiana engine boiler concern has an inquiry out for 500 to 1000 tons. Foundries specializing in railroad castings are hopeful that the proposed new plan of financing the lines will result in a better demand from that source.

We quote delivered consumers' yards, St. Louis, as follows, having added to furnace prices \$2.88 freight and war tax from Chicago and \$5.91 from Birmingham:

Northern foundry, all, 1.75 to 2.25	\$21.30
Northern malleable, all 1.75 to 2.25	21.30
Basic	21.30
Southern foundry, all rail, all 1.75 to 2.25	21.11
Southern foundry, all 1.75 to 2.25, rail and water	19.11

Finished Iron and Steel.—The demand for finished iron and steel products is rather light. Railroads centering here are not getting out any inquiries, and there is very little doing in structurals here, pending a readjustment of the wage scale. Jobbers report a little better demand, but they are not stocking up, and are depending upon the manufacturers to do that for them. A manager of sales stationed here has just returned from a trip to the jobbing centers of Tennessee, Louisiana and Arkansas, finding the jobbers buying only goods that they actually must have. They are not fearful of the market, but they feel that there is no necessity to carry large stocks so long as prompt shipments can be had from manufacturers. The awarding of the contract for the Jewish Hospital, Memphis, involving 300 tons of reinforcing bars, for which the James Alexander Construction Co. was the low bidder, has been held up for several weeks. The Kansas City, Clay County & St. Joseph Railway, Kansas City, has an inquiry out for 100 tons of 70-lb. steel rails, and the East St. Louis & Suburban Railway, East St. Louis, Ill., want 100 tons of the same weight rails. A manufacturer of engines bought 10 crankshafts, involving about 30 tons. The Union Pacific Railroad has issued notices of an indefinite postponement of the buying of 25 observation and 50 passenger cars on which they had asked prices.

For stock out of warehouse we quote: Soft steel bars, 2.62½c. per lb.; iron bars, 2.62½c.; structural shapes, 2.72½c.; tank plates, 2.72½c.; No. 10 blue annealed sheets, 3.47½c.; No. 28 black sheets, cold rolled, one pass, 4.15c.; cold drawn rounds, shafting and screw stock, 3.65c.; structural rivets, \$3.52½ per 100 lb.; boiler rivets, \$3.62½; tank rivets 7/16 in. and smaller, 65 and 5 per cent off list; machine bolts, large, 60-10 per cent; small, 60, 10 and 10 per cent; carriage bolts, large, 55-5 per cent; small, 60 and 10 per cent; lag screws, 65-15 per cent; hot pressed nuts, square or hexagon blank, \$4; and tapped, \$3.75 off list.

Coke.—There is more buying of coke in this district, and the situation looks much better than it has. Con-

sumers are drawing more heavily on supplies contracted for, and generally more interest is being shown. For the present most of the business is confined to carload orders, and these are for immediate shipment. Between 1000 and 1500 tons of Granite City by-product water gas and furnace coke were booked last week as well as 300 to 400 tons of foundry coke. A cause of increasing interest in coke is the talk of coal miners' strikes. The movement of domestic coke has been far more liberal because of colder weather.

Old Material.—The market for old material remains dull and listless, and there is very little trading of any description even among dealers. Consumers refrain from making any purchases even at what appears to be bargain prices and intimate that until their reserve stocks have been heavily depleted they will remain out of the market. Current railroad offerings include: Great Northern, 7500 tons; Northern Pacific, 2000 tons; Pullman Co., 1000 tons, and Kansas City Terminals 500 tons.

We quote dealer prices for consumers' works, St. Louis industrial district and dealers' yards as follows:

Per Gross Ton	
Old iron rails	\$14.00 to \$14.50
Steel rails, retolling	10.00 to 11.00
Steel rails, less than 2 ft.	12.50 to 13.00
15-lb. rails, standard section	23.00 to 28.00
Cast iron car wheels	13.50 to 14.00
No. 1 heavy railroad rolling steel	10.00 to 10.50
No. 1 heavy shoveling steel	9.75 to 10.00
Ordinary shoveling steel	9.50 to 10.00
Forge, switch and guards, cut apart	10.00 to 10.50
Ordinary bundle sheet	1.00 to 1.50
Cast steel bolsters	9.50 to 10.00

Per Net Ton	
Heavy axles and tire turning	6.00 to 6.50
Iron angle bars	13.00 to 13.50
Steel angle bars	9.00 to 9.50
Iron car axles	18.00 to 18.50
Steel car axles	13.00 to 13.50
Wrought iron arch bars and trapezoids	1.00 to 1.50
No. 1 railroad wrought	9.50 to 10.00
No. 2 railroad wrought	8.50 to 9.00
Railroad springs	10.00 to 10.50
Steel couplers and knuckles	9.00 to 10.50
Locomotive tires, 17 in. and over, smooth inside	8.00 to 8.50
No. 1 dealers forge	8.00 to 8.50
Cast iron borings	5.50 to 6.00
No. 1 bushings	8.50 to 9.00
No. 1 boilers cut in sheets and tubes	6.00 to 6.50
No. 1 railroad cast	12.00 to 12.50
Stove plate and light cast	11.00 to 11.50
Railroad malleable	8.50 to 9.00
Agricultural malleable	9.00 to 9.50
Pipes and flues	7.50 to 8.00
Heavy railroad sheet and tank	7.50 to 8.00
Light railroad sheet	3.50 to 4.00
Railroad grate bars	9.50 to 10.00
Machine shop turnings	3.00 to 3.50
Country mixed iron	6.00 to 6.50
Unheat railroad mixed	7.00 to 7.50
Horse shoes	9.50 to 10.00
Railroad brake shoes	9.50 to 10.00

Buffalo

BUFFALO, Feb. 14.

Pig Iron.—With radiator interests having contracted for their wants for February and March and possibly well into April, this market has settled into a condition where small business is the rule and none of this extends beyond second quarter delivery. It is generally understood the American Radiator Co. has bought between 25,000 and 35,000 tons from a Buffalo furnace and that \$18 base was the price. No inquiry was sent out on this purchase and verification of the details is not available from either the furnace or the purchaser. Carload lot purchases are freely closed at \$18.50 and \$19, and a furnace which has consistently quoted \$19.50 is not getting any business in consequence. Other than carload lot business the only inquiry out is one for 500 tons of No. 2X for a buyer in New York State outside Buffalo. Buffalo iron is quoted at \$18.50 in any quantity desired. The status of the New York vehicular project is unchanged insofar as Buffalo furnaces are concerned and quotations are made for delivery to the end of June only.

We quote f.o.b. per gross ton Buffalo as follows:

No. 1 foundry, 2.75 to 3.25 sil	\$19.50 to \$20.00
No. 2X foundry, 2.25 to 2.75 sil	19.00 to 19.50
No. 2 plain, 1.75 to 2.25 sil	18.50 to 19.00
Basic	18.00 to 18.25
Malleable	19.50
Lake Superior charcoal	31.75

Finished Iron and Steel.—In the volume of business placed the general situation compares with December, which was unusually quiet. January business held up

surprisingly well when tonnages were finally reckoned. Carload lots and less represent the size of tonnages in demand. With the exception of sheets, prices are irregular, but in the exception noted prices have held up and 3c. is generally quoted. The Lackawanna Bridge Co. will erect two bridges in Tonawanda, N. Y., the total requirements being 300 tons. The same interest has also contracted for a skating rink in Princeton, N. J., requiring 150 tons. Inquiries are out for 500 tons of shapes for use in erecting a school building in Corning, N. Y., and a new bank building at Niagara Falls, N. Y., involving 100 tons.

We quote warehouse prices for Buffalo as follows: Structural shapes, 2 1/2 c.; plates, 2 1/2 c.; No. 8 gage, 2 3/4 c.; soft steel bars and shapes, 2 3/4 c.; hoops and bands, 2 1/2 c.; blue annealed sheet, No. 10 to 3 1/2 c.; galvanized sheet, No. 10 to 3 1/2 c.; flat, No. 28, 1 1/2 c.; cold-rolled strip steel, 2 1/2 c.; cold-rolled round, halfing, 3 1/2 c.

Old Material.—Several lots of 1000 tons and a number of lesser tonnages of heavy melting steel have been bought by a mill interest at \$13.50. The demand for turnings and borings from the Youngstown and Pittsburgh districts continues to appear here, but production is a light that little of this business will be placed with Buffalo dealers. A number of foundries interested in the New York vehicular tunnel project are inquiring for cast scrap, but Buffalo dealers quoting \$16 to \$17 on this material have not interested these prospective buyers, who can buy pig iron in the same market for \$18.50 or less.

We quote market average prices per gross ton for Buffalo as follows:

Heavy melting steel	\$12.00 to \$14.00
Low alloy, bent and bent	17.00 to 18.00
No. 1 cold-rolled wrought	15.00 to 16.00
Car wheel	16.50 to 17.50
Machine iron turnings	7.50 to 8.00
Cast iron turnings	7.00 to 8.00
Heavy axle turnings	10.50 to 11.50
Grate bars	12.00 to 13.00
No. 1 machine	10.00 to 11.00
Stove plate	15.00 to 16.00
Rough sheet, turnings	8.00 to 9.00
No. 1 machine, cast	17.00 to 18.00
Hydraulic compressed	10.50 to 11.50
Patented materials	13.00 to 14.00

Fred J. Waldow, salesman, Rogers, Brown & Co.; Justus Egbert, purchasing agent American Radiator Co., and William J. McClain, district sales agent Republic Iron & Steel Co., announce the formation of a partnership to engage in sales of pig iron, coal, coke, alloys and steel products. The new firm will do a brokerage business.

Cleveland

CLEVELAND, Feb. 14.

Iron Ore.—In the opinion of ore men, some blast furnace interests are looking for greater reductions in ore prices than are likely to be made. Some consumers have been talking of a cut of \$1 or more a ton from last season's prices. The mine operators point out that while labor costs have been reduced, their other mining costs are as high as last year. The largest items of cost in mine operations, outside of labor, are for lumber and coal. Many mining companies, because of curtailment of operations, carried over large stocks of coal last year, so that they are not getting the benefit of lower coal prices. Whatever reductions are made on ore prices will depend largely on what changes are made in transportation charges. Prospects do not seem bright for a reduction in rail rates during the coming ore carrying season, but a 10 per cent cut in the vessel rate on ore is expected. While a large share of the underground mines are now operating in the Lake Superior district, this is not because sellers need the ore, but only to furnish work for the men. Ore stock piles are already unusually large.

We quote delivered lower lake ports: Old range Bessemer, 55 per cent iron, \$6.45; Old range non-Bessemer, 51 1/2 per cent iron, \$5.70; Mesabi Bessemer, 55 per cent iron, \$6.20; Mesabi non-Bessemer, 51 1/2 per cent iron, \$5.55.

Pig Iron.—Furnaces booked a fair number of orders for foundry iron during the week, but in most cases the tonnage involved was small, the largest lots being 300 to 400 tons. One lake furnace sold 4000 tons including three lots of malleable iron aggregating 400

tons. Prices continue to show a weakness on sales to competitive points. One lake furnace is quoting No. 2 foundry iron down to \$18.50 for shipment to points where it must meet competition, but is asking \$19 to \$19.50 for iron for nearby delivery. However, it seems probable that \$18.50 could be shaded. In fact, one sale in the Indiana territory is reported at \$18.25. Present prices on Southern iron have reached a level where they are becoming a factor in competition for shipment to some central and southern Ohio points and probably have some bearing on the weakness of Northern iron. The Detroit, Toledo & Ironton Railroad has announced a 53c. per ton rate reduction on pig iron from Toledo, effective Feb. 20, making the rate to Springfield \$2.13 as compared to \$2.02 from the Ironton district. The Standard Sanitary Mfg. Co. has received quotations on 2000 tons or more of Southern iron for February and March shipment to its Louisville plant and is expected to close for this business to-day. A quotation of \$15.50 has been made on this iron. This company is also understood to be in the market for a round lot of Northern foundry iron for early shipment.

Quotations below are f.o.b. local furnace for Northern foundry iron, not including a 56c. switching charge. Other quotations are delivered Cleveland, being based on a \$1.96 freight rate from Valley points, a \$3.36 rate from Jackson and a \$6.67 rate from Birmingham:

Basic	\$19.71
Northern No. 2 fdy, sil. 1.75 to 2.25	\$19.00 to 20.00
Southern fdy, sil. 1.75 to 2.25	22.17
Old silvery, sil. 8 per cent	22.86
Standard low phosph, Valley furnace	22.00

Semi-Finished Steel.—The demand shows an improvement. A Cleveland mill has placed 800 tons of sheet bars with a Youngstown mill at \$29, and another inquiry for 500 tons is pending. A Cleveland consumer has placed 150 tons of forging billets.

Finished Material.—The improvement in the demand noted last week continues. While few large orders are being placed, mills are getting a moderate volume of business from various industries and reports indicate that manufacturing plants are getting busier. Automobile manufacturers are buying a little more freely. An order from an Ohio automobile plant was for 750 tons of bars. Several small lots of steel were placed by agricultural implement manufacturers. Little change is noted in the price situation. Steel bars, plates and structural material are quoted at 1.40c., Pittsburgh, for desirable orders, with car lot sales being made in many cases at 1.50c. On boiler plates a 1.40c. price has appeared and an Eastern mill that has been quoting these at 1.60c. has reduced its price to 1.50c. for desirable orders. The demand for hot-rolled strip steel has improved and some makers of this steel now have a fair order book. The Trumbull Steel Co. has advanced its price on hot-rolled strip steel to 2c. An automobile parts manufacturer is considering his requirements for the year for the manufacture of tubing which may result in the placing of 9000 tons of strip steel or skelp. The structural outlook continues to improve. Some building projects that were held up last year are being revived and with the approach of spring considerable school building work is coming up in Ohio. An inquiry for approximately 900 tons for the sintering plant for the McKinney Steel Co. plant has come out. Bids have been taken for a municipal power plant in Lansing, Mich., requiring 1500 tons. A building for the Ohio Wesleyan University, Delaware, will require 300 tons. Bids for a Y. M. C. A. building, Columbus, requiring 500 tons, have been rejected and new bids will be taken. A reservoir in Detroit will require 1500 tons of reinforcing bars. Hard steel bars are still quoted at 1.40c., but a round lot inquiry would probably bring out a lower price because of the competition of soft steel bars. The Cleveland Railway Co. is inquiring for 1000 tons of rails.

Jobbers quote steel bars, 2.36c.; plates and structural shapes, 2.46c.; No. 9 galvanized wire, 3.25c.; No. 9 annealed wire, 2.75c.; No. 28 black sheets, 3.75c.; No. 28 galvanized sheets, 4.75c.; No. 10 blue annealed sheets, 3.10c.; hoops and bands, 2.96c.; cold-rolled rounds, 3.25c.; flats, squares and hexagons, 3.75c.

Sheets.—The demand shows a little improvement, but few orders are coming out for more than car lots. The Ford Motor Co. has divided an order for 1500 tons of frame and crank case stock between three mills. Regular prices appear to be holding well.

Bolts and Nuts.—The demand for bolts and nuts shows improvement, but consumers are buying only in small lots. The minimum discounts have virtually disappeared on machine and carriage bolts, but local makers claim they are not shading prices that have been quoted recently as maximum discounts. Prices on machine bolts, cold-punched chamfered and trimmed nuts are lower. Rivets are still in light demand. Local makers are adhering to regular prices, although these are being shaded by some makers \$1 to \$2 a ton.

Alloy Steel.—The demand for alloy steel has improved, some good orders having come from the automotive industry. The United Alloy Steel Corporation, Canton, which is operating five open-hearth furnaces is planning to start additional furnaces. The Central Steel Co., Massillon, has started two additional open hearth furnaces, now operating six of its nine furnaces. Alloy steel prices are fairly firm. Makers quote 3½ per cent nickel steel at 5c.; chrome nickel steel 4c., and chrome vanadium steel 5c. for bars and 4.75c. per lb. for spring steel.

Old Material.—The market is dull and inclined to weakness. The only local activity reported is the purchase of a few small lots of heavy melting steel by a Cleveland consumer at \$13 delivered. In the absence of activity, prices on blast furnace scrap which were recently advanced have declined 25c. a ton. The buying that was expected from the Youngstown district steel plants during February has as yet failed to materialize. There is little demand except for blast furnace scrap. Transactions between local dealers were few during the week as they are well cleaned up on old orders.

We quote per gross ton, Feb. Cleveland, as follows:

Heavy melting steel	\$12.00 to \$12.50
Steel rails, under 3 ft.	12.50 to 13.00
Steel rails, rerolling	11.00 to 11.50
Iron rails	11.00 to 12.50
Iron car axles	18.00 to 19.00
Low phosphorus melting	13.00 to 13.50
Cast borings	9.00 to 9.25
Machine shop turnings	9.00 to 9.25
Mixed borings and short turnings	9.00 to 9.25
Compressed steel	9.00 to 9.50
Railroad wrought	12.00 to 12.50
Railroad malleable	12.50 to 13.00
Light bundled sheet stampings	6.00 to 7.00
Steel axle turnings	9.50 to 10.00
No. 1 cast	15.00 to 16.00
No. 1 bushing	8.75 to 9.00
Drop forge flashings, over 10 in.	9.00
Drop forge flashings, under 10 in.	7.50 to 8.00
Railroad grate bars	12.75 to 13.00
Stove plate	13.00 to 13.25
Pipes and flues	8.50 to 9.00

Interest in Basing Point at Cleveland

The Cleveland Chamber of Commerce has appointed a special committee of seven members on basing points for steel and this committee will at once become very active in investigating the subject, although it has not yet outlined its plan of procedure. The Milwaukee hearing before the Federal Trade Commission on the Pittsburgh basing point practice and the recent complaints of some Cleveland manufacturers against using a Pittsburgh base have tendered to stimulate interest in the subject in Cleveland. Fred L. Borton is chairman of the committee and F. H. Baer, chairman of the Traffic Committee of the Chamber of Commerce, is secretary.

The Youngstown Pressed Steel Co., Warren, Ohio, closely allied with the Sharon Steel Hoop Co., Sharon, Pa., is enlarging its capacity for the production of metal lath, installing additional machinery. With its new layout, manual labor will be reduced to a minimum, various steps in the manufacturing processes being carried forward mechanically.

The Federated American Engineers, including the American Society of Mechanical Engineers and the American Institute of Mining and Metallurgical Engineers, Boston, are to maintain a volunteer employment committee. This committee will endeavor to relieve the unemployment problem among their professions in and about Boston.

Cincinnati

CINCINNATI, Feb. 14.

Pig Iron.—The market was quiet again last week although some sales of Southern iron were reported outside the immediate Cincinnati district. A radiator company is reported to have purchased 1500 tons of Southern iron at \$16 furnace, and a sanitary manufacturing company in Indiana took 500 tons of Southern iron at \$16 furnace base. The delivered price on this iron, which will be shipped by river and rail, is understood to be about \$2 a ton less than if the iron were shipped by the all rail route. An Indiana manufacturer is understood to have purchased 300 tons of 3.75 to 4.25 silicon at a price of \$18.50 Northern furnace. Several other sales of 100 tons each are reported, mostly of Southern iron at a \$15.50 base. The Standard Sanitary Mfg. Co. has an inquiry out for 1500 tons for its Louisville plant and will likely close the deal to-day. It is said that \$15.50 is the lowest price quoted on this inquiry. Other inquiries include one for 400 tons from Anderson, Ind.; one from Mansfield for 100 tons and one of 200 tons from Ft. Wayne. Prices are inclined to be weaker. It is said Chicago iron can now be purchased at \$18 furnace, and Lake iron from \$18 to \$18.50 regardless of silicon content. Southern Ohio furnaces have reduced their prices 50c. a ton and now are quoting \$19 to \$19.50, Ironton. Jackson county furnaces have cut prices on silvery and bessemer ferro-silicon \$2 a ton, effective Feb. 13. This makes 8 per cent silvery, \$27.50 furnace.

Back on track, rate of \$1.00 from Birmingham and

Southern Ohio, silvery, 3.75 to 4.25	21.25 to 22.00
(No. 2)	21.00
Basic, Northern	21.00
Malleable	20.00 to 20.50

Finished Material. An order for 1000 tons of plates is reported to have been placed by a tank manufacturer in this district, who recently secured an order for a large tank to be erected in California. Several 200 ton orders for structural shapes are also reported, but as a general thing inquiries are confined to carload lots and most of the business booked is being done on a single carload basis. There is still a fair demand for concrete reinforcing bars, as a number of small projects taking up to 100 tons are going ahead. The demand for sheets is reported to be picking up slightly, but there is no disposition on the part of buyers to contract ahead, the orders placed being for immediate shipment. Fairly good demand for wire products is reported. Prices on all finished products are ruling about the same as last week, 1.40c. now being the general quotation on bars, shapes and plates, although there is some disposition on the part of a few mills to hold out for 1.50c. Very little is heard of lower prices on sheets and it is said that 2.75c. and 3.75c. for black and galvanized respectively exist only in the imagination of some buyers, all of the orders now being placed are on the 3c. and 4c. base. In the structural field, the only new inquiry to come out was for the Athletic Club at Indianapolis involving between 1500 and 2000 tons. Bids will close on March 1 and it is expected that bids will also be taken on the Wilde Bank Building in the same city at the same time. Plans for this building, however, have not been sent out. The National Cash Register Co. has let the general contract for new buildings at Dayton to the H. K. Ferguson Co. at Cleveland; 250 tons of steel will be used. It is reported that the Belknap Hardware job at Louisville will be up again shortly for bids as some changes are being made in the plans. An auditorium at Memphis will also likely be refigured in the near future. Pending projects include a ten-story building to the Rollman department store in Cincinnati, an office building for the Southern Railroad in the same city and hotel building at Frankfort, Ky. The first two of these will be probably of reinforced concrete construction and the latter of steel. The Big Four Railroad closed bids on its axle requirements for the first quarter. The Standard Forge Co. was low

bidder, car axles being quoted at 2.05c. per lb., engine truck axles at 2.40c. per lb. and drivers and trailers at 3.40c. per lb., f.o.b. Chicago. In regard to plant operations, the East Side works of the American Rolling Mill Co. is running full time and the Newport Rolling Mill Co. has four mills on. The steel and sheet mills of the Ashland Iron & Mining Co. are closed down at the present time, but will likely reopen in two weeks.

Warehouse Business. Local jobbers report business as quiet during the past week. Some orders for wire products, however, are being booked for spring delivery. Local jobbers have at the price on wire nails to \$2.95 per keg base. All other prices are unchanged.

Base shapes and sizes, 10 lb. hoops and bands, 3 3/8c. base, cold rolled, 10 lb. under 1 1/2 in. flat, 10 lb. blue annealed sheet, 24 galvanized sheet, No. 5 annealed wire, \$2.95 per keg b.

Coke. Some fair-sized orders for prompt shipment coke are reported, two of these being for 600 tons each. The coke market is firming up slightly and some operators have withdrawn prices for nearby shipment. Prices, however, are generally as quoted in last week's report.

Old Material. The scrap market is quotably weaker and while it is expected that steel companies operating in this district will shortly be in the market for small tonnages, present business is very quiet. Most dealers have marked down their prices on practically all items 50c. per ton. The Norfolk and Western railway is offering 6000 tons.

We quote dealers' buying f.o.b.

	Per Gross Ton	
Bundled sheets	\$3.50 to \$4.00	
Iron rails	11.50 to 12.00	
Relaying rails, 50 lb. and up	24.50 to 25.00	
Retrolling steel rails	10.00 to 10.50	
Heavy melting steel	8.50 to 9.00	
Steel rails for melting	8.50 to 9.00	
Car wheels	11.50 to 12.50	
	Per Net Ton	
No. 1 railroad wrought	8.00 to 8.50	
Cast borings	3.00 to 3.50	
Steel turnings	2.00 to 2.50	
Railroad cast	11.50 to 12.00	
No. 1 machinery	13.00 to 13.50	
Burnt scrap	7.00 to 7.50	
Iron axles	15.00 to 15.50	
Locomotive tires (smooth inside)	9.00 to 9.50	
Pipes and flues	3.50 to 4.00	

Rogers, Brown & Co. pig iron and coke merchants have been appointed sole agents for the sale of Tuscaloosa and Warrior pig iron produced at Holt, Ala. The furnace company reserves the right of making sales direct to buyers in Alabama and the adjoining States. All other business will be handled through Rogers, Brown & Co. Tuscaloosa is one of the old popular brands of Southern, high in manganese and low in phosphorus. The Warrior brand is a high manganese specialty.

San Francisco

SAN FRANCISCO, Feb. 8.

Pig Iron.—The dull condition prevailing at the first of the year has not yet been relieved on the Coast. In the San Francisco market, business has been especially trivial during the past 10 days or two weeks, practically no sales of any significance having been reported, although routine buying in small lots is not wanting. Again the Southern Pacific Co. affords the major interest, this road just having closed for 400 tons of 1.75 to 2.25 silicon, 250 tons of 2.25 to 2.75 and 100 tons of standard Bessemer. It is reported that large users have just taken 500 tons of No. 1 foreign iron at Tacoma and 500 tons at San Pedro, the price being very favorable. There are liberal offerings of material here at present, and some large dealers report working on a considerable tonnage of domestic iron, which is approximately on the same basis as foreign. Quotations around \$28 are heard on American pig, for Gulf shipment, delivered here. The foreign iron market appears to be firming, with the strengthening of exchange rates and a tendency of freight rates to advance. In the absence of demand and actual sales, it is difficult to estimate the market accurately.

but prices asked appear to range from about \$27 to \$30 for good grades, ex ship, San Francisco.

Cast Iron Pipe.—Since the moderately good activity of several weeks ago, business in pipe has been quieter, both from municipal and private sources. The market is ruling around \$32 base, with the tendency toward higher levels. The 2000 tons for Portland was recently awarded to the United States Cast Iron Pipe & Foundry Co. Bids which the city of Seattle received for 2143 tons have been rejected, and it is reported it will readvertise about the end of the present month. Glendale, Cal., is asking for bids on Feb. 9 for 300 tons of 4-in. pipe, and San Bernardino the following day for 77 tons. Santa Barbara on Feb. 11 will be in the market for 30 tons.

Finished Iron and Steel.—It is a dull situation which is to be reported in this district, about the only feature being a moderate demand in small quantities for mixed materials. Prices seem to be holding pretty well, but there is no assurance of stability, except as at present, when demand is virtually absent. The larger producers are looking for a betterment in the following two or three months, but nothing large is foreseen at this time. There is fair prospect for building operations around San Francisco, which will mean a fair demand for bars. Seattle is reported inquiring in this market for 1000 tons of low range section girder rails. The Southern California Edison Co.'s contract for from 1100 to 1200 tons of hammered welded pipe was reported awarded to an Eastern fabricator.

Coke.—A steady consumption of coke in this district is reported, the main demand coming from smelters, since foundry operations are on such a narrow, hand-to-mouth basis. A considerable quantity of English material is loading and some is en route. Stocks in consumers' hands here generally are low.

Old Material.—Buying has been active in scrap of late, but this does not indicate a revival of foundry operations. A large quantity of railroad accumulation was disposed of at the prevailing market of \$10 a gross ton for heavy melting steel, delivered at the consumer's mill. Around 12,000 tons was taken by various interests. Most users, accordingly, are heavily stocked with scrap at present. Moreover, about 6000 tons of steel and cast scrap will be offered from the old cruiser Brooklyn, which is to be dismantled. The Pacific Coast Steel Co. will start up its open-hearth furnace March 1, which has been idle since last June. This is necessitated by the accumulation of ingots being exhausted.

British Pig Iron and Steel Output for January

LONDON, ENGLAND, Feb. 14 (By Cable).

The production of pig iron in Great Britain in January was 288,000 gross tons and that of steel ingots and castings 327,500 tons. These compare with an output of 275,000 tons of pig iron and of 381,000 tons of steel in December. The January pig iron is the largest since last March. The steel output is the lowest in six months.

The United States Malleable Iron Co., Toledo, Ohio, is reported to have received a large number of orders for malleable castings which will permit it to increase its present operating force during February from 150 to 650 men. It will also resume operations in its Wauseon, Ohio, plant with a force of about 175 employees.

There are now 95 Bailly electric furnaces for melting non-ferrous metals and alloys and 34 Bailly electric heat-treating furnaces operating in the United States and Canada, according to the January issue of *Electric Furnace News*, published by the Electric Furnace Co., Salem, Ohio.

The National Safety Congress held annually under the auspices of the National Safety Council, the headquarters of which are in Chicago, will meet in Detroit the week beginning Aug. 28. The Safety Council of Detroit Board of Commerce has started to make preparations and a large attendance is expected.

British Iron and Steel Market

**Steel Consumers Awaiting Price Concessions —
Tin Plate Makers Expect Lower
Steel—Coke Is Higher**

(By Cable)

LONDON, ENGLAND, Feb. 14.

PIG iron sales are increasing and traders are now more confident of the commencement of a genuine revival. Practically all production of Cleveland iron is going into consumption. Hematite is firmer; makers are well booked up and there is a fair demand from the Continent.

Best Bilbao Rubio is sold up to 26½s. (\$5.78) ex-ship Tees, an advance of 1s. (22c.) over last week.

Continental inquiries are coming in for foundry coke. Durham blast furnace coke is dearer.

India is inquiring for 15,000 tons of steel plates, delivery to be distributed over two years. The steel business generally is quieter; consumers are still awaiting price reductions.

Finished iron is cheaper. Crown iron bars are offered at £11 (2.14c. per lb.) f.o.b. Staffordshire. Marked bars are held at £14 10s. (2.82c. per lb.).

Continental quotations are slightly harder. French merchant bars are held at £8 15s. (1.70c. per lb.) f.o.b., for April and May delivery. Luxemburg merchant bars are offered at £8 to £8 5s. (1.56 to 1.61c. per lb.) for April and May shipment. Luxemburg structural shapes are quoted at £7 10s. to £7 15s. (1.46 to 1.51c. per lb.) f.o.b., for April and May delivery.

Belgian wire rods are held at £9 to £9 15s. (\$39.24 to \$42.51) f.o.b., April and May shipment. French wire rods are offered at £9 10s. (\$41.42) f.o.b., for May and June delivery. German 3/16-in. plates are quoted at £7 15s. (1.51c. per lb.) f.o.b. for June and July shipment.

Continental foundry iron is offered at £5 5s. (\$22.89).

Tin plate is weaker. Makers are selling in anticipation of a reduction in steel prices. Stock 14 x 20 in. are being sold at 18½s. (\$4.03) f.o.b., for February and March shipment; 250,000 boxes of oil sizes have been placed in Wales at 18¾s. (\$4.09 basis, f.o.b.).

Galvanized sheets are being sold to Argentina at £16 5s. (3.16c. per lb.) f.o.b., in cases. Australia has bought some small lines at £15 15s. (3.07c. per lb.) f.o.b. Japan 67's are being sold at £23 (4.48c. per lb.) f.o.b.

India has bought black sheets at £12 15s. (2.48c. per lb.) f.o.b., basis 24 gage. France is paying £12 10s. to £13 (2.13 to 2.53c. per lb.) f.o.b. Japan 33's for galvanizing have been sold at £15 15s. to £16 (3.07 to 3.11c. per lb.) f.o.b.

We quote per gross ton, except where otherwise stated, f.o.b. maker's works, with American equivalent figured at \$1.36 per £1 as follows.

Durham coke delivered	11 8s	\$6 10
Cleveland No. 1 foundry	4 1½	20 71
Cleveland No. 2 foundry	4 10	19 62
Cleveland No. 4 foundry	4 7½	19 07
Cleveland No. 1 forge	4 10	19 62
Cleveland basic	4 10	19 62
Hematite	4 0*	30 5*
East Coast mixed	3 12½ to 4 1½	20 16 to 20 71
Portuguese	15 0 & 11 10*	65 40 & 63 22*
Rails, 60 lb. and up	8 0 to 9 10	31 88 to 31 42
Billets	7 0 to 7 10	30 52 to 32 70
Sheet and tin plate bars		
Welsh	7 0 to 7 7½	31 61 to 32 15
Tin plates, base box	0 18½ to 0 19	1 03 to 1 14
		(¹ per lb.)
Ship plates	9 0 to 10 10	1 75 to 2 04
Boiler plates	11 10 to 14 0	3 13 to 2 72
Tees	9 10 to 11 0	1 85 to 2 14
Channels	8 1½ to 10 5	1 70 to 1 99
Beams	8 5 to 10 0	1 61 to 1 90
Round bars, ¾ to 3 in.	10 10	2 04
Galvanized sheets, 24 g.	15 12½ to 16 0	3 01 to 3 11
Black sheets	12 10 to 13 0	2 13 to 2 53
Steel hoops	12 0 & 12 0*	2 34 & 2 38*
Cold rolled steel strip, 20 g.	23 10	4 57

*Export price

MODERATE IMPROVEMENT

Youngstown Mills Report Better Buying, Especially of Lighter Lines

YOUNGSTOWN, Feb. 14.—Moderate improvement in buying of steel products, principally affecting the lighter lines, is noted. The Ford Motor Co. and Dodge Brothers are entering the market for larger sheet requirements, against broadened production schedules. Actual buying of sheets, however, is still restricted.

Valley furnace interests are attempting to hold to an \$18 minimum on standard basic pig iron, despite the sale of a 1000-ton lot at \$17.75 by a Valley interest. One of the larger independents appraises the market at \$18 to \$18.25, depending upon size of the order and other special considerations. Aside from the regular buying by non-integrated interests, there is comparatively little activity in the iron market.

Wire products, particularly nails, are moving with more freedom, jobbers being important factors in the market. Such schedules show some pickup over previous weeks. The principal district independent states it is adhering to quotations of 2.25c. on plain wire and \$2.50 per base keg on nails, though concessions to large buyers are reported. Buying of nails has been stimulated by seasonal requirements.

Reports of Concessions on Sheets

Valley sheet makers are still following up reports of concession prices in sheets, and say that while quotations have been shaded elsewhere, they are holding firm in this district. In fact, one buying interest, which did considerable shopping to uncover a concession on a moderate tonnage, states that the market in the Valley is tight, and there appears to be a firm disposition on the part of producers to hold prices.

Placement of sheet business is confined to 25, 50 and 100-ton lots in the main. All interests are hopeful, however, that the month will bring out tonnage in sufficient volume to appreciably accelerate production.

Despite the fact that buying in finished lines, with possible exception of tin plate, lacks sustaining influence, railroads report that shipments of steel products from Valley mills are expanding. During the first six days of February, the Ohio region of the Erie Railroad handled 4456 loaded cars per day, as compared with an average daily movement in January of 3843 cars and 3371 cars per day in February, 1921.

The Franklin division of the New York Central System, handling tonnage from the Valleys, reports that it is moving 200 more cars per day than last year's average at this time. Shipments are running to pipe, tin plate, sheets and coke oven by-products.

Inquiry for 1700 Tons of Sheets

An inquiry for a mixed lot of blue annealed, black and galvanized sheets involving 1700 tons, put forth by the Ford company, has made its appearance in this district.

Plate makers at Youngstown will benefit through a fabricating-in-transit rate on steel plates shipped to Sharon, Pa., fabricators, chiefly builders of steel cars and tanks. When this rate is finally approved, Youngstown plate interests will be enabled to ship their product to Sharon plants for working into cars and tanks at a rate based on the through rates from Youngstown to points of delivery for the completed product.

This will enable makers at Youngstown to compete on a more favorable basis with important plate interests in the East, which have heretofore enjoyed a rate advantage in this respect. Youngstown producers have been virtually shut out of the Sharon and Masury markets for some time by reason of this inequality.

* Refinery, 100% pure.

New York

NEW YORK, Feb. 14.

All the markets except lead are exceedingly inactive. Demand for copper does not improve and that for tin is brisk one day and lacking the next. Demand for lead continues steady and so do prices. Buying of zinc has not improved but quotations are stationary. Yesterday, Feb. 13, the markets were all closed in observance of Lincoln's birthday.

Copper.—Conditions which prevailed in this market in July, August and September have reappeared, in that there is a marked tendency on the part of dealers and speculators, as well as small producers, to liquidate their stocks. In some cases this has been necessary by the 10th of the month and in other cases before the end of the month, and has resulted in the offering of the market down until quotations have gradually declined again in the past week. Electrolytic copper for February-March delivery is quoted as low as 13.25c., delivered, or 13c., refinery. The amount available is not large but is apparently sufficient to meet the small buying power. Large producers, although they have somewhat modified their minimum selling prices, will not meet these low quotations and it is difficult to buy from those sources at less than 13.50c., delivered.

Tin.—With the exception of one day the market for Straits tin has been dull and uninteresting. On Friday, Feb. 10, however, consumers were buyers, and sales, estimated up to 600 tons and mostly future shipment, are reported to have been made. Following the holiday yesterday the market was quiet to-day and spot Straits tin was quoted at 30.75c., New York, quotations having declined gradually almost daily in the last week. London prices were also lower to-day by nearly £4 per ton than a week ago, with spot standard quoted at £152, future standard at £153 15s. and spot Straits at £154 10s. Arrivals thus far this month have been 1600 tons, with 8060 tons reported afloat.

Lead.—Demand and production continue to flow in the steady stream which has characterized this market for so many weeks. As a consequence there has been no reason to elevate or depress prices. The leading interest continues to quote 4.70c., New York and St. Louis, and the outside market continues unchanged at 4.40c., St. Louis, or 4.70c. to 4.75c., New York and Eastern points, all for early or 30-day delivery.

Zinc.—There has been no change in the market for prime Western zinc either for the better or for the worse and quotations remain fairly firm at 4.50c., St. Louis, or 4.85c., New York, for early delivery. This price was slightly shaded on one or two days last week, but otherwise the market is steady and demand is still confined to small lots for early delivery. Interest continues keen in the possibility of exports to England, opinion in some quarters being optimistic and in others to the contrary.

Antimony.—The market is quiet and wholesale lots for early delivery are quoted at 4.40c., New York, duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent pure, in wholesale lots for early delivery, is quoted at 19c. to 19.10c. per lb., f.o.b. plant, depending on the quantity, by the leading producer and importations of the same grade are quoted at 17c. to 18c., New York, duty paid.

Old Metals.—The market continues very sluggish with a little easing off of prices. Dealers' selling prices are as follows:

	Cents Per Lb.
Copper, heavy and crucible	13.00
Copper, heavy and wire	12.00
Copper, light and bottoms	9.00
Heavy machine composition	10.00
Brass, heavy	7.50
Brass, light	5.75
No. 1 red brass or composition turnings	8.00
No. 1 yellow red brass turnings	6.00
Lead, heavy	4.25
Lead, tea	3.25
Zinc	3.00

Chicago

FEB. 14.—In a quiet market tin and spelter have declined. The weakness in tin is accounted for by the large tonnage hanging over the market which has been held for over a year by the Federated Malay States and the Dutch Government respectively, their joint holdings being estimated at 14,000 tons. Naturally the trade is beginning to wonder when this unsold tonnage will be forced on the market. We quote in carload lots: Lake copper, 13.50c.; tin, 32.50c. to 33c.; lead, 4.50c.; spelter, 4.55c. to 4.60c.; antimony, 6.50c., in less than carload lots. On old metals we quote: Copper wire, crucible shapes and copper clips, 9.50c.; copper bottoms, 7.50c.; red brass, 7.50c.; yellow brass, 6c.; lead pipe, 3.25c.; zinc, 2c.; pewter, No. 1, 22c.; tin foil, 23c.; block tin, 25c.; all buying prices for less than carload lots.

St. Louis

FEB. 14.—Lead and zinc are unchanged. We quote lead, car lots, at 4.35c. to 4.40c.; slab zinc, 4.52½c. to 4.65c. On old material we quote: Light brass, 3.50c.; heavy yellow brass and light copper, 7c.; heavy copper and copper wire, 7.50c.; pewter, 15c.; tin foil, 16c.; tea lead, 2c.; aluminum, 9c.

Manganiferous Iron Ores Leaflets

An interesting leaflet on manganiferous iron ores has been published by Clement K. Quinn & Co., miners and shippers of iron ores, Duluth and Cleveland. Four definite assertions as to the effect of manganese in the blast furnace and open-hearth furnace are made as follows:

- (1) High manganese iron is a help rather than a hindrance in blast furnace practice.
- (2) High manganese iron improves the quality of open-hearth steel without reduction of tonnage or practice or other injurious effects.
- (3) High manganese iron is of a very great assistance in meeting the demands for the better grades of steels, alloy steels, etc.
- (4) Due to better surface conditions steel made from high manganese iron shows increased yields with ordinary rolling mill practice.

It is also urged that increasingly high sulphur fuels are making it more difficult for steel manufacturers to meet sulphur requirements and specifications without additional cost and it is urged that manganese is the answer. Various other benefits to be derived from the use of manganese are given.

The engineering association of the school of Liege, Belgium, will conduct a scientific congress on June 11 to 16 on the occasion of the seventy-fifth anniversary of the foundation of the school. The congress will comprise seven sections; mines, metallurgy, mechanical engineering, electricity, chemical industries, civil engineering and geology. The secretary-general of the association is O. Lepersonne, 16 Quai des Etats-Unis, Liege, Belgium. Circulars are available covering the questions which will be taken up by each section.

Herbert DuPuy, formerly chairman, Crucible Steel Company of America, on Feb. 10, filed a second suit against the company, claiming \$117,487.50 as the amount due him under a deferred compensation and bonus plan.

Prices Finished Iron and Steel, f.o.b. Pittsburgh

Freight Rates

Freight rates from Pittsburgh on finished iron and steel products, in carload lots, to points named, per 100 lb., are as follows:

Philadelphia, domestic.....	\$0.26	Kansas City.....	\$0.81
Philadelphia, export.....	0.26	Kansas City (pipe).....	0.77
Baltimore, domestic.....	0.35	St. Paul.....	0.66
Baltimore, export.....	0.25	Omaha.....	0.81
New York, domestic.....	0.38	Omaha (pipe).....	0.77
New York, export.....	0.38	Denver.....	1.33
Boston, domestic.....	0.105	Denver (wire products).....	1.11
Boston, export.....	0.38	Pacific Coast.....	1.65
Buffalo.....	0.29	Pacific Coast ship plates.....	1.33
Cleveland.....	0.24	Birmingham.....	0.76
Detroit.....	0.32	Jacksonville, all rail.....	0.53
Cincinnati.....	0.32	Jacksonville, rail and water.....	0.16
Indianapolis.....	0.31	New Orleans.....	0.51
Chicago.....	0.38		
St. Louis.....	0.47		

The minimum carload to most of the foregoing points is 36,000 lb. To Denver the minimum loading is 10,000 lb., while to the Pacific Coast on all iron and steel products, except structural material, the minimum is 30,000 lb. On the latter item the rate applies to a minimum of 30,000 lb., and there is an extra charge of 9c per 100 lb. on carloads of a minimum of 40,000 lb. On shipments of wrought iron and steel pipe to Kansas City, St. Paul, Omaha and Denver the minimum carload is 46,000 lb. On iron and steel items not noted above the rates vary somewhat and are given in detail in the regular railroad tariffs.

Rates from Atlantic Coast ports (i.e., New York, Philadelphia and Baltimore) to Pacific Coast ports of call on most steamship lines, via the Panama Canal, are as follows: Pig iron, 50c.; ship plates, 75c.; pigot and muck bars, structural steel, common wire products, including cut or wire nails, spikes and wire hoops, 75c.; sheets and tin plates, 60c. to 75c.; rods, wire rope, cable and strands, \$1. wire fencing, netting and stretcher, 75c.; pipe, not over 8 in. in diameter, 75c.; over 8 in. in diameter, 25c. per in. or fraction thereof additional. All prices per 100 lb. in carload lots, minimum 40,000 lb.

Structural Material

I-beams, 3 to 15 in.; channels, 3 to 15 in.; angles, 3 to 6 in., on one or both legs, 1/4 in. thick and over, and zebs, structural sizes, 1.40c. to 1.50c.

Sheared plates, 1/4 in. and heavier, tank quality, 1.10c. to 1.50c.

Wire Products

Wire nails, \$2.10 to \$2.50 base per keg, galvanized, 1 in. and longer, including large-head barbed roofing nails, taking an advance over this price of \$1.25 and shorter than 1 in., \$1.75, bright Bessemer and basic wire, \$2.15 to \$2.25, per 100 lb.; annealed fence wire, Nos. 6 to 9, \$2.15 to \$2.25, galvanized wire, \$2.65 to \$2.75; galvanized barbed wire, \$3.00 to \$3.15, galvanized fence staples, \$3.00 to \$3.15, painted barbed wire, \$2.55 to \$2.65, polished fence staples, \$2.55 to \$2.65, cement-coated nails, per count keg, \$1.30 to \$2.00; these prices being subject to the usual advances for the smaller trade, all f.o.b. Pittsburgh, freight added to point of delivery, terms 60 days, net, less 2 per cent off for cash in 10 days. Discounts on woven-wire fencing are 70 1/2 per cent off list for carload lots, 69 1/2 per cent for 1000-rod lots, and 68 1/2 per cent for small lots, f.o.b. Pittsburgh.

Bolts and Nuts

Machine bolts, small, rolled threads, 70, 10 and 10 per cent off list
Machine bolts, small, cut threads, 70 and 10 per cent off list
Machine bolts, larger and longer, 70 and 10 per cent off list
Carriage bolts, 3/4 in. x 6 in.:

Smaller and shorter rolled threads, 70 and 10 per cent off list
Cut threads, 70 per cent off list
Longer and larger sizes, 70 per cent off list
Lap bolts, 70, 10 and 10 per cent off list
Pilot bolts, Nos. 1, 2 and 3 heads, 60 and 10 per cent off list
Other style heads, 20 per cent extra

Machine bolts, c.p.c. and t. nuts, 3/4 in. x 4 in.:

Smaller and shorter, 65, 10 and 5 per cent off list
Larger and longer sizes, 65 and 10 per cent off list
Hot pressed sq. or hex. blank nuts, \$5.50 off list
Hot pressed nuts, tapped, \$5.25 off list
C.p.c. and t. sq. or hex. blank nuts, \$5.25 off list
C.p.c. and t. sq. or hex. blank nuts, tapped, \$5.00 off list
Semi-finished hex. nuts:

1/4 in. to 9/16 in. inclusive, 80, 10 and 10 per cent off list
Small sizes S. A. F., 80, 10 and 10 per cent off list
3/4 in. to 1 in. inclusive, U. S. S. and S. A. F., 70, 10, 10 and 10 per cent off list

Stove bolts in packages, 80, 10 and 5 per cent off list
Stove bolts in bulk, 80, 10 and 7 1/2 per cent off list
Tire bolts, 65, 10 and 10 per cent off list
Track bolts, carloads, 3c. to 3.25c. base
Track bolts, less than carloads, 4c. to 4.25c.

Upset and Hex. Head Cap Screws

1/4 in. and under, 80 and 10 to 80, 10 and 10 per cent off list
9/16 in. to 1 in. 80 and 10 to 80, 10 and 10 per cent off list

Upset Set Screws

1/4 in. and under, 80, 10 and 5 to 85 per cent off list
9/16 in. to 1 in. 80, 10 and 5 to 85 per cent off list

Milled Square and Hex. Cap Screws

All sizes, 75 and 10 to 80 per cent off list

Milled Set Screws

All sizes, 70, 10 and 10 per cent off list

Rivets

Large structural and ship rivets, \$2.25
Large boiler rivets, 2.35
Small rivets, 10, 10 and 10 to 10, 10, 10 and 5 per cent off list

Wire Rods

No. 5 common basic or Bessemer rods to domestic consumers, \$26 to \$31, chain rods, \$36 to \$37, screw stock rods, \$41 to \$42, rivet and bolt rods and other rods of that character, \$36 to \$47, high carbon rods, \$43 to \$49, depending on carbons.

Railroad Spikes and Track Bolts

Railroad spikes, 9 1/2 in. and longer, \$2.15 to \$2.20 base per 100 lb. in lots of 200 kg. of 60 lb. each or more; spikes, 1 1/2 in., 3 1/2 in. and 1 1/2 in., \$2.20 to \$2.30 base, 3 1/2 in., \$2.25 to \$2.30 base. Bolt and track spikes, \$2.20 to \$2.30 base per 100 lb. in carload lots of 200 kg. or more, f.o.b. Pittsburgh. Track bolts, 3/4 to 1 1/2 in. base per 100 lb. The plates, \$2 per 100 lb. Angle bars, \$1.70 per 100 lb.

Terne Plates

Prices of terne plates are as follows, 8-lb. coating, 200 lb. \$9.30 per package, 8-lb. coating, 1 c., \$9.60; 15-lb. coating, 1 c., \$11.80; 20-lb. coating, 1 c., \$12; 25-lb. coating, 1 c., \$14.25; 30-lb. coating, 1 c., \$15.25; 35-lb. coating, 1 c., \$16.25; 40-lb. coating, 1 c., \$17 1/2 per package, all f.o.b. Pittsburgh, freight added to point of delivery.

Iron and Steel Bars

Steel bars, 1 in. to 4 in. diam. and 1/2 in. to 2 in. square, 2c. to 2 1/2c.

Welded Pipe

The following discounts are to jobbers for carload lots on the Pittsburgh basis card.

Butt Weld			Iron		
Inches	Steel	Galv.	Inches	Black	Galv.
1 1/2	51 1/2	28	1 1/2	3 1/2	+22 1/2
1 1/2 to 3/8	60	33 1/2	1 1/2	3 1/2	18 1/2
3/8	61	34 1/2	1 1/2	4 1/2	27 1/2
3/8 to 1	60	36 1/2	1 1/2 to 1 1/2	4 1/2	29 1/2
1 to 3	71	58 1/2			
			Lap Weld		
1 1/2	61	51 1/2	2 1/2	29 1/2	25 1/2
1 1/2 to 6	68	55 1/2	2 1/2 to 6	42 1/2	29 1/2
6 to 8	65	51 1/2	7 to 12	40 1/2	27 1/2
8 to 12	61	50 1/2			
Butt Weld, extra strong, plain ends			Lap Weld, extra strong, plain ends		
1 1/2	50 1/2	33	2 1/2	40 1/2	27 1/2
1 1/2 to 3/8	56	38 1/2	2 1/2 to 4	43 1/2	31 1/2
3/8	62	60 1/2	4 1/2 to 6	42 1/2	30 1/2
3/8 to 1	67	55 1/2	7 to 8	39 1/2	23 1/2
1 to 1 1/2	69	57 1/2	9 to 12	30 1/2	18 1/2
2 to 3	70	58 1/2			

To the large jobbing trade the above discounts are increased by one point, with supplementary discounts of 5 and 2 1/2 per cent.

Boiler Tubes

The following are the discounts for carload lots f.o.b. Pittsburgh:

Lap Welded Steel		Charcoal Iron	
1 1/2 in.	26 1/2	1 1/2 in.	5
2 to 2 1/2 in.	41	1 1/2 to 1 3/4 in.	15
2 1/2 to 3 in.	52	2 to 2 1/4 in.	25
3 1/4 to 13 in.	57	2 1/2 to 3 in.	30
		3 1/4 to 4 1/4 in.	32

To large buyers of steel tubes a supplementary discount of 5 per cent is allowed.

Standard Commercial Seamless Boiler Tubes

New discounts have been adopted on standard commercial seamless boiler tubes, but manufacturers are not yet ready to announce them for publication, and for that reason we publish no discounts this week.

Sheets

Prices for mill shipments on sheets of standard gage in carloads, f.o.b. Pittsburgh, follow:

Blue Annealed		Box Annealed, One Pass Cold Rolled	
Cents per Lb.		Cents per Lb.	
Nos. 8 and heavier.....	2.20	Nos. 11 and 12.....	2.30

PERSONAL

William J. Morris, for many years assistant treasurer Youngstown Sheet & Tube Co., Youngstown, Ohio, has been elected treasurer, succeeding Richard Garlick, resigned because of ill health. Mr. Garlick had been treasurer virtually since the formation of the company in 1900. He continues on the board of directors. For the past few years Mr. Morris has been practically acting treasurer. Walter E. Meub, secretary of the company and assistant to President James A. Campbell, was elected assistant treasurer. Mr. Garlick is now in the south with his family.

L. A. Lenhart, vice president and general manager Youngstown Steel Car Co., Niles, Ohio, was added to the board of directors at the annual stockholders' meeting, Feb. 7. Other directors are: James A. Campbell, A. E. Adams, George F. Alderdice, R. E. Cornelius, U. C. DeFord, L. B. McKelvey, Porter Pollock, William Wilkoff, D. J. Wilkoff and L. C. Wilkoff.

Robert A. McDonald, for a number of years manager, Crescent Works, Crucible Steel Company of America, Pittsburgh, has been promoted to the position of general superintendent of all plants of the company, with headquarters in New York.

Charles Russ Richards, dean of the College of Engineering and director of the Experimental Engineering Department at the University of Illinois, has been elected president of Lehigh University, Bethlehem, Pa. Mr. Richards succeeds Dr. Henry S. Drinker, who retired more than a year ago to become president emeritus. Mr. Richards was born in Clarksville, Ind., March 23, 1871. He received his bachelor's degree in mechanical engineering from Purdue University in 1890 and the following year his master's degree, continuing his post-graduate studies at Cornell University. For several years he was instructor of mechanical engineering at Colorado Agricultural College, in later years becoming associate dean of the Industrial College in charge of all engineering. In 1907 he was chosen dean of the College of Engineering. In 1909 he went to the University of Nebraska and in 1917 to University of Illinois.

Col. James Milliken has been elected president of the Pittsburgh Testing Laboratory, Pittsburgh, succeeding George H. Clapp, who remains with the organization as a member of the board of directors. Colonel Milliken, during the war, was assistant to S. M. Felton, of the Railroad Administration, and was active in the designing, construction and shipment of railroad equipment to France.

Bradley Stoughton, formerly secretary of the American Institute of Mining and Metallurgical Engineers, was elected president of the Yale Engineering Association at the annual meeting on Feb. 2.

Albert H. Whipple, superintendent of the Whitin Machine Works, Whitinsville, Mass., recently received a 50-year service pin from the company. Mr. Whipple entered the employ of the Whitin company in January, 1872, as an apprentice and has had an unbroken service record ever since.

Louis F. Vonier, Milwaukee, who resigned recently as sales engineer Federal Bridge & Structural Co., Waukesha, Wis., has been appointed district representative for Wisconsin of the National Pressed Steel Division, Central Steel Co., Massillon, Ohio, and has established headquarters at 412 Matthews Building, Milwaukee.

Frederick K. Vial, chief engineer Griffin Wheel Co., Chicago, and consulting engineer for the Association of Manufacturers of Chilled Car Wheels, will represent the last named organization at the convention of the International Railway Association at Milan, Italy, April 18 to 30. This will be the first meeting of the International Association to be held since 1910. This body

ordinarily convenes every five years, but the last meeting, which was scheduled to take place at Berlin in 1915, was abandoned for obvious reasons.

Herman A. Zannoth, Detroit, connected with the Cadillac Motor Car Co. of that city for the past nineteen years, has been appointed plant manager of the company's new works on Clark Avenue.

F. N. Arbaugh, of Lansing, Mich., has been elected president of the Auto Body Co., of Lansing, one of the largest companies of its kind in the Middle West.

Albert U. Widman has been made manager of manufacturing for the Cadillac Motor Car Co., Detroit, succeeding George H. Layng, resigned.

The American Spring & Mfg. Corporation, Holly, Mich., has elected C. J. Lane president. Other officers are: vice president, R. D. Tobin; secretary, treasurer and general manager, E. A. Hartz.

James F. Finneran, secretary and treasurer Northway Motors Corporation, Boston, has resigned. William W. Caswell takes his place. James F. Cavanagh has resigned as president to become chairman of the board of directors. Ralph E. Northway, formerly vice-president, has been made president and general manager.

F. M. Germane has been elected a director and vice-president of the Gilliam Mfg. Co., Canton, Ohio, and will have charge of the sales of the company's line of taper bearings. He was for many years associated with the former Standard Roller Bearing Co., Philadelphia.

D. W. Pratt of the Philadelphia office, the United States Cast Iron Pipe & Foundry Co., has been appointed sales agent in Kansas City territory at an office just established at 604 Interstate Building, Kansas City, Mo.

H. H. Hines has been appointed Toronto agent for the Consolidated Steel Corporation, succeeding Allan Hills, who has resigned.

Business in Refractories Restricted

PITTSBURGH, Feb. 13.—Purchases of refractories still are of a size sufficient only to meet actual requirements of buyers. There is absolutely no disposition on the part of the iron and steel industry to stock up at present and, indeed, there are numerous instances where the order is considerably smaller than the known needs of the purchaser. Fire clay brick seems to be finding a better sale than silica brick. No important change in prices is noted. Occasional instances come to light of Pennsylvania makers of fire clay brick going as low as \$30 per 1000, f.o.b. works, on high duty brick, and the claim is made by buyers that they have had quotations of \$28 per 1000, f.o.b. works, on Pennsylvania silica brick. These prices are about \$2 per 1000 below the general market quotation and in the case of fire clay brick it was stated that there being no close observance of standard specifications, some makers might offer as high duty grade, brick not coming quite up to standard.

We quote per 1000 f.o.b. works:

Fire Clay	High Duty	Moderate Duty
Pennsylvania	\$32.00 to \$35.00	\$30.00 to \$32.00
Ohio	30.00 to 35.00	28.00 to 30.00
Kentucky	32.00 to 35.00	30.00 to 32.00
Illinois	32.00 to 35.00	30.00 to 32.00
Missouri	32.00 to 35.00	28.00 to 32.00
Silica Brick:		
Pennsylvania		30.00
Chicago		35.00 to 37.00
Birmingham		40.00
Magnesite Brick:		
Standard size, per net ton (f.o.b. Baltimore)		53.00
Chrome Brick:		
Standard size, per net ton		41.00 to 43.00

The Coxe Traveling Grate Co., Port Carbon, Pa., resumed operations on full time on Monday. The plant employs 200 men, who have been idle for about one month.

OBITUARY

GEORGE A. OHL, veteran machinery manufacturer, died at his home in East Orange, N. J., Feb. 8, in his eighty-fifth year. He retired from business activities in 1892 when he turned the business over to his son, George A. Ohl, Jr. Up to that time, he had taken out 52 patents on machinery of his own invention. He was born in Germany May 18, 1837, and came to this country when 15 years of age. He found employment in a locomotive works in Trenton and was also employed by the Newark Machine Co. and the Hewes & Phillips machine shops, Newark, N. J. Later he organized George A. Ohl & Co., of which his son, George A., Jr., is president and treasurer. His energies were devoted largely to making sheet metal machinery.

GEORGE W. BLAKE, president Buckeye Aluminum Co., Wooster, Ohio, died Feb. 6, following an operation for appendicitis, aged 36 years.

RICHARD HENRY RICE, manager Lynn Works General Electric Co., Lynn, Mass., died suddenly Feb. 10, at Bolton, Lake George, N. Y., where he had gone two days previously to recuperate from the shock of the sudden death of his son in Montreal. Mr. Rice was born in Rockland, Me., Jan. 9, 1863. His early education was obtained in that town. He graduated at the Stevens Technical School, Hoboken, N. J., as engineer, following which he was engaged in western railroad work and ship construction, latterly at Bath, Me. From Bath, Mr. Rice went to Providence, R. I., with the Providence Machine Works and subsequently became a member of the engineering firm of Rice & Sargent, that city. In 1903, he became associated with the turbine department, General Electric Co., Lynn, and in 1918 was made manager of the Lynn Works.

WILLIAM C. SARGENT, secretary Chain Belt Co., Milwaukee, died suddenly on Feb. 5 from heart trouble, at the age of 73 years. He was born in Troy, N. Y., and went to St. Paul, Minn., as a youth, entering the farm implement industry. In 1900 he, with the late C. W. LeValley, left St. Paul to go to Milwaukee, where they founded the Chain Belt Co.

WALTER READ, president and treasurer Filer & Stowell, Co., Milwaukee, died Feb. 10 after a brief illness with heart trouble. He was 66 years of age and resided in Milwaukee 59 years. He became associated with the Filer & Stowell Co., 45 years ago as an apprentice and afterward, with Thomas J. Neacy, became the principal owner.

CLARENCE J. CURBY, 39 years old, vice-president and general manager of the Smith & Davis Mfg. Co., manufacturer of iron bedsteads, St. Louis, was found dead in a room on the third floor of his home. It was believed that he was accidentally shot while cleaning an automatic pistol or a high-power rifle. Mr. Curby began work with the Smith & Davis Mfg. Co. as a boy of 18, gradually rising to an executive position upon the death in 1912 of his father, Clarence Edgar Curby, who was secretary and a heavy stockholder in the company.

BARTHOLOMEW TOOMEY, superintendent of the rolling mills of the American Car & Foundry Co., Detroit, died in that city, Jan. 29, at the age of 76.

ALBERT LEE BALDWIN, production manager and member of the board of directors, the Detroit Steel Products Co., Detroit, died at his home in that city on Jan. 30, following three weeks illness with pneumonia.

JOHN H. STREETER, secretary and treasurer Riverside Iron Works, Chicago, died on Jan. 26.

GEORGE W. PECK, manager of Miner & Peck Mfg. Co., Derby, Conn., manufacturer of drop presses, died Feb. 2.

WALTER D. OSBORNE, president of C. S. Osborne & Co., Harrison, N. J., manufacturer of tools, died Feb. 1, at Winter Park, Fla., where he had gone for his health. His death resulted from apoplexy. He was 65 years of age, and is survived by his wife and son.

WILLIAM S. FAIRHURST, proprietor of the American

Compressed Air Works, Brooklyn, died Feb. 3 at the Hahnemann Hospital, as the result of an operation.

ALBERT LEE BALDWIN, production manager and member of the board of directors of the Detroit Steel Products Co., of Detroit, died recently after a three weeks' illness. Mr. Baldwin joined the company in 1911 as an order clerk, and was advanced to a directorship in January, 1920. When the Fenestra Construction Co. was organized as a subsidiary of the Detroit Steel Products Co., he was made secretary.

E. R. ARMSTRONG, proprietor Wil-on Stove & Mfg. Co., Easton, Pa., was killed in an automobile accident, as was also Mrs. Armstrong, at a grade crossing near Miami, Fla., Thursday, Feb. 2.

Plant Operations in the Mahoning Valley

YOUNGSTOWN, Feb. 14.—Owing to accumulation of iron, the Sharon Steel Hoop Co., Sharon, Pa., has blown out its Mary blast furnace at Lowellville, Mahoning county, leaving 17 of 47 stacks active in the Mahoning and Shenango Valleys. This suspension eliminates a stack using beehive coke.

Production of the lighter steel products is holding up in the Youngstown district. In the Mahoning Valley, 33 of 51 independent open hearth furnaces are charged, while sheet mill capacity was scheduled at the beginning of the week at about 45 per cent, as compared with 39 per cent the previous week.

On the other hand, pipe production is sagging, eight of 17 pipe furnaces being fired. The Youngstown Sheet & Tube Co. has six tube mills in operation and the Republic Iron & Steel Co., three.

Blast furnace operation in the Mahoning Valley is being carried forward as follows—Carnegie Steel Co., 5; Sheet & Tube Co., 2; Brier Hill Steel Co., Republic Iron & Steel Co., A. M. Byers and Trumbull-Cliffs Furnace Co., one each.

The Republic company is operating its plate mill on skelp for pipe.

The Newton Steel Co., which has been running its 10-mill sheet plant at Newton Falls steadily for some time, has booked a sizable order for full finished sheets, placed by an automobile manufacturer.

Large Judgments Granted

Judgments aggregating \$721,580 were granted the Pittsburgh Tinplate & Steel Corporation, Marietta, Ohio, against its ex-officers and directors and the brokerage firm of Goodman & Josephs, Cleveland, in a report filed Feb. 7, in the Franklin County Common Pleas Court, Columbus, Ohio, by Attorney Henry A. Williams, master commissioner. The company brought action for an accounting. In his report, Commissioner Williams declared that the Cleveland brokers received \$556,909.52 from the company under three commission contracts that were illegal. A finding in the same amount was made against Lakin C. Taylor, ex-president of the company, for permitting these brokerage contracts and also for \$116,802.09 for the receipt of which from the treasury of the company he failed to make satisfactory explanation to the master commissioner. Findings for the amounts paid the Cleveland brokers also were made against Curtis E. Waters, ex-treasurer, and John W. White, ex-secretary.

Lakin C. Taylor Sentenced to Penitentiary

Lakin C. Taylor, convicted several weeks ago in the criminal court in Pittsburgh on a conspiracy charge based upon the sale of stock in the Pittsburgh Tin Plate & Steel Corporation, was sentenced Feb. 10 to serve not less than 14 months nor more than two years in the Western Penitentiary of Pennsylvania. The maximum sentence allowed is two years. Taylor, who was president of the company, is alleged to have secured stock subscriptions by issuing prospectuses in which the condition and capacity of the company's plant at Marietta, Ohio, were exaggerated. Counsel for Taylor announced an appeal to the Superior Court would be taken at once.

IRON AND INDUSTRIAL STOCKS

Irregularity Noted in Quotations During the Past Week

Quotations for iron and industrial stocks the past week have been irregular. The strength of the common shares of United States Steel has been an outstanding feature. On the other hand, shares of those companies included in pending consolidations of steel properties have been weaker. No news is forthcoming to explain the strength of one and the weakness of the other. Quotation for industrial shares in general have moved up and down by turn, the net change for the week, on the average, not being worthy of special mention. At the moment the two outstanding constructive features in the business world are the strength of steeling exchange and of grain quotations. In both instances, greater buying power is indicated.

The range of price of iron and industrial stocks from Monday of last week to Monday of this week was as follows:

Albis Steel corp.	117 1/2	104 1/2	Midvale Steel	29 1/2	31 1/2
Albis Steel pt.	9 1/2	9 1/2	Nat. Acme		12 1/2

Trumbull Steel Co.'s Report

YONKOSTOWN, Ohio, Feb. 11. President Jonathan Warner of the Trumbull Steel Co. stated at the annual stockholders meeting at the main offices in Warren last week that the company had received invitations to participate in merger negotiations, but had declined and was not a party to any such plans. He predicted gradual betterment in business conditions over the rest of the year, which, he said, would be reflected in the steel industry, though he looked for a period of little activity during the summer. Gross sales of \$12,851,000 last year compared with \$35,850,811 in 1920. The company reported a surplus account as of Dec. 31 last of \$7,581,000, a reduction from \$8,129,000 reported a year ago. The statement for the year showed a depreciation write-off against the plant of \$500,000 and inventory readjustment of \$750,000. The company produced 137,746 tons of finished steel including 50,000 tons of tin plate last year, and shipped 136,711 tons. Shipments for 1920 aggregated 250,451 tons. The company reported operating profit for the year of \$260,000. The 1921 payroll of \$1,285,000 compares with a wage distribution of \$9,922,516 in 1920. There was a further set up of \$250,000 against doubtful accounts, which the company expects to be 10 times more than necessary.

J. G. Brill Co. Report

The annual report to the stockholders of the J. G. Brill Co. says:

"For the year 1921 the combined output of your company's four plants amounted in sales value to \$7,647,898.56.

"The combined output of your company's plants for each of the past six years follows:

1916.....	\$6,180,895.79
1917.....	7,706,099.28
1918.....	16,761,154.95
1919.....	14,210,622.09
1920.....	17,587,293.13
1921.....	7,647,898.56

"After deducting from earnings the sum of \$370,453.93 for depreciation and the cost of all maintenance and repairs for the year, and after charging against earnings and reserves, set aside for this purpose, the sum of \$325,915.80 to cover depreciation in inventory values, the result, combined for the year, of the operation of all the plants of your company, shows a profit of \$163,899.96.

"While your company has been doing business in Canada for many years, it seemed desirable to extend its operations in that territory, and for this purpose a new company was formed known as Canadian Brill Co., Ltd., all the stock of

which is owned by your company, except the directors' qualifying shares. The new company has leased, with an option to purchase, a moderate size plant at Preston, Ont., which was put in operation Sept. 1, 1921, and now has sufficient work to keep it running at its full capacity."

Industrial Finance

The Norwalk Iron Works, Co., Norwalk, Conn. has filed a preliminary certificate of dissolution. All claims should be sent to A. Raymond Betts, care of the company, South Norwalk.

The Winchester Repeating Arms Co., New Haven, Conn. has issued 90,000 shares of heretofore unissued authorized capital stock, thereby bringing the outstanding capital up to \$10,000,000.

The 1921 net earnings, after federal taxes, depreciation and reserves, of the Sullivan Machinery Co., Chicago and Claremont, N. H., were \$512,488, equivalent to \$3.25 a share on its 157,803 no par shares outstanding. In 1920, the net earnings were \$1,347,315, or \$8.69 a share on 155,118 shares. At the close of 1921, the company had current liabilities of \$1,937,242, and current assets of \$7,829,124, leaving a net working capital of \$6,791,882.

At the annual meeting of the Greenfield Tap & Die Corporation, Greenfield, Mass., held recently, it was announced 1921 results would not be available until March. Incoming orders for January, 1922, were more than 50 per cent larger than those for the corresponding month last year. The company is employing 600, contrasted with 1500 fifteen months ago.

The Pittsburgh Steel Co. reports gross earnings for the six months ended Dec. 31, 1921, at \$6,609,876, against \$18,077,585 in the same period in 1920 and net profits of \$242,035, against \$1,469,700 in the last six months of 1920.

Trade Changes

Maxwell Spiro, formerly district manager of the New York office of Briggs & Turivas, operators in iron and steel scrap, is now connected with the Merchants' Metals Corporation, Woolworth Building, in the capacity of general manager. The Merchants Metals Corporation deals in iron and steel and machinery, and it is intended to develop the scrap iron department of the corporation. Mr. Spiro, prior to his service with Briggs & Turivas, was a commanding officer of a motor transport company in the U. S. Army in France during the World War. He was also connected with the engineering staff of the Baldwin Locomotive Works at Burnham, Pa.

The American Foreign Steel Co., Grand Central Terminal Building, New York, which has been liquidating its affairs in the past two months, has just sold its iron and steel scrap yard at Lackawanna, New York, to the Joseph Schuchthal Co., Columbus, Ohio, which operates scrap yards at Columbus, Huntington, W. Va., Detroit and Cleveland. Joseph Neel, general manager of the Lackawanna plant of the American Foreign Steel Co., has been retained in the same position by the purchasing concern.

J. D. Adams has opened an office at 204 Seitz Building, Syracuse, N. Y., as manufacturers' agent (not a jobber) for foundry equipment and supplies. He will also represent the E. Reed Burns Mfg. Corporation with platers and polishers supplies in New York State, outside of the Metropolitan District. For the past three years Mr. Adams has been salesman for the S. Obermayer Co. through the east.

D. E. Hadley, S. H. Baird and John F. Kevern, all formerly connected with the Sly Mfg. Co. in sales and engineering capacities, have just organized the Mutual Equipment Co., 251 Port Washington Avenue, New York, to bring out modern and improved sand blast equipment, dust arresters, core ovens, tumbling mills, and special machinery to meet the requirements of the foundry trade.

The Max Anis Machine Co., New York, announces that on Feb. 1 it opened an office in Rochester, N. Y., at 705 Commerce Building. H. S. Freeman who was the Western representative of the company, has charge of the Rochester office. L. J. La Cava has been appointed western representative at the company's new Chicago office, 20 East Jackson Boulevard.

The general offices of the Superior Steel Corporation have been removed from the Union Arcade Building, Pittsburgh, to the works of the company at Carnegie, Pa. The company, however, retains sales offices in the Union Arcade Building.

The Standard Sanitary Mfg. Co. regular quarterly of 1 1/2 per cent on preferred stock and 2 per cent on common stock, both payable Feb. 15, to stock of record Feb. 7.

The A. C. Warner Co., Philadelphia and Baltimore, is now representing the Dow Co., Louisville, Ky., designing and supplying conveyors.

PIG IRON MAY BE EXPORTED

**American Price Decline Favoring Sales to Europe
—Ore Imports—Foreign Buying Largely
Governmental**

NEW YORK, Feb. 14.—Foreign buying continues, but is almost entirely confined to Japan, with sporadic inquiring from other Far Eastern markets. A large part of the Japanese buying is either by the Imperial Government or municipalities. Black sheet business has dwindled to a few scattered orders, but there is a noticeable activity in blue annealed sheets in small lots. The recent inquiry of a large Japanese oil company for 20,000 base boxes of oil can tin plate has been placed in the United States and will probably go to the leading interest. The government call for bids on about 8000 tons of structural material for two bridges, issued some time ago, is also understood to have been placed in this country with an exporter, who submitted the quotations of one of the largest independents.

The Imperial Government Railways, beside the 10,000 tons of rails now being bid upon, has purchased several hundred tons of steel for the construction of light locomotives. Among inquiries still open is a tonnage of light rails (about 18-lb.) and 300 tons of 15-in. steel beams. The Taiwan Electric Power Co., Formosa, which has purchased electric equipment and pipe in the United States, has placed a part of the 225 miles of steel transmission towers required with a Japanese export house in New York.

British sheet mills are at present strong competitors in Japan, but the gradual rise of the pound sterling toward parity is expected to mark an increase in sales of the American product. The increase in European exchange is affecting imports and purchases for shipment to other markets. The German fuel shortage and its consequent effect upon pig iron prices and production, coupled with the rise in foreign exchange of the Belgian franc, has placed Belgian iron upon too high a price basis for importation into the United States, excepting, as has been the rule for some time, to the Pacific coast. Even in this market transactions are diminishing as values increase. Belgian foundry iron, which a few weeks ago with the franc quoted at about 7c., could be landed c.i.f. Atlantic port at 300 fr. per ton (about \$21), now costs about \$24.57 per ton with the Belgian franc at 8.19c. in exchange.

In view of the rise in Continental prices and exchange and the decline in American prices on pig iron, one importer and exporter of pig iron and semi-finished material believes that should this condition continue, it will be possible before long to export pig iron to European consumers. In fact, with foundry iron quoted at \$15.50 to \$16 per ton, Birmingham, this exporter claims that he could consummate sales now, were it not for the freight rate from Birmingham to a port abroad.

Foreign ores are in a much better position in the American market than foreign pig iron. Ore imports are not only possible but Eastern furnaces show a strong inclination to negotiate for their purchase. A trial cargo of North African low phosphorus ore, from Algiers, analyzing about 50 per cent iron, raw, and 57 per cent, dry, has been shipped to a Pennsylvania furnace. Should this ore prove satisfactory, a contract for continued shipments will probably be made with the importer. Ore of this analysis can now be delivered, c.i.f. Atlantic port at about 10½c. per unit.

Practically the only manganese ore, except Indian, that it is now possible to import is Brazilian, on which contracts have recently been made at 22c. per unit. Caucasian manganese ores from Poti, Georgia, are not only reported to be uncertain as to quality, but are now quoted at 25c. per unit, c.i.f. Atlantic ports. The situation at these mines is said to be steadily improving since the organization of an association of the government and the producers, but rail connections do not permit of shipments from mines to port and current shipments are practically all from stock.

The list of electrification projects in various foreign markets continues to grow. According to the Bureau

of Foreign and Domestic Commerce, a company has been organized at Utsunomiya, Japan, to construct a high speed electric railroad between Nikko and Tokio, at an estimated cost of 10,000,000 yen (about \$4,725,000). German competition in the Far East on electrical material is reported to be keen. Highly satisfactory credit arrangements appeal to Chinese buyers particularly. The German Siemens-Schuckert Co., has combined with Chinese interests to erect an electrical manufacturing plant at Soochan and with the Furukawa Electro-Industrial Co. in Japan to erect a plant for the manufacturing of small electric meters.

Stocks of Coal Increasing

WASHINGTON, Feb. 14.—Warnings of Government officials to industries of the country to lay in stocks of coal on account of the threatened strike of union bituminous and anthracite miners on April 1, are bearing fruit. It is evident that stocks are being added to and as indicative of this is the fact that production of both grades of fuel is increasing, according to the report of the United States Geological Survey. The total output of bituminous coal, including a small amount of lignite, during the week ended Feb. 4, is estimated at 9,708,000 net tons. In comparison with the week preceding, this was an increase of 88,000 tons, and in comparison with the corresponding period a year ago, the increase was 1,576,000 tons. The present production is declared to be large enough to meet current requirements for consumption and export, and at the same time add to the reservation in storage. Stocks of bituminous coal on Jan. 1, consisted of 47,500,000 tons in the hands of consumers, and 7,151,000 tons on the upper lake docks.

The stocks at steel works were sufficient to last 48 days and those at coal plants were sufficient to last 42 days.

Nearly a million tons of by-product coke, according to the Survey, is on hand at coke plants, much of which can be used for domestic fuel. While production of anthracite coal increased in the first week of February, and amounted to approximately 1,811,000 net tons, it is declared that the reserve in storage and in transit has probably decreased because production in January was not enough to meet estimated current consumption. But since then its report indicates greater stocks.

Nine Years Without a Strike

A record of nine years' operation of plants without a strike is one of the achievements noted by Simon Guggenheim, president of the American Smelting & Refining Co., in a general report on improvement in industrial relations between the company and its employees, which has just been issued for the information of stockholders.

The report indicates that as a result of the company's policies in its relationships with its working forces, only a couple of minor differences intervened since 1913, and these incidents were practically repudiated by the employees.

President Guggenheim shows that the company early adopted an 8-hr. day, was a pioneer in establishing a system of pensions and indemnities, and employees' committees for co-operation in plant operation, together with other features aimed to promote harmony and efficiency.

Blast Furnace Activities

The Mary furnace, Sharon Steel Hoop Co., Lowellville, Ohio, was blown out Feb. 11, after a run of eight months. The furnace, which has a capacity of 12,000 tons a month, has been producing from 3500 to 4000 tons a month more iron than the company has been charging and the accumulation is sufficient to carry the company along for several months at the present rate of consumption. This leaves only 16 of the 47 blast furnaces in the Mahoning and Shenango valleys in blast. Preparations are being made to start up the Dover furnace, Dover, Ohio, during the week of Feb. 19. This is a Hanna Furnace Co. stack.

EXPECTS IMPROVEMENT

President Campbell Looks for Gradual Change— Discusses Proposed Consolidations

YOUNGSTOWN, OHIO, Feb. 14.—“At the present time the outlook for profitable business during the year is not good,” President James A. Campbell of the Youngstown Sheet & Tube Co. told stockholders to-day at the annual meeting. “I am of the opinion that the first half of the year will be unprofitable, because of the small volume of business and the very low prices prevailing. There are, however, many hopeful signs of future improvement, which in my judgment bid fair to make for better conditions. The most hopeful of these are the success of the Arms Limitation Conference recently held in Washington; the arrangement between Great Britain and France, by which Great Britain agrees to assist France in case of invasion by any other power, which marks, in my opinion, the end of deterioration and the beginning of reconstruction in Europe, and the proposed financial conference at Genoa, which gives hope for the solution of some of the serious financial problems of Europe and the stabilization of exchange.

“With these things accomplished, taxes should be greatly reduced, disorder in Russia and the Balkan States should rapidly diminish, and order be restored in Europe. I think that few of us fully realize the vast importance of the events that have taken place during the last 60 days, or their probable influence on the peace of the world, the reduction of Government expenditures, and the business situation both here and abroad.

President Harding's Policies

“In our own country the President is thoroughly impressed with the importance of liquidation of labor and material values where this has not fully taken place, realizing that such liquidation is necessary to reduce the cost of living. He has already taken steps that have lowered freight rates in some instances and will bring about further reductions in the near future. He has also taken steps to prevent profiteering and assure to the consumer the benefit which should result from lower production costs, which are in many cases now absorbed by middlemen and are, therefore, not reflected in retail prices.

“It takes time to accomplish all of these things, but I am convinced that by the middle of the present year the combined results of all of them will restore confidence and make for greater business stability. I am, therefore, in hopes that the last half of the year will bring us a greater volume of business and perhaps a small margin of profit.

Discussing the past year, he said: “In volume of business, in shrinkage in value of inventories, and in earnings, the year 1921 was the poorest year in the history of your company. The actual amount charged off for this reduction in value of stocks was less than in some other years, but we absorbed a considerable amount of this loss in our costs during the year which does not show in this charge.

Reduction of Wages

“On Feb. 16, 1921, we reduced the wages of all employees about 20 per cent. On July 1 we abandoned the 8-hr. basic day, which discontinued paying time and a half for all time over 8 hr. On August 16 we made a further reduction of about 20 per cent in the wages of all labor. These reductions combined reduced common labor from 46c. to 30c. per hour, the present rate. Steel plants in the East are now paying from 20c. to 25c. per hour for common labor, and in Buffalo the rate paid is 23c. per hour. We should dislike very much to further reduce wages, because we believe that employees in the steel industry have already suffered greater reduction of wages than those in most other lines, and we do not believe that the cost of living has declined sufficiently to justify it. We are not willing, however, to dissipate our capital in meeting conditions as we find them to-day, by selling our products at less than cost. There is a very serious question involved as to whether we should give the men more employment at

a lesser wage by trying to meet conditions as we find them, or close down those departments which are operating at too great a loss.

“The steel industry, in its anxiety for business, has tried to name prices during the past year to meet the ideas of the consumer. The published statements of most of the steel companies for this year show considerable loss. Some of this is due to shrinkage in value of inventories with which labor has nothing to do, but a large percentage of it has been lost in operation of plants.

Reducing Expenses

“We have reduced our overhead expenses during the year to the very minimum by eliminating employees in every department where it was possible to do so, and also by reducing the salaries of officials, superintendents and men holding important positions.

“Relations with employees during the year have been very harmonious and we believe that this is due in a great measure to our representation plan. Representatives and their committees meet at stated times and discuss any questions pertaining to operation or working conditions, and they are usually settled to the satisfaction of all concerned. We believe that there is closer contact between the management and the men than heretofore, which leads to a better mutual understanding.

Proposed Mergers

“You have probably read much in the public press with reference to proposed combinations in the steel industry, in which your company has been mentioned. There has been considerable discussion on this subject during the past year among executives of different steel companies, who have hoped that such combinations would make it possible to reduce cost and improve the distribution of their products, owing to the different geographical locations of the plants under consideration.

“We have attended the conferences held and have had valuations of our properties made, with a view to joining in the proposed consolidation of interests when we are convinced that we can do so without impairing your position. You can rest assured that we will not make any recommendation to the stockholders with reference to these combinations until we are thoroughly convinced, after careful consideration, that your interests will be better served by joining with other companies.”

The company's financial statement for 1921 shows:

Earnings from operations including miscellaneous income, but after deducting repairs and maintenance expense, special charges and reserve for general taxes, \$3,878,011.60; less provision for depreciation of plants and equipment, \$3,139,110.72; provision for exhaustion of coal properties, \$36,848.79; reduction in value of inventories to cost of market at Dec. 31, 1921, \$721,947.73; net loss for year, \$19,895.64.

Dividends paid on preferred stock, \$695,401; on common stock, \$1,998,727.50; deficit for year, \$2,714,024.14.

Gross sales of the Sheet & Tube company and its subsidiary properties were \$39,277,979.57; gross receipts of the parent company, including pig iron, coke, by-products, etc., \$29,963,919.48; payroll for year, \$10,105,667.95. Shipments of finished and semi-finished iron and steel products, 367,410 tons.

Cutting fluids is the subject of technologic paper No. 204 of the Bureau of Standards soon to be issued. The difficulties attending the proper lubrication of the cutting tool in machine work and the reason why lard oil is particularly suitable are discussed. Part 2, dealing with actual practice, will consider the correspondence which the bureau conducted with many large machine shops as to their experience with cutting fluids. The bulletin, when ready, may be had from the superintendent of Documents, United States Printing Office, Washington, at 15 cents per copy.

Z. L. Sault, Boston, delivered an address on heat treating before the Boston chapter American Society of Steel Treathers at the City Club, Boston, Feb. 10. His address took the form of a practical discussion of experiences in the treatment of steels during heating, and methods employed in overcoming defects.

Machinery Markets and News of the Works

MORE INQUIRIES ISSUED

General Electric Co., Lynn., Mass., in Market for Considerable Equipment

Trade Is Disappointed, However, That So Few Inquiries Result in Buying

Inquiries for machine tools continue to come out in fairly encouraging volume, but the trade is still disappointed in the small number of orders being placed. Whether the greater interest that prospective buyers appear to be taking in new equipment betokens a larger measure of buying this spring is a question for which machine-tool manufacturers have found no answer.

Some of the inquiries now pending are of fairly good size, as for example, one from the General Electric Co.,

Lynn., Mass., for 42 machines for an experimental laboratory and another list from the same company for about 30 tools for its Gloucester, Mass., works.

Railroad buying is very limited, but a few inquiries are being quoted on. The Nickel Plate has issued at Cleveland an inquiry for about a dozen tools and the New York Central Lines west of Buffalo want five machines.

Some business continues to come from the automobile manufacturers and there is quite a little under negotiation. A Michigan manufacturer has bought seven turret machines. The Ford Motor Co. is expected to close shortly on two planers.

Good used tools are in demand. A Cincinnati valve manufacturer bought about 10 used machines and two orders each for \$10,000 worth of used tools have been received by Cincinnati dealers from Louisville manufacturers.

New York

NEW YORK, Feb. 14

No signs of improvement in the machine-tool trade in this district are apparent. A large machine-tool company doing a national business reports that it is receiving more inquiries, but most of these come from sections of the country other than the New York territory. Locally, both orders and inquiries are at low ebb. Sellers of tools have very few live prospects to work upon and everyone in the trade seems at a loss to predict when there will be an improvement. There is disappointment over the slowness of the railroads to buy, and it is admitted that little may be expected from this quarter until a decision has been reached at Washington in the matter of freight rates.

Although few closings on either electric or hand power cranes are reported for the past week, inquiries continue to pile up. Increased activity is noted in electric hoists. One fair sized export inquiry appeared during the week from New York exporters. All bids are in on the two 10-ton, 90-ft. span overhead traveling cranes inquired for by the American Car & Foundry Co., for Huntington, W. Va. The Kelsey Motor Co., Newark, N. J., is interested in quotations on monorail hoists (electric) and will later purchase a 5-ton electric overhead crane. The Wallingford Steel Co., Wallingford, Conn., which issued an inquiry several weeks ago for a 15-ton and 3-ton, overhead traveling crane, is reported to have purchased. The L. B. Foster Co., 154 Nassau Street, New York, has asked for prices on a 20-ton, used locomotive crane. The electric cranes for the Narragansett Electric Light & Power Co., Providence, R. I., will probably consist of two 10-ton and three 1-ton electric cranes.

Among recent sales were: Shepard Electric Crane & Hoist Co., two 3-ton and one 7½-ton electric hoists to the American Circular Loom Co., Kenilworth, N. J.; Whiting Corporation, a 5-ton, 58-ft. span overhead traveling crane to the Lamson Co., Boston, Mass.; H. D. Conkey & Co., a 5-ton, single I beam hand power crane to the General Engineering & Management Corporation, 141 Broadway, New York.

The Remington Arms & Ammunition Co., 25 Broadway, New York, is perfecting plans for the conversion of a part of its former munition plants to manufacture cash registers and parts, and will establish headquarters for this branch of the business at 13 East Forty-second Street.

The Perfect Brick & Hollow Tile Co., Brooklyn, care of Silverstein & Infanger, 188 Montague Street, architects, is taking bids for the erection of a one-story plant at Grand Street and Newtown Creek, 100 x 100 ft., estimated to cost about \$50,000, including machinery.

The Bureau of Supplies and Accounts, Navy Department, Washington, is taking bids until Feb. 28, for a large quantity

of miscellaneous tool steel for use at the Brooklyn Navy Yard and other navy yards.

The Consolidation Coal Co., 67 Wall Street, New York, has disposed of a bond issue of \$10,000,000, the proceeds to be used for the purchase of the properties of the Carter Coal Co., in the Pocahontas field, W. Va., and other properties, and for the installation of tipples, electrical and mechanical equipment, etc. C. W. Watson is president.

The Aeromarine Plane & Motor Co., Locust Street, Keyport, N. J., is arranging for increased production with additional working force, to manufacture 25 Martin-type airplane bombers for the War Department, Washington. The order approximates \$500,000. Paul G. Zimmermann is engineer.

The Jefferson Co., 732 Jefferson Street, Hoboken, N. J., is making inquiries for a 200-hp boiler, with 100-kw., 220 volt generator.

The Kelsey Motor Co., 25 Branford Place, Newark, N. J., will install machinery at once in the first unit of its new plant on Washington Avenue, Belleville, N. J., comprising about 34,000 sq. ft. of space. A portion of the works will be used for the manufacture of power transmission equipment for the Kelsey traction drive unit, and the remainder for assembling. E. E. Shade is president, and C. W. Kelsey, general manager.

The Solar Electric Mfg. Co., Newark, has been organized with a capital of \$100,000 to operate a plant at 24 Mechanic Street, Newark, recently leased in the name of the Solar Light Co., 69 Wooster Street, New York. It will manufacture high-power electric lamps and kindred products. Charles E. Gluckman and Joseph Ihum head the company.

Refrigerating machinery to cost about \$122,000, will be installed in the new municipal market building, now being erected by the Department of Parks and Public Property, City Hall, Newark, N. J., and which complete, will cost in excess of \$1,000,000. An electric light and power house also is being planned, estimated to cost \$117,000. Charles P. Gillen is director of the department. George B. Hooper and Frank Grad, 245 Springfield Avenue, are associated architects.

Philadelphia

PHILADELPHIA, Feb. 13.

The Philadelphia Electric Co., Tenth and Chestnut streets, Philadelphia, is arranging for an increase in capital from \$60,000,000 to \$150,000,000, a large part of the proceeds to be used for extensions and improvements in generating plants and system. It is planned to install a new 30,000-kw. turbo-generator at the power house at Beach and Palmer streets, and to build an entire new plant unit at this location with like output. Extensions will be made

in the power plant at Christian street and the Schuylkill River, and new equipment installed.

Motors and other electric power equipment will be installed in the three-story printing plant, 120 x 150 ft., to be erected at Sanson and Seventh streets, Philadelphia, by the Curtis Publishing Co., estimated to cost about \$200,000. S. C. Roberts & Co., Real Estate Trust Building, are engineers.

The Bath Portland Cement Co., Finance Building, Philadelphia, will take bids at once for a new cement plant on property acquired at Sandts Eddy, Northampton County. It will comprise a power plant, machine shop, etc., and is estimated to cost \$1,750,000. The company has also arranged an appropriation of \$300,000 for extensions in the electrical and operating departments at its plant at Bath, Pa. It is planned to completely electrify this works. Louis Rafetto is president, and John Barnes, treasurer.

The Bureau of Water, City Hall, Philadelphia, will soon call for bids for the construction of a one-story electrically operated pumping plant at the Lower Roxborough waterworks, Eva Street and Shawmont Avenue.

The Standard Smelter Mfg. Co., Bessemer Building, Pittsburgh, has leased a building to be erected at Glenwood Avenue and Oxford Street, Philadelphia, for a local branch.

The Frick Co., Waynesboro, Pa., manufacturer of agricultural machinery, tractors, etc., has awarded contract to A. E. Warner, 41 East Main Street, for a one-story shop addition, 50 x 100 ft., for engine work and assembling. A. C. Frick is vice president and general manager.

The Pennsylvania Edison Co., Easton, Pa., a subsidiary of the General Gas & Electric Co., operated by W. S. Barstow & Co., 30 Pine Street, New York, will commence the immediate erection of an addition to its electric generating plant, to include the installation of a 10,000-kw. steam turbo-generator and auxiliary equipment, estimated to cost about \$800,000.

Following the complete electrification of its local properties, the Jamison Coal & Coke Co., Greensburg, Pa., will proceed with similar installations at its properties in the Farmont, W. Va., field. Plans have been completed for the electrification of the No. 3 mine at Farmington, W. Va.

The Queens Run Fire Brick Co., Lock Haven, Pa., has taken over the North Branch Fire Brick Co. and the West Branch Fire Brick Co., both operating plants in the section, and will consolidate the companies under its present name. A number of improvements will be made. William Slesinger is president, and George H. Black, general manager.

The Wyoming Valley Water Co., Hazleton, Pa., will install electrical equipment at its pumping plant for light and power service at Hudsondale and vicinity. John T. Seaton is superintendent.

H. A. Feering, Bethlehem, Pa., care of Howard J. Wegner, Bethlehem Trust Building, architect, will soon take bids for a three-story automobile service and repair works, 60 x 100 ft., estimated to cost \$45,000.

A vocational department will be installed in the new high school to be erected at Doylestown, Pa., estimated to cost about \$75,000, plans for which have just been ordered prepared.

Fire, Feb. 3, destroyed the sheet metal shop of the Philadelphia & Reading Railroad Co., Reading, Pa. The exact amount of loss has not been announced, but is reported as considerable, including building and equipment.

The Gelsinger Garage, C. S. Gelsinger, 3223 Derry Street, Harrisburg, Pa., head, will soon commence the erection of a new one-story and basement automobile service and repair works, 60 x 100 ft., at Twenty-eighth and Main streets, Penbrook, Pa.

The Gurney Electric Elevator Co., Honesdale, Pa., manufacturer of elevators, hoists, etc., has abandoned plans for the removal of its works to another location and operations will be continued at the present plant. A bond issue of \$300,000 has been sold, a portion of the proceeds to be used for extensions and improvements.

The Board of Education, Easton School District, Easton, Pa., has commissioned William H. Michler, Drake Building, and John Shay, Easton Trust Building, architects, to prepare plans for a two-story and basement high school, 65 x 230 ft., to include vocational department, and estimated to cost about \$350,000.

The Traylor Engineering & Mfg. Co., Allentown, Pa., will devote a portion of its plant to the manufacture of a special type of steel spring. Production has been under way on this specialty at the Cornwells plant of the company, and the full capacity of this works will be used for this line of manufacture, in addition to the steel spring output to be developed at the Allentown plant.

A vocational department will be installed in the new high school to be erected at Nazareth, Pa., estimated to cost \$100,000.

Electric motors, ranging from 500 to 300-hp., and smaller, and other electrical equipment will be installed for coal breaker operation at the new plant of the Lehigh Coal & Navigation Co., at Coaldale, near Lansford, replacing a plant destroyed by fire. It will cost about \$1,000,000 with machinery.

Chicago

CHICAGO, Feb. 13.

The tendency toward expansion in business noticeable in January has not been sustained and the current market is exceedingly quiet. Inquiries are fewer and orders are almost nil. The railroads have bought nothing against their lists, but the Santa Fe has added two more items to its outstanding inquiry as follows: One lathe for piston work with 36-in. swing and 9 ft. between centers, arranged for direct current motor drive, and one double-end punch and shear with 8-in. throat, capable of punching a 4-in. hole in a 2-in. plate, and shearing 12 x 2 1/4-in. flats and 4 1/4-in. rounds and splitting 1 1/2-in. plate, arranged for direct current motor drive. The only new inquiry of importance comes from the Board of Education, Hammond, Ind., and calls for 10 engine lathes, one milling machine, one sensitive drill, one arbor press, one 12-in. crank shaper, one hack saw, one grinding machine, and a sliding-head drilling machine. Here and there a few sales of individual machines are being made, as for example, a sale of a 20-in. crank shaper to the Brunswick-Balke-Collender Co., for its Muskegon, Mich., plant. The crane market is inactive.

The Donahue Steel Products Co., People's Gas Building, Chicago, has sold to the Saylor Mfg. Co., Pittsburgh, the following machinery from its Chicago stock: A 1 1/2-in. Acme upsetting and forging machine, a Pawtucket shear for bolt stock, a No. 2 Williams-White eye bender, a No. 4 Williams-White bulldozer, and a three spindle Landis threading machine.

The Cyclone Motors Co., a new company organized to manufacture motorcycles, will locate at Benton Harbor, Mich. The head of the company is John M. Eaton, Detroit, for 15 years associated with Henry M. Leland, the Detroit automobile manufacturer. The company has entered a contract to buy the plant of the Peninsula Lumber Co., Benton Harbor. While it will specialize in the manufacture of delivery cars of the motorcycle type, it will also make a three-passenger automobile. Remodeling of the Peninsula plant is to commence at once.

The Damascus Steel Products Corporation, recently incorporated to manufacture tools, will open a factory on Fourteenth Avenue, Rockford, Ill., where it has leased floor space, and is now installing equipment. The company has \$50,000 capital stock.

The United Light & Power System, Abilene, Kan., has purchased the Williamson power plant and dam on Republican River at Chuy Center, Kan., and will improve the property.

The W. T. Safety Tool Co., Taylorville, Ill., was recently incorporated to market tools, on which it has patents, for use on high-tension electric transmission lines, these tools being intended to make all repairs of lines without interruption in the service. The company will not build a plant for the present for the reason that its president operates a machine shop, and part of its products will be made there, while the remainder will be let out on contracts. The officers are C. R. Wood, president; M. T. Tipsord, vice-president; W. D. Williams, secretary-treasurer.

The Pacific Malleable Iron Co. has been incorporated with \$50,000 capital stock at Gresham, Ore. A \$10,000 foundry will be constructed on a site which has already been purchased. M. Moga is the head of the company.

The Wisconsin Steel Works, 106th Street and Torrence Avenue, Chicago, has let contract for a one-story electric station, 29 x 52 and 16 x 52 ft., to cost \$10,000.

The Oettinger Ice & Coal Co., 1725 West Fifteenth Street, Chicago, has let a contract for a one and two-story ice manufacturing plant to cost \$35,000.

C. A. Passer, architect, 38 South Dearborn Street, Chicago, is receiving bids on a three-story factory and boiler house, 30 x 214 ft., to be equipped with high-pressure boiler, for the Gurinlan Candy Co., St. Joseph, Mich. It will cost \$75,000.

The Hug Co., Highland, Ill., has been incorporated with \$100,000 capital stock to manufacture road building equipment. It is constructing a one and two-story plant, 36 x 300 ft., and has purchased most of the machinery required. C. J. Hug is president and general manager.

The National Stamping & Electric Works, 426 South Clinton Street, Chicago, has let contract for an addition to its plant at 3238-50 West Lake Street, 156 x 118 ft., to cost \$20,000. It manufactures electrical household appliances.

The Edward Katzinger Co., manufacturer of bakers' tools and machinery, 910 West Washington Boulevard, Chicago, will build an additional unit to its plant, 332 x 599 ft., at Armitage and Cicero avenues.

A deed was recently filed in the probate court at Edwardsville, Ill., calling for the transfer of a tract of land in the south extension of Granite City, Ill., to the American Locomotive Co. This is another step toward the proposed location of a large plant in the St. Louis district by the locomotive company.

The Union Utilities Co., Rutland, Iowa, has plans under way for a new hydroelectric generating plant to cost about \$150,000. Toltz, King & Day, 1410 Pioneer Building, St. Paul, Minn., are engineers.

A vocational department will be installed in the three-story high school, 101 x 162 ft., to be erected at Fremont, Neb., bids for which are being received until Feb. 20. Equipment bids will be taken later. It is estimated to cost \$200,000. The A. H. Dyer Co. is architect. James A. Donahue is secretary of the board.

The Northwestern Paper Co., Cloquet, Minn., has plans under way for a new three-story pulp and paper mill, estimated to cost \$500,000, including machinery. George F. Hardy, 309 Broadway, New York, is engineer. C. J. McNair is general manager.

C. R. Berglund, 2630 Wentworth Avenue, Chicago, is taking bids for a new one-story plant, 100 x 125 ft., at South Park Avenue and Sixty-seventh Street, to manufacture automobile bodies. A. G. Lund, 449 West Sixty-third Street, is architect.

A vocational department will be installed in the new Theodore Roosevelt high school to be erected at Des Moines, Iowa, to cost in excess of \$1,000,000. Bids for the building have been taken and contract will soon be let. Bird & Rawson, 810 Hubbell Building, are architects. George L. Garton is secretary of the board.

The Arkansas Valley Railway, Light & Power Co., Pueblo, Col., has construction under way on a new power plant, and plans the installation of generating and other equipment at an early date.

Jacobson Brothers, 410 Columbia Building, Duluth, Minn., have completed plans for the erection of one-story automobile service and repair building, 75 x 140 ft., estimated to cost about \$100,000, including equipment. Halstead & Sullivan, 409 Palladio Building, are architects and engineers.

Baltimore

BALTIMORE, Feb. 13

Slayman & Co., Pratt and President streets, Baltimore, machinists, will install a number of machine tools at their works, including drilling and milling machines.

A filtration plant to cost about \$1,200,000 will be erected by the Water Board, City Hall, Baltimore, at Montebello. It will include pumping plant with electrically operated machinery, settling basins, filtering equipment, etc. Plans are being drawn. William A. McGraw is water engineer.

The Chicago Nipple Mfg. Co., Richmond, Va., manufacturer of oil well machinery, nipples, fittings, etc., is planning for the establishment of a new factory at Baltimore and is negotiating with the local Merchants' & Manufacturers' Association for a building to approximate about 25,000 sq. ft. of floor space. It is planned to remove the Richmond works to the new location. Dixon C. Williams is president.

The property of the National Ship Supply & Machinery Co., Sollers Point, Baltimore, will be offered for sale Feb. 28-March 2, inclusive, including buildings, machinery, etc.

The Town Commission, Littleton, N. C., has completed plans for a municipal electric light and power plant and will commence work at an early date. The J. B. McCrary Engineering Corporation, Atlanta, Ga., is engineer. H. C. Smith is town clerk.

The Wilson Motor Co., High Point, N. C., will take bids in the spring for a three-story repair and service building, 75 x 100 ft., on property recently acquired, estimated to cost about \$75,000.

The Thomasville Variety Works, Thomasville, Ga., is planning to rebuild its woodworking factory, recently destroyed by fire with loss estimated in excess of \$100,000, including machinery. K. E. Mack heads the company.

Freight handling and conveying machinery, hoisting equipment, etc., will be installed by the Port Commission, Norfolk, Va., at the new docks and warehouses to be erected at Sewells Point, bids for which will be asked early in March. Neff & Thompson, Seaboard Bank Building, are architects. The Folwell-Ahlsgog Co., 332 South Michigan Avenue, Chicago, is engineer.

The City Council, Hertford, N. C., has authorized the sale of bonds to an amount of \$100,000, the proceeds to be used for the construction of a municipal electric light and

ice-manufacturing plant, with portion of the fund for water-works.

The Dyson Brothers Hardware Co., Olanfa, S. C., is making inquiries for machinery to manufacture axe handles and kindred turned wood products.

A vocational department will be installed in the two-story and basement high school to be erected at Fayetteville, N. C., to cost \$150,000, plans for which are being prepared by Millburn & Heister, 710 Fourteenth Street, N. W., Washington, D. C., architects. John A. Oates is president of the board.

The Town Council, Wilson, N. C., is arranging for the construction of a municipal electric light and power plant. A bond issue of \$70,000 has been approved.

The Virginia Machinery & Well Co., 1319 East Main Street, Richmond, Va., is inquiring for a second-hand steam hoisting engine, double drum type.

The Winchester Lumber Corporation, Winchester & Western Railroad Building, Winchester, Va., recently organized, has acquired about 3,000 acres of timber properties in Hardy and Hampshire counties, W. Va., and contemplates the construction of twenty sawmills and a number of general wood-working and finishing plants, including power houses. A cooperage plant is also being considered. William B. Cornwell, head of the Winchester & Western Railroad, is president of the company, and T. D. Kenny, secretary.

Detroit

DETROIT, Feb. 13

A vocational department will be installed in the new two-story high school to be erected at Traverse City, Mich., estimated to cost about \$500,000, bids for which are now being asked. S. E. Patterson, 406 Hochman Building, Kalamazoo, Mich., is architect.

The Reading Corporation, 113 West Fort Street, Detroit, is asking for quotations on a high lift steam shovel.

W. P. Papworth, receiver for the Fox Typewriter Co., Grand Rapids, Mich., is planning for the sale of the plant to a corporation, now in process of formation, for about \$300,000. The new organization, J. C. Goldman and William Remington, is planning for change and the installation of equipment to manufacture a new typewriter, with special keys for short words.

About \$100,000 will be expended by the Kalamazoo Vegetable Parchment Co., Kalamazoo, Mich., manufacturer of paper, for the erection of a two machine unit plant addition, two-stories, 90 x 925 ft. Billingham & Cobb, Press Building, are architects. J. Kudlebarger is president and manager.

The Owen Sanitary Co., Ypsilanti, Mich., will build a power house in connection with its new two-story and basement building for light manufacturing service, estimated to cost about \$75,000. O. W. Henz is general manager.

The Auto Specialty Mfg. Co., St. Joseph, Mich., manufacturer of automobile equipment, is taking bids for its one-story addition, estimated to cost \$100,000. Davidson & Weiss, 53 West Jackson Boulevard, Chicago, are architects.

The Department of Motor Transportation, City Hall, Detroit, is having plans prepared for a three-story municipal garage and service building, 760 x 140 ft., estimated to cost about \$600,000. William C. Markham, 312 Marquette Building, is engineer.

The Michigan State Prison Commission has been authorized to purchase a steel factory building for erection at the Iowa State Reformatory, the cost not to be in excess of \$45,000. It will house a shoe shop, toy factory and other metal industries.

The Village Council, Union City, Mich., has completed plans for a municipal hydroelectric power plant, to cost about \$150,000.

The Curran Motor Product Co., Detroit, will open manufacturing headquarters in Philadelphia. Temporary executive headquarters in Detroit will be in the Book Building.

Indiana

INDIANAPOLIS, Feb. 13.

A vocational department will be installed in the new two-story high school to be erected at Bloomington, Ind., estimated to cost about \$175,000. A. Grindle, 122½ Walnut Street, is architect.

Edward E. Dean and William S. Carleton of the Kokomo Machine Co., Kokomo, Ind., have recently acquired the Wiley interests in the company, and in the future will operate

as sole owners of the business. C. W. Adams is general manager.

A vocational department will be installed in the new two-story high school, 125 x 160 ft., now being erected by the Board of Education, North Jolison, Ind., and estimated to cost about \$125,000. Freymuth & Maurer, South Bend, Ind., are architects.

The Inter-State Car Co., Indianapolis, Ind., completed the addition to its foundry last November and is not making a second extension as reported.

The Varney Electrical Co., Evansville, Ind., is planning for enlargements and improvements in its factory, including the installation of additional equipment. It has increased its capital from \$250,000 to \$400,000 for expansion. H. A. Robertson is manager.

William O. Mainer, trustee in bankruptcy for the Elwood Foundry Co., Elwood, Ind., is planning for the sale of the plant and property of the company, as a going concern, Feb. 23.

A vocational department will be installed in the new one-story high school to be erected at Butlersville, Ind. H. M. Griffin, McFarland Building, Connersville, Ind., is architect.

Pittsburgh

PITTSBURGH, Feb. 15

In a prospective way the past week has been the most active in the equipment market for several months. This is particularly true of cranes, inquiries for which total about 34. The Wheeling Steel Corporation is inquiring for about 20. One list includes one 30-ton and one 40-ton for the blooming mill, one 30-ton for the continuous mill, one 20-ton for the power house, two of 25-ton capacity for the slab yard, two 25-ton overheads for the sheet bar yard, two 150-ton ladle cranes and a 7½-ton revolving jib crane. The latter is for the galvanizing plant at Beech Bottom, W. Va., and was inquired for sometime ago, and the other cranes are for installation at the Steubenville, Ohio works, for which a 30-ton crane also is wanted. The company also has put out a list of eight cranes for its Portsmouth, Ohio works, six of 5-ton capacity and two of 15-ton. The Ritter-Conley Mfg. Co. is asking for bids on six cranes for installation at its plant at Leetsdale, Pa. A 10-ton crane is wanted with a 5-ton and a 10-ton trolley, two 7½-ton cranes, each to be equipped with two 5-ton trolleys, and three 3-ton cranes with single trolley and floor control. The Lorain Steel Co., Johnstown, Pa., is in the market for two 5-ton and a 10-ton crane, all mill type. In addition to these there are individual inquiries for two cranes and three cranes from undisclosed sources.

Business remains extremely limited, but the trade is encouraged by the big increase in inquiries, especially as some give promise of closing at an early date. Machine tool sales also are light, but practically all local dealers and manufacturers' agents are figuring against inquiries and orders are expected to materialize before the end of the month. One house is figuring on six heavy face grinders and expects to close on some shortly. The price situation shows no appreciable change. Competition for orders is keen and buyers are sitting back and letting sellers slash prices and sacrifice profits.

The Allen-Chalmers Mfg. Co. has taken the order for equipment for the slag-crushing plant of the Shenango Furnace Co., Sharpsville, Pa., which is rebuilding the works recently destroyed by fire.

The Keystone Driller Co., Beaver Falls, Pa., manufacturer of oil drilling machinery and parts, has taken bids for three one-story additions, 80 x 100 ft., 60 x 110 ft., and 80 x 80 ft., estimated to cost about \$200,000, with machinery.

The Pen Public Service Co., Johnstown, Pa., has arranged for a bond issue of \$750,000, a portion of the proceeds to be used for plant and system extensions and improvements.

The National Auto Co., Uniontown, Pa., is planning the erection of a new automobile service and repair works, estimated to cost about \$300,000, including equipment.

The Board of Directors, Joint Consolidated Elementary and Vocational High School, Unionville, Pa., will hold in abeyance until spring the completion of the new high and vocational school, two-stories, 112 x 160 ft., foundation work for which has been completed, and will take equipment bids later. Ritter & Shay, North American Building, Philadelphia, are architects.

The Wilton Tool Mfg. Co., 2123 Grand River Avenue, Detroit, will soon commence the erection of a new plant at Sharon, Pa., consisting of two one-story buildings, 50 x 200 ft., and 20 x 100 ft., for general tool manufacture.

The S. E. Dickey Coal Co., Johnstown, Pa., has pre-

liminary plans under way for a new coal mining and handling plant in the vicinity of New Florence, Pa. Bids for electrical and mechanical equipment will be asked later.

The Gilmore Coal Co., Oliver Building, Pittsburgh, will soon commence the erection of a new power house, 35 x 90 ft., at its properties at Venice, Pa., estimated to cost about \$50,000. T. E. Corneliuss, Megee Building, Pittsburgh, is engineer.

The Seminole Automotive Accessories Corporation, Charleston, W. Va., recently organized with a capital of \$100,000, will establish a machine and repair department for automobile work in connection with a local accessories plant. H. K. Flynn, 1028 Virginia Street, is president and manager.

The Board of Education, Wayne, W. Va., is taking bids until March 2, for a two-story high school, 110 x 160 ft., with vocational department, and estimated to cost about \$150,000. Holmboe & Pogue, Empire Bank Building, Clarksburg, W. Va., are architects.

Bids will be taken until Feb. 21, by the Board of Education, Charleston, W. Va., for a two-story high school, 60 x 218 ft., to include vocational department, estimated to cost about \$250,000. Warne, Tucker & Patterson, Masonic Temple, are architects.

A power house will be erected in connection with the two-story school to be built by the Board of Directors, Orange Rural School District, Chagrin Falls, Ohio, estimated to cost \$200,000, plans for which are being prepared by Charles W. Bates, 701 National Bank Building, Wheeling, W. Va. Bids will be called for early in March.

Milwaukee

MILWAUKEE, Feb. 13

Unmistakable evidence that there is a definite recovery in the metal-working industry in this territory is imparting confidence to the machine-tool trade. Operating schedules of foundries as well as machine shops are steadily, if slowly, increasing. Most encouraging is the first sign of a revival in the agricultural implement and farm operating equipment industry, which has been out of the tool market for about 18 months. Sharp reductions in selling prices, especially tractors, have brought about an improvement in demand similar to that following the further let-down of automobile selling prices. The immediate benefit of enlarged operations to the tool industry is of small consequence, considering the small margin of profit left by present reductions, but there seems every reason to believe that a fundamental step has been taken toward an enlarging demand which will require a commensurate extension of production. Presently there is no broad need for tools except perhaps for replacement and small additions, but this small requirement is an improvement upon the almost absence of demand for many months past.

The Wisconsin Public Service Co., Green Bay, Wis., a subsidiary of the Wisconsin Securities Co., Milwaukee, has been granted 1922 budget appropriations amounting to \$825,000 for new construction, equipment and development. The most important item is the construction of a new hydro-electric generating plant costing approximately \$500,000 and developing 6200-hp. at Johnson Falls, on the Peshtigo River, near Peshtigo, Wis., a project intermitted three years ago because of unfavorable conditions. Mead & Seaton, consulting engineers, Madison, Wis., are now revising original plans and specifications and will take bids for the construction of a concrete dam, power house, etc., about March 1. C. R. Phenecle, Green Bay, Wis., is vice-president and general manager Wisconsin Public Service Co.; Clement C. Smith, Milwaukee, is president Wisconsin Securities Co.

The Minneapolis, St. Paul & Sault Ste. Marie Railway Co., Minneapolis, has tentative plans for the construction and equipment of a new terminal plant at Park Falls, Wis., involving an investment of approximately \$500,000 in round-house, repair and machine shops, car sheds and other facilities with a 200-car capacity. The engineering department is at work on plans and specifications, which probably will be available to contractors about the middle of March.

The Board of Education, Ashland, Wis., has engaged Kelley & Schefchik, architects, Ashland, to design a manual arts building as an addition to the present high school. It will cost about \$100,000, including machinery and other equipment for vocational training. Bids will be taken about March 20. Samuel Wheeler is secretary of the board.

O. P. Chatfield, formerly of Marinette, Wis., has concluded negotiations with the Commercial Club of Iron Mountain, Mich., by which he will establish a new brass and aluminum foundry, using the abandoned electric light plant building, which he has purchased. The club has contributed \$2,500 in

The Southland Motor & Body Corporation Old Hickory, near Shelbyville Tenn will install new equipment at its plant. P. A. Wells is secretary and treasurer.

The Ozark Power & Water Co., Joplin, Mo., has arranged for a bond issue of \$2,000,000, a portion of the proceeds to be used for plant and system extensions and improvements.

The S. G. Hoffman Magneto Co., 3932 Olive Street, St. Louis, has broken ground for its one-story works at 3872 Washington Avenue, 100 x 235 ft., estimated to cost about \$50,000. S. G. Hoffman is president.

Lawler & McKinney, Monett, Mo., P. O. Box 311, are making inquiries for machinery for use at a wood-working plant.

F. W. Parks, Frisco Building, St. Louis, has plans under way for a three-story automobile service and repair building, 100 x 140 ft., on North Euclid Avenue, estimated to cost about \$50,000.

The American Foundry & Mfg. Co., 2027 Brooklyn Avenue, Kansas City, Mo., will hold in abeyance the erection of its new plant, one story, 90 x 135 ft., estimated to cost about \$35,000, contract for which recently was awarded. It is expected to commence work early in the spring.

The Big Sandy Refining Co., Paintsville, Johnson County, Ky., recently organized, has plans under way for a new refinery with initial daily capacity of about 100 bbl. utilizing crude oil from the Berea fields. Ralph Stafford is president, and Earl Stafford, secretary and treasurer.

The E. B. Hartwell Handle Co., 120 Dock Street, St. Louis, has leased a building for the manufacture of handles and will develop an initial daily capacity of about 40,000. Equipment will be electrically driven, with power furnished from the company's plant. E. B. Hartwell is secretary and manager.

The Lucey Mfg. Corporation, 233 Broadway, New York, manufacturer of oil drilling machinery, engines, pumps, etc., has acquired property at Henryetta, Okla., 100 x 200 ft., for the erection of a new factory branch, 70 x 120 ft.

A vocational department will be installed in the three-story junior high school building to be erected at Springfield, Mo., 60 x 172 ft., with wing, 50 x 70 ft., estimated to cost about \$200,000, bids for which are being taken by Hawkins & Hoener, 400 McDaniel Building, architects.

The Universal Co., Oliver and Beaumont streets, St. Louis, manufacturer of automobile tops and other automotive equipment, has acquired property, 135 x 250 ft., for a new three-story plant, to approximate about 100,000 sq. ft. of floor area, and estimated to cost in excess of \$250,000, including equipment.

The Acme Brass & Machine Works, 1628 Oak Street, Kansas City, Mo., has awarded a contract to S. W. Hite, South Park, Kan., for a two-story machine shop, 25 x 115 ft., at 609 East Seventeenth Street.

The Wilson Slaughtering Device Co., 511 American Bank Building, Kansas City, Mo., is arranging for the erection of a new plant in the vicinity of Raystown, Mo., to manufacture special meat cutting and slaughtering equipment estimated to cost about \$50,000. John A. Wilson is president.

Adolph Schmolinski, who has been operating an automobile repair shop at 1552 South Seventh Street, St. Louis, under the name of the Red Star Motor Co., has organized the Cert-N-The Piston Ring Co., with a capital stock of \$50,000, \$30,000 paid, to manufacture piston rings at the address named.

The University of Missouri will open bids at Columbia, Mo., Feb. 21, for the construction of a power plant, also boilers, traveling cranes, etc. Jamieson & Pearl, Arcade Building, St. Louis, are the architects.

Canada

Toronto, Feb. 13

Machinery and equipment dealers are securing a fairly steady volume of business. While big lists are still absent, buyers are entering the market in larger numbers with small lists. Inquiries for various lines are being received, and although some of these are turning into almost immediate sales, the majority appear to be sent out by users who are contemplating buying later. Municipal governing bodies are spending money more freely on equipment for waterworks, sewage and electric plants. On the whole this market is beginning to show steady signs of improvement and the outlook is brighter than it has been at any time since the close of the war. Practically all lines of small tools have been moving freely of late and users are beginning to buy in larger quantities, and at the same time some orders are coming in for future delivery.

The city of Sarnia, Ont., will enter the market soon for the following equipment for its new technical school, which is expected to be opened by next September: Five lathes with 6-ft. bed, 14-in. swing, one to be a tool-room lathe with quick change gears; one 16-in. shaper; one drill press; one universal milling machine; one power hack saw; forges, anvils, vises, etc. In the wood-working department the following machines will be required: One combination cut-off

planer and three wood-turning lathes of different sizes. In addition, a blue print machine will be purchased. All machines will be motor driven.

T. J. Moore, Warton, Ont., is in the market for a double-end matcher for hardwood flooring.

The Dresden Machine Shop & Garage, Dresden, Ont., is in the market for equipment for a machine shop and auto repair shop.

The Malcolm Furniture Co., Listowel, Ont., is in the market for equipment for a machine shop, including small metal working tools, drills and lathes.

The Canadian Tobacco Growers' Co., Kingsville, Ont., is in the market for tanks, shredders and special machinery for the manufacture of fertilizers for tobacco growers.

The Holden Co., 354 St. James Street, Montreal, has assumed control of the Canadian Brake Shoe Co., Sherbrooke, Que., manufacturer of electric steel castings, etc., and is in the market for a punch and shear. New tools are preferred, but second-hand or re-manufactured machines in good condition will be considered for prompt delivery. N. J. Holden, president Holden Co., is president of the reorganized Brake Shoe company. The board of directors of the Holden Co. comprise largely the directors of the Canadian Brake Shoe Co., and as the Holden Co. has interests in other plants, machinery from some of these is being moved to Sherbrooke in an endeavor to consolidate the Holden manufacturing activities in one plant.

The Fraser Bruce Co., Montreal, will shortly commence construction on four ships at its Three Rivers, Que., shipyard.

The Canadian Pacific Railway will construct mechanical coaling plants at Estevan, Sask.; Swift Current, Sask.; Medicine Hat, Alta., and La Riviere, Man., to cost \$17,000 each. J. C. Holden, Winnipeg, is district engineer.

La Cie de Machinerie Merciere, St. Laurent Street, Levis, Que., will build an addition to its machine shop at a cost of \$20,000. N. J. Merciere is manager.

The town of Bright, Ont., is contemplating the installation of an electric light and power plant. George Oliver is clerk.

The town of Southampton, Ont., contemplates installing a power system. D. MacAuley is clerk.

T. Dick, Jr., president National Sand & Material Co., Welland, Ont., has signed a contract with the Collingwood Shipbuilding Co., Collingwood, Ont., for the construction of a sand and gravel carrier with a capacity of 2200 cu. yd. Mr. Dick stated that he could have let the contract in Glasgow, Scotland, at a saving of \$30,000, but as the boat is to be used on Canadian public and municipal works, also in view of the unemployment in Ontario, he thought it best to have the shipbuilding done in Canada. The company has increased its staff by 150 men.

The Fleming Publishing Co., Ltd., Owen Sound, Ont., is in the market for a 3-hp., variable speed 550-volt, three-phase, 60 cycle motor, about 1200 r.p.m.

The Bain Wagon Co., Ltd., Woodstock, Ont., advises that its plant has not been acquired by the Ford Motor Co., as stated in these columns Feb. 2.

The Gulf States

BIRMINGHAM, Feb. 13.

The Todd Shipyards Corporation, 25 Broadway, New York, has acquired property of the Mobile Shipbuilding Co., Mobile, Ala., for the establishment of a new branch plant. William H. Todd is president.

The Dallas Power & Light Co., Dallas, Tex., has preliminary plans under way for extensions in its electric power plant and system, including the installation of considerable new equipment. C. W. Davis is vice-president and general manager.

The Sterling Carbon Co., Sterlington, La., is planning to rebuild the portion of its plant, including machine shops and power house, destroyed by fire, Jan. 11, with loss estimated at close to \$30,000.

The Common Council, Dothan, Ala., has arranged a special election to vote bonds for \$70,000, a portion of the proceeds to be used for the erection of an addition to the municipal electric power plant.

The Singer Sewing Machine Co., 149 Broadway, New York, has tentative plans for a new works at Tallulah, La., to manufacture sewing machine cabinets, cases, etc. It has a large tract of timber property in this section.

The Humphreys-Pure Oil Co., Mexia, Tex., has completed plans for a one-story machine shop, 50 x 100 ft., to be used primarily for automobile repair and parts manufacture, in conjunction with a new one-story service building and garage, 60 x 100 ft., for company trucks and cars, now in course of construction.

The A. B. C. Millwork Co., 8 Jackson Street, Fort Myers, Fla., is planning for the establishment of a new factory to manufacture store fixtures, show cases, etc. A list of equipment is being prepared.

New England

Boston, Feb. 13.

The General Electric Co., Lynn, Mass., the past week issued a list of 42 machine tools for an experimental shop, to be applied to fine measurement work. While price is a consideration, early deliveries are the primary factor. In addition, the company is inquiring for a comparatively large amount of heavy equipment, including 12 large vertical milling machines, two 42-in. vertical boring mills, six heavy plain horizontal milling machines, four large horizontal boring mills, four medium sized lathes and other equipment, presumably for its Gloucester, Mass., works. The heavy equipment is part of a list originally issued months ago and abandoned because of business conditions. Since then the company has drawn on several of its New England subsidiary plants for equipment needed at Lynn.

With the exception of the above list the local machine-tool market has been without special feature. Sales have been small, amounting in the aggregate to perhaps a dozen pieces of equipment to as many different concerns. The H. B. Smith Co., Westfield, Mass., list has not been covered. Prices given this company by used machine-tool dealers here and elsewhere practically eliminate representatives of builders.

It is believed the Maine Central Railroad will close on its three tools, one of which is a driving wheel lathe, before the end of the week. While nothing authentic has been given out, it is the opinion that the Bangor & Aroostook, the Central Vermont and the Rutland railroads will take some definite action on their lists within the next month or two. Purchases against the Boston & Albany list probably will be extended over the entire year.

The inquiry of Gray & Davis, Cambridge, Mass., for special automatic machinery, involves large equipment and competition is keen. Prices for automatic equipment, on the surface, appear weaker than the ordinary run of machine tools. Certain makers of lathes, however, are willing to make concessions, provided the business warrants, and prospective customers report low prices have been named.

The prospect of a general strike in the cotton textile industry, as a result of a cut in wages, has resulted in a few withdrawals of inquiries for machine tools. The rubber mold making trade, on the other hand, is more active, most of the plants operating on full schedules and showing more or less interest in metal-working equipment.

The crane market is slightly more active. The Lanson Co., Boston, has purchased one 10-ton crane for its new New York State plant and a Rhode Island oil refinery bought two 2-ton cranes. Stone & Webster, Boston, are inquiring on one 15-ton crane with a 33 ft. span, three motor, for the Ford, Flat Rock, Mich., development.

The Rhode Island Malleable Iron Works, Halls Grove, R. I., will shortly erect a one-story, 67 x 252 ft., manufacturing unit.

The Hartford Electric Light Co., Hartford, Conn., has awarded contract for a one and two story addition, 80 x 160 ft., to its plant on Sheldon Street.

The Board of Fire Commissioners, New Britain, Conn., have plans for the erection of a repair shop to cost about \$6,500.

The Eastern Mfg. Co., Norwalk, Conn., has recently been incorporated under Connecticut laws to manufacture timer protectors, internal combustion engines, tools and equipment for motor vehicles. The capital stock is \$50,000 and the officers are Phillip H. Pickling, 20 Pleasant Street, East Norwalk, president and general manager, Frank N. Glover, vice-president and secretary, and Charles P. Pickling, treasurer.

The Clapes Brothers Garage Co., West Main and Virgil streets, Stamford, Conn., will erect a garage and service station on the Boston Post Road, one-story, 55 x 70-ft. It will contain a repair shop.

Fire, Feb. 5, destroyed a building at the plant of the Trumbull-Vanderpool Electric Mfg. Co., Bantam, Conn., with loss estimated at about \$20,000.

A vocational department will be installed in the new two-story high school at Palmer, Mass., estimated to cost about \$168,000. E. C. & G. C. Gardner, Springfield, Mass., are architects.

The George Grow Tire Co., 323 Columbus Avenue, Boston, has awarded a contract to Coleman Brothers, Inc., Boston, for a one-story, reinforced-concrete addition to its plant on Jackson Street, Canton, Mass., 41 x 101 ft., estimated to cost about \$50,000.

A vocational department will be installed in the proposed addition to be erected to the Salem, Mass., high school, for which an appropriation of \$250,000 is being arranged.

The Crompton & Knowles Loom Works, Harris Avenue, Providence, R. I., manufacturer of textile machinery, awarded contract to Bowerman Brothers, 230 Industrial Trust Building, for a one-story addition, 26 x 105 ft.

A one-story automobile service and repair building for company cars will be erected by the National Betting Co., 28 School Street, Boston, to be 75 x 133 ft., and estimated to cost about \$12,000. The F. J. Van Elten Co., 80 Boylston Street, is contractor.

A one-story steam power house, 26 x 42 ft., to cost about \$30,000, will be erected by the Fall River Gas Works Co., 21 Manton Street, Fall River, Mass.

The John Hugo Mfg. Co., New Haven, Conn., has recently filed a certificate to increase the capital stock of the company from \$50,000 to \$150,000.

Buffalo

Buffalo, Feb. 13.

The Chevrolet Motor Co., Flint, Mich., with eastern plants at Tarrytown, N. Y., has arranged for the erection of a new three story, reinforced-concrete branch on Delaware Avenue, Buffalo, totaling about 10,000 sq. ft. A portion of the building will be given over to assembling and other operations, and the remainder as a distributing plant. Elwood M. Harris is local manager.

The Pyrene Mfg. Co., Inc., 17 East Forty-ninth Street, New York, will operate a new plant in three buildings secured from the Wickwire-Spencer Steel Corporation, Buffalo, for the manufacture of tire chains. The organization will be known as the Off & On Chain Corporation, a subsidiary. It is proposed to concentrate all manufacturing at this point. O. H. Christie is local manager.

The Bolivar Refining Corporation, Bolivar, N. Y., has preliminary plans under way for the erection of a local refinery. Charles A. Chapman is president.

The iron and metal working plant of Hyman L. Lapides, Maple Street, Danville, N. Y., was partially destroyed by fire, Feb. 6, with loss estimated at about \$17,000.

A vocational department will be installed in the new high school to be erected at Corning, N. Y., to be known as the Corning Free Academy. Howard Greenley and F. H. Dewey & Co., Inc., 175 Fifth Avenue, New York, are architects and engineers.

The Pierce Arrow Sales Co., Buffalo, 1695 Elmwood Avenue, has acquired property at Main and Riley streets, 38 x 300 ft., for the erection of a building for service works and headquarters.

John P. Jackel, City Hall, Auburn, N. Y., city manager, has completed plans for a one story municipal automobile service and repair building, 38 x 119 ft., for city cars. M. J. Dolan, City Hall, is engineer.

Plans of New Companies

The Morrison Concrete Products Co., Pleasantville, N. J., has taken over the business and equipment of Horace Morrison for the manufacture of blocks, cast stone and concrete products in general. The company expects to build on a plot which it has purchased. Its present plant is in full operation.

The Automotive Appliances Mfg. Co., New Brunswick, N. J., is having all its work done by contract and has arranged all contracts with the exception of a small high speed lathe with electric motor. It is making a specialty of a patented oil cock for Ford cars.

Frank Harris Sons Co., Inc., 332 South Michigan Avenue, Chicago, has been incorporated in Illinois with power to purchase and liquidate plants of all kinds, properties, railroads, inventories, etc., and to carry on a general trading and merchandising business. The aim of this company will be to secure greater realization from assets than was heretofore obtainable through public auctions, private negotiations, etc. The company has a staff of merchandising experts in nearly every field, and will enjoy the benefits of co-operation with New York and Chicago financiers. Organizers of the company are Harvey L. Harris and Francis L. Harris, both formerly connected with Harris Brothers Co., Chicago.

Hennings Brothers & Smith, Inc., smelters and refiners of metals, Engert Avenue at Eckford Street, Brooklyn, have not yet perfected plans but expect to erect a building with about 10,000 sq. ft. of ground space. The company will be in the market for equipment by next spring.

The Philadelphia office of the Hauck Mfg. Co., manufacturer of portable oil burners, torches, furnaces, etc., has been moved to 1726 Sansom Street. Herbert Vogelsang, who has been connected with the company for six years, will be in charge.

Current Metal Prices

On Small Lots, Delivered from Merchants' Stocks, New York City

The following quotations are made by New York City warehouses.

As there are many consumers whose requirements are not sufficiently heavy to warrant their placing orders with manufacturers for shipment in carload lots from mills, these prices are given for their convenience.

On a number of articles the base price only is given, it being impossible to name every size.

The wholesale prices at which large lots are sold by manufacturers for direct shipment from mills are given in the market reports appearing in a preceding part of THE IRON AGE under the general heading of "Iron and Steel Markets" and "Non-ferrous Metals."

Iron and Soft Steel Bars and Shapes

Bars:	Per Lb.
Refined bars, base price	2.53c.
Swedish bars, base price	10.00c.
Soft steel bars, base price	2.53c.
Hoops, base price	3.88c.
Bands, base price	3.13c.
Beams and channels, angles and tees	
8 in. x 1/4 in. and larger, base	2.63c.
Channels, angles and tees under 3 in. x 1/4 in., base	2.53c.

Merchant Steel	Per Lb.
Tire, 1 1/2 x 1/2 in. and larger	2.50c.
(Smooth finish, 1 to 2 1/2 x 1/4 in. and larger)	2.70c.
Toe-calk, 1/2 x 3/4 in. and larger	3.20c.
Cold-rolled strip, soft and quarter hard	6.25c. to 7.25c.
Open-hearth spring steel	3.55c. to 6c.
Shafting and Screw Stock:	
Rounds	3.45c.
Squares, flats and hex.	3.95c.
Standard cast steel, base price	12.00c.
Extra cast steel	17.00c.
Special cast steel	22.00c.

Tank Plates—Steel

1/4 in. and heavier	2.63c.

THE IRON AGE

New York, February 23, 1922

ESTABLISHED 1855

VOL. 109, No. 8

Side Line Tides Foundry Over Depression

Sporting Goods Castings Kept Foundry Going—Showed
Considerable Increase in 1921—Application of
Special Metal to New and Difficult Field

BY MORRIS A. HALL

IT has often been said in jest, "If your business interferes with your pleasure, give up the business." Yet there is a great deal of truth hidden in that supposedly humorous remark, for, no matter how poor business may be, the business man seldom gives up his pleasures or recreations, especially the out-of-doors ones which help conserve his health. One foundry has learned this in the last two years, and has continued to do a fine business in a small side line, which happened to be of a sporting nature, when all other business fell off or was canceled because of dull times.

This foundry is that of the Monel Metal Products Corporation, Bayonne, N. J., a subsidiary of the International Nickel Co., and the active agent for pushing the latter company's natural copper-nickel alloy. This metal is not an easy one to handle, and the plant is primarily a laboratory for the purpose of finding out all there is to know about the metal, its melting, molding, casting, and general handling and use, and is actively engaged in disseminating this information. Incidentally, in seeking new fields of use for the metal, the

plant takes in a considerable amount of job foundry work in monel metal, and some in nickel.

In seeing new fields for the metal and more work for the foundry, golf club heads were tackled several years ago. It is a well-known fact that the advanced golfer is very particular about his clubs, especially his irons. In caring for these, however, it is found that they rust easily. This is probably due to the fact that, in use on the links, they become wet or damp, with no means of drying them until the club house is reached an hour or two later. When the iron has rusted, it can be cleaned up only by buffing, or grinding and buffing, according to how badly it has rusted. This process changes the size and shape, and with it the hang of the club, for no matter how minute the amount of metal taken off, several repetitions of this treatment make an appreciable difference.

Monel metal is both rust- and acid-proof, consequently it fits well into this service. Moreover, it has a nice white color, not unlike silver, which gives it a good appearance. As it is hard, like steel, it wears well;

Cope and Drag Molds for a Group of Six Golf Club Heads; in the Foreground is Another Drag Mold with the Pattern and the Gate Pattern in Place

as it is strong, it will withstand the hard knocks equally as well as steel heads. In addition, it is slightly more resilient than steel, so that the ball will leave a monel metal head "clean," and with just the right "feel."

If desired, it can be given a very high polish, and when polished, it will retain this beautiful surface sheen much longer than other metals. When given its normal dull finish, that of a razor or of a nickel piece

Group of Twenty eight Representative Golf Club Heads
Made in Monel Metal

after some use, it can quickly be restored by the use of soap and water, or by rubbing with sand.

The fact that it is a cast metal, and when cast has the properties of forged steel, makes it possible to duplicate any head or to copy the best imported forged heads from the leading Scotch cleek makers, without variation, quickly and, comparatively speaking, cheaply. Granting all these qualities, it was simply a matter of getting golfers to try the new metal, when it was at once established as satisfactory. Since that happened, several years ago, the plant has been making these heads in considerable quantities for a New Jersey firm, which finishes them up in final club form with handles, and markets them.

This business has grown slowly, but surely, and now has reached the point where it forms a considerable portion of the work done. Moreover, it has not dropped off during the recent dull times. In fact, some 35,000 of these heads were turned out in 1921, up to the middle of September, with the business continuing so strongly as to indicate the year's total at above 45,000. For 1922 the company expects to turn out about 60,000. In 1920 the number was very much less.

This could hardly be classified as "tonnage," for the heads average 0.6 lb. each. This makes a gate of six of them, with very large risers and wide gates, total less than 10 lb. One illustration gives an idea of the wide variety of the styles which are being made now; these 28 shapes, however, do not represent all that are made, as new shapes are constantly being added as demand develops for them. As has been said, the metal is not an easy one to handle, but so many of these golf heads have been turned out from the plant that valuable experience has been gained and they are now handled very readily, cheaply and quickly.

It has been found that this metal gives the best results only with baked molds, as well as baked cores; but in very small articles, weighing a pound or less, such as these golf heads, the molds are made in green sand. A complete mold is shown ready for closing; in the background at the right is the cope, at the left

the drag, and in the foreground another mold with the patterns in place.

While cast as a gate, these patterns are individually not gated, so that it is possible to change the shapes very quickly. A new pattern is simply substituted for the one which is least wanted, and the molding goes on exactly as before. In molding the metal, very wide gates and many large risers must be used, because the metal is not easily held in a fluid state. It has to be heated to 3000 deg. Fahr. in melting, but does not hold this high temperature for any length of time, and must be poured quickly. Hence the molds are made up with wide gates and easy bends, so as to lead the metal to the molds quickly, while still hot. This can be noted in the pattern for the gate, used for quickness and convenience, to be seen in the front of the cut, and also visible in the cope at the rear.

Another photograph shows a front and a rear view of a gated group of golf heads, where the gates will be noted to be practically as wide as the widest part of the molds. The large amount of metal in the gates and risers, approximating 50 to 55 per cent of the total metal, will be noted, as well as the size and shape of the leads from the main gate to the individual patterns, very short, wide and with easy bends, to lead the molten metal to place quickly.

The metal is poured from ladles holding 100 to 150 lb., after pouring and deoxidizing with magnesium, using 1½ oz. per 100 lb. This is a continuous process, as many molds being poured each heat as are ready for pouring, and the molding going on continuously. They are bench molded, and are rammed up by hand.

After castings, like those shown, are ready, the excess metal of gates and risers is cut off, and is cleaned before being charged back into the furnaces. An average furnace charge is 40 per cent scrap and 60 per cent new metal. The cutting off is done with a very fine alundum wheel for this small stuff, but large risers are

Front and Rear Views of a Complete Gated Group of
Six Heads, Showing the Unusual Width of Gates and
Size of Riser

cut off with the oxy-acetylene torch. After cutting apart, the individual castings are ground to a clean, smooth surface.

This is rather a nice job, because the shape as cast closely approximates the shape desired, and only enough metal should be taken off to produce a smooth, even surface. Special holding fixtures are not used, since this would run the expense up too high, but these are approximated by holding the heads in formed soft pine blocks, and grinding them while so held. These blocks are 4 x 3 x 1½ in., this being large enough, on the one hand, to receive the golf head, and a good size for the workman, on the other.

The head is slipped into a block and held up to the grinding wheel and the grinding completed as quickly as possible. But this is not an instantaneous process, as one might think, for the surface is quite hard and

a number of applications are necessary. One photograph shows this work, with a supply of the partly ground heads visible at the right, and, at the left, some of the wooden forms for holding them in contact with the wheel. As this view shows, a large and wide wheel is used, this being a Norton alundum, 14 x 2½ in., grain 29, grade 2. The operator soon acquires great skill in producing the required smooth surface without

Simple and Quick Method of Grinding Golf Club Heads to a Commercial Finish by Use of Wooden Holding Forms

taking off much metal, and this, in turn, becomes a factor in turning the heads out quickly and cheaply.

After the grinding is completed, the socket for the handle, which has been cored out slightly, is reamed. For this purpose a special taper reamer is used and the heads, which usually have a very mean shape with nasty angles, are held in a special vise with hinged jaws. Both the reamer and the vise can be seen in one view, a drill press being used for this work. The heads are slid into the vise from below, a turn of the handle catches them, the drill press arm is drawn down, moving the reamer into the cored hole. A little more pressure, and in a second the socket is complete. In this form, the golf heads are completed so far as this plant is concerned, and are ready for delivery to the sales agents, who fit the handles and distribute them.

As can be seen, this small part, forming very much of a side line in the beginning, and still not important from a tonnage basis, has nevertheless kept the plant turning over through the dullness of 1920 and 1921, and bids fair to go even further in 1922. The number of heads in 1921 will show close to 40 per cent increase over 1920, and the present estimate for 1922 shows a further increase of about 35 per cent. Considering general business conditions and these figures, we have to go back to our starting point for an explanation that business may be poor, but certain sports or recreations go on forever. A good tip for foundrymen, taken from this instance, would be: "in dull years, get into some form of sporting goods production."

T. E. Keating, general engineer of the Westinghouse Electric & Mfg. Co., presented a paper before the Cleveland section of the American Institute of Electrical Engineers Feb. 21, on "Power Plant Economics with Special Reference to the Steam Turbine."

In 1921 the United States imported 3,365,732 tons of manganese ore, 1,952,848 tons coming from Brazil, 734,516 tons from British India, 965 tons from Japan, 679 tons from Cuba and 676,724 tons from other countries.

Railroads of Japan

An annual report for the year ending March 31, 1919, with supplementary data for the following year, has just been issued in English by the Department of Railroads of the Government of Japan. This consists of a book of 116 pages, 8½ x 12 in., and includes a large amount of tabulated data concerned chiefly with the financial operation of the state railroads. Some attention is paid also to the privately operated railroads and tramways in Japan. A folder in the back contains a comprehensive map of Japan with the railroad systems clearly outlined.

Some of the outstanding features in the 1920 report include the railroad extent as 6133 miles, the train mileage as 77,222,058, and car mileage as 1,644,562,327. This works out at 21.1 cars average per train and at 26,815 car miles per mile of line. It shows also 1259 train miles per mile of line. Passengers to the total of 357,881,957 were carried a total distance of 7,942,632,396 miles, or an average journey of 22.2 miles. Freight to the extent of 59,933,535 tons was carried an aggregate of 6,293,798,261 miles, or an average of 105 miles per ton. This works out at 1,311,000 passenger miles and 1,026,000 freight ton miles per mile of line.

Small cars are the rule, for the aggregate capacity of the 51,067 freight cars is 570,192 tons, or 11.17 tons per car, on the average. And the average number of passengers carried per car is but 14.8, there being an average of 13.6 cars in each passenger train. Locomotives number 3120, with an aggregate weight of 194,655 tons, or an average of 62.4 tons each.

Labor Efficiency Related to Hours of Work

Labor efficiency, in a statement by the American Engineering Council, is said to be higher with three 8-hr. shifts than with two 12-hr. shifts. This is the conclusion of a committee on work periods in continuous industries, with special reference to the steel industry. Investigations thus far have been to a great extent

Swivel-Jaw Vise and Special Taper Reamer Used in Drill Press to Ream Out Sockets to Fit Handles

outside the steel industry. There are said to be from 40 to 50 industries involving a certain amount of continuous operations, and, as a class, these industries underlie a large portion of our industrial fabric.

As there are still a great many plants operating with 12-hr. shifts, the matter of fatigue and labor efficiency assumes importance. It is estimated that the number of shift workers in the United States is somewhere between 500,000 and 1,000,000. It is also estimated that the number of men on 12-hr. shifts in the period preceding the depression was about 300,000. About as many of these were outside the steel industry as were in it, and, as might be expected, the results in efficiency of working have varied enormously in different plants, depending upon conditions. It is stated that in most of the plants which have recently changed from two shifts to three, efficiency was not greatly improved, due to unfavorable labor conditions.

TAKING INITIATIVE IN BUYING

Importance of Knowing the Market Where to Get Machines, Supplies, Men

BY JOHN J. RALPH

With the realization that purchasing is an opportunity, that the neglect to buy costs money and that unwise buying is inexcusable, there logically follows the realization that the initiative should be taken by the buyer and not by the seller. The tenseness of the conditions of the past six years has added appreciation to the importance of buying, but not particularly to the betterment of the technique. There developed a realization that buying was a necessity its perfection was assumed to be simply a lengthening of the purse at the buyer's disposal.

There has grown up in our popular business literature a curious appreciation of love and sentiment in the relation between buyer and seller. At times this has been quite pushing. Just a little common sense. There is but one real long time basis for relations between buyer and seller:—"The biggest possible re-sale value for a dollar." That is all, just simply value that we can pass on to those who buy from us.

Another bit of cynicism—"Loyalty, like gratitude, is a lively expectation of favors to come." There has been a rather naive feeling that loyalty of the buyer meant coming back as a customer regardless! Nay, nay. True loyalty, like parental love, chasteneth.

It is due to the seller to bring it sharply to his attention when he has failed to come up to or beyond the average. There has grown up a system of extraneous services which have been and are very costly. The buyer has paid for them. When the use of automatic and semi-automatic machinery, and high capacity cutting steels, was in its infancy the services were justified. To-day, he who demands them pays for them and they should not be a general charge on all buyers.

No buyer is interested in anything in his purchase that he cannot sell. Any other service his dollar buys is sheer waste, from a profit standpoint.

Determination of Needs

One of the largest expenses of the seller is that of searching for business and selling. Just as those who buy from you must pay for this, so do you pay for the expense to which those who sell to you have been put. This is particularly interesting, because that additional expense is an item for which there is no tangible equivalent, but which must be passed on to the next customer. If your competitor has found a way to eliminate this, there is only one fund to pay it from—the profit account.

Day after day salesmen tell customers: "If you need it, you pay for it, whether you get it or not." Perfectly logical, is it not? If the material being sold would save them money, they are paying for it and more too—and the profit account shows the loss. If the machine offered is needed, but not bought, the operating and capital account show the expenditure, but inventory and profit account are shy.

Day after day salesmen are saying it to you. And they are proving it. Sometimes it takes three, four, five, even twenty years to prove it. Talk to your own salesmen about their experiences, and check back on that last piece of apparatus purchased, that proved up so handsomely, and see when it was that the salesman handling that line of machinery first approached you on the subject!

You finally came to it and are now enjoying the fruit of it, but how are you going to get back the profits lost through not buying when you first needed it?

Knowing What the Market Affords

The market? How many of us have any realization of the extent of the available supply?

In a little village in Massachusetts is a real buyer. For twenty years he had patronized a small section of the earth for a certain material. He bought in New

York from one of three or four jobbers, who in turn bought from three or four German firms. Without doubt they were his best suppliers. For years they had faithfully met his requirements. Having a canny knowledge of the world, and being a real citizen of it, he knew what was happening in 1914, and went into the markets of the world.

Two years later he showed me curiously marked and odd sized barrels and boxes from the interior of China, from India, from Honduras, from Spain, from the Dutch East Indies. Yes, and there were packages which came from New York and California, from Canada and Mexico, and from all between.

Have you asked your salesmen to tell you of their experiences from 1914 to 1921? How purchasing agents, superintendents, owners, came to them seeking this and that? Asking how certain operations could be done. What machines would do the work best, what substitutes could be used for some material to obtain this effect or that? In New York men ran around with rich contracts in their hands, eagerly hunting for men to take them. Some paid three and four prices for second-hand machinery, and begged for supplies.

That was the test of the advancement of purchasing art in this country. Overloaded and at sea, forced to listen to wild demands, and wildly searching for assistance, much of our purchasing talent lost its head and neglected the commonest assistance. Ask your salesmen what purchasing agents they assisted, just by searching the index of THE IRON AGE and turning to the proper page.

Do they remember how cordially they were thanked, and how their word was taken as that of a priest, when they gave information about some other fellow's line—and the dark looks of suspicion when they told of machine capacities, delivery situation and probabilities in their own line?

Conditions have changed. No more do salesmen avoid factories because they cannot make deliveries. Once more they are combing the highways and byways for business. It is once more a buyer's market, but the necessity of purchasing is not relieved. Nor are the rewards of intelligent buying less than they were.

To-day's Opportunities

As the market is world wide, competition will be world wide. Sellers and buyers do not fully realize this. As sellers, how many of us look out of the beaten path for business? How many have considered going away from home to supply other needs? How many have investigated other industries, and far away sections of this country, to see what they have and want?

Who sells us, and from whom do we buy? Do we know what this country affords in materials? Do we know from whom they are to be obtained? Do we know the relative values of materials of different kinds? Do we know the trade practices, how they work to our advantage and how to our disadvantage?

If the foundry now supplying your castings burns up, and your patterns with them, do you know who could turn out patterns for you in the shortest possible time, and whom you could call upon to deliver castings of superior quality?

Suppose the "Old Man" were to bring home a contract to make a new line of machinery, to fit a new mill, to be running before the sugar cane is ripe.

Where will you get the extra drafting and design talent? Who has equipment and shop facilities you can use to supplement your own? Who can supply the special materials necessary in this work? How will you go about to obtain the information you do not know?

How can you send out information of your wants to the concerns specializing in supplying materials for this work—concerns of whom you have never heard?

How will you check up to find the reliability of your new suppliers?

It is not a repeat order. It is a chance to make a single profit, and to fill in the present gap in production, he has seized. Some additional machines will be needed. Second-hand ones will do. Who has them? Where can you find out about them? Who is reliable?

French Investigation of Rail Failures

Causes of the Increasing Number—Effect of Exfoliation —Rapid Corrosion of Rails—Segregation and Poor Quality Metal

IN *Le Genie Civil* for Nov. 19, there is an article taken from a paper on rail failures by the eminent French investigator, Charles Fremont, who was led to carry out this work because of the frequency of rail failures in France. It is estimated the number in France is 2500 to 3000 per year. Records show also

detached, leaving a fissure which gradually increases and divides the head of the rail, as shown in Fig. 2.

The question arises whether the exterior fissures are the cause of the interior cavity or, on the other hand, whether the interior fissure is not formed first and finally reaches the surface. To determine this,

Fig. 1—Exfoliation or Scaling of French Steel Rails

the number to be increasing, on some systems such as the Midi and L'Est, at a rapid rate. The rapid corrosion of certain rails in tunnels he finds to be due to the presence of non-metallic inclusions in the metal. This corrosion is also a cause of rapid wearing away because it reduces the useful rolling surface.

Exfoliation of French rails is shown by the samples in Fig. 1, which exhibit this scaling in different degrees. At the beginning small longitudinal fissures are seen on the running surface. These fissures elongate and join. Often only one line is seen, as shown in the third sample, then later a second line at a distance usually of 1 or 2 cm. Sometimes these two lines appear at about the same time, the part between them is gradually

Fig. 2—Formation of Surface Fissure and Split Head

Fig. 4—Blister from a Pipe

Fig. 3—Large Interior Cavity in French Rail

cross sections show that wherever the exterior fissure is found, even when very small, an interior cavity is always present; and sometimes wide cavities are found, as shown in Fig. 3, which have not yet reached the surface. The beginning of such a defect is then always in the interior of the rail. In cases where not sufficient discard is taken the pipe is reduced to a fissure. Fig. 4 shows the section of such a rail in which this fissure, enlarged, has formed a blister in the web. In other cases the internal fissure, especially that in the head, does not come directly from the pipe cavity. After etching the section it is seen, Fig. 5, that the fissure passes through several nuclei of impurities. In this case the fissure is produced by the effects of shock

from the passing trains. Mr. Fremont believes it comes from segregation of the metal and depends on the distribution and composition of this segregation.

The distribution of this segregation in the heads of the rails takes widely variable forms. Sometimes it is condensed in a central compact zone distinct from the sound metal. At other times the central zone is surrounded by nodules of small nuclei. It may be divided into secondary nuclei. Finally the heads of many rails are spoiled by the presence of a zone of

ticular to this rail, and finally caused failure. Experimental tests would indicate that the fissures travel from one small nucleus of impure material to another, as shown in Fig. 8 of heads fractured in service.

After a further discussion of the matter Mr. Fremont believes the exfoliation or scaling of the rails to be due to bad initial quality of the steel, and not to fatigue of the metal brought about by cold work, as has been sometimes suggested. Careful tests with a specially designed hardness measuring device show

Fig. 6 (Above)—Interior Cavity Passing Through Nuclei

Fig. 8 (Right)—Rails Fractured in Use

FIGS. 6 and 7 (Right)—Upper Is a First Fissure at Central Nucleus; Lower Is a Fissure at Periphery of Central Zone. Both are reduced one-half from an original magnification of two diameters

blowholes parallel to and a little distance below the surface.

All these zones of impurities, almost concentric, are the cause of various defects. Figs. 6 and 7 give two examples of failure in which the influence of the central zone can be seen. Fig. 7 shows a central nucleus of good material, but surrounded by a segregated zone, from which emanate the radial fissures that are par-

that the cold worked material on the head only extends in 0.14 mm., and even with a softer rail the depth was only 0.23 mm.

The article closes with a description of superficial quenching of the metal of the rolling surface, as mentioned in a recent report by Mr. Howard, and the danger of the cracks in this hardened layer extending through the rail if the metal is not sound. G. B. W.

Budget of the St. Louis-San Francisco Railway Co.

The budget of the St. Louis-San Francisco Railway Co. for 1922, providing for considerable buying, has just been completed. President Kurn, writing to THE IRON AGE, says:

"Our 1922 budget does not provide for any additional locomotives, but we do contemplate purchasing eight 70-ft. all-steel coaches and six 70-ft. all-steel chair cars, which equipment is to be used in two of our important through main line trains.

"We propose to lay approximately 185 miles of new 90-ft. rail, but all of this rail is on hand or contracted for.

"On shop tools and machinery we figure on expending approximately \$200,000, most of which is in the nature of machinery for maintaining equipment and consists of engine lathes, traveling cranes, steam hammers, forging furnaces, and miscellaneous mill shop machinery. The largest single item contemplated is the erection of a 200-ton electric traveling crane at our West Shops, Springfield, Mo. This crane will enable us to handle our Santa Fe type locomotives much more economically than at the present.

"So far as additional shop buildings are concerned, we have nothing in mind for the present year except a few minor extensions to round houses.

"We propose to do considerable grade reduction at Crocker, Garnsey and St. John, Mo., where grades will be reduced for a distance of 1.62, 1.50 and 3.57 miles respectively at an estimated cost of \$675,000, and we also contemplate the construction of 4.75 miles of second main track from Windsor Springs to Valley Park, Mo., which will give us double track from St. Louis to Valley Park, where our traffic is exceptionally heavy, due to the number of regular freight and passenger trains and suburban trains which operate in this territory. Between Spring Hill and Paola, Kan., a distance of 12.7 miles, we are going to construct the second main line which will give us double track from Kansas City to Paola. Our traffic in this territory is exceptionally heavy, due to the M. K. & T. using our track between these two points. We have already asked for bids from responsible contractors on the two pieces of double track and the three pieces of grade revision."

A joint convention of the Indiana State Sheet Metal Contractors' Association and the National Sheet Metal Contractors' Association will be held May 15-19 at Indianapolis, in the Cadle Tabernacle, a building that seats 10,000 persons. One of the features will be the sheet metal products exposition. All of the space for the exposition has been taken. Joseph Mattingly, president of the Indianapolis association, is one of the committee on arrangements.

Operation of Oil-Burning Steam Plants

Discussion of the Plant Characteristic Diagram, with Particulars Regarding Its Use in the Establishment of a Standard of Performance and in Increasing Plant Efficiency

BY C. H. DELANY*

TEN years ago there were many plants operating reciprocating engines, in which the maximum performance obtained was not over 150 kwhr. per bbl. of oil. With the high-pressure steam-turbine plants of to-day a record of 330 kwhr. per bbl. has been made. This increase in efficiency has been brought about by introducing more efficient machinery and increasing the range of steam pressure in the prime mover. The introduction of the steam turbine to replace the reciprocating engine effected a remarkable saving in fuel. Moreover, the steam turbine caused a saving in operation due to the fact that its operation does not depend on the personal element in the plant.

In reciprocating engines there were many adjust-

ments to be made by the engineer in charge, and the economy obtained depended very largely on his skill and the care with which he made these adjustments. With the steam turbine, however, there is nothing that the operator can do to improve the efficiency, after the machine is once installed and placed in good operating condition. While this is true as regards the prime mover, it is not true in regard to many other features of the power plant.

Plant Characteristic Diagram for a San Francisco Station

ments to be made by the engineer in charge, and the economy obtained depended very largely on his skill and the care with which he made these adjustments. With the steam turbine, however, there is nothing that the operator can do to improve the efficiency, after the machine is once installed and placed in good operating condition. While this is true as regards the prime mover, it is not true in regard to many other features of the power plant.

In the boiler room, particularly, there are many points where the operating engineer can effect a saving if he carefully studies the situation and pays attention to the small details. In condensers and vacuum pumps also a great saving can be made if proper attention is paid to maintaining a high vacuum. There is still, therefore, a large field for the operating engineer in improving the economical operation of the plant, and the question of operating efficiency is consequently one worthy of careful study.

Many tests have been published showing high efficiency of boilers fired with fuel oil, efficiencies as high as 80 and 82 per cent being not uncommon in test reports. It is very rare, however, that any such high efficiencies are obtained in the regular operation of power plants. To maintain high efficiency in regular operation, the first requisite is some means of comparing one day's operation with another.

In oil-burning electric power plants it is customary to report the economical operation of the plant in terms

of kwhr. generated per bbl. of oil. This is an excellent method of comparing one day's operation with another, provided there is steady load on the plant and conditions remain the same from day to day. With a variable load, however, such as occurs in an ordinary central-station plant, it is always found that the economy is much better at periods of heavy load, and poorer at periods of light load. Thus it is possible, with a fairly heavy load on the plant, to secure from 220 to 230 kwhr. per bbl. of oil without difficulty, whereas with the same plant operating at a light load, it may be difficult to secure more than 150 kwhr. per bbl. of oil.

When the good results are obtained with the heavy load, the operating men consider results better than the average. On the days of light load, when the results are poor, they do not worry but say, "What's the use, you can't expect any results with such a light load." Thus in neither case is there any incentive to improve the economical operation.

Another reason for more or less lax methods, so far as efficiency is concerned, is the fact that efficiency must always be secondary to continuity of service. The men know that any interruption to service will be a matter of close investigation on the part of the management, and they devote all of their energies to maintaining the plant in operation and keeping the lights burning. For instance, if a fireman in endeavoring to adjust carefully the air supply in his boilers neglects to keep up the steam pressure, with the result that the turbine slows down and some of the load has

Plant Characteristic Diagram with Scale Altered to Show Results Obtained on an 8-Hour Shift

to be dumped, he is sure to be called on for an explanation. If, on the other hand, he keeps up the steam pressure, but neglects to regulate the air in the proper proportion, there usually will be no complaint; and the boilers may be allowed to operate in this inefficient manner for a considerable length of time.

The author is far from disputing the fact that continuity of service is a matter of prime importance, but he does wish to point out that efficiency is a close second. The problem before us, therefore, is so to interest the operating men in the matter of efficiency that they will not neglect the various operating details that must have attention to secure good results.

To improve these conditions and to interest the men in the problem of efficiency, it is essential to devise

*Pacific Gas & Electric Co., San Francisco; abstract of a paper presented at a joint meeting of the San Francisco sections of the American Society of Mechanical Engineers and the American Institute of Electrical Engineers.

some means of comparing the performance of a plant from day to day. For this purpose, the diagram here called the "plant characteristic diagram" has been plotted.

Such a diagram, as shown for one of the San Francisco stations, consists merely in plotting the oil consumption against the kwhr. generated. Each point in this diagram represents one full day's operation, and while the points as shown are more or less scattered, it is apparent that they form a well-defined line. It is thus possible to draw a straight line through the midst of these points in such a way that it will represent the average location of all points in the diagram.

Use of Diagram as Standard for Guidance

Having once been drawn through the points as described, the diagonal line may be used as a standard

Diagram of Operating Efficiency of a Plant Over a Two-Months' Period

for the guidance of the men in future operation of the plant. Thus each day the kwhr. generated and the oil burned the day before may be plotted on this diagram. If the point so plotted falls below the diagonal line, it is evident that the results obtained are better than the standard. If the point falls above the line, too much oil has been used, and something requires a special investigation. Since the diagram takes in all loads from zero up to the full load on the plant, it allows for the poor economy obtained at light loads. It is thus possible for the operating men to know immediately whether they are keeping up to the required standards of efficiency or running behind. They can therefore investigate causes of low efficiency immediately, while all matters entering into the plant operation are fresh in their minds.

In adopting the standard it would be possible, instead of drawing a line through the average of the points, to draw a line through the best points, thus establishing a standard that would represent the best results yet obtained from the plant. Again, it would be possible to establish a higher standard by drawing a theoretical line below all of the points, this line to be based on the steam consumption of the turbines and auxiliaries, as determined by tests, a boiler efficiency of, say, 80 per cent and the best possible vacuum; in other words, a line representing ideal conditions.

In adopting the average line as the standard it is felt that the men will have greater confidence in the method than if a theoretical line had been adopted. The average line is really a standard that has been established by the men themselves. It is not an arbitrary ideal impossible to attain, but as it represents the average already attained, it should be as easy to improve on the results represented by the line as to fall below them.

If the men are successful in improving on the standard each day, it is obvious that the average for a given year will represent better efficiency than the average for the previous year. With all of the points falling below the line on the diagram, another line drawn through the average of these new points would also fall below the original line.

A similar diagram, but with the scale altered so as to show the kwhr. generated and the oil burned during a period of 8 hr. instead of 24 hr., may be used by the different shifts in the station, so that each shift can check up its own performance and compare it with the performance of the other shifts. A large diagram of this form is posted on the wall of the fire room, and

different colored pins to represent the different shifts are inserted each day, so that the diagram shows at all times which shift is running above the line and which below it. This system has a far-reaching effect in awakening interest, and leads to such rivalry and competition to improve the efficiency that the laxity which previously existed is disappearing.

Operating Efficiency Determination

There is one objection to the diagram—it does not indicate the order in which the records are plotted, and therefore does not show whether the results are improving as time goes on.* To overcome this objection, and also to enable the operation of different plants to be compared with each other, the term "operating efficiency" has been introduced. Operating efficiency as used in this connection means the percentage of standard attained for the day's run. "Operating efficiency" is entirely distinct from "boiler efficiency" or "turbine efficiency" or "thermal efficiency" or "Rankine-cycle efficiency." All of these enter into the operation of the plant in determining the standard. Operating efficiency is merely a comparison of the results, actually obtained, with the standard.

Determining operating efficiency can best be shown by an example: During one 8-hr. shift there were generated 313,000 kwhr., and 1440 bbl. of oil were burned, representing 217 kwhr. per bbl. From the diagram it is found that for a load of 313,000 kwhr., with standard efficiency, there would be burned only 1400 bbl.

Power Used by Electric Auxiliaries in a Station, Plotted Against the Total Generation

of oil, which would be equivalent to 224 kwhr. per bbl., as against the actual result obtained of 217 kwhr. per bbl. The operating efficiency is therefore 97 per cent. During another 8-hr. shift, where there were only 25,000 kwhr. generated, the oil burned was 200 bbl., equivalent to 125 kwhr. per bbl. From the diagram it is found that for 25,000 kwhr. with standard efficiency the oil burned would be 220 bbl., equivalent to 114 kwhr. per bbl. This operating efficiency is therefore 110 per cent. It is thus seen that, although in the second case there were only 125 kwhr. per bbl. obtained, as against 217 in the first, the operating efficiency was actually higher in the second case.

This method of determining operating efficiency makes allowance for inefficient machinery, for it is just as easy to obtain 100 per cent operating efficiency in a plant having old-fashioned turbines of poor design as in a plant having the most up-to-date machines, for the standard is based on the actual records of the plant itself.

One chart shows operating efficiency plotted for

*There is a second: it does not distinguish between a day or shift during which the average kwhr. and the maximum kwhr. are nearly the same, and one during which they vary heavily. In the former case the results should be much better than in the latter.

each day during the months of January and February. In this diagram, the horizontal line at 100 per cent represents standard efficiency, and the zigzag line the actual operating efficiency obtained each day. The records show a gradual improvement during the period, which is a direct result of the attention to small details brought about by this method of checking up efficiency.

Since the diagonal line in the plant characteristic diagram is usually a straight line, it can of course be represented by a simple equation, namely:

$$y = a + bx$$

where y is the oil consumption in a given period in barrels or pounds, x the kw-hr. generated in the same period, and a and b are constants.

Evidently the constant a is equal to y when $x = 0$. In other words a represents the quantity of oil burned for zero load; that is, the amount required to keep up steam on the boilers, keep the turbine running up to speed, operate the vacuum pumps, circulating pumps and other auxiliaries, and keep the entire plant in readiness to take on load at a moment's notice. Obviously a will be larger if two turbines with their auxiliaries are kept in operation than only one, so that its value depends on the amount of load the plant is expected to take on. Where a plant is operated as a standby to a hydroelectric system and is kept in readiness to pick up its full load instantly in case of trouble, a will have a higher value than where it is possible to shut down the turbines gradually, one after the other, as the load falls. The constant b evidently represents the additional amount of oil burned in proportion to the load carried on the plant. It determines the slope of the line in the diagram, and is large for uneconomical turbines or engines and small for the most efficient types. The equation of the line for an 8-hr. shift, in terms of barrels of oil and kw-hr., is

$$y = 120 + 0.0041x$$

Other Uses of the Diagram

The diagram may be used for many other purposes besides the overall efficiency of the plant. By plotting the steam generated against the oil burned in one diagram, and the steam consumption against the kw-hr. generated in another, it is possible to study the boiler-room and engine-room operations separately, and thus quickly locate the cause of low efficiency. By setting separate standards for the boiler-room and engine-room crews, responsibility can be more definitely fixed, and the advantages of the system of operation greatly enhanced.

Since boiler efficiency usually decreases rapidly as the load increases above the boiler's rating, a single boiler will naturally have a curved characteristic. In a plant containing a large number of boilers, however, the boiler-room characteristic will be approximately straight until the load exceeds the economical capacity of all the boilers in the plant, after which it will begin to curve upward. A curved line, based on previous performance, is just as satisfactory as a straight line for setting standards and calculating operating efficiency in the manner described. A last diagram shows the power used by electric auxiliaries in a station, plotted against the total generation, and is of interest in showing that the points do form well-defined straight lines, and that the same methods may be used for standardizing these items as for fuel consumption and steam consumption.

To sum up, the essentials for securing the best efficiency in power-plant operation are:

1. A fair standard by which the daily performance can be measured and compared with previous results, at the same time giving the operating men a definite goal to which to work.
2. Means of comparing results obtained by different groups of men, such as different shifts of one plant or the crews of different plants, and the posting of this comparison so that the men can see the results of their efforts.
3. A system of reports that keeps up the interest of the men, combined with suggestions and advice that show where losses occur and how they may be avoided.

If the operating men are kept interested, see the

results of their work, and have a definite standard to reach, they will do their best. As interest flags, some sort of bonus or prize for the crew showing the best operating efficiency will stimulate them to greater effort, and by guiding this effort by means of thoughtful analysis of the technical features of the power plant, maximum efficiency may be obtained.

New Chain Pipe Wrench

An improved chain pipe wrench made in seven sizes for pipe and fittings from $\frac{1}{4}$ to 16 in. in diameter is being offered by the Armstrong Brothers Tool Co., Chicago. The illustration shows the wrench equipped with flat link chain; cable chain is also supplied.

The improved design is intended to eliminate some of the weak points of the usual tool of this kind, especially the tendency of the jaws to work loose on the bar, resulting in spreading of the rear end of the jaw and wedging of the chain. Increased bearing of jaw sockets upon the bar, combined with two hardened chrome-nickel steel bolts are said to effectively hold the jaws in place under the most severe usage. The rear

Improved Chain Pipe Wrench

bolt is located directly under the chain socket where the spreading strain is greatest.

Chain guides are provided on the jaws. The handles are forged from high carbon steel and the jaws are drop forged from special steel, treated and hardened.

New Eye Protector

The goggle shown in the illustration is a recent addition to the line of eye protectors offered by the Chicago Eye Shield Co., Chicago. It is known as style No. 220 and is intended to permit of unusually wide range of vision and comfort.

The special features are the lens-retaining bar which is locked with the headband and the collapsible

The Lens Retaining Bar Is Locked with the Head Band

and adjustable nose bridge which permits adjustment of the goggle to the correct pupillary distance of the wearer. The goggle is regularly furnished with a rubber binding which provides a smooth bearing against the face.

Eriessons Monitor to Be Commemorated

A DeLamater-Eriessons commemoration, with the unveiling of four bronze tablets, will be held March 9, the sixtieth anniversary of the battle between the Monitor and the Merrimac. One of these tablets will be fixed to the site of the residence of Captain Eriessons, Beach Street, New York, with the ceremony in charge of the American Society of Swedish Engineers. Another will be raised on the site of the Phoenix foundry, where some of Eriessons work was done; another at the Cunard pier No. 54, the site of the DeLamater Iron Works, and the fourth at the Continental Iron Works, Brooklyn. A banquet will be held at the Waldorf-Astoria Hotel, New York, and a simultaneous banquet will be held in Stockholm, Sweden. Further information may be obtained by applying to H. F. J. Porter, of the DeLamater-Eriessons Commemoration Committee, Engineering Societies Building, 29 West Thirty-ninth Street, New York.

Disintegration of Blast Furnace Linings

Split Furnace Shells Undoubtedly Due to Expansion of Zinc-Impregnated Linings—Remedies Suggested

BY PAUL O. MENKE*

WITHIN recent years blast furnace men have become more or less alarmed over the repeated failures of blast furnace linings. In some districts it is no uncommon occurrence to burst furnace shells; in fact it became such a regular thing at one plant, that it has led to the design of a very ingenious banding lug for banding shells whenever they show signs of giving way. The first few failures were confined to a certain well known brand of steam pressed brick. Shortly afterward, other well known and popular makes of furnace linings began to give out. All of these early failures were confined to steam pressed linings, but recently there has been found disintegration in some well known hand made linings. The probable reason that the failures have not been more numerous in the hand made brick is on account of the popularity of steam pressed linings.

Poorer Brick Not Wholly Responsible

There is no doubt that the quality of most of the popular brands of fire brick has greatly deteriorated during the last five or six years, principally due to careless and inefficient labor, over which the maker had no control, but some of this is probably also due to mixing in some inferior clays. The proportion of plastic clay was increased beyond the usual ratio. The flint clays were ground finer in order to make a nice looking brick; in fact most of the furnacemen in recent years have laid too much stress on getting a smooth, nice looking fire brick that would lay up with minimum cutting and labor. Nevertheless, all of these changes do not account entirely for the trouble.

Early last year, while visiting a large Eastern plant, the author's attention was drawn to some shell failures. Some of these were light shells, but one of them was built out of 1 in. plate, well riveted and butt strapped—in every way a first class job. It had a steam pressed lining laid against the shell without any packing space. This shell had started to split vertically several sheets above the mantle. At the time, this was attributed to the probable expansion of the steam pressed brick.

On looking over the shell, some matter was noticed at the point of fracture which looked like a deposition of zinc fumes. On having the deposit analyzed, in addition to taking a drilling through the crack and having some of this brick material analyzed, zinc was found.

Several Furnaces Examined

Shortly afterward, there occurred a very bad shell failure with fatal results, which was generally attributed to an explosion. As this mishap was so unusual, and of such fatal consequence, it alarmed most all of the furnacemen who heard of it. Photographs of this wreck seemed to show the action of zinc impregnation

and disintegration. The manager insisted there was no zinc, as he did not use any zinc bearing raw material. Examination of the furnace revealed a distinct vertical separation and cleavage of the remaining portion of the inwall and although no metallic zinc was found particles of zinc oxide were discernible in this cleavage. Later analysis of the brick material showed zinc to be present in the oxide, chloride and metallic state, as high as 40 per cent down to 0.15 per cent.

With zinc impregnation as high as shown in the analysis presented, it does not seem unreasonable at all, knowing the terrific strain that a zinc saturated lining exerts, that it split this shell, particularly as it was water cooled. A splash jacket prevented the operators from promptly detecting any signs of the splitting of the furnace shell. With the shell split it would not necessarily take a very heavy slip to put on enough additional strain to tear horizontally and open up.

Some furnaces that had been banked for several months were shoveled out. One of these had a considerable "belly" in the lining, extending from the

mantle to 30 ft. above the mantle, reaching less than one-third of the way around the furnace. The brick was well glazed and hard for a depth of 4 to 12 in. back to the inner face of the lining. Beyond that, was a zone of separation and spalled cleavage for a distance of $\frac{1}{4}$ in. to 2 in. This space was filled with zinc oxide, metallic zinc and large carbon deposits; zinc oxide from 2 to 20 per cent. Beyond that, for a distance of 2 to 4 in., the brick was disintegrated and crumbly, saturated to the extent of 0.03 to 6.82 per cent of Zn. Beyond that point, extending to the shell, the brick was firm and in a good state of preservation, with practically no zinc impregnation. The balance of the lining seemed very good, and had worn back less than 2 in.

Two test holes through the good lining back to the shell, opposite the bad place, disclosed no disintegration. The face of the brick was glazed and firm, and really harder than it would be in the original state. Metallic zinc appeared in the joints, also some oxide of zinc about 12 in. back from the inner face of the lining, but this had in no way penetrated the brick.

Some spray cooling on the outside of the shell on the thin spot of this furnace may have been the cause for disintegration at this point. This furnace was lined up with the same make of steam pressed brick that had given more than 800,000 tons during the preceding blast, and was in good serviceable condition when blown out.

On finding this condition at this furnace test holes were cut above the mantle at another furnace that had been lined up with the hand made brick of a popular make. This lining had been stored over five years, so must have been made at a time before disintegration of furnace linings had become alarming. The inner face was glazed and firm for a distance of about 4 in.

On Jan. 12 an editorial appeared in THE IRON AGE suggesting that zinc played an important part in the disintegration of blast furnace linings and consequent bursting of furnace shells. Investigations carried out by Paul O. Menke and set forth in the accompanying article very largely confirm this interesting theory. His findings may suggest to furnace operators a line of study that will eventually eliminate trouble from this source.

*Superintendent of blast furnaces, Shenango Furnace Co., Garyville, Pa.

From there on, zinc was found, both metallic and oxide, and disintegration to the extent of making the brick soft and very easy to cut, to within 4 or 5 in. of the shell. The conditions were identical at the two opposite points of the furnace. However, the holes were plugged without further repairs, and this furnace is operating to-day.

On the strength of these observations some of the more prominent cases of disintegration were made the subject of closer investigation. In one particular case where two linings had been lost zinc was found up to 18 per cent in this brick. Considerable of this was metallic, but apparently was not blamed for the disintegration of these linings.

Zinc Evidently the Cause of Failure

Our own experience in this matter has been expensive, and the cause of great delay. Nine or ten years ago, on account of low phosphorus content, our furnaces had used a proportion of Blue Billy agglomerates in our burden. First a shell split on the smaller furnace which had seen considerable service. This shell had to be renewed. Within two years a larger, newer furnace opened up her shell both in the vertical and horizontal seams, in the heavy section. We promptly banded this furnace. She burst these bands until we put on 12 by 1½ in. bands, very closely spaced. After that, the pressure sheared the horizontal seams of the shell, and showed swellings and distortions on the side of the furnace. This furnace was excessively water cooled in the bosh, and also had cooling plates above the mantle. Most of the trouble and breaks in the shell took place in the cooled zone. More or less metallic zinc was evident around the bosh plates of the furnace.

When it became necessary to put this furnace out for renewal of stack, it was impossible to blow it down more than thirty-five ft. as it shook so badly as to make it unsafe. On taking this lining out we found the most complete disintegration we ever saw. It was not burned out in any way, but had the full thickness of the lining, in addition to some scabs on the inside. It was not necessary to use any picks or steel bars, but the lining was shoveled out. The full outline of the brick and joints was visible until we got to the water cooled portion, where the zinc showed up, mostly in the metallic form, probably due to the water cooling.

On making an analysis we found zinc up to 49.86 per cent in the lining, and up to 40 per cent in the scab and scaffold. In fact lining and scab were so rich in zinc that it was sold to a chemical company for the recovery of the zinc. A considerable portion above the water cooled section was in the form of chloride of zinc.

On finding this condition, we put up a 1 in. shell, discontinued the cooling above the mantle, reduced the cooling below the mantle, and cut out Blue Billy agglomerates and other zinc bearing material. A steam pressed lining was laid tight against the shell, following the same practice used on our other furnaces with the lighter shells. Results were satisfactory, until we ran into zinc recently. Very probably we would not have encountered any difficulties even then, if we could have kept our furnaces running, but banking, shoveling out and cooling largely aggravate this condition.

Chemical Reaction Quite Simple

It might be well to give a brief outline of the action of the zinc in the furnace. Being charged into the top as zinc oxide, finely disseminated through the ore, it descends unchanged to the fusion zone, as the reduction temperature is 1000 deg. C. and over. The zinc oxide is reduced by solid carbon to metallic zinc; liberated as vapor, it ascends with the gases to the

cooler zones. The zinc is re-oxidized through the temperatures from 1000 deg. to about 500 deg. C., the reaction being $\text{Zn} + \text{CO}_2 = \text{ZnO} + \text{CO}$, and is carried up by the gases as zinc oxide. The larger portion passes out into the stoves, dust catcher, boilers or into the atmosphere. A portion redeposits on the descending stock to repeat the before-mentioned cycle of changes.

Some of the zinc vapor is absorbed by the lining up to as high as 50 per cent. It usually shows up as small yellow crystals. Sometimes it is found with carbon deposits in the disintegrated and laminated portions of the lining. Some of this zinc shows up in the metallic form. It usually is around the water cooled part of the furnace, also in the part of the lining that is not water cooled but had a chance to cool down after banking or blow out.

In scabs that adhere to the water cooled portion of the furnace, it probably combines with the alumina, forming zinc spinel, which is practically irreducible, as these scabs are largely intact, after the furnace has been blown out. It is also generally assumed that the zinc oxide combines with the alumina in the fire brick. As the coefficient of linear expansion of zinc is like 60 to 1, compared to silica, which is the principal constituent in fire brick and is about 3 to 1 compared to steel, it can readily be seen that it would not take a great deal of impregnation to destroy the bond of the brick and exert great expansive stresses. The hand made brick, on account of its greater porosity, has a tendency to take up more of this element than the steam pressed.

Remedies Suggested

Most of the Blue Billy agglomerates carry zinc, which can easily be guarded against, but as some limestones carry traces of zinc, also some of the Lake Superior ores, it makes it rather hard to be absolutely sure there is no zinc bearing material charged into the blast furnace. No matter how low the percentage of zinc is in the raw material, gradual accumulation will cause it to show up in time.

It is hard to see why it should be in any way detrimental to lay a lining against the shell without packing space, and particularly so, steam pressed brick which is a good conductor of heat, and would warm up the shell to a point where it can expand with the brick work. Most blast furnace lining brick should be somewhere near neutral and not subject to a great deal of expansion under heat. By using a heavy shell, (if necessary above 1 in. thick), eliminating the water cooling above the mantle the trouble should be reduced to a minimum. It might also be well for the fire brick makers to make experimental tests to find the resistance to zinc fumes of their various makes of bricks.

Automatic Train Control Devices

WASHINGTON, Feb. 21.—Taking official notice that parties interested in particular automatic train control devices are giving the impression to the public that it has approved their devices and ordered the railroads to install them, the Interstate Commerce Commission last week issued a memorandum to the press saying that it desires it to be understood that the commission's order of Jan. 10 requiring 49 carriers to show cause why they should not install control devices does not prescribe any type to be used. The only requirement, the statement points out, is that installation shall pass certain technical specifications and requirements which have been found to be necessary for the successful operation of devices of this character. These are so broad, the commission says, through Secretary G. B. McGinty, as to afford the desired freest field of opportunity for inventors and for trying out all automatic control and train stop devices.

NEW OSBORN MOLDING MACHINE

Air-Operated Jolt — Electrically-Operated Roll-Over Pattern Draw and Run-Out Car

A molding machine equipped with the standard air-operated jolting mechanism, combined with an electrical roll over, pattern draw and an electrically-operated run-out car has been developed by the Osborn Mfg. Co., Cleveland.

The machine is shown in the accompanying illustration. It is compact and self-contained. The mechanism is assembled on a large frame which is cast integral and without bolted parts. The mechanisms are inclosed and where necessary operate in an oil bath. The

The Roll-Over Device Is Electrically Controlled. Pattern draw and run-out car are electrically operated also. Rammung is by compressed air

machine rotates on the approximate center of gravity of the load, an arrangement intended to reduce rolling-over strain. The jolting operation is performed by compressed air at 80 lb. pressure and the jolt controlled by the company's single-piece, air-balance piston-type valve, adjustable to give the desired force of blow.

The roll-over operation is effected by an electric motor transmitting its power through a worm wheel and a pair of spur gears directly connected to a narrow drum for coiling the cable attached to the bottom of the lifting rods. Either push button or manual control is used. The motion is said to be steady and positive and the table, being rigidly held throughout its travel, cannot sway or swing. Although the operation is automatic, rolling over is under control of the operator and may be stopped in any position.

Pattern drawing is by one rolling-over mechanism, but is electrically controlled to secure a speed of only 1½ ft. per min. during the time necessary to loosen and start the pattern. The remainder of the draw is accomplished at high speed. Rolling over, lowering and drawing of patterns are all performed by moving the handle around the marked dial of the controller.

After the mold is rammed and ready for rolling-over, the controller handle is placed at the "rolling-over" position. After the roll, the machine stops automatically. The run-out car is brought into place by its motor and also stopped automatically. The table is locked into position and the controller handle swung to the "lower" mark on the dial. The mold then lowers until it makes contact with the automatic lowering device on the run-out car and stops automatically. The mold is then prepared for drawing by releasing the clamps and setting the vibrators in motion, after which the controller handle is turned to "slow draw." As the slow speed is used only to loosen the pattern, the controller is left at this point only for 2 or 3 sec., after which it is moved to the notch marked "fast draw." The pattern is then rapidly withdrawn from the mold, automatically stopping at the top of the stroke.

In lowering the machine to the jolt position the run-

out car is propelled from under the table to the end of its track. The table is unlocked and the controller handle is placed again at the lowering position, and the table automatically comes to rest on the jolt table. This completes the cycle of rolling over the mold and withdrawing the pattern which, with the jolting operation, makes the total time consumed by the machine per mold approximately 2 min.

The number of blows desired to jolt the mold is predetermined, and by moving the jolt-operating lever to the number of blows desired, the machine will continue jolting, automatically stopping when that number is reached. The machine is easily lifted into place on the foundation by a crane or hoist. Very little assembling is necessary. The foundation is cast in one piece, and since the machine operates on its own center of gravity, it is not necessary for the foundation to be heavy enough to counterbalance over-hanging loads.

Close control is obviously a feature. Among other advantages it is claimed that electrically-operated pattern draw eliminates jerky motion so dangerous to the mold, the speed of drawing being certain and instantaneous; lowering of the roll-over table is begun instantly upon placing the control handle in the lower position; and the motion in rolling over the mold is constant, steady and positive, without strain or shock. When lowering the roll-over table to its jolting position it is unnecessary to start the table rolling by hand.

The machine is built in capacities from 5000 to 20,000 lb. and in various heights and flask lengths.

Alternating-Current Grinder

A ½ h.p. alternating-current electric grinder in both floor and bench style has been placed on the market lately by the Standard Electric Tool Co., Cincinnati.

The machine is shown in the accompanying illustration. It is fitted with double-row ball bearings, and a Westinghouse motor with the latest type of Westinghouse circuit breaker is used. The machine can be equipped for either 110 or 220 volts, single, two or three phase. The grinding wheels are 8 in. in diameter, with ¼ in. face and ⅝ in. hole, and are extended well out from the body of the motor to facilitate the grinding of long and irregular work. The floor type is fitted with a water pot and both types have adjustable tool rests.

The motor is powerful and is quick to start on a single-phase line and a quick make-and-break switch is located on top of the motor within easy reach. Ten feet of re-inforced cord fitted with a plug is furnished, the regular equipment including also one fine and one coarse grinding wheel. The bench type machine weighs 110 lb. net and the floor type, 225 lb.

Grinder for Operation on Alternating Current

The next annual convention of the Southern Supply & Machinery Dealers' Association will be held in Birmingham, Ala., April 24, 25 and 26, 1923, with headquarters in the Tutwiler Hotel.

THE X-RAY IN METAL ANALYSIS*

Some German Results — Work of Von Laue — Detecting Presence of Tungsten

The idea of using the X-ray as an aid in determination of the internal structure of metals followed closely Roentgen's momentous discovery. More than 20 years ago the English scientists Heycock and Neville investigated the nature of alloys by these means. They found that the opacity of metals to the rays was in general closely related to the atomic weight. They therefore made alloys of the light metals, such as sodium and aluminum, with the heavy ones, lead, silver and gold. From these alloys, after rapid or slow solidification, were cut horizontal and vertical slices of about 1 mm in thickness from which X-ray photos were made. These showed in some cases (the sodium-gold alloy for example) a simple separation of the components without the formation of either alloy crystals or compounds. In the sodium-gold alloy the shadows of the sodium crystals and the heavier ones of the gold alloy, both imbedded in the eutectic mixture, give a complete picture of the metal structure.

In considering the use of X-rays in the metallography of iron and steel we are confronted with the fact that the most important elements met with in ferrous alloys, namely manganese, nickel, chromium and vanadium, have atomic weights so close to that of the principal constituent that a practical differentiation of their opacity cannot be expected. Carbon and silicon have indeed less opacity than iron, and separated graphite which is 400 times as translucent as iron will be recognizable in the X-ray photograph. On the other hand the transparency of cementite or the carbide of iron Fe_3C cannot be more than 25 per cent greater than that of ferrite, while the low carbon alloys show still less difference. Under these conditions the X-ray method of analysis cannot compete with the splendidly perfected methods of metallography. For the separation of silicon the conditions are still more unfavorable.

The X-Ray and Tungsten Steels

Only in the case of tungsten steels is it possible that the X-ray method might be preferable to the microscopic. Tungsten has the atomic weight 184 which is more than three times that of iron, while its opacity is 100 times that of the principal metal. The presence of tungsten in steel can be detected even in the presence of pearlite or the double carbide, and indeed in cases where the metal consists of a homogeneous mixture of martensite crystals. In fact, in the latter case a quantitative determination is possible by measuring the depth of shading in an X-ray photograph of the alloy and comparing it with the photograph of a similar strip of soft steel.

The measurement of the depth of shading has been brought to a high degree of perfection, so this method is promising. Other constituents which may be present do not interfere with the result. Molybdenum, for instance, which may replace the tungsten does indeed increase the opacity but not nearly to the same extent as tungsten. Its atomic weight is 96 and its opacity six times that of iron.

On the same principle the lead content of glass or the metal content of copper ore may be determined. The fact that in these cases the metals exist in chemical compounds is of no importance as the opacity is a property of the atom itself and does not depend, as in the case of ordinary light, on the form of combination.

The relationship between opacity and atomic weight is not proportional. The determining factor is not the atomic weight but the place number in the natural system of the elements. Except in special cases where selective absorption of the rays takes place, the opacity which is dependent on diffusion is in general proportional to the fourth power of the ordinate number.

Accordingly the greatest opacity is possessed by uranium and thorium, the least among the solids by

lithium and beryllium. The latter metal is one which should prove itself extraordinarily useful for many most important physical experiments. It has the advantage over lithium that it is unaffected by air. It is less opaque to both Roentgen and cathode rays than aluminum or even water and such organic substances as rubber and paper. Its physical characteristics at low temperature must be very striking. It would doubtless be profitable to produce this remarkable metal on a somewhat larger scale.

Nature of X-Rays

The author comments briefly on the nature of X-rays. A decade or more elapsed after Roentgen's discovery before Barkla, by succeeding in partial polarization of the ray, proved the transverse nature of these ether waves. He also showed the way to their approximate measurement which is 10,000 times smaller than the waves of visible light. At the same time the difference between the penetrating "hard" rays and the more easily absorbed "soft" rays was shown, like that between violet and red light rays, to consist only in the length of the waves. The hard rays have a short wave length and great frequency, the soft rays greater wave length and slower frequency. Both are extremely short-waved light.

The greatest step in our knowledge of these rays since 1912 is due to von Laue. His discovery puts at our disposal resources which permit us to penetrate more deeply into the interior of solid bodies than any of the existing methods of metallography.

A well-known means of determining the wave length of light consists in passing a monochrome ray through a lattice of bars placed very close together. The bars deflect the light, which causes to be seen on a screen set up behind the lattice not only the direct effect of the ray, but also a number of reproductions of the same effects deflected to the side. The shorter the wave length of the light to be examined the finer the lattice must be.

To adapt this optical method to the extremely short-waved X-rays would require a lattice finer than could be made by the hand of man. Nature comes to our aid, however. In crystalline structures lattices already exist built up of atoms or molecules, with a constant of 10^8 , and it was von Laue's happy idea to use them for the investigation of the rays. These crystal lattices are of a different nature from the Rowland gratings used for spectroscopic measurements. They are not only crossed but consist of a whole system of such crossed gratings placed one behind the other. Laue's discovery was the foundation of a new epoch in crystallography in the midst of which we now are. The art of making the plates has attained a high degree of development and a rich mass of data has been collected.

We await with great interest the result of experiments as yet unfinished on metallic alloy crystals in which the presence of a second kind of atom in the lattice introduces disturbances of the electrons, made manifest in a lessening of the diffraction of the electrons and with it of the electrical conductivity and a change in the mechanical properties, such as increased hardness, etc.

Possibly the investigation by the aid of the X-rays, of materials which play such an important part in industry will throw light on the causes of the principal characteristics.

F. E. N.

Business conditions, according to a survey of current business issued by the Department of Commerce, are improving. The preliminary survey for January states that the iron and steel industry is still without definite trend, though activity in certain lines was greater than in December. Although the automobile industry showed the usual seasonal dullness, marked interest was exhibited in the shows, and greater activity in the tire industry gave every prospect of a satisfactory season. Industries depending upon rural purchases have shown little recovery, and cannot be expected to show much until the new crop year. This is particularly true of agricultural implements.

*From Dr. R. Schenck in *Stahl und Eisen*, Oct. 13, 1921.

Press for Tires and Other Uses

A new 250-ton hydraulic press designed primarily for forcing solid rubber tires on and off truck wheels, but adaptable also for a variety of other uses, has been brought out by the West Tire Setter Co., Rochester, N. Y.

The frame or resistance pieces are of cast steel. The top platen is of steel, cast solid with the top resistance piece, the bottom platen being also of steel and removable from top of the ram. The area of the

The Distance Between Platens Is 37 In. and Horizontal Distance Between Strain Rods, 43 In.

ram is said to be sufficient to produce the required tonnage with comparatively low initial pressure, thus permitting longer life of valves and other working parts. It is claimed that where this press will use 2000 lb. initial pressure, other designs frequently require 5000 lb. initial pressure.

The pump is of the 3-plunger type with automatic cut out for large plunger and has one 2-in. low-pressure plunger, for throwing a greater volume of oil, to fill pipes and cylinder quickly. When about 200 lb. pressure has been obtained the larger plunger is automatically cut out by a special by-pass valve, leaving the two smaller plungers in operation for completing the higher pressure required for maximum tonnage.

The vertical measurement between platens is 37 in. and the horizontal measurement between strain rods, 43 in. The diameter of the platens is 42 in. and the travel or stroke of ram, 33 in. The bore of the cylinder is 16 in. The height from floor line to top of pulleys is approximately 7 ft. 9 in. and the overall height, approximately 9 ft. 3 in. The strain rods are of 4 1/4 in. round steel.

New Safety Code for Use in Grinding

A new safety code for the use, care and protection of abrasive wheels has recently been approved by the American Engineering Standards Committee and released for publication, the date of approval being Feb. 11. This code has been in the process of preparation for about two years. It was prepared under the rules and procedure of the American Engineering Standards

Committee and has as its sponsors the International Association of Industrial Accident Boards and Commissions and the Grinding Wheel Manufacturers of the United States and Canada. These sponsors appointed a sectional committee to draft the code, consisting of 28 members representing various branches of both Federal and State Governments, several national manufacturing associations, a number of individual employers, associations of employees using grinding wheels, several technical societies, insurance associations and others interested in the manufacture or use of grinding wheels. Dr. L. W. Chaney of the U. S. Bureau of Labor Statistics is chairman and A. Rousseau of the Norton Co., secretary of the sectional committee.

The new code is said to be a distinct improvement over the codes previously issued by the grinding wheel manufacturers, and contains much information not found in any other publication. The size and scope of representation of the organizations sponsoring and endorsing the code give it an air of authority which cannot but commend it to the careful consideration of everyone interested in any way in grinding wheels.

The code is now in the hands of the printer and will be ready for general distribution about the middle of March. Copies can be obtained from any grinding wheel manufacturer on request.

New Inside Micrometer

The Reed Small Tool Works, Worcester, Mass., has placed on the market the inside micrometer caliper shown in the accompanying illustration. The barrel, spindle and thimble have the same diameter as the corresponding parts of the company's outside micrometer, large surfaces allowing for generous sized figures on the barrel and spindle.

A feature of the tool is the detachable handle, easily and quickly adjustable, making it convenient for right or left hand work. Measurements can be made in inaccessible places or the entire length of a cylinder bore can be gaged. With a range of one inch, time

The Detachable Handle Is a Feature

lost, while in actual use, is less than with tools having a smaller range. Extra rods, fitted with anvils, are intended to permit of quick change with little possibility of error. The rods are interchanged by unscrewing from a threaded stud at the end of the barrel and each rod is internally threaded and ground square at the hardened end, which sets squarely against the barrel shoulder. At the point of measurement the rod is fitted with a hardened tool-steel anvil, adjustable for lengthening the rod and compensating for any anvil wear. Anvil faces are ground on a comparatively small radius, making the tool especially adaptable for measuring parallel or curved surfaces.

The Pittsburgh-Des Moines Steel Co. has consolidated its structural and plate sales departments and W. W. Hendrix, who for some time has had charge of plate sales, has been placed in charge of the consolidated division. Mr. Hendrix, who has been with the company for 20 years and is vice-president, now has the title of assistant general manager of sales and sales manager for the Pittsburgh territory.

NO BONUS BILL

Belief in Washington That the Measure Cannot Be Passed at This Session

WASHINGTON, Feb. 21.—Predictions are being freely made in official quarters that there will be no bonus legislation enacted at the present session of Congress. It is apparent that the interminable controversy over this largess to soldiers will be passed on to the next session and the legislation indefinitely postponed. At present there are indications that the House may jam the measure through at the current session purely as a matter of supposed political expediency, realizing that the Senate and the President favor postponement of action.

There is a strong element in the House, manifestly at variance with the Administration, who would like to return to their constituents at the forthcoming fall election as sponsors of a bonus regardless of how the money should be raised. The Administration is insistent that the bill shall include a plan for obtaining the revenue and has recommended a sales tax. The Chief Executive has announced himself in favor of a production tax to be collected at the source because of its so-called simplicity of collection and equitable distribution. The agitation for a retail tax apparently has not impressed the President, for he has expressed the belief that it would be too complicated and would involve more expense in collection than a manufacturer's tax. The President refrained from suggesting the rate which could be levied at the source, but it is said that he would approve a 1 per cent tax on wholesale sales of manufacturers' products. It is estimated that approximately \$350,000,000 could be obtained annually from this source and this would be sufficient to meet the demands of a cash bonus plan.

The agricultural bloc in Congress is strongly opposed to the sales tax plan. It is supported in this view by the American Federation of Labor. Business interests of the country, as Congress is well aware, are opposed to any kind of bonus legislation because of its serious economic effects. The attitude of agricultural interests is reflected by the statement of T. C. Atkeson, representative of the National Grange, in a formal statement to Congress. He said "The Grange is opposed to the introduction of the new principle of taxation variously known as sales tax, consumption tax, manufacturers' tax or turnover tax in any form and by any name, and considers the effort to enact it into law indefensible, wrong in principle and designed to shift the burden of taxation from those most able to pay, and receiving the greatest benefits to the shoulders of those least able to pay, and receiving the least benefit from the Government. The National Grange has suggested an excess profits tax for the bonus." He pointed out that, should this be inexpedient, a tax should be levied which will not be added to the cost of living of the millions with limited incomes. The President is unalterably opposed to the restoration of the excess profits tax, which proved so burdensome to business and industry. It is generally conceded that a levy on manufacturers' products could not be added to prices paid by ultimate consumers. Business men feel that it is not feasible to raise prices at this time. They also realize that they are the first to feel the effects of extra pressure from taxation in diminution of profits and would undoubtedly be compelled to absorb this assessment through narrowing of the margin of profits. Judging from the volume of protests received by Congress from business interests it is evident they are convinced that the study of the economic effects of a bonus by the legislators is exceedingly superficial and that the political side only has been considered.

January Fabricated Steel Business Relatively Good

In January 72,100 tons of fabricated structural steel work was contracted for throughout the United States, against 71,500 tons in December and 63,000 tons the monthly average for 1921. In January, 1921, the total was only 32,000 tons, but in January, 1920, it was 135,000 tons. Taking into account the hesitation evident in consummating investment enterprises, the fact that January is slightly better in tonnage than December may be significant. In the last ten years January has always shown a falling off from December with two exceptions, 1913 and 1914. January bookings for a decade have averaged 82,800 tons, while December bookings have averaged 111,200 tons. Thus January is about 15 per cent better than the 1921 rate and not quite 13 per cent under the January rate. February has normally been 10 per cent better than January.

The statistics of the volume of business taken by the bridge and structural shops of the country are those of George E. Gifford, secretary of the Bridge Builders and Structural Society, 50 Church Street, New York. The January business indicates that 40 per cent of shop capacity was covered, the total monthly capacity being put at 180,000 tons.

Improvement in Michigan Foundries

BATTLE CREEK, MICH., Feb. 20.—Considerable improvement in the business of Michigan foundries was reported at the quarterly gathering of the Michigan Foundrymen's Association, held last week in Battle Creek. A. W. Blodgett, secretary of the organization, made the report to that effect.

Mr. Blodgett stated that at one time during the summer of 1921 business had dropped as low as 20 per cent of normal, but that at the present time it is 35 per cent of normal.

S. T. Plimpton, Cleveland, led a discussion on the subject of the "Universal Iron Contract." It is a uniform iron purchasing contract designed for use

between the foundry and the furnace companies and which has been drawn up and submitted by the National Association of Purchasing Agents.

Other matters discussed were a uniform cost accounting contract and the important research work that is now being done by the University of Michigan along lines of particular interest to the iron industry.

Reorganization of Commonwealth Fuel Co.

PITTSBURGH, Feb. 21.—Announcement is made of a reorganization and an increase in the capitalization in the Commonwealth Fuel Co., principal offices of which are in the Oliver building, Pittsburgh, with branch offices in Philadelphia, New York and Clarksburg and Morgantown, W. Va., a result of which is that W. G. Ireland, for the past 10 years sales manager the Jamison Coal & Coke Co., Pittsburgh, becomes financially interested in the company and has been elected its vice-president. The Commonwealth Fuel Co., which was incorporated and began business in 1913, owns and operates a mine in the Fairmont, W. Va., district and acts as sales agent for several bituminous operations, including the Simpson Creek Coal Co., and the Maryland Coal Co., with properties in West Virginia. George Paull, president of the Commonwealth Fuel Co., is a director in those companies. The company will continue to conduct a general brokerage business in coal and coke and will handle sales in this district of foundry coke produced from coal from the Jamison mines in the Greensburg basin, recently taken over by the Keystone Coal and Coke Co. Officers of the Commonwealth Fuel Co., in addition to Mr. Paull and Mr. Ireland are J. P. Fife, secretary and J. H. Roelofs treasurer. Robert Dickey is sales manager.

The Danbury Mill Supply Co., Inc., 37 Liberty Street, Danbury, Conn., which was recently incorporated to deal in mill supplies, machinery, etc., has chosen the following officers: President, George A. Seagrave; secretary and treasurer, Winfield S. Holman, who is in the plumbing and heating business in Danbury.

Compound Seam Closer

A machine for producing a side seam tighter and more substantial than the single lock seam has been developed recently by the Niagara Machine & Tool Works, Buffalo. It is shown in the accompanying illustration and is known as the No. 42 compound seam closer.

The seam produced by the machine can be filled with sealing compound to make it air tight, although the seam is said to be practically air tight without the filling. Calcium-carbide drums and calcium-chloride cans are examples of containers requiring air-tight

Offsets Are Formed in Double Crank Press and the Sheet Rolled to a Cylinder and Placed Over the Horn

seams and the machine is especially adapted for this class of work.

The offsets shown in the left hand insert are formed by dies in a double crank press. The sheet is then rolled to a cylinder and placed over the horn of the seam closer, with the offsets laid on the guide piece set into top of horn. The machine runs continuously and therefore does not require tight and loose pulleys or a clutch. By depressing the treadle connected to the sliding gage, the work is moved forward along the horn, and fed between the first set of rolls, which squeeze the seam together at the bottom. After these rolls take hold, the body feeds automatically through the machine. The next set of rolls flatten and thereby close in one operation the double-lock seam, shown in the right hand insert.

The machine weighs approximately 2700 lb. The pulley is 20 in. in diameter, 3 in. face and is run at 100 r.p.m. The maximum length of work that can be seamed is 42 in., the minimum diameter of the longest work being 13½ in. Shorter diameters, for work of short length, can be seamed. The capacity is given as No. 22 gage soft steel and lighter.

Patent Office Bill Now a Law

WASHINGTON, Feb. 21.—President Harding last Saturday signed the Lampert patent office bill. Now that the measure has become a law, much to the gratification of industrial, engineering and other interests of the country, salaries in the patent office will be increased, and the force of examiners and other employees expanded in order to relieve the congestion of work. The measure also is expected to check the resignations of experts, who as is well known, receive totally inadequate salaries.

The bill passed the Senate last week, after having been previously passed in the House, without any opposition and in the exact form in which it came to the Senate. It was in charge of Senator Johnson, chairman of the Committee on Patents.

"Familiarity with the patent office demonstrates the necessity of the bill," said Senator Johnson. "Increase in business has been so disproportionate to aid accorded the office that it has fallen far behind. The receipts of the office are sufficient to justify additional expenditure and make unnecessary draft on the treasury."

St. Louis Companies Merged

The Hagen Metal Products Co., 119-127 Bowen Street, St. Louis, and the Western Screw-Products Co., 3219-25 South Broadway, St. Louis, have been merged. The combined interests are capitalized at \$125,000, and business will be conducted in the name of the Western Screw-Products Co., which is the older of the two companies.

Jos. J. Hagen, president Hagen Metal Products Co., since its organization in Detroit in 1919, and who was secretary and treasurer of the Western Screw-Products Co., prior to that time, has assumed the management of the combined interests.

The company specializes in screw machine products, cap screws, plain and castle nuts and light metal stampings. The officers of the Western Screw-Products Co., are as follows: Jos. J. Hagen, president; Jno. T. Soy, vice-president; Herman Giesecke, secretary and treasurer.

Portable Power Hack Saw

The bench hack saw shown in the accompanying illustration has been placed on the market recently by the Edlund Machinery Co., Inc., Cortland, N. Y.

The machine is of the portable type, intended to eliminate the labor of hand sawing and to handle a large share of the work usually done on larger machines. It cuts tool and machinery steel efficiently

Cutting Is Done on the Backward Stroke

and is especially adaptable for use in tool rooms and machine shops.

Power is supplied by a small motor, direct connected, the power being transmitted through cut gearing. The machine can be attached to any electric light socket. The cutting is done on the backward stroke, the saw blade being relieved automatically on the forward stroke, an arrangement intended to diminish the wear and prolong the life of the blade. The feed is regulated by a weight, which can be instantly adjusted for various cuts and sizes of work from the lightest tubing to the heaviest bars.

The saw arm when raised for placing the work is held automatically in position until released by the operator. The machine also stops automatically when the cut is finished and can be stopped or started at any time while the cut is being made. Any standard 8-in. blade can be used and the blades can be easily replaced without the use of tools.

of March 3, 1879.

Steel Production Costs

It is common knowledge that many of the steel mills have been losing money in the past few months, but the remarkable thing is that the losses are not greater. The losses are chiefly of overhead, i. e., a mill fails to earn all its overhead expense, but if it were idle, it would have an overhead nevertheless. There are, of course, losses in depreciation of inventory, but those are caused by extraneous conditions and are not chargeable to operation.

Speaking generally, comparisons of selling prices lately ruling with prices obtaining before the war and in the early months of the war, with allowance for known and inescapable increases in various items of cost, such as freight rates and wage rates, indicate that in some respects steel is being produced more economically than before the period of inflation, or the losses would be larger than are being reported.

There are two expensive factors in present operating conditions whose influence is not commonly appreciated, the low operating rate and the very mixed character of the specifications being filled. Before the war, it was considered almost impossible, from the profit and loss standpoint, to operate the average mill at less than about half its capacity, but of late many mills have had to contend with a much worse operating rate than that.

The other condition, the mixed specifications that have to be filled, is well understood by all who have any familiarity with mill operations, but is given little thought by the average buyer of mill products. It is the natural and unavoidable consequence of the hand-to-mouth buying, on the most conservative scale, that has characterized the market for months past. The buyer is unwilling to wait for delivery until a convenient and economical rolling schedule can be made up, but insists on immediate attention, and if one producer will not agree to almost instant rolling another producer will. In all the ups and downs of the steel market in the past, managers have noticed the sudden increase in costs that comes when orders run short, and the sudden drop in

costs that occurs when it becomes possible to schedule mills a little distance in advance.

With the various handicaps existing, the showing of efficiency and economy made by the mills is noteworthy. In many respects, perhaps minor individually, but important in the aggregate, steel mills are undoubtedly being operated more efficiently than before the war. The efficiency of labor is not excluded as an item in this connection, for there are cases in which a direct comparison can be made between results in 1913 and results to-day, showing a greater labor efficiency at the present time.

Further decreases in costs and increases in efficiency are to be expected, although there can be no sudden improvement except such as may come from enlarged operation and better scheduling of rollings. No further general reduction in wages seems at all probable in the near future, although there may be readjustments in spots. The "general freight rate reduction" that used to be looked upon as a certainty, the time only being in doubt, now seems likely to come rather gradually.

Some reductions may occur of such character as to be considered more or less "general," but, if so, they will not be large. If the rate makers consider this matter with an eye to the traffic producing possibilities of reductions, they may well turn their attention to iron and steel scrap rates, which are in many cases too high to permit scrap to move. Scrap dealers point out that there are piles of scrap that can be looked at, ocular evidence that traffic movement can be developed. The holders can afford to wait, for the interest cost of holding is practically nothing.

Steel prices are now so low, considering all conditions, that no decreases in production costs are likely to appear in recognizable form in changes in selling prices. Steel prices are not fixed, but they are as nearly stabilized as can possibly be expected in the circumstances.

One of the striking effects of the steel depression of 1921 has been the decline in the output of electric furnaces making steel ingots. It has been out of all proportion to that in either open-hearth or Bessemer steel. The slump in the

electric ingot output began in August, 1920. In December, 1921, the production was less than half that of January of the same year or 1539 tons contrasted with 3629 tons. In January, this year, it fell still further to only 822 tons, which compares with 10,687 tons in January, 1920. While the open-hearth output last year was about 50 per cent less than that of 1920, the electric steel ingot production was hardly one-sixth of that of 1920. Compared with 1913, when the American electric steel industry was in its infancy, the present rate of operations is less than it was then and, in proportion to capacity, it is less than the Canadian production.

Changes in European Steel Industry

Several captains of the American steel industry have made trips to Europe, but none has brought back a more comprehensive or interesting analysis of conditions in the European steel industry outside of France, than the one published as an interview in THE IRON AGE of Feb. 16.

Two significant facts stand out from the result of the intimate talks of this traveler with nearly 300 steel men of Europe. In Germany the 48-hour week, and in Holland and Belgium the 45-hour week, legally prevail. In those countries, as well as in England, the 8-hour day prevails throughout the steel industry, even in the operation of blast furnaces and open-hearths, with three 8-hour shifts. The conviction prevails everywhere that labor conditions and wages will not return to the pre-war levels, but that a new era is dawning.

The other fact is a corollary of the first. It being admitted that labor is to be more expensive than before the war, European steel men, in order to compete with each other and with America, must lower costs by the modernization of equipment and the adoption of every possible labor saving device. Larger blast furnace units and improved open-hearth and rolling mill equipment are being widely discussed and in some cases planned. Even the ancient conservatism of British pig iron makers has collapsed and they confess that a change is necessary. Conditions generally in those countries are pointed to as paralleling those in the United States before the war and as likely to remain so. These industries, therefore, face new conditions in the future.

With taxes high and likely to be so for some time to come, with labor more expensive and on a changed basis, with transportation and fuel charges high and with economic and metallurgical conditions radically changed both in Germany and England, those industries are sure to develop along new lines with the ultimate result of larger capacity units and labor saving devices. The effect on the American steel industry cannot now be measured, but the competitive conditions of 1913 and 1914 have disappeared. The introduction of the 8-hour day in those steel industries may have its bearing on the American and perhaps cause its introduction here. In any event the progress of these changes will command the careful attention of American iron and steel makers.

Two pertinent facts characterize the copper export movement in 1921. Sales to foreign consum-

ers were the largest for any year since the war, exceeding both 1920 and 1919 by a liberal margin, and they were over 60 per cent of the 1913 exports. In a year of acute depression and light exports in all other products of the American steel and metal industries, this record is noteworthy. The other striking fact is the heavy purchases by Germany of American copper last year. According to official data just made public, German purchases were not only the largest of any other country, but they were in excess of those of France, Great Britain and Japan combined. German consumers bought about 39 per cent of the total exports and, if Holland's receipts be credited to Germany, this amount would constitute over 44 per cent of the total. Before the war, or in 1913, Germany took only 33 per cent of American copper exports, largely, as a preparation for war. The renewed movement reflects not only the acute need of copper in Germany, but is an example of what a country can do under the handicap of a depreciated currency.

Progress in Steel Welding

That rapid strides have been made in the fundamental principles of welding metals, so that the practice is more of a science than an art, is clearly an inference from an article in THE IRON AGE last week on welding rods. In the early stages of welding steel and even up to recently, the practice consisted too often in filling a steel weld with whatever rod was ready at hand. This often resulted in poor or weak welds and in a prejudice against the art in general.

Much research has been conducted recently both on the correct mixture of gases and the proper distribution to attain controllable temperatures as well as on the kind and composition of the rod which is to supply the welding metal. Attention has also been paid to the use of proper fluxes, as well as to the needs in obtaining a high grade weld, of being certain that the base metal and the welding rod are fused at the proper temperature to insure a thorough mingling of the metals. It has been conclusively demonstrated that to obtain a weld as good or better than the original metal it is necessary to use a rod of a composition which will produce a joint better than the original or base metal. To attain this rods of various compositions, including nickel steel, manganese steel and other alloys, have been developed. Their judicious use in the hands of experts is producing results hitherto unexpected.

It may safely be said that the art of welding has developed to a stage where, by controlling the temperatures, the materials and the fluxes, furnace conditions originally existing in the actual manufacture of the metal are imitated as nearly as possible at the welding point, to the decided improvement of the welded portions. Reinforced by modern practice and apparatus in heat treatment as well as by new magnetic devices, already in use or in prospect, for testing the reliability of welds, it is probable that still more advances may be looked for, not only in steel but in brass, copper and other non-ferrous metals.

CORRESPONDENCE

Joint for Electric Furnace Electrodes

TO THE EDITOR: Mr. Moore in his very interesting report on the present development of the electric furnaces, (*THE IRON AGE*, Sept. 22, 1921) emphasizes very intelligently the great importance which should be given to the furnace heat losses.

In most cases the heat loss is increased due to the poor joint between the furnace frame and the electrodes. Few electric furnaces on the market possess such a tight joint at the electrodes as to prevent air flowing through, especially when the furnace is pour-

Section of Electric Furnace Electrode Holder to Indicate Scheme to Secure Air Tightness of Joint

ing. This air current not only cools off the furnace interior, but causes injury to the electrodes.

Mr. Moore gives as an example the Stobie electric furnaces (England) which has an improved electrode joint, but I think that the Fiat electric furnace has solved this problem by the use of a patented device which was developed after many years of study and experience. By using this device on six Fiat furnaces of 5 and 6 tons capacity in our foundries at Turin, we saved 650 kw. hr. of power and 3 kg. of electrodes per ton of steel, and with the furnaces cool at the start. This device gave so tight a joint that the efficiency of the furnace was greatly increased and the use of a larger electric current and electrodes was made possible. Another saving was made in extending the life of the refractory furnace lining which was destroyed often before the adoption of this device.

This device is protected in the United States by patent No. 1,320,884, Nov. 4, 1919, and by other patents throughout the world.

Fig. 1 shows a transversal section of a 5-ton Fiat furnace and the general design and assembly of this joint device. A steel bridge mounted on the sides of the furnace, supports the three electrode housings which are made out of a cooled steel cylinder. Inside of the cylinder a series of insulated rings acts as guides to the graphite electrodes and prevents it coming in contact with the metal wall of the cylinder. At the top of the cylinder a large asbestos disk is fixed, sup-

ported by a metal ring, over which is placed a bell shaped flange attached to the external steel covering. An opening is made at the center of this covering to allow the electrode to pass through. The current terminals for the electrodes are attached to the top of this covering by means of insulated disk and bolts. The movement of this covering is made by two bolts on the side and the electrodes are adjusted by a combination of gears driven by a small electric motor. This motor is operated by a drum controller located on the switchboard.

All parts of this device are accessible to be cleaned or inspected. The entire outfit forms a completed unit which can easily be placed or removed from the furnace by a small hoist.

This device can be attached to almost any type of electric furnace and will shortly pay for itself. With our 6-ton furnaces, manually charged, we can do nine charges in 24 hr. operation.

The Fiat electric furnace works are at the present time using electric furnaces of 5 to 20 tons capacity in their foundry shops. Knowing the results obtained from all the furnaces equipped with this Fiat joint device here in Italy, especially in the steel car wheel industry, which is rapidly progressing. I thought the readers of *THE IRON AGE* would be interested.

DR. ALFREDO STROMBOLI.

General Commercial Manager of the Fiat Electric Furnaces.
Turin, Italy

Warwick Furnace Characteristics

TO THE EDITOR: My attention has been called to the article in your issue of Feb. 2, relating to the Warwick furnaces, and to certain statements made therein. The Warwick No. 2 furnace plant was built under the designs and supervision of my firm; furthermore, my firm had been the engineers for the Warwick Iron Co. for several years prior to the construction of No. 2 furnace. It may, therefore, be safely assumed that I am familiar with the conditions that controlled the design of the furnace lines adopted in both the old and the No. 2 furnace.

It is faint praise, indeed, to state that a man of the initiative and scientific attainments of Edgar S. Cook determined the lines of No. 2 furnace by a "proportionate enlargement of those of the older stack," as stated in the article; furthermore, such a statement is incorrect. The lines adopted for No. 2 furnace were the result of many conferences on the part of Mr. Cook and myself, in which the operating result of several furnaces 100 ft. in height were carefully considered and analyzed.

At that time six 100-ft. furnaces designed by my firm were in use, and the results of their operation were at our disposal; i. e., No. 3 Lebanon (the first furnace 100 ft. in height built in the east), Nos. 1 and 2 Lorain, Nos. 2, 3 and 4 Jones & Laughlin Eliza Furnaces. The lines adopted for Warwick No. 2 furnace were as follows: hearth 14 ft., bosh 21 ft. (not 22 ft., as given in the article); angle of bosh 72 deg., stock line 14 ft. and height 100 ft. On the other hand, the lines of the old Warwick furnace were of the following dimensions: hearth 10 ft.; bosh 16 ft., 4 in.; angle of bosh 74½ deg.; stock line 11 ft. and height 70 ft.

It is, of course, difficult to realize, under present conditions of furnace practice, that Mr. Cook's proposal to make 500 tons of foundry iron per day, in one furnace, was regarded as impossible by most blast furnace managers. Progress and initiative, however, were among Mr. Cook's ruling characteristics, and modern furnace practice is indebted to him in many particulars. Contrary to the statement contained in the article in question, the lines adopted did give expected results, and no difficulties were encountered other than those prevalent at modern furnaces, during that transition period in furnace practice.

The furnace was blown in Oct. 8, 1901, and no changes whatever were made in the lines or plant, until the furnace was blown out for relining in 1904.

when the following lines were adopted: hearth 15 ft., bosh 22 ft., angle of bosh 75 deg. and stock line 15 ft. In the relining of 1907 the lines were changed to provide the following: hearth 15 ft. 6 in.; bosh 22 ft. 6 in.; angle of bosh 75 deg. and stock line 15 ft. In the relining of 1911, the lines of 1907 were repeated, except that the bosh and stock lines were made 23 ft. 6 in. and 16 ft., respectively. Mr. Cook's active participation in the management ceased in 1912. At no time has the furnace been blown out except for the replacement of wornout linings.

It is an interesting fact that, except for relining periods, No. 2 furnace plant has been in continuous operation since it was first placed in blast in 1901, and further, that the original linings of the firebrick stoves are still in use.

I do not have the latest figures at my disposal, but from Oct. 8, 1901, to Dec. 1, 1920, Warwick No. 2 furnace had produced 2,663,257 gross tons of pig iron. When the depression of 1920 developed, No. 2 furnace was continued in blast and is at the present time in blast, whereas the new furnace described in the article was blown out in December, 1920, after about four months' operation, and is still out of service.

Reference is made in the article to the replacement of the Hugh Kennedy stoves at the old furnace by "those of larger dimensions and of a center combustion type;" it may be well to add that the latter stoves are of my three-pass design and are built under my patent.

FRANK C. ROBERTS, C. E.

Real Estate Trust Building,
Philadelphia, Feb. 9.

Scrap Dealers Ask for Lower Freight Rates

WASHINGTON, Feb. 20.—Iron and steel scrap dealers appeared to-day before the Interstate Commerce Commission in connection with the general rate investigation and asked that the 40 per cent advance in freight charges made in August, 1920, be removed. This is the same request as was made by most iron and steel manufacturers when the hearing was opened.

H. F. Masman, traffic manager for the National Association of Waste Material Dealers, who asked reductions of rates in all kinds of so-called waste materials, said that scrap iron and steel should take the pig iron rate instead of the billet rate as both are raw materials used in the production of steel.

J. L. Low, manager of the freight department of Briggs & Turivas, Chicago, submitted exhibits to show pig iron rates are lower than scrap iron and steel rates, but conceded that the carriers had made some adjustments recently. He asked for removal of the alleged discrimination in rates against scrap and then elimination of the general 40 per cent advance.

It was said that practically no scrap is moving from Eastern points to the central district, because of high rates, and that the business is demoralized because 70 per cent of the scrap used at Youngstown must move from distant points.

A. B. Alpirin, an Omaha scrap dealer, asked for specific reductions in rates from Omaha to Chicago, St. Louis, Kansas City, Denver and Peoria, Ill., ranging from 20 to 50 per cent. He said that 60 per cent of the scrap dealers in the small cities of Nebraska are out of business.

A jury in Pittsburgh pared \$265,318 from the claim made by the Crucible Steel Co. of America against the city of Pittsburgh for damages sustained to its property fronting on West Carson Street as a result of widening that thoroughfare and raising it from the flood level. The company asked \$292,318 but the jury awarded it only \$27,000.

The Richardson & Boynton Co., Dover, N. J., manufacturer of stoves, ranges, etc., is arranging to transfer a number of local plant departments to its works at Buffalo, N. Y., including molding, tin and sheet metal operations. The change is being made owing to continuance of local labor troubles.

Belgium's production of spelter in December, 1921, is reported to have aggregated 7370 metric tons.

DISTRIBUTION OF OVERHEAD

Industrial Cost Association Considers Merits of Productive Hour and Machine Rate Method

A paper on "Overhead Distribution Methods" was presented at the Feb. 16 meeting of the New York section of the Industrial Cost Association at Keen's Chop House, New York, by F. Brugger of the Pittsfield works of the General Electric Co. The discussion following centered chiefly upon the relative merits of the productive hour method and the machine hour rate method of figuring costs.

In defense of the machine hour rate method in a modified form, a representative of the De Laval Separator Co. explained how that company had, after investigation of both methods, introduced a greatly modified machine hour rate method, with what, up to the present, appears to be satisfactory results. In a department of 70 machines, large and small, operating on different kinds of work and on which, by way of illustration, about \$2 per hr. was formerly charged as overhead, under the new method of figuring, an overhead on the smaller machines of 30 cents to 40 cents per hr. was shown, and up to as high as \$5 per hr. on the larger machinery. As a result the company began to consider the advisability in some cases of turning certain of this larger work over to other shops.

The questions of tax, insurance, light, heat and power charges were discussed and the proper methods of charging these items, as well as the value of charging interest on the investment in a machine against overhead, as part of the operating expense.

There was some disagreement over the proper method of figuring overhead in dull and active business years, Mr. Brugger preferring the establishment of a normal overhead, to be evenly distributed over dull and active periods, arguing that business activity and depression occurred in cycles and should be so considered. Those in opposition pointed out that there was no good reason for making a period of two or three years prosperity pay the overhead run up by one year of depression.

The board of directors for the coming year was unanimously elected, the board being vested with authority to elect the officers of the organization. The elections to the board were as follows: H. D. Starr, assistant comptroller New Jersey Zinc Co.; C. A. Porter, comptroller Hardinge Co., New York; J. H. Ramsey, auditor, Electro-Dynamic Co., Bayonne, N. J.; Addison Bonen, Yale & Towne Mfg. Co., Stamford, Conn.; R. W. Matter, office manager Jenkins Mfg. Co., Bloomfield, N. J.; F. B. Van Vleet, general auditor Ruberoid Co., New York; Durlin Wade, Jr., general auditor Cross, Austin & Ireland Lumber Co., Brooklyn, N. Y.

Midvale Shuts Down Munition Departments

The armor plate, gun and projectile departments of the Nicetown works of the Midvale Steel & Ordnance Co. have been shut down, following the recent action of the Conference on Limitation of Armament in restricting the naval building programs of the United States and other countries. About 400 men were thrown out of employment.

No plans have been announced as to the use to which the idle departments may eventually be put.

The Niles Steel Products Co., Niles, Ohio, formerly the Allsteel Supply Co., has developed the production of stampings and pressed metal parts. It is located very advantageously in the Mahoning Valley for its source of supply, being surrounded by sheet, plate and strip mills. Besides its regular factory building, it has, in the past year, added a warehouse and office building. It has a completely equipped machine shop of sufficient size to supply and maintain dies for its press department. It also has a well developed department to furnish agricultural implement seats and other stampings used by implement manufacturers.

Opposition to Foreign Valuation Plan

Action of Senate Committee Members Not Favorably
Regarded by Iron Trade—Arguments Presented by
John A. Topping for American Valuation

BY L. W. MOFFETT

WASHINGTON, Feb. 21.—The iron and steel trade being on record in favor of the American valuation plan as a principle for basing tariff duties will applaud the steadfast opposition of Chairman Fordney of the House Ways and Means Committee to the foreign valuation plan, which, to the disappointment of the trade and American manufacturing interests generally, has been tentatively agreed upon by the Republicans of the Senate Committee on Finance. Mr. Fordney has made the flat statement that if the Senate sends the permanent tariff bill over to the House based on foreign valuation, that branch of Congress "may expect that it will be sent to the Ways and Means Committee, which will send back to the Senate a bill based on American valuation." Mr. Fordney added that he would "never agree to any foreign valuation and I do not know of any Republican member of the House who will or who wants foreign valuation."

This situation plainly opens a breach. Its outcome is purely problematical. It may greatly delay enactment of tariff legislation, which already has been deferred by the Finance Committee to a point where the manufacturing interests of the country have become irritated. There are even those who have no restraint in saying that the Senate Committee is purposely trying to delay tariff legislation further in the hope that the dilemma it has faced over the valuation feature will be worked out through some sort of adjustment of world-wide economic conditions. At the same time, the Republicans, who are responsible for legislation, undoubtedly would have fears of political results if they postponed tariff legislation when their platform has pledged them to tariff revision. It is clear that the Republicans fear the possible political effect if action is deferred much longer. A way out of the situation may not be found unless the President goes definitely on record in favor of some tariff valuation plan. Those in favor of the American valuation plan do not accept the statement that the Senate committee's present attitude can be logically based on any suggestion made by the President. The President, in his annual message to Congress last December in speaking of the American valuation plan, said there could not be ignored "the danger of such valuation making American tariffs prohibitive." Republicans of the House assert that this statement by no means condemns the American valuation plan and does not justify the action of the Finance Committee. On the contrary, they say the reasoning of the President is perfectly sound and simply was a warning against the danger of fixing duties too high. Manifestly a given ad valorem duty is more highly protective under the American valuation plan than it is under the foreign valuation plan. This difference obviously is due to the exchange situation and, according to House Republicans, was taken into consideration when they passed the American valuation plan.

Urged Moderate Duties

Iron and steel manufacturers in substance have expressed the same sentiment as that of the President and have consistently urged only moderate duties based on the American valuation plan. Unless it is finally adopted, they point out that higher duties than those carried in the House bill will be necessary as a measure of protection. This is one of the contentions made in a brief recently filed with the Finance Committee by Chairman John A. Topping of the Republic Iron & Steel Co., on behalf of the independent steel industry in which he asked that the American valuation plan be adopted. His brief was in reply to arguments made

against the American plan and supplemented previous statements he and other steel producers have made before both the Ways and Means and Finance Committees.

The Smoot Amendments

The tentative plan of the Senate Committee is based on amendments prepared by Senator Smoot, which Republicans of that committee maintain are designed to meet disturbed economic conditions of the world with the resulting depreciation of foreign exchange. They take into account proclaimed American valuation, flexible rates that might be moved up a maximum or down a minimum of 50 per cent and depreciated foreign exchange as well as provisions intended to prevent discrimination against American exports. Final action on the Smoot provisions is being withheld until an opinion is received from the State Department as to whether the American valuation plan and the depreciated exchange provisions would be in violation of "most favored nation" clauses of existing commercial treaties. Those favoring the American valuation plan plainly do not take much stock in the claim that it would violate such treaties and have pointed out that countries throughout the world have had no hesitancy in erecting high tariffs such as this country has not contemplated.

They also say that granting that there is any substance to the argument about the violation of the treaties mentioned, the Senate Committee has been slow to raise the point. They also are unable to reconcile the attitude of the Finance Committee with the fact that it had employed a staff of experts under the direction of James B. Reynolds to investigate the practicability of the American valuation plan, and despite the attitude of Mr. Reynolds that it is practicable, has for the present at least suggested the foreign valuation plan. The report of Mr. Reynolds has never been made public, but in a brief statement at the recent convention in Washington of the National Association of Manufacturers, who went on record in favor of the American valuation plan, he made the statement that the plan is workable. Critics of the Senate Finance Committee also have commented on the fact that it at one time had practically determined upon this system and was engaged in transferring many duties from an ad valorem to a specific basis. Then also, it is pointed out, it had been about concluded to base duties on the American wholesale selling price. The present shift consequently has aroused real interest, to say the least, but apparently the Republican members of the Finance Committee think it is the logical step to take and work now is under way of returning many duties, it is said, from a specific to an ad valorem basis. There has been a difference of opinion on the plan of duty assessment among officials of the Treasury Department as well as among members of the Tariff Commission. The final solution determined upon necessarily is being awaited with anxiety and even more concern is being shown over the outcome of the difference between the House Republicans and the Republicans of the Committee on Finance.

Mr. Topping's Brief

In his brief filed recently with the Finance Committee, Mr. Topping said that unless the American valuation plan is adopted rates of duty on iron and steel products will have to be greatly increased. He contended that the American valuation plan is necessary even to rates on iron and steel articles which take specific duties. He explains that the value of iron and steel determines in many cases the classification under which duty is assessed and to prevent undervaluation

or fraudulent methods, American valuation is necessary for protection. Furthermore, he states, there are important iron and steel rates rated on the ad valorem basis which selling methods long in vogue require should be continued and these special products, it is pointed out, are exposed.

The brief of Mr. Topping, in part, says:

It has been stated before the Senate Finance Committee by a representative of the Fair Tariff League, that the method of American valuation proposed, results in tariff discrimination, because cost varies with the country of production, and therefore, the exporting country with the minimum cost, would pay a lower rate of duty than the exporting country with the maximum cost. This may be admitted, but this objection would be also true of foreign valuations, because cost variations are not leveled by any method we might adopt in valuing importations.

American valuation, on the other hand, has the distinct merit of not being discriminatory, as all exporting countries would pay the same amount of duty, and therefore, no discrimination is practiced, whereas discrimination is unavoidable under foreign values, as the amount of duty varies with the cost of the product.

The administrative features of the American plan are practical, and can be easily operated. It has been demonstrated, that it is easier to obtain necessary data at home for appraising commodities, than it is to obtain data of a reliable character, in foreign countries.

In fact, under the present law, which permits of duty being levied upon American values, when no other method for determining values is obtainable, emphasizes the fact that American values are always obtainable, whereas experience shows, this is not true of foreign values.

American valuation will not increase the price to the American consumer, but will prevent under-valuations. Under-valuations principally benefit the exporting country and the importing agent, because the imported product is sold, like domestic products, on the basis of what competition, from time to time, suggests, rather than by what the cost of the product justifies. It is, therefore, more important to prevent under-valuation to conserve Government revenues, and to prevent the uncertainties and inequalities arising from depreciated and fluctuating currency values, than it is to legislate to support a theory with doubtful advantages to the consumer, particularly when there can be no doubt that every dollar of imported product brought into our markets, means less work for our people.

Assessment of duty on foreign valuations, converted into United States money at prevailing low rates of exchange, is now enabling foreign manufacturers to displace American products at the expense of American workmen. Unemployment is destroying the purchasing power of the people, and unless this situation is remedied, it will eventually prostrate all American industries which are exposed to this unfair competition.

BASING POINT HEARING

Sessions at Milwaukee Ended—Investigation to Be Continued This Week at Washington

MILWAUKEE, WIS., Feb. 20.—The first hearing of the series ordered held by the Federal Trade Commission upon its complaint against the United States Steel Corporation, seeking the abolition of the Pittsburgh basing point practice because of the alleged discriminatory effect upon Western rolled steel consumers, was brought to an end on Saturday, at the close of the third week of trial sessions opened Jan. 30 in the Government building at Milwaukee by Examiner John W. Bennett.

It was announced that the commission will open the second of the series of hearings on March 1 at Minneapolis.

In the meantime, however, the commission will conduct a hearing at its headquarters in Washington upon the results of the investigation in Milwaukee. Questions concerning the admissibility of evidence will be definitely decided and decisions made upon a large number of motions and objections made by counsel for the commission as well as the Steel Corporation during the hearing at Milwaukee, which during the introduction of testimony were merely noted by the trial examiner for future determination. The decisions upon these questions are expected to have an important effect upon the large mass of evidence recorded thus far, and upon the conduct of future hearings.

Points in Controversy

W. W. Corlett, general solicitor of the Steel Corporation, entered motions at the final session of the hearing in Milwaukee on Saturday, indicating that the points of evidence in controversy will be taken up under four separate headings at the hearing before the entire commission in Washington this week. These are as follows:

1. The introduction of contracts, invoices and correspondence with manufacturers of rolled steel material other than those between the respondent, namely, the U. S. Steel Corporation, and its subsidiary corporations, and concerns whose officials and representatives have testified.

2. The limitation upon cross-examination of inquiry

into the (a) profits made upon any article manufactured, and the (b) profits as a whole made by any concern, its increase in net assets, the amounts of dividends paid, and any other facts tending to show the state of prosperity of the concern.

3. The introduction of testimony intended to show a higher cost to the ultimate consumer, or in other words, "the public interest."

4. The mere expression of an opinion by a witness as to the ability of the company which he represents to compete in a given territory, heretofore admitted as expert testimony.

Last Week's Evidence

Witnesses who testified during the final week of the hearing in Milwaukee reiterated to a large extent the evidence presented by previous witnesses. A new angle was introduced by the testimony of L. E. Geer, secretary and treasurer, and Herman A. Meyer, purchasing agent, Manitowoc Ship Building Corporation, Manitowoc, Wis. This testimony in effect was that the company in the last five years purchased approximately 42,000 tons of plates and other rolled material, of which amount about 90 per cent was purchased from the Illinois Steel Co. and shipped from mills in the Chicago or Gary districts, with the freight rate from Pittsburgh to Manitowoc invariably included in the invoice price, although billed f.o.b. Manitowoc. Both witnesses testified that the Manitowoc company lost a considerable quantity of business in competition with shipyards along Lake Erie because of the more advantageous geographical location of the Lake Erie yards in relation to the cost of material purchased upon a Pittsburgh basing point. The witnesses testified that they estimated the amount of money represented by unearned freight charges paid on steel in the past five years at \$140,000.

E. E. Russell, vice-president J. I. Case Threshing Machine Co., Racine, Wis., in his testimony, revealed that his company fixes its selling prices by finding the cost of production and then adding a 10 per cent margin of profit. Thus, Mr. Russell testified, every purchaser of a Case product, wherever located, paid not only 10 per cent upon cost, but a similar percentage upon unearned freight charges when steel material was derived from mills near Racine and freight from Pittsburgh to Racine was added to the purchase price. Upon cross-examination, Mr. Russell admitted that the International Harvester Co. was able to sell threshers at a lower cost than the Case company, but that this difference did not materially affect the competition, which is

governed to a considerable extent by prestige and other considerations not related to cost and selling prices.

Fabrication in Transit Plan

Herman A. Wagner, president Wisconsin Bridge & Iron Co., Milwaukee, testified his company consumes about 16,000 tons of structural shapes annually on the average, and by reason of the imposition of unearned freight charges from Pittsburgh, it was impossible to compete on an equal basis with fabricators east of Chicago. Western competition is possible, he said, only under the fabrication-in-transit privilege, which imposes a penalty of 2c. per 100 lb. It has been the intention of the Wisconsin company to increase its capacity and enter Eastern fields of competition if it were not handicapped by the Pittsburgh basing point practice, Mr. Wagner said, but under existing conditions it is not possible to employ the capacity of the present plant to the utmost because the field is restricted.

W. T. Bastian, purchasing agent Harvey Spring & Forging Co., Racine, Wis., testified that his concern purchased about 10,000 tons of steel annually, and 84 per cent is shipped from mills of the Illinois Steel Co. in the Chicago district, but freight from Pittsburgh to Racine invariably was added, save in the last six or

eight months, when purchases have been made on a Chicago basing point. E. J. Harvey, president of the company, testified that the steel represented 68 per cent of the cost of the finished article, and that 30 to 40 per cent of the material was wasted in the process, which increased the handicap he said his company was under in competing with competitors located nearer Pittsburgh, for business in such automotive centers as Cleveland, Detroit and Flint.

Irving Smith, president Sterling Wheelbarrow Co., Milwaukee, testified that he purchases 2000 tons of steel annually and that 30 per cent of this amount is derived from Chicago district mills, but freight from Pittsburgh is charged on such purchases as well as on those delivered by mills farther east.

W. E. McCollum, secretary Western Association of Rolled Steel Consumers, which is supporting the complaint of the Federal Trade Commission, stated that according to the best information available, Milwaukee fabricators of rolled steel consume between 150,000 and 200,000 tons annually. The freight rate from Pittsburgh to Milwaukee is 41½c. per 100 lb. He figures that unearned freight charges collected on material delivered from Chicago district mills amount to more than \$1,000,000 annually under the Pittsburgh basing point practice.

Steel Plates Containing Zirconium and Other Elements

An investigation of the manufacture and properties of steel plates containing zirconium and other elements has been conducted by the Bureau of Standards and has been published as Technological Paper No. 207. The investigation originated from the need of the ordnance department of the army and navy for information regarding the effects on the ballistic properties of light armor plate of certain chemical elements such as zirconium:

A joint program was outlined according to which the Bureau of Mines was to produce and analyze ingots of the desired compositions; the Bureau of Standards to manufacture and heat treat the plates, carry out physical tests, micro-examinations and chemical analyses, and develop methods of chemical analysis, when needed, for the more unusual elements in steel and in the presence of each other; and the Navy Department was to carry out the ballistic tests.

Although the results of the ballistic tests are not available for publication, an account of the mechanical properties and tests of this series of somewhat unusual steels was considered worthy of publication. These results may be summarized as follows:

About 192 heats of steel containing in various combinations the following principal variable elements, carbon, silicon, nickel, aluminum, titanium, zirconium, cerium, boron, copper, cobalt, uranium, molybdenum, chromium and tungsten, have been studied.

None of the steels presented any difficulties in rolling into plate except those containing boron.

The usual mechanical properties and impact tests were carried out on all of the steels. It is shown that steel containing 0.40 to 0.50 per cent carbon, 1.00 to 1.50 per cent silicon, 3.00 to 3.25 per cent nickel and 0.60 to 0.80 manganese and deoxidized with a simple deoxidizer such as aluminum can be produced having a tensile strength of approximately 300,000 lb. per sq. in. with excellent ductility and toughness. This type of steel is recommended for a structural material.

Although the same high properties are obtained in steels of the above composition with the aid of additional elements, it does not appear necessary to resort to such additions of expensive alloying elements.

Zirconium, like titanium and aluminum, acts primarily as a scavenger, and when it is not removed as part of the slag remains in the steel in the form of square bright yellow inclusions not directly visible at magnifications lower than 500 diameters. It is not considered that these inclusions can be very beneficial and if they are segregated and rolled out into thin plate-like streaks they may be detrimental, especially in armor plate.

Of the other elements that are regarded as special alloying additions, chromium, tungsten, vanadium and molybdenum go into solution and produce a martensitic pattern in the air-cooled specimens. Cerium and ura-

istic inclusions. Copper goes into solution but a larger amount is required to produce a martensitic-pattern in the air-cooled samples than for the others. Boron forms a complex eutectic, probably that of an iron-carbon-boron compound with iron. This eutectic is fusible at the temperatures ordinarily used in rolling, but at slightly lower temperatures steel containing boron can be rolled successfully. Hot working breaks up the eutectic and spherical hard particles, similar to iron carbide globules, are formed.

Contract for Reconditioning the Leviathan

WASHINGTON, Feb. 21.—The contract for reconditioning the liner Leviathan, was formerly awarded by the Shipping Board last Wednesday, to the Newport News Shipbuilding & Dry Dock Co., Newport News, Va. The vessel is to be ready for service early in 1923. The work of putting the ship in condition for service will begin at once both at Hoboken, N. J., where the Leviathan now is, and at the yards of the Newport News company, which corporation will convert the steamer into an oil burner for the sum of \$6,110,000. The contract for steward's equipment and interior furnishings was awarded to Gimbel Bros., New York, at \$551,000. The total cost to the Shipping Board will be \$8,200,000. The hull of the vessel will be painted at the Boston Navy Yard at a cost of \$191,000.

Unavailing efforts were made by representatives and senators from Massachusetts to have the vessel reconditioned at the Boston Navy Yard, and qualifying legislation to this end was enacted.

Ford Co. New Brass Foundry to Use Electric Melting Equipment

The Detroit Electric Furnace Co., Detroit, has recently received an order from the Ford Motor Co. for five 2000-lb. 300 kva. Detroit rocking electric furnaces to be installed in the company's new brass foundry in the Highland Park plant. These furnaces are to be equipped with automatic electrode control and, together with the first Detroit unit already installed, will afford a melting capacity of approximately 150,000 lb. of metal per 16-hr. day. The battery of furnaces will be installed and in operation about April 1.

The Erie Foundry Co., Erie, Pa., recently completed an order for 67 steam drop hammers ranging in size from 800-lb. to 5000-lb. for the Ford Motor Co., for installation at its Highland Park plant. There are now approximately 100 Erie hammers in the Ford Motor

LEATHER BELTING RESEARCH*

Manufacturers Have Conducted Investigation Into Various Phases of Its Use

The experienced belt-maker would probably say that the two most frequent sources of trouble are belts stretching and running crooked, the latter usually with very high speed drives where single belts are most likely to be used. It is evident that there are a number of things which may affect the stretch of a belt, such as the kind of hide used, tannage, method of currying—that is, the percentage and distribution of grease in the leather itself, and the thoroughness of stretching given to the leather before it is made into a belt. The hide of spongy fiber or consistency is likely to make leather that is more "stretchy." It is well-known that certain tannages, probably those which do not well fill the inter-fibular spaces, make leather which is more likely to stretch than that which is dead tanned.

Belts running crooked, when not due to abuse, are certainly sometimes caused by the springing of the piece of leather, after it is stripped to width, which is probably related somewhat to the factors influencing stretch just previously noted. With leather which is not very thoroughly tanned there seems to be a tendency for one edge of the strip to draw up more than the other after it has been stretched, and thereby pulling crooked. Aside from the annoyance to the user by having frequently to tighten the belt, the tendency to stretch causes a rapid reduction in the tension, and unless the coefficient of friction is unusually good, there results a rapid diminution in the effective tension and the work which the belt will do. While a moderate amount of stretch is perhaps not a serious matter, the importance of this being removed as soon as possible, so that an effective tension high enough to carry the load satisfactorily may be maintained is of great importance.

Increased Belt Tensions Not Unlikely

As far back as the days of Frederick Taylor considerable work was done in determining what was the proper tension to give a belt. He arrived at figures which were certainly conservative and practicable. I think there is not much doubt that if the belt users of the country had been willing to adopt his recommendations in this respect, they would have had greater economy with belting than has been the case. However, the tendency has been to load closer to the limit and to settle upon a tension which could be maintained fairly steadily, but which would give a maximum of power transmission. It would not be surprising to see higher tensions still adopted with improved methods of manufacture and better types of bearings.

Closely allied with the question of stretch is that of creep and its cause, and elasticity, which we have for a long time thought one of the most valuable properties of the leather belt, and one which differentiated it sharply from most of the substitutes available. Some of the work on this has been done by Mr. Jones and Professor Sawdon, which has thrown rather more light on earlier work and theories in connection with the subject.

Questions of Creep and Elasticity Studied

They have shown that the leather belt is not perfectly elastic in that it comes back immediately after the removal of tension, but that there is a time lag which may have some bearing upon the problem of transmission of power. Just what this is will probably vary a little with different leathers, but from the practical standpoint of power transmission it seems pretty clear that it will account for perhaps the first three quarters of one per cent or one per cent of what we read as slip in our power transmission curves, and it would seem reasonable that there is room for further improvement in reducing this a little more in a way

which will increase slightly the efficiency of the leather belt.

The wide variation in the observed coefficient of friction readings on a belt when it is just new and that obtained after it has been in use some time shows clearly the importance of a proper finish on the surface. One interesting feature which had not been carefully studied until perhaps of recent times is in the observation that the coefficient of friction changes quite noticeably at different speeds of slip on a given piece of leather, though the coefficient of friction does not apparently change in any considerable way at different tensions. It is obvious that in a running belt the effective tension, which is the difference between the tension on the tight side and the slack side, is limited very definitely by the coefficient of friction obtained at a given speed of operation and of slip. This problem seems to be one of the very fertile fields for further work.

So far I have not mentioned the often spoken of factor of tensile strength, though it is apt to be one of the main things alluded to in leather belting specifications. I have not mentioned it because the factor of safety in a good leather belt is high, often 5 to 1 to 10 to 1, and it is a very rare thing to hear of a belt tearing because of the load applied to it, unless some accident has occurred.

Belt Speeds

Another very important factor in the capacity of a given belt to transmit power is speed, and while considerable work has been done on this subject, there is still a good deal to learn. It has only been a few years since a prominent leather belting manufacturer stated that he considered it good practice to run leather belts for woodworking machinery at speeds in the neighborhood of 9000 ft. per min. Other makers disagree with him. Dr. E. D. Wilson, in presenting data on the subject published in 1913 (and on which the tables published by the Exchange are based) has shown that at this speed a double belt will transmit practically no power and a single very little indeed.

There is no available machinery for actually making such tests at these high speeds, and general experience in which little scientific data is available seem to indicate that the greatest efficiency is obtained at speeds of 4000 to 5000 ft. per min. So far as I am aware, none of the data submitted take into consideration the effect of grease, and of the varying coefficient of friction at the high speed of slip which would be obtained at any such speed as 9000 ft. per min. We do know, of course, that the centrifugal force increases very fast on higher speeds, tending to throw the belts away from the pulleys, and it is likely that in scientific work on this subject when it is done thoroughly will, as is so often the case, bear out practical shop experience, at least in large measure, and recommend the limitation of speed to a more reasonable figure.

Some years ago the subject of humidity and its effect upon leather belts was investigated, but whether or not due consideration was given to the variation in the modern methods of currying from the old hand stuffing, and whether the tests were made on a large number of belts, or only on a few of one make, I am not aware. It does seem, however, pretty clear that the presence of large amounts of humidity lowers the effectiveness of a leather belt, but it is also likely that proper treatment will do something to lessen this tendency.

Use of Belt Tightening Pulleys

During the past few years the use of compressors and machines with a wide variation in loads has rather increased, and motor driven compressors with a binder pulley or tightener have become very much more common. This type of drive has received comparatively little careful investigation, though it has known to work quite well with proper installation and sufficient belt capacity. It does, however, seem quite clear that it is necessary to have more belt for a load of this kind based upon the power required from the motor than for an ordinary steady pull; some say twice

*From a paper read by J. Edgar Rhoads before the National Association of Leather Belting Manufacturers.

as much is needed, but I believe this is still another subject requiring careful test under well controlled conditions.

Closely allied with this is the question of arc of contact, the effect of increasing or decreasing this in the load which a belt will carry, and also the most effective way to arrange drives where there is a small driver and a large driven or vice versa.

The subject of center distance was investigated somewhat during this past year at Purdue University, but time prevented final or the most thorough kind of test. The millwright has known for a long time that increasing the center distance was a great help, and that with a well designed drive, the position of the catenary formed by the slack side on top was a great help in steadying the belt, particularly on sloping

drives where belts were running at angles with the floor.

During the past few weeks a very careful comparison has been made to settle the much mooted question as to which side of a single belt should run next to the pulley, and Mr. Jones has prepared very complete figures which he has probably just about ready to publish, which represents an enormous amount of careful work and prove conclusively that the grain side of the leather belt is on the average decidedly superior to the flesh, though he has found that some belts, carrying very high amounts of grease, will do nearly as well when run with the flesh side to the pulley as the grain. These, however, are not representative of the great mass of standard leather belts upon the market.

POWDERED COAL INSTALLATIONS

Considerations of Capacity of Equipment and of Power Requirements for Pulverizing Coal

In a 131-page pamphlet, entitled "The Preparation, Transportation and Combustion of Powdered Coal," prepared by John Blizard, the Canadian Department of

for bituminous coal containing not more than 10 per cent of moisture. When greater moisture is contained, in some cases larger sizes would be required, or the moisture removal would be less than standard.

Table III. shows the amount of heat required, and the amount of undried coal which has to be burned, in order to dry coal containing from 4 to 14 per cent of moisture. The figures are worked out on a basis

Table I—Standard Sizes and Capacities of Aero Pulverizers

	Size and Weight (Lb.)	Normal Load Soft Coal (Lb. per Hr.)	Floor Space (Inches)	Height (Inches)	R.p.m.	(Horsepower—Normal Consump- tion Motor Recom- mended)	Space Occupied (Cu. Ft.)	(Per Net Ton of Load—Weight (Lb.) Hp. Con- sumption (Cu. Ft.)
A.....	2,250	600	27" x 81"	28"	2,050	10	28.5	7,500 33.3 95.0

Mines has put forth a compendium of information on the subject, based partly upon direct investigation in the shape of field studies, and partly upon a compilation from printed data otherwise available. So much of the information in this volume is of permanent value that a portion of it, in the shape of tables, is

Table II—Fuller-Lehigh Dryers for Bituminous Coal with Not Over 10 Per Cent Moisture

Tons Coal per Hour	Size of Dryer Diam. Ft.	Length Ft.	Volume Cu. Ft.	Horsepower to Rotate Shell	Horsepower per Ton Hourly Capacity
4	3	30	212	3	0.75
6	3 1/2	30	289	4	0.67
8	4	30	477	5	0.625
10	4 1/2	42	668	6	0.6
14	5 1/2	42	998	7	0.5
20	6	42	1,188	8	0.4
25	6 1/2	42	1,394	10	0.4

republished here. This has been somewhat rearranged from the tables as given and has been amplified in certain particulars.

Table I. shows standard sizes and capacities of Aero pulverizers, with normal loads ranging from 600 to 5000 lb. per hour of soft coal. This shows not only the size and weight of the pulverizer for the

of obtaining, as a final product, 100 lb. of coal with 2 per cent of moisture, and the coal consumption for drying is figured on a basis of 70 per cent, 60 per cent and 50 per cent efficiency in the combustion of the coal used for this purpose.

Table IV. shows the power required for pulverizing coal to certain degrees of fineness. In the first part of this table, which relates to Raymond pulverizers, capacities are covered from 1 to 25 tons of coal per

Table IV—Power Required for Pulverizing Coal A—In Raymond Pulverizers

Grinding Room Capacity, Tons per Hr.	Percentage Through		Horsepower Required	
	100 Mesh	200 Mesh	Total	Per Ton

70% efficiency	0.68	0.95	1.25	1.58	1.93	2.32
80% efficiency	0.79	1.11	1.46	1.84	2.26	2.71
90% efficiency	0.95	1.34	1.76	2.21	2.71	3.25

various capacities, but also the power consumption and the size of motor recommended.

Table II. shows the sizes of Fuller-Lehigh dryers and the power requirements for hourly capacities ranging from 4 to 25 tons of coal. These figures are given

hour. In the second part of the table, which relates to Fuller-Lehigh pulverizers, capacities range from 1/2 ton to 10 tons per hour.

The Minnesota Steel Co., Duluth, Minn., has work in active progress on its new wire manufacturing plant on local site, and plans to commence the installation of machinery in about 60 days, having the entire plant ready for operation early in June.

The Alliance Structural Co., Alliance, Ohio, has increased its capital stock from \$200,000 to \$500,000.

BIDS OPENED ON TUNNEL JOB

Booth & Flinn, Ltd., Quotes Lowest Price \$19,331,723.50, and Will Get Contract

Booth & Flinn, Ltd., 17 Battery Place, New York, was low bidder on the contract for construction work on the Hudson River vehicular tunnel, bids on which were opened at the Hall of Records, New York, Feb. 15, its price on contracts Nos. 3 and 4 being \$19,331,723.50. Among the itemized bids a price of \$57.50 per ton was submitted on the 33,200 tons of cast iron segments in contract No. 3 and \$47.50 per ton on the 72,300 tons of cast iron segments in contract No. 4, totaling \$1,782,840 and \$3,434,250, respectively.

Booth & Flinn, Ltd., has handled numerous tunnel and subway construction contracts, among the most recent being the tunnel extending from Clark Street, Brooklyn, to Old Slip, New York, built for the Interborough Rapid Transit Co. and the Montague Street tunnel in Brooklyn, constructed for the Brooklyn Rapid Transit Co.; a tunnel from Fourteenth Street, New

York, to North Seventh Street, Brooklyn; tunnel construction in Newark, N. J., for the Passaic Valley Sewage Commission; Liberty tunnel through rock, for Pittsburgh, and several contracts on clay tunneling for sewers in Detroit. Award of the sub-contracts for materials involved will probably be made by Booth & Flinn within the next week or 10 days.

Quotations on some of the iron and steel items in the Booth & Flinn bid were as follows: On the 2000 ft. of wrought iron or steel pipe, 1-in. to 4-in., quotations ranged from 40c. to \$1.70 per ft. and totaled \$2,130; on 34,100 ft. of galvanized iron electric conduit the prices were from 15c. to 75c. per ft. and totaled \$10,468.50; on the cast steel tunnel lining totaling 9,050 tons, \$85 per ton was the price submitted in contract No. 4, and \$90 per ton on contract No. 3, totaling \$769,750; on cast steel pile segments the total was 370 tons and the prices \$85 and \$90 per ton; on 15,590 ft. of cast-iron service pipe, ranging from 6-in. to 12-in., \$1.40 to \$3.50 per ft. was quoted; on bolts and nuts the total was 1,615 tons at \$150 per ton, totaling on both contracts \$692,250.

JAPANESE MERCHANTS BUYING

**Purchases No Longer Confined to Government--
German Competition Slackens-- Low
Rail Prices**

NEW YORK, Feb. 20.—Practically all export inquiries of any importance are still appearing from Japanese sources with some slight activity on the part of China. Buying from Japan, which has heretofore been largely governmental, is beginning to include merchant buying. Last week one Japanese export house booked orders for about 1800 tons of merchant steel for Japan. This included 450 tons of merchant bars; 250 tons of structural steel; a tonnage of black and blue annealed sheets, and a fairly large order for 15-in. beams. Japanese buyers are beginning to evince a strong interest in steel bars and there have been several small orders booked by New York exporters. Sizes on these orders generally range from 3/4-in. to as large as 1-in. One bar order for 600 tons is reported and another for 200 tons. Wire rods also continue active, one exporter having booked during the past two weeks about 2000 tons in small orders. A New York exporter is quoting on an inquiry for 200 tons of 42 to 80-lb. I beams of 15, 20, 22 and 24-in. and has sold about 5000 kegs of checker head, countersunk wire nails.

German competition in Far Eastern markets seems to be largely confined to material upon which labor is a large item. German bars, however, have quite recently been sold to Japanese buyers on a basis which figures back to 1.09c. per lb., Pittsburgh. British sellers are now quoting \$53 per ton on wire rods, c.i.f. Japanese port. If this is the lowest possible price by United Kingdom sellers, exporters in the United States are contemplating selling wire rods into England, provided they can buy low enough to deliver at about \$45 per ton, c.i.f. United Kingdom port.

The recent rail purchases by the Imperial Government Railways and the South Manchuria Railway Co. are said to have brought out low quotations. The Imperial Government Railway specification, which called for 10,000 tons of 60-lb. rails, is said to have been placed with a Japanese export house at \$43.96 per ton, c.i.f. Japan, while the South Manchurian rail contract involving about 6800 tons of 100-lb. rails is said to have gone at \$46.25 per ton, c.i.f. Dairen, Manchuria. On this latter the best bid possible by German mills was \$47, but German bids through the United States were not permitted. Inquiries for rails by Far Eastern interests will undoubtedly bring out good prices. One New York exporter states that he was quoted \$36.23 per ton, f.a.s., New York, on a tonnage of 35-lb. rails for the Far East and was given a still lower quotation by another mill.

Chinese activity is at present confined to purchases of small lots of black sheets, nails, second-hand struc-

tural steel and bar crop ends. The Japanese government inquiry for bridge material, which was to have closed the latter part of January, has been placed with one of the large Japanese export houses, which quoted on the price of a leading independent. It totals 4000 tons. Another tender on bridge material is still pending. Kobe municipality is in the market for another tonnage of T rails for its trolley line, bids on which will be opened the latter part of this month.

Steel Manufacturers Elect New Officers

At the annual meeting of the Association of American Steel Manufacturers, held at the William Penn Hotel, Pittsburgh, Feb. 17, Jesse J. Shuman, inspecting engineer Jones & Laughlin Steel Co., was elected president; E. F. Kennery, metallurgical engineer, Midvale Steel & Ordnance Co., vice-president, and J. O. Leech, manager bureau of inspection and tests, Carnegie Steel Co., secretary-treasurer. Robert H. Irons, Central Iron & Steel Co., retiring president, was presented with a silver after-dinner coffee service.

Shipping Board Will Sell Steel at Auction

WASHINGTON, Feb. 18.—After rejecting sealed bids which were opened last Wednesday, the Shipping Board has turned to the plan of disposing of the 105,000 tons of surplus steel at Hog Island by public auction and named to-day to sell the material in this manner. The board did not reveal either the number of bids received or prices offered nor its reason for rejecting them last week. It is said, however, that there were seven or eight bids received and that they were rejected because of the low figures named.

Hammond Iron Works, Warren, Pa., recently shipped on the Ward line steamer, Canto, from Baltimore, 95 carloads of fabricated plates, part of a contract for 13 82,000-barrel tanks for the Gulf Refining Co., Port Arthur, Texas. The tanks are 140-ft. in diameter and 30-ft. high.

The New England Iron League will hold its annual winter outing at Jackson, N. H. Members will leave Boston, Saturday afternoon, Feb. 18, and will return on the evening of Feb. 22. C. N. Pitts, New England Structural Co., Everett, Mass., has charge of arrangements.

The Anchor Concrete Machinery Co., Rock Rapids, Iowa, has moved to Adrian, Mich. The plant and site of the Adrian Steel Castings Co. have been purchased and machines for producing blocks, brick and cement will be made as soon as equipment can be installed.

Iron and Steel Markets

INCREASED ACTIVITY

February Exceeding January Production

Advances in Pig Iron But Weakness Still in Steel—Broad Demand Maintained

Increased pig iron and steel making is the outstanding factor of the week. It is the response to necessity buying and the railroad purchases of cars and track material of the past month.

The Steel Corporation is operating at better than 50 per cent, but business accumulated by the independents has shortened the gap between their scale of operations and that of the corporation. The Illinois Steel Co. is making 55 per cent of its capacity in ingots and the Inland Steel Co. is on a 60 per cent basis. Little of the railroad business went to the East, but the average of independent makers is over 40 per cent and the February production rate promises to exceed measurably the January output, which in steel was 46½ per cent of capacity.

An unexpected development was a well-defined effort to stabilize pig iron prices. Against doubts that advances can be held is the actual blowing in of at least five more blast furnaces, with two others scheduled to go on the active list before the end of the week.

It remains that rolling mills are yet unable to bring up order books to a point necessitating deferred shipments, and buyers, sure of deliveries, continue to cover merely for needs. Present activity represents orders taken at a sacrifice to establish backlogs and price weakness has not yet disappeared. A firmer attitude on new inquiries is, however, more general.

Railroad car business is still encouraging. The Great Northern, which closed on 500 cars, is still to buy 750; the St. Paul is expected shortly to cover for 2000 and the Pacific Fruit Express Co. for 3300. Five or six round lots of rail orders have been booked and the Gary mill has had releases on 20,000 tons on existing contracts.

The demand for bridge and building construction is indicated by fresh projects involving 22,000 tons and the awards aggregating 14,000 tons. January's business in fabricated structural steel, 72,100 tons, was at a rate of 40 per cent of the country's capacity and is barely 13 per cent under the January average for 10 years.

A few sales of various grades of pig iron have been made in the Chicago district on a basis of \$20, an advance of \$2 over recent quotations, but doubt is expressed that this advance can be maintained. The effect has been to cause firmer prices on irons which have been competing with the Chicago product. This is particularly noticeable in Cleveland, but concessions of 50c. have been made on iron from the Cleveland district when made in territory distant from Chicago. At Philadelphia there is more activity, but furnaces are absorbing freight when necessary.

Cast iron pipe awards, some of it seasonal, total 17,000 tons in a number of large size orders.

Three freight boats are now under negotiation for construction at Lake yards, each taking 4000 tons of steel.

The broadening market has brought increasing business from the automobile and the agricultural implement trade. The American Sheet & Tin Plate Co. has opened its books for the second quarter at to-day's prices.

In wire products there is no lack of inquiry from jobbers in preparation for spring demand. Manufacturers find it difficult to get concessions on small lots and hesitate to buy in a large way when meeting a refusal for a guarantee against price declines. Wire rods have been sold at \$35 a ton, with \$36 the usual quotation.

On shafting 2c. is still an asking price, but 1.90c. is the more common maximum, and even this is shaded.

Shading of \$3 and \$4 a ton is occasional on hot-rolled strips.

Rivets are lower, reductions in some centers amounting to \$3 a ton. Structural rivets are now obtainable at \$2.10 and boiler rivets at \$2.20. For a large pipe line in the East, structural rivets were bought at close to \$2.

A large order of tie plates was booked at less than \$30 per ton at mill. Light rails are \$1 and \$2 a ton lower, and now a minimum at 1.40c. a pound.

Better export trade is indicated by participation of private buyers as distinguished from the recent large part taken by Government agencies. For bridge work in Japan 4000 tons of structural material has been placed. American prices in the Far East have so well cut under those of Europe that added promise is given to the possibility of shipping steel to European markets.

Pittsburgh

PITTSBURGH, Feb. 21.

Aside from a well-defined effort to stabilize pig iron prices, general iron and steel market conditions have undergone very little change in a week. Most producers of foundry iron now regard the market as \$19, furnace, for the base grade, and similarly, \$18, furnace, has been set up as a minimum on basic. Some fair-sized tonnages of foundry iron have been placed in the past week at \$19, but there also was a good-sized transaction at \$18.75, this from a Valley furnace. A sale of 1000 tons of basic is noted to a Pittsburgh district sheet maker, but not very definite information as to the price is obtainable. There are reports that the business was placed at \$18, and also that the price paid was the same as on the last previous purchase by the same interest, which was \$17.75. It is clear that none of the producers went below \$18 on this inquiry, but all disclaim having taken the order, and the assumption is that it was placed at less than that figure.

General demand for steel still is for actual rather than future requirements and there has not been much change one way or another in the number of orders placed.

The possibility of a strike of union coal miners on April 1 has come only slightly into the foreground as a factor, but it is seen in the efforts of manufacturers to stock material against such an exigency rather than in any advance buying by either jobbers or con-

Composite Price, Feb. 21, 1922, Finished Steel, 2.005c. Per Lb.

Based on prices of steel bars, beams, tank plates, plain wire, open-heart rails, black pipe and black sheets	Feb. 11, 1922, 2.005c Jan. 24, 1922, 2.062c Feb. 22, 1921, 2.821c (10-year pre-war average, 1.689c)
These products constitute 88 per cent of the United States output of finished steel	

Composite Price, Feb. 21, 1922, Pig Iron, \$18.35 Per Gross Ton

Based on average of basic and foundry irons, the basic being Valley quotation, the foundry an average of Chicago, Philadelphia and Birmingham	Feb. 14, 1922, \$18.02 Jan. 24, 1922, 18.39 Feb. 22, 1921, 26.76 (10-year pre-war average, 15.72)
---	--

sumers. Having access to so much non-union coal, steel makers in the Pittsburgh district are not seriously perturbed over the strike possibility and while indications point rather strongly to a strike or a suspension of union mines over the wage question, there is a belief that Government intervention may come before the crisis is reached. The prospect of trouble is looked upon pretty calmly here, not only because there has been a good deal of quiet stocking of coal, both by the railroads and industrial consumers during the past few weeks, but because business is not so heavy or urgent that a suspension would be looked upon as serious.

Steel prices do not change much, but as a general proposition they lean in favor of buyers. The American Sheet & Tin Plate Co. yesterday opened its books for second quarter business, naming the same prices as for first quarter orders. This interest also has reaffirmed the base of \$4.75 for tin plate on second quarter contracts from jobbers. The market is at least steady on these products, although intimations of con-

cessions still are common, and on merchant steel bars there appear to be no important deviations from 1.40c. base. The market is not very firm at 1.40c. for beams and plates nor for other finished steel products not specifically referred to.

A flurry in the coke market last week strengthened coal prices, but prices of both products this week show a reactionary tendency. The scrap market has strengthened slightly as a result of purchases of some of the mills outside of Pittsburgh, which serve to bring to the surface the meagerness of available supplies.

Pig Iron.—There is a distinctly firmer tone to the market, due partly to a somewhat larger demand, which shows more strongly in foundry than in the other grades, and partly to an increasing unwillingness on the part of producers to meet prices recently done. A sanitary ware manufacturer with plants in this district and in the South has bought about 1500 tons for each plant, or a total of 4500 tons of foundry iron for March delivery. On Northern iron, this interest was

able to buy a No. 2 Valley iron at \$18.75, but paid \$19 at furnaces outside the Valley district, which, however, have slightly lower freight rates to point of consumption than the Valley furnaces. This interest also was able to buy some No. 2 foundry iron from Valley furnaces at \$19. On its Southern iron, some of the tonnage was secured at \$15, Birmingham. The National Radiator Co. is in the market for 2000 to 2500 tons of No. 2 and No. 2X foundry, for March, April and May delivery in equal amounts to its New Castle and Johnstown, Pa., plants. Producers now are generally quoting \$19, and it is claimed that some fair sized lots have been placed at this price in the past few days. Western Pennsylvania furnaces probably will be able to do more business in Johnstown from now on, as it is reported that the stock of the Cambria Steel Co., which had been on foundry grade, lately was shifted over to steel making iron. In addition to a purchase of 1000 tons of basic, a Pittsburgh district sheet maker also has taken 300 tons of Bessemer which it is understood will come from Johnstown, Pa. The rate from that point to destination is the same as from the Valley, or \$1.96, and the sales price is understood to have been around \$19. Valley furnaces having any of this grade for sale are holding to \$19.50, but middlemen have lately been taking small lots about 25c. below that price.

We quote Valley furnace, the freight rate for delivery to the Cleveland or Pittsburgh district being \$1.96 per gross ton:

Basic	\$17.75 to \$18.00
Bessemer	19.50
Gray forge	18.75 to 19.00
No. 2 foundry	18.75 to 19.00
No. 3 foundry	18.75 to 19.00
Malleable	19.00

Ferroalloys.—A Valley steel maker who recently inquired for 100 tons of 16 to 19 per cent spiegeleisen is reported to have covered this requirement at \$30 delivered and the price of \$30, furnace, recently named by an Eastern maker, remains merely a quotation as far as sales in this and nearby districts are concerned. Interest in ferroalloys generally is pretty low in this district and prices largely are nominal. Despite the recent cut of \$2 per ton in Jackson, Ohio, prices of Bessemer ferrosilicon, the advantage in price still is with producers making this material in the electric furnace, and the former moves slowly. On 50 per cent ferro-silicon a price of \$55, furnace, freight allowed, still is being made, though the more common range is from \$57 to \$60. The recently established prices for ferromanganese have not yet found basis in sales.

We quote 78 to 82 per cent ferromanganese, \$62.50 c.i.f. Atlantic seaboard for domestic and English and \$58.35 for German. Average 20 per cent spiegeleisen, nominal: 16 to 18 per cent, \$30 to \$35, delivered Pittsburgh or Valleys; 50 per cent ferrosilicon, domestic, \$55 to \$60 furnace, freight allowed. Bessemer ferrosilicon is quoted f.o.b. Jackson and New Straitsville, Ohio, furnaces as follows: 10 per cent, \$36.50; 11 per cent, \$39.80; 12 per cent, \$43.10; 13 per cent, \$47.10; 14 per cent, \$52.10; silvery iron, 6 per cent, \$25; 7 per cent, \$26; 8 per cent, \$27.50; 9 per cent, \$29.50; 10 per cent, \$31.50; 11 per cent, \$34; 12 per cent, \$36.50. The present freight rate from Jackson and New Straitsville, Ohio, into the Pittsburgh district is \$4.06 per gross ton.

Billets, Sheet Bars and Slabs.—The market is beginning to reflect the recently enlarged movement of finished products, but this is seen more in freer specification against contracts than in new business, although sales are slightly more numerous than they were recently. A middle interest is seeking 200 tons of slabs and inquiries for forging billets are coming to makers with a little more frequency than recently was the case. Prices do not change much, but since there is considerable competition between Pittsburgh and Valley mills, equalization of freights is common practice.

We quote 4 x 4-in. soft Bessemer and open-hearth billets at \$28 to \$29; 2 x 2-in. billets, \$29 to \$30; Bessemer and open hearth sheet bars, \$29 to \$30; slabs, \$29 to \$30; forging billets, ordinary carbons, \$32 to \$33, all f.o.b. Youngstown or Pittsburgh mills.

Wire Rods.—Demand is moderate and with business in finished products possible only at concessions from regular prices, considerable difficulty is experienced in selling rods at recent levels. We note a fair-sized sale of new stock rods at \$40, mill, and on soft rods, \$36 lately

has been maximum, while sales have been done as low as \$35. Buyers seem willing to pay the latter price and usually find accommodation. Prices are given on page 559.

Steel Skelp.—Open market inquiries are so few and small that prices are indeterminate. Makers still quote 1.50c. for pipe skelp, but this may be regarded merely as a negotiation quotation, which would be shaded, probably to the plate base, on the appearance of sizable inquiries.

Wire Products.—There is no lack of inquiry from the jobbers, most of whom are going along with light stocks and who appear to want to prepare for the spring demand, but actual business is kept down by the uncertainty over prices. Practically all manufacturers are taking business from the larger distributors at \$2 per ton below the Dec. 15, 1921, prices and the smaller factors seem to believe they should be able to buy at the same prices. It is because manufacturers are unwilling at the moment to meet this demand or to give guarantees against a decline in prices that larger orders are not being booked.

We quote wire nails at \$2.40 to \$2.50 base per keg, Pittsburgh, and bright basic and Bessemer wire at \$2.15 to \$2.25 base per 100 lb., Pittsburgh.

Steel Rails.—The market is definitely weaker on light rails with prices off \$1 to \$2 per ton from recent levels. In the immediate Pittsburgh district, makers of these sections, rolling them from new steel, are able to obtain 1.45c., base, but to the East as low as 1.40c. has been done and some business has been lost at that price to mills rerolling old standard sections.

We quote 25 to 45-lb. sections, rolled from new steel, 1.40c. to 1.45c. base; rolled from old rails, 1.35c. to 1.40c. base; standard rails, \$10 per gross ton mill for Bessemer and open-hearth sections.

Iron and Steel Bars.—Suggestions that business in merchant steel bars has been taken as low as 1.35c., Pittsburgh, are denied by makers here, at least as far as Pittsburgh and nearby points are concerned. Demands are not large, but they are fairly numerous and it is insisted that 1.40c. is minimum. However, there is not much support for a higher price, even on small lot orders. Makers of refined iron bars still are holding to 2c., minimum, for carload lots.

We quote steel bars rolled from billets at 1.40c.; reinforcing bars, rolled from billets, 1.40c. to 1.50c. base; reinforcing bars, rolled from old rails, 1.35c. to 1.40c.; refined iron bars, 2c. to 2.10c. in carloads, f.o.b. mill, Pittsburgh.

Structural Material.—Fabricating companies in this tract are busy in their estimating departments, but not in their shops. Only small lot jobs are coming out in this district. Plain material is slow of sale and the accepted base now is 1.40c., even on comparatively small tonnages. Prices are given on page 559.

Sheets.—The American Sheet & Tin Plate Co., as of Feb. 20, opened its books for second quarter business, naming the same prices as it quoted for the present quarter, or 3c. base for black, 4c. base for galvanized and 2.25c. base for blue annealed. It is stated in explanation for the comparatively early announcement of second quarter prices that there were a number of inquiries for that delivery. Affirmation of present prices by this interest should serve to dispel suggestions of higher prices which have been heard lately in some quarters. There is a pretty general observance of present prices on black and galvanized sheets where new rollings are involved, but stock material can be bought at concessions and it is a fact that some contracts placed \$5 per ton below current quotations have more elasticity than they were intended to have. Demand is steady rather than active, with not much anticipation of needs. The Steel Corporation sheet making subsidiary this week is operating more than 70 per cent of its mills, with the independents running about 50 per cent. Prices are given on page 559.

Tin Plate.—Current demands are light, but the mills keep well engaged on contract specifications. February is never a very active month, but by comparison with other years, it is showing relatively well this year. The

American Sheet & Tin Plate Co. has announced a price of \$4.75 per base box, Pittsburgh, on second quarter contracts from jobbers.

We quote standard production coke tin plate \$4.75 per base box f.o.b. Pittsburgh for carload lots.

Plates.—There is some business pending in connection with tank and large size pipe inquiries, but in a broad sense the market is quiet and buyers are confining their purchases closely to actual needs. The going market is 1.40c., but since this prevails on small tonnages, there is a common impression that sizable orders could be placed at 1.35c.

We quote sheared plates, $\frac{3}{4}$ in. and heavier, tank quality, at 1.40c. f.o.b. Pittsburgh.

Hoops and Bands.—The market does not appear to be quotable at above 1.90c. on either product, although the official quotation on hoops still is 2c. A range of 1.75c. to 1.90c. is quoted on bands, while some business in hoops has been placed at 1.80c.

Hot-Rolled and Cold-Rolled Strips.—Buyers continue to take supplies only as they are needed, and while a fair number of orders is being placed, the aggregate leaves much to be desired. On cold-rolled strips there is not much deviation from the 3.50c. base, but on comparatively attractive orders for hot-rolled strips the regular quotation of 2c. is being shaded as much as \$3 and \$4 per ton.

Iron and Steel Pipe.—Makers of both steel and wrought iron pipe are enjoying a reasonably good business with orders and specifications showing almost as great a gain so far this month over January as that month showed over December. In steel pipe, orders for oil country goods lately have been gaining and with some makers they are as large as those for merchant pipe. Line pipe inquiries are fairly numerous and it is believed one for 98 miles of 12-in. for a gas line from Monroe to Alexandria, La., inquired for by the Hope Engineering & Supply Co., Mount Vernon, Ohio, will be closed soon. Observance of the Dec. 16 price card is not particularly rigid, with rather low prices being named on line pipe. Plant operations are higher than are warranted by current orders, but there is some stocking in anticipation of plant suspension in the event of a strike of the union coal miners. Card discounts are given on page 559.

Boiler Tubes.—Business is picking up in steel tubes, but there are not enough orders to give all makers a share and price cutting still is pretty common. There are no established quotations on seamless tubes and the quoted discounts on lapwelded goods frequently are supplemented by an additional 5 per cent. Iron tubes are relatively firm. Discounts are given on page 559.

Nuts and Bolts.—Business is no more than it has been, but it does not show much increase either, and as far as makers in this district are concerned, it is pretty much localized, due to the fact that on most sizes and styles, buyers can save money by placing business with mills having a lower freight rate than those observing the Pittsburgh base. Demand is purely hand-to-mouth. Discounts are given on page 559.

Cold-Finished Steel Bars and Shafting.—There is just a fair demand for screw stock and shafting, purchases of which for the most part merely are for the rounding out of stocks. Jobbers in some parts of the country still have unliquidated stocks and the agricultural implement industry has had little opportunity to work off big purchases of 1920. Stocks in distributing and consuming hands as a whole are small by comparison with what they have been in recent years, but this is not necessarily a favorable augury. It is recognized that even when general business returns to its normal stride, there will hardly be a repetition of the urgent demands of early 1920 and consequently not the necessity for consumers and jobbers to carry big stocks. For some time it is probable that supply will be sufficient for all demands, and so long as delivery can be made in two or three weeks, buyers will feel safe with about half the stocks they formerly carried. The "official" quotation on cold-rolled or cold-drawn steel bars still is 2c., but 1.90c. is the more common maximum and even that price is being shaded against occasional orders of attractive features. Ground shafting is unchanged at 2.25c. base, mill, for carloads.

Rivets.—The market is very largely a buyer's affair, and while an effort is being made to maintain \$2.25 to \$2.35, base, per 100 lb. on heavy rivets, it is frankly admitted that these prices are being obtained only on retail lots and that attractive orders can be placed \$2 to \$3 per ton less. Prices and discounts are given on page 559.

Spikes.—No information yet has been received here as to the disposition of the 30,000 to 40,000 kegs of spikes for the New York Central Lines. It is rumored that the order has been divided between the Lackawanna Steel Co. and Jones & Laughlin Steel Co., but the latter company has no official advice with regard to the order. Prices on standard spikes still are inclined lower and the common belief is that the New York Central business will be placed at less than \$2.15, base, per 100 lb., the minimum public quotation of makers. Prices are given on page 559.

Coal and Coke.—Two or three good-sized orders for furnace coke last week resulted in such a complete cleaning up of available tonnages that the advance of the previous week was further extended, some sales being made as high as \$3.50 per net ton ovens. Demands having been satisfied, however, the market this week has grown weaker and \$3.25 now appears to be as high as any business can be done. Higher prices for coke have naturally enhanced the appraisal value of coal, but there has not been sufficient demand to sustain the advance and the market is weaker this week. Some business in by-products coal was done as high as \$2 at mines, for run-of-mine, but in the past few days the market has settled back to \$1.85 as a maximum, with some tonnages available at less. The current price on steam coal for spot tonnages is right around \$1.50 for mine-run grade, while non-union gas coal can be bought at \$1.90 for spot or prompt shipment. Foundry coke for spot shipment ranges from \$4 to \$4.50.

Old Materials.—The market has grown distinctly firmer on the steel works grades since a week ago, due to purchases by mills outside the Pittsburgh district proper. Some of these melters who ordinarily charge light scrap, unable to obtain tonnages except at relatively stiff prices, have turned to the heavier grades and this demand has stiffened prices. Neither dealers nor consumers lately have been able to obtain even carload lots at less than \$14. A price equivalent to about \$14.50 at Pittsburgh has been paid by Youngstown mills. The market has been helped not only by the slightly heavier demand, but also by light offerings. Dealers are not pressing yard stocks for sale and current production is restricted by the light operations of producing industries. Only small lots of compressed or bundled sheet scrap are coming out because of that condition. There is not much demand for the foundry grades.

We quote for delivery to consumers' mills in the Pittsburgh and other districts taking the Pittsburgh freight rate, as follows:

Heavy melting steel	Steuersville, Follansbee, Brackenridge, Monessen, Midland and Pittsburgh.	\$14.00 to \$14.50
No. 1 case, cupola size		16.00 to 16.50
Re-rolling rails	Newark and Cambridge, Ohio; Cumberland, Md.; Huntington, W. Va. and Franklin, Pa.	15.00 to 15.50
Compressed sheet steel		12.00 to 12.50
Bundled sheets, sides and ends		10.75 to 11.25
Railroad knuckles and couplers		14.50 to 15.00
Railroad coil and leaf springs		14.50 to 15.00
Low phosphorus standard bloom and billet ends		17.00 to 17.50
Low phosphorus plates and other grades		16.50 to 17.00
Railroad malleable		12.50 to 13.00
Iron car axles		23.00 to 24.00
Locomotive axles, steel		21.00 to 22.00
Steel car axles		14.50 to 15.00
Cast iron wheels		15.00 to 15.50
Roller steel wheels		14.50 to 15.00
Machine shop turnings		9.50 to 10.00
Sheet bar crop ends		14.00 to 14.50
Heavy steel axle turnings		11.50 to 12.00
Short shoveling turnings		11.00 to 11.50
Heavy breakable cast		14.50 to 15.00
Stove plate		12.50 to 13.00
Cast iron horns		11.00 to 11.50
No. 1 railroad wrought		11.50 to 12.00

The Bureau of Supplies and Accounts, Navy Department, Washington, is taking bids until Feb. 28 for 65,000 lb. of slab zinc for use at the Norfolk, Va., navy yard.

New York

NEW YORK, Feb. 21.

Pig Iron.—Interest is centered in the bids for the segments for the New York-New Jersey vehicular tunnel, and while nothing definite is known except the names of the firms that have been figuring with the successful bidders, Booth & Flinn, it is generally expected that contracts for the segments are likely to go to the Federal Shipbuilding Co., the Bethlehem Steel Co. and Davies & Thomas. The tonnage may be divided among these three, or some of it may go to others, but the three concerns named are considered as best equipped to do the work. Davies & Thomas have done a large part of the work on previous tunnels at their plant at Catsaugua, Pa., and the Bethlehem Steel Co. is considered especially well equipped. Outside of the tunnel business no large tonnages are being figured on, but the Essex Foundry Co., Newark, N. J., is in the market for from 500 to 1000 tons of No. 2X for delivery after March 1, and it is understood that the contract will not be made until next week. Numerous smaller inquiries are pending and the most encouraging feature of the situation is that a large number of foundries report increasing melt.

We quote delivered in the New York district as follows, having added to furnace prices \$4.52 freight from eastern Pennsylvania, \$5.16 from Buffalo and \$6.16 from Virginia.

East. Pa. No. 1 fvy., 80 1/2 to 3 1/2...	\$23.52
East. Pa. No. 2X fvy., 80 1/2 to 2 7/8...	23.02
East. Pa. No. 2 fvy., 80 1/2 to 2 3/4...	22.52
Buffalo 80 1/2 to 2 3/4...	\$23.16 to 23.71
No. 2 Virginia, 80 1/2 to 2 3/4...	23.16

Ferromanganese.—Demand for ferromanganese is not heavy, sales being confined to carload lots and inquiries totaling about 500 tons. Quotations are unchanged at the higher levels recently put into effect. The spiegel-eisen market continues fairly active in the absence of stocks of the 20 per cent grade, and in the belief that the quantity of the 16 to 19 per cent grade available is small. Inquiries before the market amount to about 1000 tons, but there has been no change in the asking price from that announced a week ago. There have been no developments in the manganese ore market, but from offerings that have appeared from sellers it is likely that high-grade foreign ore could not be purchased at less than 25c. to 26c. per unit, seaboard. The 50 per cent ferrosilicon market is quiet and firm at unchanged levels, sales being confined to carload lots, several having been sold in the past week, among which is noted one carload at \$59, Chicago. The recent reduction in quotations for Bessemer ferrosilicon of \$2 per ton is understood to have been caused by the competition of electric ferrosilicon of approximately the same percentage content of silicon, as well as the fact that the 50 per cent grade can be used to advantage and bought as cheaply as Bessemer in proportion to the silicon content. Quotations are as follows:

Ferromanganese, domestic, seaboard, per ton...	\$62.50
Ferromanganese, British, seaboard, per ton...	\$62.50
Spiegeleisen, 16 to 19 per cent, furnace, per ton...	\$30.00
Ferrosilicon, 50 per cent, delivered, per ton...	\$55.00 to \$60.00
Ferrotungsten, per lb. of contained metal 40c. to 50c.	
Ferrocromium, 6 to 8 per cent carbon, 60 to 70 per cent Cr., per lb. Cr., delivered...	12c. to 14c.
Ferrovandium, per lb. of contained vanadium...	\$4.00

Ores

Manganese ore, foreign, per unit, seaboard, 25c. to 26c.	
Tungsten ore, per unit, in 60 per cent concentrates...	\$2.00 up
Chrome ore, 40 to 45 per cent Cr ₂ O ₃ , crude, per net ton Atlantic seaboard...	\$20.00 to \$25.00
Chrome ore, 45 to 50 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard...	\$25.00 to \$27.00
Molybdenum ore, 85 per cent concentrates, per lb. of MoS ₃ , New York...	50c. to 60c.

Finished Iron and Steel.—Betterment is difficult to measure except through increasing mill operations. There is evidence that the small replenishment orders are making a gradually increasing aggregate, although in an individual selling office the daily volume fluctuates so that it is difficult to define the trend. Fabricated steel work still remains active, though there is at the moment a drop in the total of fresh projects. The East is not as yet getting any sizable railroad equip-

ment business. Uncertainty exists with regard to the stability of wire and wire products prices and there are intimations that better than 1.40c. Pittsburgh can still be done on large orders for plates, shapes and bars. About the only structural project which has come to light covers 100 tons for the American Car & Foundry Co., Huntington, W. Va. For the shields for the vehicular tunnel under the Hudson river 9000 to 11,000 tons of steel work will be required. Awards were in part as follows: New York Cotton Exchange, 4000 tons, to Post & McCord; West Penn power house, Wellsburg, 2900 tons, to Fort Pitt Bridge Works; apartment house, Kingsbridge Road and Grand Concourse, New York, 850 tons, to Levering & Garrigues Co.; Orient Life Insurance Co., Hartford, 500 tons, to Levering & Garrigues Co.; apartment house, 108th Street and Riverside Drive, 1000 tons, to A. E. Norton Co.; shelters for the Pennsylvania Railroad at Jersey City, 300 tons, for which the Triest Contracting Corporation is the general contractor; plate girders for the New York Central at Tonawanda, N. Y., 300 tons, to Lackawanna Bridge Works Corporation; United States Gypsum Co., Oakfield, N. Y., 106 tons, to the Lackawanna Bridge Works Corporation; tanks for Mexican Petroleum Co., 2 at Providence, 2 at Portland, Me., 700 tons, to the American Bridge Co. Outside of car repair contracts for the Boston & Maine and the Norfolk & Western, about the only Eastern railroad work covers 50 suburban cars awarded to the Harlan & Hollingsworth plant of the Bethlehem Steel Co. The Great Northern placed an order for 500 refrigerator cars with the General American Car Co. and is in the market for 250 gondolas and 500 stock cars. The Pacific Fruit Express Co. will probably buy 3300 cars and the St. Paul may buy 2000 cars. Car builders are inclined to believe that there will be plenty of business to satisfy the plants of the country by the latter half of the year.

We quote for mill shipments, New York, as follows: Soft steel bars, 1.78c. to 1.88c.; plates, 1.78c. to 1.88c.; structural shapes, 1.78c. to 1.88c.; bar iron, 1.78c. to 1.88c. On export shipments the freight rate is now 28.5c. per 100 lb., instead of 38c., the domestic rate.

High Speed Steel.—The market continues dull with sales of extremely small quantities only reported. There is some shading of prices and a fair estimate of the market on 18 per cent tungsten high speed steel is probably 80c. to 90c. per lb. with special brands of some companies selling up to \$1.05 per lb.

Cast-Iron Pipe.—Optimism still prevails in this market and purchases by private consumers are slightly larger than usual. At present no municipal lettings are in sight in this district excepting the pipe involved in the Hudson River vehicular tunnel, which will be purchased by Booth & Flinn, Ltd., New York. The Metropolitan Water Supply Co., Boston, has closed on 3000 tons of 12-in. to 24-in. cast iron pipe with the Warren Foundry & Machine Co. The 600 tons of pipe, to be purchased by contractors with municipal contracts in New York, has not yet been bought. We quote per net ton, f.o.b. New York, carload lots, as follows: 6-in. and larger, \$47.30; 4-in. and 5-in., \$52.30; 3-in., \$62.30, with \$4 additional for Class A and gas pipe.

Warehouse Business.—The market is fairly active, the increase in business during the past few weeks being well maintained. Warehouses carrying structural material continue to report more than usual activity, but it is believed that there has been some shading of quoted prices along this line. A domestic and export seller in this district is offering a fairly large tonnage of structural material, bars, angles, beams, channels and plates, at a price of \$28 per ton, f.o.b. point of shipment. This is, however, probably canceled material. Sheets are slightly stiffer on small lots, but a satisfactory tonnage of galvanized or black sheets would bring out a good concession. In general, prices in this line are uneven. Offerings of one company of new galvanized and black sheets at considerably under the prevailing prices are said to be seconds. The railroads are buying small lots of special steels. German tool steel is being offered by a Philadelphia importer at 7.75c. per lb., f.o.b. Hamburg, which is about 9c. per lb. New York. The wrought iron and steel pipe mar-

ket is quiet. Brass rods have dropped $\frac{1}{2}$ c. per lb. from 14 $\frac{1}{2}$ c. to 14 $\frac{1}{4}$ c. per lb. We quote prices on page 576.

Coke.—The Eastern By-Product Coke Co. has quoted \$4.50 on 700 tons per month for the coke which will be required by foundries making segments for the new vehicular tunnel, and it is understood that another company named even a lower figure, but it was not accepted. Owing to the fact that coal has been sold readily and that there is an active demand for coke due to fear of a strike in the bituminous regions April 1, a number of Connellsville coke operators have found themselves unable to make deliveries at an early date and have withdrawn from the market. It is expected that some of these operators will be back in the market in a few days, but others may be out for a month or more. The price has been advanced 25c., and \$4.25 seems to be the lowest obtainable price on high grade foundry coke. By-product coke continues to be quoted at \$8.59, delivered New Jersey points, this being on the basis of \$4.25 for Connellsville coke at ovens and \$4.34 for freight. An advance in the price of by-product coke does not seem to be probable.

Old Material.—The market has been rather inactive during the past week and most dealers are offering slightly lower prices, except for heavy melting steel, which is still fairly firm at \$7.50 to \$8.00 per ton. Small contracts continue to be made on No. 1 heavy melting steel from time to time. The Lukens Steel Co. is reported to have ordered resumption of shipments on old contracts. The Midvale Steel & Ordnance Co. is paying \$12.50 per ton for No. 1 heavy melting steel, delivered Coatesville, and the American Bridge Co. \$11.50, Pencoyd. One broker in this district has reduced his buying prices on several items by 50c. per ton. No. 1 railroad wrought iron car axles and wrought iron track all show a slight reduction from the previous week's quotations.

Buying prices per gross ton, New York, follow:

Heavy melting steel, yard	\$7.50 to \$8.00
Steel rails, short lengths, or equivalent	8.00 to 8.25
Rerolling rails	9.25 to 9.75
Relaying rails, nominal	27.00 to 28.00
Steel car axles	10.00 to 10.50
Iron car axles	17.50 to 18.50
No. 1 railroad wrought	9.50 to 10.00
Wrought iron track	8.00 to 8.50
Forge fire	5.00 to 5.50
No. 1 yard wrought, long	9.00 to 9.50
Cast borings (clean)	7.00 to 7.50
Machine-shop turnings	4.50 to 5.00
Mixed borings and turnings	4.50 to 5.00
Iron and steel pipe (1 in. diam., not under 2 ft. long)	7.25 to 7.75
Stove plate	10.00 to 10.50
Locomotive grate bars	9.00 to 9.50
Malleable cast (railroad)	8.00 to 8.50
Cast-iron car wheels	10.50 to 11.00

Prices which dealers in New York and Brooklyn are quoting to local foundries, per gross ton, follow:

No. 1 machinery cast	\$16.50 to \$17.00
No. 1 heavy cast (columns, building materials, etc.), cupola size	15.50 to 16.00
No. 1 heavy cast, not cupola size	11.00 to 11.50
No. 2 cast (radiators, cast boilers, etc.)	10.00 to 10.50

Birmingham

BIRMINGHAM, ALA., Feb. 21.

Pig Iron.—More orders were booked by Birmingham iron makers the past week than in many months. The iron goes over a more scattered territory than has been the case since the industrial slump began. Alabama iron is going to more foundries in competitive territories than it has done in practically a year. One maker booked 15 carloads in one day, the total representing 11 different customers from St. Louis, Michigan, Illinois and Indiana to Florida, the Carolinas, Texas and Pacific Coast. The last-named business is on a continuous base and bids fair to remain so pending the excellent ocean rates prevailing. The Sloss-Sheffield Steel & Iron Co.'s initial shipment from its Sheffield stack in extreme northern Alabama to Metropolis for St. Louis, Chicago and Northwestern distribution is scheduled to take place this week and to consist of 1600 tons in 400-ton barges with delivery in 40 hours. This delivery was the experience of the company with the same transportation agency, the Arrow Transportation

Co., before the war. This river shipping does not appear to have cut into business in the same territory done by Birmingham makers. St. Louis took several lots last week at \$15.50. That was also the base on sales into Michigan and other north of Ohio River points. Pacific Coast business is the choicest, being done on a base of \$16. Two operators say they will ship their make and reduce yard stocks this month. One maker booked over 3000 tons in small lots during the week. Most of the business comes without solicitation, the market base of \$15.50 appearing to be very generally accepted with \$16 charged under certain circumstances. Indications point to greater furnace capacity incident to evidently large melt to be made by the high pressure pipe shops. The feeling in industrial circles is more buoyant than it has been at any time in many months.

We quote per gross ton for Birmingham district foundries as follows:

Foundry, section 17 to 17.5	\$15.50 to \$16.00
Base	14.50 to 15.00
Charcoal, with black	32.00

Cast Iron Pipe. High pressure pipe plants of the National Cast Iron Pipe Co. and the American Cast Iron Pipe Co. are not far from capacity. United States Cast Iron Pipe & Foundry Co. will make the 2000 tons for Portland, Ore., here and ship by Mobile. The Seattle order is also expected here. National Cast Iron Pipe Co. is finishing an order for 1000 tons for Port Arthur, Texas and has, among other orders, one for 1200 tons for St. Paul. American Cast Iron Pipe Co. booked Wisconsin orders for 1000 tons. A vessel is putting in at Mobile to load with 3000 tons of pipe for the Pacific Coast.

Finishing Mills.—The Tennessee company is shortly to blow in No. 4 blast furnace at Ensley, making five on basic iron there. Open hearth demand continues operation of seven of the nine furnaces.

Coal and Coke.—Demand for coke is stronger and shipments are larger. The price remains at about \$5 for standard foundry.

Old Material.—Scrap dealers begin to look for improvement incident to what seems to be a prospect of a real expansion of steel and iron foundry business. Very little business is being done now.

We quote per gross ton for Birmingham district yards as follows:

Steel rail	\$11.00 to \$12.00
No. 1 steel	10.00 to 11.00
No. 1 cast	11.00 to 12.00
Car wheel	12.00 to 14.00
Tramway wheel	12.00 to 13.00
No. 1 wrought	11.00 to 12.00
Stove plate	11.00 to 12.00
Cast iron bearing	6.00 to 7.00
Machine shop turnings	6.00 to 7.00

Buffalo

BUFFALO, Feb. 21.

Pig Iron.—The majority of sales are made at \$18.50 base, but in general the volume is small. An inquiry for 5000 tons from outside the district has reached several furnaces and two have responded with the \$18.50 price. The average run of orders ranges from carload lots to 200 tons. Generally, inquiry is light and without particular feature. Furnace operation is maintained on the same basis which existed at the beginning of the year and the whole selling object is summed up as that of liquidation rather than doing business on a profitable basis.

We quote for Buffalo as follows:

No. 1 foundry, 2.75 to 2.25 sil	\$19.50 to \$20.00
No. 2X foundry, 2.25 to 2.75 sil	19.00 to 19.50
No. 2 plain, 1.75 to 2.25 sil	18.50 to 19.00
Base	18.00 to 18.25
Malleable	19.50
Lake Superior charcoal	31.75

Warehouse Business.—An increase in the number of orders and in the volume of inquiry within the last 10 days is an encouraging sign. Much of this business is for maintenance work and is indicative of easier conditions in factories and shops. There are many evidences of anxiety to get equipment in good order.

Finished Iron and Steel.—The anticipated adjustment of prices on wire products which buyers believed

would be announced last week but did not develop, had a quieting effect on demand for those products. Sheet inquiry has been brisk, but much of this activity is taken to mean that buyers are circulating requests for prices with a view to finding a break in the uniformity of prices. With all mills quoting \$3 on black sheets, there is little advantage in "shopping" and the inquirers who thought they could find a weakness have been disappointed. Bar prices, however, are not as firm. Quotations range from 1.40c. to 1.50c. Some inquiry on irregular sizes has developed, but one agency has declined to bid because mills are not rolling the material sought, and the tonnage is not sufficient to change the roll. Some rod inquiries have been made by nail manufacturers and some requests for prices on reinforcing bars are also out. Structural affairs are quiet; plans for the Buffalo Athletic Club are ready, but structural requirements have not been announced.

We quote warehouse prices f.o.b. Buffalo as follows: Structural shapes, 2.60c.; plates, 2.60c.; plates, No. 8 gage, 2.55c.; soft steel bars and shapes, 2.50c.; hoops and bands, 2.15c.; blue annealed sheets, No. 10, 3.40c.; galvanized steel sheets, No. 28, 5.25c.; black sheets, No. 28, 4.25c.; cold-rolled strip steel, 5.00c.; cold-rolled round shafting, 3.40c.

Coke. Inquiry is lively and is attributed to the strike possibility. Best grades are quoted at \$4 to \$4.25 ovens.

Old Material.—Because of the light production and the disposition of dealers to retain their stocks for better prices, the market is slow and demand for most materials fairly brisk. The price situation on heavy melting steel is unchanged and dealers willing to sell at \$13.50 could find plenty of business. Turnings and borings are also much in demand.

We quote dealers' asking prices per gross ton f.o.b. Buffalo as follows:

Heavy melting steel	\$13.00 to \$14.00
Low phos., 0.01 and under	17.00 to 18.00
No. 1 railroad wrought	15.00 to 16.00
Car wheels	16.50 to 17.50
Machine shop turnings	7.50 to 8.00
Cast iron borings	7.00 to 8.00
Heavy axle turnings	10.50 to 11.50
Grate bars	12.00 to 13.00
No. 1 busheling	10.00 to 11.00
Stove plate	15.00 to 16.00
Bundled sheet stampings	8.00 to 9.00
No. 1 machinery cast	17.00 to 18.00
Hydraulic compressed	10.50 to 11.50
Railroad malleable	13.00 to 14.00

St. Louis

St. Louis, Feb. 21.

Pig Iron.—The new market price of \$20, Chicago, for Northern iron, made rather suddenly in Chicago last week, seems firmly established in this territory. The advance is being followed by producers in Granite City. Sales for the last week, although still largely confined to carloads for immediate shipment, showed an improvement, and there was a better tone to the market, a condition helped by the advance. The \$20 price for Northern iron gives Southern iron at \$15.50, Birmingham, an advantage of \$1.56 a ton, St. Louis, on all-rail shipment, and an even greater advantage on the Sheffield water and rail movement, which affords a saving of 80c., as a differential and \$1.50. For the first movement by barge from Sheffield to Metropolis, Ill., and thence by rail, there were two barge loads sold here; one each for Bridge & Beach Mfg. Co., and the Enterprise foundries in Belleville. The largest inquiry pending is for 2000 tons for March and April shipment for an Illinois melter. The Mt. Vernon Car Mfg. Co. has an inquiry out for 1000 to 2000 tons, of which 200 tons is to be delivered during February and the remainder at the rate of 100 tons a week. Another Illinois melter wants 500 tons of foundry iron for March and April shipment.

We quote delivered consumers' yards, St. Louis, as follows, having added to furnace prices \$2.50 freight from Chicago and \$5.74 from Birmingham:

Northern foundry, sil. 1.75 to 2.25	\$22.80
Northern malleable, sil. 1.75 to 2.25	22.80
Basic	22.80
Southern foundry, all rail, sil. 1.75 to 2.25	21.24
Southern foundry, sil. 1.75 to 2.25, rail and water	19.44

Finished Iron and Steel.—The most important development of the week was the announcement of J. M.

Kurn, president of the St. Louis & San Francisco Railroad, of plans to expend \$7,766,000 on improvements, of which \$5,500,000 is to be for track and grade improvements, and more than \$2,000,000 for new or restrengthened equipment. It is planned to spend \$1,385,000 for laying of double track, and the laying of 185 miles of new 90-lb. rails at different points and 100 miles of relay rails. Eight 70-ft. all-steel passenger coaches and six 70-ft. all-steel chair cars will be bought at an estimated cost of \$435,000. No inquiries covering this material have been issued by the purchasing department of the road. The Union Pacific Railroad bought a carload of wheels, and 100 tons of wire rods also were purchased by a Missouri River concern. The Missouri Pacific Railroad is planning to buy more than 5000 tons of 90-lb. rails. The demand for structural steel here is still light because of the wage situation. Figures submitted for the proposed new Jewish Hospital at Memphis, involving 300 tons of reinforcing bars, are greater than the promoters had expected, and it is likely that new bids will be asked for.

For stock out of warehouse we quote: Soft steel bars, 2.62½c. per lb.; iron bars, 2.62½c.; structural shapes, 2.72½c.; tank plates, 2.72½c.; No. 10 blue annealed sheets, 3.47½c.; No. 28 black sheets, cold rolled, one pass, 4.15c.; cold drawn rounds, shafting and screw stock, 3.65c.; structural rivets, \$3.52½ per 100 lb.; boiler rivets, \$3.62½; tank rivets 7/16-in. and smaller, 65 and 5 per cent off list; machine bolts, large, 60-10 per cent; small, 60, 10 and 10 per cent; carriage bolts, large, 55-5 per cent; small, 60 and 10 per cent; lag screws, 65-15 per cent; hot pressed nuts, square or hexagon blank, \$4, and tapped, \$3.75 off list.

Coke.—The business in coke is increasing, although most of the orders being placed are for carloads and for immediate shipment. The most encouraging feature is the steady increase in shipping instructions against contracts, more especially from the producers of lead in the Oklahoma-Kansas-Missouri districts. Granite City by-product producers have renewed contracts for 30,000 tons for shipment over 12 months. Domestic coke is only in fair demand, because of warmer weather.

Old Material.—The situation is unchanged, the market remaining dull and sluggish. The large consumers are still out of the market, and will not make any further purchases this month. Although economy of operation could be effected by unloading old material direct from railroad cars to charging boxes, consumers prefer not to make such cash outlays and are still using their reserve stocks at higher prices. The only railroad list before the market this week was issued by the Texas & Pacific Railway aggregating 1750 tons.

We quote dealers' prices f.o.b. consumers' works, St. Louis industrial district and dealers' yards, as follows:

Per Gross Ton	
Old iron rails	\$14.00 to \$14.50
Steel rails, rerolling	10.50 to 11.00
Steel rails, less than 3 ft.	12.50 to 13.00
Relaying rails, standard section	23.00 to 28.00
Cast iron car wheels	13.50 to 14.00
No. 1 heavy railroad melting steel	10.00 to 10.50
No. 1 heavy shoveling steel	9.75 to 10.00
Ordinary shoveling steel	9.50 to 10.00
Frogs, switches and guards, cut apart	10.00 to 10.50
Ordinary bundle sheet	4.00 to 4.50
Cast steel bolsters	9.50 to 10.00

Per Net Ton	
Heavy axles and tire turnings	6.00 to 6.50
Iron angle bars	13.00 to 13.50
Steel angle bars	9.00 to 9.50
Iron car axles	18.00 to 18.50
Steel car axles	12.50 to 13.00
Wrought iron arch bars and transoms	15.00 to 15.50
No. 1 railroad wrought	9.50 to 10.00
No. 2 railroad wrought	8.50 to 9.00
Railroad springs	10.00 to 10.50
Steel couplers and knuckles	10.00 to 10.50
Locomotive tires, 42 in. and over, smooth inside	8.00 to 8.50
No. 1 dealer's forge	8.00 to 8.50
Cast iron borings	5.50 to 6.00
No. 1 busheling	8.50 to 9.00
No. 1 boilers cut in sheets and rings	6.00 to 6.50
No. 1 railroad cast	12.00 to 12.50
Stove plate and light cast	11.00 to 11.50
Railroad malleable	8.50 to 9.00
Agricultural malleable	9.00 to 9.50
Pipes and flues	7.50 to 8.00
Heavy railroad sheet and tank	5.50 to 6.00
Light railroad sheet	3.50 to 4.00
Railroad grate bars	9.50 to 10.00
Machine shop turnings	3.00 to 3.50
Country mixed iron	6.00 to 6.50
Uncut railroad mixed	7.00 to 7.50
Horseshoes	9.50 to 10.00
Railroad brake shoes	9.50 to 10.00

Cleveland

CLEVELAND, Feb. 21.

Iron Ore.—The first ore sale reported for this season was made during the week, this being 1500 tons of manganiferous ore which was bought by a St. Louis consumer. The purchaser will pay whatever market price is established later in the season. Recently a sale of 10,000 tons of manganiferous ore was made for use in manufacturing spiegel, but this was a resale lot to be shipped from Lake Erie docks. Mining companies are making estimates of probable mining costs for the season with a view of arriving at conclusions as to what ore prices should be. Some of the independent mining companies that are paying wage scales below those of the Steel Corporation regard their present wage scales as a temporary expedient in order to keep the men at work and say they will probably use the Steel Corporation's wage schedule as a basis for figuring mining costs.

We quote delivered lower lake ports: Old range Bessemer 55 per cent iron, \$6.45; Old range non-Bessemer 51½ per cent iron, \$5.70; Mesabi Bessemer 55 per cent iron, \$6.20; Mesabi non-Bessemer, 51½ per cent iron, \$5.55.

Pig Iron.—Sales increased during the week and included some good-sized orders. The action of Chicago producers in marking up prices has resulted in a stiffening by one lake furnace, but this appears to be mostly on iron for shipment to points at which Chicago furnaces can enter competition, as this producer is still quoting foundry iron at \$18.50 in some cases. With this market firmness in one direction, lake furnaces apparently will meet keener competition with southern iron in central and southern Ohio, as further concession of 50c. a ton has been made in Alabama iron on the inquiry from the Standard Sanitary Mfg. Co. for its Louisville plant, which brought out a \$15 base price. On foundry iron \$19 appears to be the more general quotation by lake furnaces except for delivery to points where competition is sharpest. The Standard Sanitary Mfg. Co. has purchased 1000 tons and the United States Sanitary Co. 300 tons of foundry iron from a Valley furnace, both at \$19 and we also note the sale of 1000 tons of foundry iron to a Michigan automobile foundry and 1000 tons of malleable iron to an Ohio foundry at the same price. A lake furnace that booked the two last mentioned orders also sold about 4000 tons additional during the week in small lots. Locally the demand has increased, a number of small foundries buying small lots at \$19.50 to \$20 at furnace. Sales of three lots of Ohio silvery iron aggregating 500 tons were made to Cleveland foundries at the new price. Shipments continue to improve and one producer expects that its February shipments will be 50 per cent greater than in January. The Hanna Furnace Co. blew in its Dover furnace Feb. 18 and Pickands, Mather & Co. will put their Perry furnace at Erie, Pa., in blast this week.

Quotations below are f.o.b. local furnace for Northern foundry iron, not including a 50c. switching charge. Other quotations are delivered Cleveland, being based on a \$1.96 freight rate from Valley points, a \$2.26 rate from Jackson and a \$6.67 rate from Birmingham:

Basic	\$19.71
Northern No. 2 fdy., sil 1.75 to 2.25	\$19.00 to 20.00
Southern fdy., sil 1.75 to 2.25	21.67 to 22.17
Ohio silvery, sil 8 per cent	30.86
Standard low phos., Valley furnace	32.00

Finished Materials.—The demand for finished materials shows a further improvement and has broadened, orders being well scattered from various manufacturing industries. Fabricating shops which have been buying plates and shapes only for specified work are now adding some additional material for stock. The price situation shows little change. On steel bars, plates and structural material 1.40c. is the minimum price and that is being quoted only on the more desirable orders, the greater percentage of the business being booked at 1.45c. to 1.50c. The structural outlook continues to improve. The Fort Pitt Bridge Works has taken 350 tons for the auditorium for the National Cash Register Co., Dayton, and bids have been taken for 300 tons for a building for the Commercial Savings Bank & Trust Co., Toledo. An inquiry has come out for 600 tons for the Kresge Store Building, Cleveland. Lake shipyards have received another inquiry for a

freight boat, this making three inquiries now pending for lake boats, each involving 4000 tons of steel. Some business is coming from the automotive industry and among the week's orders was one for 420 tons of spring steel.

Jobbers quote steel bars, 2.36c.; plates and structural shapes, 2.46c.; No. 9 galvanized wire, 3c.; No. 9, annealed wire, 2.50c.; No. 28 black sheets, 3.75c.; No. 28 galvanized sheets, 1.75c.; No. 10 blue annealed sheets, 3.10c.; hoops and bands, 2.96c.; cold-rolled rounds, 3.25c.; flats, squares and hexagons, 3.75c.

Sheets.—The improvement noted in other lines has not extended to the sheet market, which is quiet. While regular prices are holding well there is an occasional report of a concession to 3.75c. on galvanized sheets.

Warehouse Business.—Local warehouses have reduced prices on wire and nails. Warehouse orders show an improvement.

Bolts, Nuts and Rivets.—The demand for bolts and nuts has improved materially, but buying is mostly in small lots. A broadening is noted in the demand. Some orders are now coming from the implement manufacturers. Prices still lack firmness. The leading local rivet manufacturer reduced prices Feb. 18 \$3 a ton, making structural rivets 2.10c. and boiler rivets 2.20c. Some makers had recently shaded prices to this extent. Small rivets are weak, quotations of 75 and 10 per cent off list appearing.

Coke.—Prices have stiffened slightly, but the demand has quieted. We quote standard Connellsville foundry coke at \$4 to \$4.50.

Old Materials.—The improvement in steel plant operations has not resulted in any better demand for scrap and the market was unusually dull during the week. Prices are still inclined to weakness, this being particularly true of blast-furnace scrap. Prices on borings and turnings have declined about 25c. a ton. There is a limited demand from Cleveland dealers for turnings to fill old orders with a local mill and they are offering \$9 for this grade. Some inquiry has come from Pittsburgh foundries for prices on couplers, knuckles and coil springs. These prices are to be used as a basis for quoting prices on railroad castings.

We quote per gross ton f.o.b. Cleveland, as follows:

Heavy melting steel	\$12.00 to \$12.50
Steel rails, under 3 ft.	12.50 to 13.00
Steel rails, re-rolling	11.00 to 11.50
Iron rails	12.00 to 12.50
Iron car axles	18.00 to 19.00
Low phosphorus melting	17.00 to 18.50
Cast borings	9.00 to 9.25
Machine shop turnings	8.50 to 8.75
Mixed borings and short turnings	8.50 to 8.75
Compressed steel	9.00 to 9.50
Railroad wrought	12.00 to 12.50
Railroad malleable	12.00 to 13.00
Light handeled sheet stampings	6.00 to 7.00
Steel axle turnings	9.50 to 10.00
No. 1 cut	15.00 to 16.00
No. 1 bushing	8.75 to 9.00
Drop forge flashings, over 10 in.	7.75 to 8.00
Drop forge flashings, under 10 in.	9.00 to 9.25
Railroad gate bars	12.75 to 13.00
Stove plate	13.00 to 13.25
Pipes and flues	8.50 to 9.00

J. C. Reed has organized the Reed Railway Supply Co., of which he is president, with offices in the Railway Exchange Building and warehouse at Main and Chestnut streets, St. Louis. Mr. Reed was the president of the Southern Hardware & Supply Co., which was purchased recently by Geller, Ward & Hasner Hardware Co. T. W. McLean is vice-president, and T. B. Fitzwilliam, secretary of the company, which will have a capital stock of \$50,000.

Effects of modern sales and advertising methods upon stabilization is the subject of a meeting to be held at the Auditorium Hotel, Chicago, on March 14, by the Society of Industrial Engineers, George C. Dent, 327 South La Salle Street, Chicago, manager.

The Lebanon Drop Forge Co., Lebanon, Pa., has taken over the Rivetless Chain & Engineering Co., with local plant, and will merge the organization under its present name. The consolidated company will operate with a capital of \$165,000.

Philadelphia

PHILADELPHIA, Feb. 21.

More replenishment buying of steel products has marked the past week's business in this market and has created a somewhat more hopeful feeling among steel companies. Steel bars, spring steel and galvanized wire have been the principal beneficiaries of improved buying and the demand has come both from jobbers and from manufacturing consumers. Detroit automobile manufacturers have furnished a goodly share of the business. In a minor degree, there has also been better buying of plates and structural shapes. Some plate consumers who have not been buyers in many months have placed orders within the past week. A better demand for light rails is also a feature.

Pig iron buying is not large, but there is a better volume of inquiry. Most of the wants are immediate, there being little or no indication at the moment of interest in speculative buying by foundries. In steel-making iron, there is practically no interest.

Prices continue weak with the trend downward whenever changes occur. Eastern blast furnaces are conceding something from their f.o.b. furnace prices when necessary to meet competitive delivered prices, or in other words they are absorbing a part of the freight rate. In steel products the principal change is in wire products, which are now quoted quite generally at \$2 below the recent levels, wire nails selling at \$2.40 per 100 lb. keg, Pittsburgh, plain wire at \$2.15 and galvanized wire at \$3.05. Bars, plates and shapes continue at 1.40c., Pittsburgh, but shading of this price on plates is reported. Sheets remain firm despite weakness of other steel products. Light rails are selling at 1.40c. per lb., Pittsburgh. A recent large sale of structural rivets was made at about 2c., Pittsburgh, which is \$5 a ton below recent so-called regular quotations.

Pig Iron. There is comparatively little buying of iron, but prospects are somewhat brighter due to a greater number of inquiries received in the past few days. Most of these inquiries are for replenishment only, there being little or no interest among users of foundry iron in speculative buying. The quantities inquired for are small, ranging from a carload to 200 or 300 tons. The only important sales of the week were of gray forge iron, which totaled 3500 or 4000 tons, the buyers being two cast iron pipe companies and a maker of iron plates. Sales were made at prices ranging from \$19 to \$19.50, furnace, but the delivered prices were almost identical at \$20.50. Foundry iron delivered prices are unchanged, but furnaces show a disposition to meet competition by absorbing, when necessary, a part of the freight rate. A New Jersey foundry received several identical bids of \$21.76, delivered, on No. 2X iron, but the f.o.b. furnace prices in one or two instances were close to \$19.50. There is no interest in steelmaking iron.

The following quotations are, with the exception of those on low phosphorus iron, for delivery at Philadelphia, and include freight rates varying from 81 cents to \$1.54 per gross ton.

East Pa. No. 2 plain, 1 7/8 to 2 3/8 sq.	\$20.84 to \$21.26
East Pa. No. 2X, 2 3/8 to 2 7/8 sq.	21.34 to 21.76
Virginia No. 2 plain, 1 7/8 to 2 3/8 sq.	27.24 to 27.74
Virginia No. 2X, 2 3/8 to 2 7/8 sq.	27.74 to 28.24
Basic delivery Eastern Pa.	19.81
Gray forge	20.50 to 21.50
Malleable	22.50 to 24.00
Standard low phos. (f.o.b. furnace)	30.00
Copper bearing low phos. (f.o.b. furnace)	28.60

Ferroalloys.—The advance to \$62.50, Atlantic seaboard, on both British and domestic ferromanganese has checked buying. Practically no business has been closed since the price was advanced, several buyers having covered at the former price just previous to the rise. There is very little demand for spiegeleisen, which is nominally quoted at \$30 for the lower grade, 16 to 19 per cent. The higher grade, 20 to 22 per cent, is scarce.

Billets.—On the small tonnages of rerolling billets which make up the bulk of current business, the usual price is \$28, Pittsburgh, but this could be shaded on larger tonnages. Forging billets have been sold within the week at \$32, Pittsburgh. There are reports of recent substantial sales of rerolling billets for shipment to England.

Plates.—An Eastern plate mill reports that its bookings of orders in the past week constitute the largest week's business in many months. Some consumers who have not been in the market in a long time placed fairly good orders, mostly for boiler steel. On the whole, however, the demand for plates leaves much to be desired. Prices are weak, and there are reports that 1.40c., Pittsburgh, has been shaded on desirable tonnages. Most any order from a carload upward can easily be placed at 1.40c., and only the less-than-carload lots fetch as high as 1.50c. An Eastern fabricator bidding on the proposed Castleton bridge of the New York Central Railroad is inquiring for 10,000 to 12,000 tons of plates, half sheared and half universal. Deliveries are wanted over a three months' period. This is the largest inquiry before the trade, most of the inquiry and buying involving lots of 500 tons and less. The Philadelphia & Reading Railroad last week distributed orders for 800 tons of tank steel for car repairs among three or four mills.

Structural Material.—A better run of small orders is reported by some of the Eastern mills. Building activity in Philadelphia is not extensive, though many rather indefinite projects are talked of. Fabricators have no difficulty in getting protection at 1.40c., Pittsburgh.

Bars.—In steel bars there has been a marked betterment. Orders have come in freely within the past week or 10 days from jobbers and manufacturers. The Detroit district has furnished considerable business. Spring steel as well as soft steel bars has been ordered. The bar mills of the Cambria plant at Johnstown, Pa., are running close to 90 per cent of capacity, although the plant as a whole is not exceeding a 45 per cent operation. Steel bars are being sold freely at 1.40c., Pittsburgh. In bar iron the same price obtains, with the possible exception that it might be difficult to buy large flats and rounds at less than 1.45c.

Sheets.—Prices on sheets continue firm, being the exception among steel products. There is, however, little inquiry in this district to test the market. Blue annealed is quoted at 2.25c., black at 3c. and galvanized at 4c., Pittsburgh.

Wire Products.—Practically all makers of wire products have now reduced prices \$2 a ton as a result of the cutting which has been going on for some weeks. Wire nails are quoted at \$2.40, plain wire at \$2.15 and galvanized wire at \$3.05, all per 100 lb., Pittsburgh. A fairly good demand is reported, particularly for galvanized wire.

Light Rails.—The demand for light rails has improved, but prices are weak. Sales have been made as low as 1.40c. per lb., Pittsburgh, though some mills are asking 1.45c. and 1.50c.

Rivets.—A recent large purchase of structural rivets, approximately 500 tons, was consummated at a price about 2c. per lb., Pittsburgh, which is \$5 a ton below so-called regular quotations.

Old Material.—There was a little better buying of scrap in the past week, but tonnages wanted were small. Prices are unchanged. For delivery at consumers' works in this district we quote:

No. 1 heavy mangle steel	\$12.00 to \$12.50
Scrap rail	12.00 to 12.50
Steel rails, rerolling	15.00 to 15.50
No. 1 low phos. heavy 0.04 and under	18.00 to 19.00
Cast iron car wheels	15.00 to 15.50
No. 1 railroad wrought	14.50 to 15.00
No. 1 yard wrought	12.00 to 12.50
No. 1 forge fire	10.00 to 10.50
Bundled sheets (for steel works)	9.50 to 10.00
No. 1 busheling	11.00 to 12.00
No. 2 busheling	9.00 to 10.00
Turnings (short shoveling grade for blast furnace use)	9.50 to 10.00
Mixed borings and turnings (for blast furnace use)	9.50 to 10.00
Machine-shop turnings (for rolling mill and steel works use)	9.50 to 10.00
Heavy axle turnings (or equivalent)	9.50 to 10.00
Cast borings (for steel works and rolling mills)	12.00 to 12.50
Cast borings (for chemical plants)	13.50 to 14.00
No. 1 cast	16.50 to 17.00
Railroad grate bars	14.00 to 14.50
Stove plate (for steel plant use)	14.00 to 14.50
Wrought iron and soft steel pipes and tubes (new specifications)	12.00 to 12.50
Iron car axles	No market
Steel car axles	17.00 to 17.50

Warehouse Business.—Moderate improvement in buying of steel out of stock continues. Prices locally on plates and shapes are lower. We quote for Philadelphia delivery as follows:

Soft steel bars and small shapes, 2.50c.; iron bars (except bands), 2.50c.; round edge iron, 2.80c.; round edge steel, iron finish, $1\frac{1}{2}$ x $\frac{1}{2}$ in., 2.95c.; round edge steel planished, 3.70c.; tank steel plates, $\frac{1}{4}$ -in. and heavier, 2.50c.; tank steel plates, $\frac{3}{16}$ -in., 2.55c.; blue annealed steel sheets, No. 10 gage, 3.50c.; light black sheets, No. 28 gage, 4c.; galvanized sheets, No. 28 gage, 5c.; square twisted and deformed steel bars, 2.65c.; structural shapes, 2.50c.; diamond pattern plates, $\frac{1}{4}$ -in., 4.60c.; $\frac{3}{16}$ -in., 4.75c.; $\frac{1}{2}$ -in., 4.90c.; spring steel, 4.10c.; round cold-rolled steel, 3.25c.; squares and hexagons, cold-rolled steel, 3.75c.; steel hoops, No. 13 gage and lighter, 3.25c.; steel bands, No. 12 gage to $\frac{3}{16}$ -in., inclusive, 3.10c.; iron bands, 3.90c.; rails, 2.75c.; tool steel, 8c.; Norway iron, 5c.; toe steel, 4.50c.

Boston

BOSTON, Feb. 21.

Pig Iron.—Business in pig iron suffered a relapse this week, orders booked consisting of a carlot here and there, the aggregate tonnage involved being unimportant. The Gurney Heater Co., Framingham, Mass., inquiring on 2000 tons of No. 2 X, has withdrawn, temporarily, from the market. The largest prospective inquiry is for 500 tons, silicon 2.75 to 3.25, to be put out within the immediate future by a maker of textile machinery. In the absence of business, Buffalo irons appear firmer. One furnace heretofore offering silicon up to and including 3.25 at \$18, furnace, this week is quoting \$19 on small tonnages and \$18.50 on large. Other furnaces quote \$18.50, which suggests a recovery of at least 50c. Eastern Pennsylvania furnace interests are meeting \$19, Buffalo delivered, iron. The market on such irons therefore cannot be considered firmer. Some Virginia and Alabama iron is coming into this territory, but hardly enough to constitute a real market.

We quote delivered at common New England points as follows, having added to furnace prices \$1.06 freight from eastern Pennsylvania, \$5.16 from Buffalo, \$6.58 from Virginia and \$10.66 from Alabama:

East Penn., sil. 2.25 to 2.75	\$23.06 to \$24.56
East Penn., sil. 1.75 to 2.25	23.06 to 24.06
Buffalo, sil. 2.25 to 2.75	23.96 to 24.46
Buffalo, sil. 1.75 to 2.25	23.96 to 24.46
Virginia, sil. 2.25 to 2.75	29.08 to 30.08
Virginia, sil. 1.75 to 2.25	28.58 to 29.58
Alabama, sil. 2.25 to 2.75	27.16
Alabama, sil. 1.75 to 2.25	26.66

Cast Iron Pipe.—The Metropolitan District Commission, Boston, this week placed the largest single order for cast iron pipe noted in this territory for several months. From the Warren Foundry & Machine Co. it purchased 3150 tons of 20-in., 24-in. and 30-in. pipe, and from the United States Cast Iron Pipe & Foundry Co. 50 tons of fittings for 20-in. and 30-in. pipe, deliveries to begin at once and to terminate on or before May 1. The city of Portland, Me., has placed an order for approximately 1800 tons of 6-in. to 12-in. pipe and 35 tons of fittings with the Warren Foundry & Machine Co., for delivery up to May 1. A large tonnage of additional business is in the making, but prospective buyers are slow in making up lists. Representatives of pipe makers report books well filled with orders. Prices are firm and unchanged, as follows: per net ton, f.o.b. Boston and district, in carload lots, 3-in., \$66.70; 4-in., \$56.70; 6-in., \$50.70; 10-in. and larger, \$49.70, with \$4 differentials on Class A and gas pipe. Bids will be opened March 1, by the city of Boston, on 2150 tons 6 in. to 36 in. pipe, Boston specifications. R. D. Wood & Co. have secured approximately 800 tons of gas pipe from Stone & Webster, Boston.

Warehouse Business.—Further increases in the movement of iron and steel out of warehouses is noted, with the greatest activity in sheets and structural steel. The average order for bars involves small weights, and the increase in the movement out of stock is due entirely to an increase in the number of orders received daily. An improvement in the demand for bolts and nuts also is noted, but business is spotty. Local quotations on wire nails have been reduced 15c. to \$3.25 per keg base.

Finished Material.—The New England Structural Co. has been awarded 600 tons of structural steel for the Beacon Press Co., Boston, building, and 200 tons

for an Allston theater, and the American Bridge Co. the steel for a \$100,000 Holyoke, Mass., silk mill. Bids are being taken on 3000 tons for a Park Square, Boston, building, 240 tons for a Manchester, N. H., theater and 138 tons for a Winter Street, Boston, building, as well as on approximately 5000 tons for other projects, negotiations for which are private, all to be awarded presumably within the next fortnight. Mill representatives report business running well ahead of last month on bars, bands, plates, sheets and structural steel for stocking purposes. The Bangor & Aroostook Railroad has bought 2000 tons 80-lb. rails from the Bethlehem Steel Co., and 7400 standard angle joints. The Maine Central Railroad 3000-ton rail inquiry remains open.

Jobbers now quote: Soft steel bars, \$2.55½ per 100 lb. base; flats, \$2.65½; concrete bars stock lengths, \$2.55½; structural angles and beams, 7.65½; plates, \$2.65½ to \$2.83; tire steel, \$3.85 to \$4.25; open hearth spring steel, \$4.50; crucible spring steel, \$11.50; bands, \$3.15½ to \$3.53; hoop steel, \$3.15½; cold-rolled steel, \$3.10 to \$3.30; toe rail steel, \$8; refined iron, \$2.55½ per 100 lb. base; best refined iron, \$4.25; Wayne iron, \$5.50; Norway iron, \$5.50; No. 10 blue annealed sheets, \$3.48 per 100 lb. base; No. 28 black sheets, \$1.50; No. 28 galvanized sheets, \$5.50.

Coke.—Daily shipments of by-product foundry coke by the New England Coal & Coke Co. and the Providence Gas Co. continue to run well ahead of those for the corresponding period last month. While business is better than it was, the above mentioned companies have not found it necessary to increase oven production. The buying is in anticipation of labor troubles at the coal mines April 1, rather than because of any marked increase of foundry operations. Only an occasional car of Connellsville foundry coke is finding its way into this territory. Prices are reported as firm by both New England producers on a basis of \$10.15, delivered, where the local freight does not exceed \$3.40.

Old Material.—Little of interest developed in the old material market the past week. New England users, as well as Pennsylvania mills, showed the same indifference they did during the previous week. In the absence of business, prices are largely nominal and therefore not subject to change. The demand for borings, the outstanding feature of the market during the latter part of January, appears to have dried up, yet dealers are quoting on the former basis. The low cost of pig iron and the low operating ratio of the average foundry in this territory account in a large measure for the inactivity of machinery cast.

The following prices are for gross ton lots delivered consuming points:

No. 1 machinery cast	\$18.00 to \$18.50
No. 2 machinery cast	16.00 to 16.50
Stove plate	15.00
Railroad malleable	12.00 to 13.50

The following prices are offered per gross ton lots f.o.b. Boston late shipping points:

No. 1 heavy melting steel	\$8.00 to \$9.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	9.50 to 10.00
Wrought pipe (1 in. in diam. over 2 ft. long)	7.00 to 7.25
Machine shop turnings	4.00 to 4.50
Cast iron borings, rolling mill	7.50 to 8.00
Cast iron borings, machine	5.00 to 9.00
Blas furnace borings and turnings	3.50 to 4.50
Forged scrap and banded skeleton	4.50 to 5.00
Street car axles and shafting	10.50 to 11.00
Car wheels	11.50 to 12.00
Retrolling rails	10.00 to 10.50

Bids on the Navy's Copper and Brass Scrap

WASHINGTON, Feb. 20. — Submitting figures ranging from 7.0199c. to 9.3899c. per lb., Herman Jaffe, 220 Broadway, New York, was the highest bidder for 9 out of 11 lots of copper and brass scrap offered for sale by the Navy Department, tenders being opened this morning. The total quantity involved was 1,000,000 lb. The biggest lot included in Mr. Jaffe's bids was 500,000 lb. of reclaimed copper composition scrap ingots at Norfolk, Va., this material containing 81.5 per cent copper, 7.46 per cent tin and 9.51 per cent zinc with minor contents of other non-ferrous material. The price offered for this lot was 8.5699c. per lb. The highest individual bid was 9.76c. per lb., made by the U. T. Hungerford Brass & Copper Co., New York, for 25,000 lb. of brass primer rods at Newport, R. I. Besides the Norfolk and Newport navy yards the material offered for sale is located at the Hingham, Mass., and Portsmouth, N. H., yards. There were nine bidders in all.

Chicago

CHICAGO, Feb. 21.

Railroad purchases of cars and track material during the past month together with recent releases against rail contracts, have had their effect on local mill operations, which now average well over 50 per cent. The Illinois Steel Co. has put in another blast furnace at Joliet, giving it 11 active stacks in all, and is producing steel at the rate of 55 per cent of ingot capacity. The Inland Steel Co. is on a 60 per cent basis, having its entire No. 1 plant in operation and having started three open hearths and its 40-in. blooming mill and 32-in. roughing mill on the No. 2 side.

Much of the business which made these gains in production possible was taken at a sacrifice. This was particularly true of orders taken from car builders and railroads which involved large tonnages. Because of the mills' anxiety to build up a backlog, the advantage was clearly with the buyers and in some instances exceptionally low prices resulted. Recent orders for car steel have gone at 1.40c., Chicago, and even lower, one sale having been made at that price with a freight of 17c. allowed to the point of delivery. Likewise a large railroad order for tie plates was placed at less than \$30. mill. Mills profess to be sick of low-priced business, however, and are showing a firmer attitude on new inquiries. Even at 1.50c., Chicago, it is asserted no profit can be made on plates, shapes and bars. As producers are now fortified with substantial backlogs, it seems probable that the necessity for cutting so far below costs has passed.

Pig Iron.—Buying has been light since the advance in local irons, but such purchases as have been made, ranging from carload lots to 200 tons, have been at \$20 base. Here and there some Southern iron has been sold in this district, but as yet the tonnage has not been large. Although orders have fallen off sharply, some good-sized inquiries are current. The Mt. Vernon Car Mfg. Co. wants 1000 to 2000 tons of malleable for February and March shipment, while a Milwaukee melter is in the market for 2000 tons of Northern and 400 tons of Southern foundry for delivery in the next 60 days. The American Brake Shoe & Foundry Co. is inquiring for 300 tons of foundry for April shipment at the Southern Wheel Co. plant, St. Louis. The Western Electric Co. is negotiating for an additional 300 tons of 3 per cent foundry for March and April shipment. A current local inquiry for 250 tons of low phosphorous is expected to bring out keen competition. Copper free material appears to have firmed up to \$30, Valley furnace, but copper bearing is available at \$2 less. We note several sales of carload lots of charcoal at \$27 base, furnace, and one carload sale at \$28 base. While most producers are now insisting on a minimum of \$28, at least one maker is still offering material at the lower price.

Quotations on Northern foundry, high phosphorous malleable and basic irons are f.o.b. local furnace and do not include a switching charge averaging 70c. per ton. Other prices are for iron delivered at consumers' yards, or when so indicated, f.o.b. furnace other than local.

Lake Superior charcoal, averaging	
sl. 1.50, delivered at Chicago	\$30.50 to \$31.50
Northern coke, No. 1, sl. 2.25 to 2.75	20.50
Northern coke, foundry, No. 2, sl.	
1.75 to 2.25	20.00
Northern high phos.	20.00
Southern foundry, sl. 1.75 to 2.25	21.47
Malleable, not over 2.25 sl.	20.00
Basic	20.00
Low phos., Valley furnace, sl. 1 to 2	
per cent copper free	30.00
Silvery, sl. 8 per cent	32.82

Ferroalloys.—Spiegelisen has been advanced to \$30, Eastern furnace, or \$40.10 delivered. Furnace stocks are low and consist largely of 16 to 18 per cent material. Several sales of ferromanganese, ranging from one to two carloads, have been made at the new price of \$62.50, seaboard. A local steel works has bought 300 tons of 10 per cent Bessemer ferrosilicon at \$34 delivered.

We quote 78 to 82 per cent ferromanganese, \$70.90, delivered; 50 per cent ferrosilicon, \$56 to \$57.50, delivered; spiegelisen, 16 to 18 per cent, \$40.10, delivered.

Railroad Equipment.—The Great Northern has ordered 500 refrigerator cars from the General Ameri-

can Car Co. It has deferred action on its box car inquiry and has reduced its gondola inquiry to 250 cars. It is expected to close presently on the gondolas and 500 stock cars.

Bars.—Business in soft steel bars is still expanding, although not sufficiently as yet to stiffen prices, which range from 1.50c. to 1.60c., Chicago, on ordinary orders. The sources of new business are growing more diversified from day to day, although large individual tonnages continue to be placed mainly for car construction and for reinforcing purposes. The Kansas City Bolt & Nut Co. will furnish 1100 tons of reinforcing for a building to be erected for the Kansas City Warehouse & Cold Storage Co. The Concrete Steel Co. has the contract for 800 tons for the Phoenix Knitting Co. plant, Milwaukee. The reinforcing for the Putnam Department Store, Davenport, Iowa, amounting to 135 tons, has been let to the Corrugated Bar Co. The Milwaukee Sewerage Commission has not yet made a formal award of the 5000 tons for the Jones Island disposal plant. Reinforcing jobs pending include 300 tons for the Churchill Hotel, Chicago, 300 tons for the Popular Mechanics Building, Chicago, and 120 tons for state highway work in Bureau County, Ill.

Bar iron demand is light and prices are weak at from 1.55c. to 1.60c., Chicago.

Mill prices are: Mild steel bars, 1.50c. to 1.60c., Chicago; common bar iron, 1.50c. to 1.60c., Chicago; rail carbon, 1.50c., mill or Chicago.

Jobbers quote 2.53c. for steel bars out of warehouse. The warehouse quotation on cold-rolled steel bars and shafting is 3.40c. for rounds and 3.90c. for flats, squares and hexagons. Jobbers quote hard and medium deformed steel bars at 1.90c. base. Hoops and bands, 3.13c.

Sheets.—Domestic demand is slow to improve, but local mills have export business to fall back upon to fill up holes in their rolling schedules. Prices are fairly firm. The local independent is running at capacity with over a month's work ahead.

Mill quotations are 3c. for No. 28 black, 2.25c. for No. 10 blue annealed and 4c. for No. 28 galvanized, all being Pittsburgh prices, subject to a freight rate to Chicago of 38c. per 100 lb.

Jobbers quote: Chicago delivery out of stock, No. 10 blue annealed, 3.38c.; No. 28 black, 4.15c.; No. 28 galvanized, 5.15c.

Wire Products.—Buying is of unsatisfactory volume for this time of the year and prices are unsteady. For mill prices see finished iron and steel, f.o.b. Pittsburgh, page 559.

We quote warehouse prices f.o.b. Chicago: No. 9 and heavier black annealed wire, \$3.13 per 100 lb.; No. 9 and heavier bright basic wire, \$3.28 per 100 lb.; common wire nails, \$3.25 per 100 lb.; cement coated nails, \$2.65 per keg.

Steel Castings.—The castings for the Burlington cars have not yet been let. Owing to the substitution of rolled steel construction for some car parts ordinarily supplied by the steel foundries, the tonnage of castings to be bought will not be so large as was expected. The castings market is generally quiet, although the prospect of further car lettings is encouraging. Figures submitted on a number of recent inquiries indicate a tendency toward firmness and a rather general adherence to prices which approximate those published on pages 348 to 350 of THE IRON AGE of Feb. 2, although the manner of quoting was in some cases different.

Plates.—Demand continues to broaden with orders coming from widely distributed sources. While the individual tonnages are generally small, their increasing number is regarded as an indication of growing confidence in the present market level as well as a gradual improvement in general industrial activity. While prices are still soft, ranging from 1.50c. to 1.60c., Chicago, on the general run of business, the tendency is toward greater firmness on the part of sellers. Further railroad car business has been let with more in sight, but little new work of consequence is being undertaken by the oil industry. The only recent oil tank job placed was a small one, consisting of 10 station tanks, involving 400 tons, to be fabricated and erected in this city for the Standard Oil Co. by the Graver Corporation.

The ruling mill quotations range from 1.50c. to 1.60c., Chicago. Jobbers quote 2.53c. for steel bars out of stock.

Rails and Track Supplies.—Track supplies are in active demand and specifications against rails on contract are heavier. The New York Central has placed 12,000 kegs of spikes, as well as some bolts and angle bars with the Illinois Steel Co. The Big Four is in the market for 6000 tons of tie plates. Recent inquiries for tie plates have brought out keen competition, the going market price of \$35 per net ton having been shaded in one or two instances. New rail orders reported include 3000 tons bought by the Hocking Valley from the Lackawanna Steel Co. and 2500 tons placed with the Gary mill by the Monon. The latter road has also released 2000 tons on contract. Altogether releases received by the Gary mill during the week totaled 20,000 tons, including 8000 tons for the Great Northern and substantial tonnages for the Baltimore & Ohio and the Missouri Pacific. The demand for light rails is light and prices range from 1.50c. to 1.60c., mill.

Standard Bessemer and open-hearth rails, \$40; light rails rolled from new steel, 1.50c. to 1.60c., f.o.b. makers' mills. Standard railroad spikes, 2.10c., Pittsburgh; track bolts with square nuts, 2.10c., Pittsburgh; tie plates, steel and iron, 1.75c., f.o.b. mill; angle bars, 2.40c., f.o.b. mill.

Bolts and Nuts.—Both jobbers and consumers are buying a little more freely, but bookings are still exceedingly unsatisfactory and discounts remain very weak.

Jobbers quote structural rivets, 3.43c.; boiler rivets, 3.53c.; machine bolts up to $\frac{3}{4}$ x 4 in., 60, 10 and 10 per cent off; larger sizes, 60 to 10 off; carriage bolts up to $\frac{3}{4}$ x 6 in., 60 and 10 off; larger sizes, 55 and 5 off; hot pressed nuts, square and hexagon tapped, \$3.75 off, blank nuts, \$4 off; coach or lag screws, gimlet points, square heads, 65 and 5 per cent off. Quantity extras are unchanged.

Structural Material.—There are few new lettings to report and while much fabricating work is in the formative stage, it is slow in getting to the bid-taking stage. Prices on plain material are still weak and the general market appears to range from 1.50c. to 1.60c., Chicago. Fabricating awards include:

Sun Drug Co. Building, Los Angeles, 600 tons, to Llewellyn Iron Works. Michigan State Highway Department, one 150-ft. through truss span near Rockland, Mich., 112 tons, to unnamed fabricators. Repairs to south approach Missouri River Bridge, Sioux City, Iowa, 200 tons, to American Bridge Co.

Pending business includes:

Northern Pacific Railway, miscellaneous spans for distribution over entire system, 1922 requirements, 2900 tons.

Central Y. M. C. A. building, Columbus, Ohio, 500 tons, bids in.

London Guarantee Life Assurance Building, Chicago, 4400 tons, general contractor's bids in.

Shrine Auditorium, Indianapolis, 350 tons.

Wisconsin Highway Commission bridge, Tomahawk, Wis., 278 tons, Stein Construction Co., Milwaukee, general contractor.

Jones Island Sewage Disposal Plant, Milwaukee, 450 tons, bids to be opened by John H. Fowles, City Hall, March 10.

The mill quotation on plain material ranges from 1.50c. to 1.60c., Chicago. Jobbers quote 2.63c. for plain material out of warehouse.

Cast-Iron Pipe.—The People's Gas Co., Chicago, has placed 9000 tons of gas pipe with the United States Cast Iron Pipe & Foundry Co., and the Milwaukee Gas Co. has awarded 500 tons to the Lynchburg Foundry Co. Other lettings include:

Brook Park, Ohio, 600 tons of water pipe to the National Cast Iron Pipe Co. Fairfax, Okla., 175 tons, to National Cast Iron Pipe Co. Muscatine, Iowa, 650 tons, to United States Cast Iron Pipe & Foundry Co. Detroit Fire Commissioners, 300 tons of high pressure pipe, to United States Cast Iron Pipe & Foundry Co. Minneapolis, 800 tons, to American Cast Iron Pipe Co.

Pending business includes:

Grove City, Ohio, 350 tons, bids in Feb. 28, contractor's job. Wausau, Wis., 200 tons, Feb. 18. Madison, Wis., 150 tons, Feb. 18. Moulton, Iowa, 300 tons, Feb. 23. Stratton, Col., 200 tons, Feb. 23. Cody, Wyo., 325 tons, Feb. 24. Muskegon, Mich., 150 tons, Feb. 24.

We quote per net ton, f.o.b. Chicago, as follows: Water pipe, 4-in., \$45.60 to \$46.60; 6-in. and above, \$41.60 to \$42.60; class A and gas pipe, \$3 extra.

Old Material.—Conservative buying has improved.

although it cannot be said that a real buying movement is under way. A number of important local melters have made fair purchases of cast and malleable, however, and an iron mill has closed for about 1500 tons of No. 1 busheling. It is also evident that there have been substantial purchases of open-hearth grades. According to an unauthenticated report, the Gary works has placed orders for 10,000 tons, while it is also said that several thousand tons have been bought by another steel mill. On the whole, prices show greater firmness and a number of grades have advanced. That dealers anticipate a rising market is indicated by the fact that they are paying higher prices for railroad material than are quoted below.

We quote delivery in consumers' yards, Chicago and vicinity, all freight and transfer charges paid, as follows:

Per Gross Ton	
Iron rails	\$16.00 to \$16.50
Relaying rails	20.00 to 25.00
Cast iron car wheels	15.00 to 16.50
Rolled or forged steel car wheels	13.00 to 13.50
Steel rails, rerolling	12.00 to 12.50
Steel rails, less than 3 ft.	12.75 to 12.25
Heavy melting steel	11.50 to 12.00
Frogs, switches and guards cut apart	11.50 to 12.00
Shoveling steel	11.00 to 11.50
Low phos., heavy melting steel	13.50 to 14.00
Drop large flashings	7.50 to 8.00
Hydraulic compressed steel	8.00 to 8.50
Axle turnings	8.50 to 9.00

Per Net Ton	
Iron angles and splice bars	14.00 to 14.50
Steel angle bars	10.75 to 11.25
Iron arch bars and trapezoids	15.00 to 15.50
Iron car axles	19.50 to 20.00
Steel car axles	12.50 to 13.00
No. 1 busheling	8.50 to 9.00
No. 2 busheling	6.00 to 6.50
Cut forge	10.00 to 10.50
Pipes and flues	6.50 to 7.00
No. 1 railroad wrought	10.50 to 11.00
No. 2 railroad wrought	10.00 to 10.50
Steel knuckles and couplers	11.00 to 11.50
Coil springs	12.50 to 13.00
No. 1 machinery cast	13.50 to 14.00
No. 1 railroad cast	13.00 to 13.50
Low phos. punchings	11.00 to 11.50
Locomotive tires, smooth	10.00 to 10.50
Machine shop turnings	4.50 to 5.00
Cast borings	6.25 to 6.75
Stove plate	12.50 to 13.00
Grate bars	10.50 to 11.00
Brake shoes	10.50 to 11.00
Railroad malleable	11.50 to 12.00
Agricultural malleable	11.50 to 12.00

Cincinnati

CINCINNATI, Feb. 21.

Pig Iron.—Some fair sized sales of pig iron were reported during the week, but in the majority of cases carload orders were the rule. There are evidences however, that the melt of iron is increasing slightly, and buyers are more receptive to advances by the sellers. The inquiry from some districts is still light and prices are inclined to be rather unsteady. Reports are current that Southern iron has been sold at \$15, Birmingham base, and in this connection it is said that a Kentucky sanitary company has placed 1500 tons for prompt shipment at this figure. The general market, however, in the South remains quotable at \$15.50, but a desirable tonnage no doubt could be placed at lower prices. Sales are about evenly divided between Northern and Southern. Of the former, a Portsmouth stove maker took 300 tons, and a Mansfield melter 100. An Indiana manufacturer bought 400 at a price said to be \$18, Lake furnace. Several 100-ton sales of Northern furnaces also are reported. A Louisville melter bought 500 tons of Southern at \$15.50 base, and an Indiana melter 100 tons at the same figure. A Cleveland district melter took 400 tons of silvery iron at the schedule. Outside the district a Michigan melter bought 5000 tons of foundry iron, and a St. Louis district foundry 200 tons of low phosphorus. Prices in the North are ruling about the same as last week, although a firmer tone is noted in Chicago and Cleveland iron.

Based on freight rates of \$4.50 from Birmingham and \$2.52 from Ironton, we quote f.o.b. Cincinnati:

Southern coke, sil. 1.75 to 2.25 (base), \$20.00 to \$20.50	
Southern coke, sil. 2.25 to 2.75 (No. 2 soft)	20.50 to 21.00
Ohio silvery, 8 per cent sil.	30.02
Southern Ohio coke, sil. 1.75 to 2.25 (No. 2)	21.52 to 22.02
Basic, Northern	21.02
Malleable	22.02 to 22.52

Finished Material.—If one is to judge from reports, the aggregate tonnage placed during the week was perhaps the best for any similar period since Jan. 1. The orders, however, are still confined to carload lots, although occasionally up to 100 tons are desired. The largest inquiry reported is for 450 tons of bars for the L. & N. Railroad. There is no particular branch of the trade that is especially active and orders placed cover bars, shapes, plates and wire products. The sheet market has slowed up a little during the past two weeks, but several 100-ton orders were reported during the past week. Practically all orders placed are for immediate shipment and there is desire apparent on the part of buyers to contract for the future. Prices as a rule are holding at last week's levels, although it is said on wire fencing and wire nails, considerable shading is being done. Reports were current that one manufacturer of wire fencing was quoting 71 per cent off the list and that wire nails are available under the regular price of \$2.40 per keg. On bars, shapes and plates, the usual quotation is 1.40c., and on sheets 3c. and 4c. for black and galvanized, respectively. Several weeks ago it was reported that galvanized sheets could be had at 3.75c., but this price apparently has disappeared, as all the orders now being placed are at the full schedule. There was little activity in the structural field during the week, the only award of consequence being 250 tons for the Capital Hotel at Frankfort to the Dayton Structural Steel Co., Dayton, Ohio. The American Car & Foundry Co. is taking bids on an addition to its plant at Huntington, W. Va., involving 500 tons. Frank L. Packard, Columbus, Ohio, will shortly call for bids on a twelve-story office building at Canton, Ohio, and a twelve-story bank building at Ironton, Ohio. The same firm will, early in April, send out plans for the North High School at Columbus, which will take a considerable tonnage of steel. Bids will close on Feb. 28 for the Wilde Bank Building at Indianapolis, involving 500 tons, on March 1 for the Indianapolis Athletic Club, involving 1200 tons, and on the same date for the Business Men's Club in Cincinnati, involving 500 tons. Pending projects include two school buildings at Middletown, Ohio, bids for which will close on Feb. 23, and a high school at Greenville, Ohio, which will come up during April. The new Hotel William at Columbus, Ohio, will not likely be up for bids before late spring, and plans are now being completed for the new hotel to replace the old Neil House in the same city. This building will be of sixteen stories and will also contain a theatre. The Big Four Railroad is inquiring for approximately 100,000 tie-plates and 3200 kegs of track bolts, bids for which will close on Feb. 27.

Old Material.—Local dealers report several tentative inquiries from steel companies, and also from jobbing foundries, but actual sales are few. It is expected, however, that some activity will be shown during the next week or two. Prices are soft, but unchanged.

We quote dealers' buying prices for cars
Per Gross Ton

Bundled sheets	\$3.50 to \$4.00
Iron rods	11.50 to 12.00
Refractory rails 50 lb. and up	24.50 to 25.00
Refractory steel rails	10.00 to 10.50
Heavy melting steel	8.50 to 9.00
Steel rails for melting	8.50 to 9.00
Car wheels	11.50 to 12.50

Per Net Ton

No. 1 railroad wrought	8.00 to 8.50
Cast borings	3.00 to 3.50
Steel turnings	2.00 to 2.50
Railroad cast	11.50 to 12.00
No. 1 machinery	13.00 to 13.50
Burnt scrap	7.00 to 7.50
Iron axes	15.00 to 15.50
Locomotive tires (smooth inside)	9.00 to 9.50
Pipes and flues	3.50 to 4.00

Coke.—The coke market is showing considerable activity, the threatened coal strike being responsible in large part. Prices are stiffening somewhat, and Connellsville foundry coke is now quoted at \$4 to \$4.50, Wise County foundry at \$5 to \$5.50, and New River foundry at \$7.50 to \$8.

Warehouse Business.—Local jobbers report a fair week with particularly good orders for concrete reinforcing bars. While the tonnages are not heavy, the number of orders is increasing and on the whole con-

ditions show some improvement. Some weakness has developed in the wire and nail market and it would not be surprising if lower prices were heard in the near future.

Iron and steel bars, 2.75c. base; hoops and bands, 3.35c. base; shapes and plates, 2.85c. base; reinforcing bars, 2.82½c. base; cold rolled rounds, 1½ in. and larger, 3.50c. base; under 1½ in. and flats, squares and hexagons, 4c.; No. 10 blue annealed sheets, 3.60c.; No. 28 black sheets, 4.25c.; No. 28 galvanized sheets, 5.25c.; wire nails, \$2.95 per keg base; No. 9 annealed wire, \$2.85 per 100 lb.

Proposed Merger for Japanese Iron Furnaces

"The proposal for a merger, which was recently started and at once dropped, is revived by Japanese furnaces, whose position, it is feared, becomes more helpless when the proposed naval holiday is effective," states the *Japan Advertiser* of Dec. 24. Views regarding the merger are again being exchanged among furnace managers, although it is thought that much time will elapse before the proposal materializes.

During the early months of 1921 the industry was confronted with its worst crisis, and at one time during the summer it was proposed by some ironmasters to render easier the position of the industry through the merger of all mills. This proposal was at once dropped because of some difficulties that were foreseen.

Buying, however, has been improving, which, coupled with the limited production at home and restricted importation from abroad, has served to lighten the burden of the market and industry. According to a stock report of Nov. 11, 1921, the total of the pig-iron stock in Japan was up to 255,990 tons. It is now believed to have fallen to approximately 250,000 tons.

Merger Proposal Revived

The proposal for a merger of the iron furnaces has again been revived, evidently because of the proposed naval holiday and its effect on the industry and also because of the uncertainty regarding the general revival of business. A short time ago representatives of several leading furnaces held a conference in the Industrial Club of Japan to discuss their present difficulty. As a result, the conclusion was reached that the only way open to them is to combine and readjust all Japanese furnaces.

It is stated in a report emanating from reliable quarters that managers of furnaces have begun the study of all problems pertaining to the maturing of their proposal, such as the warlike consumption of iron in Japan, the consumption of iron for commercial and industrial purposes, imports and exports, the cost of production at the different mills, etc.

Improved Situation in Spanish Iron Mines

Commercial Attaché Charles H. Cunningham, Madrid, says the situation in the mines of Bilbao is slightly improved, due to the increased demand for mineral ore in England. It is stated that orders have recently been received for about 115,000 tons of various classes of iron ore. This does not mean, however, a relief from the difficult situation which has prevailed in Bilbao during the past year, and where there are at present approximately 2,000,000 tons of red earth piled up without demand.

A voluntary petition in bankruptcy was filed Feb. 9 by the Racine Auto Tire Co., Racine, Wis. Schedules admit liabilities of \$1,453,216 and claim assets of \$1,642,836, which does not include the going or replacement value. Unsecured claims amount to \$972,675, and secured claims \$116,332. The largest secured creditor is the J. I. Case Threshing Machine Co., Racine, with a claim of \$90,000, secured by a land contract. The largest items of the assets is machinery, which is listed as having a value of \$402,185.

The referee in bankruptcy at Milwaukee has designated March 1 as the date when the entire assets of the defunct John Obenberger Forge Co. of West Allis, suburb of Milwaukee, are to be offered for sale at public auction. The sale will be held in room 502 of the Federal Building at Milwaukee, under the direction of J. F. Gerdis, trustee in bankruptcy.

Prices Finished Iron and Steel, f.o.b. Pittsburgh

Freight Rates

Freight rates from Pittsburgh on finished iron and steel products, in carload lots, to points named, per 100 lb., are as follows:

Philadelphia, domestic...	\$0.36	Kansas City	\$0.815
Philadelphia, export...	0.265	Kansas City (pipe)...	0.77
Baltimore, domestic...	0.35	St. Paul	0.665
Baltimore, export	0.255	Omaha	0.815
New York, domestic...	0.38	Omaha (pipe)	0.77
New York, export	0.285	Denver	1.35

The minimum carload to most of the foregoing points is 36,000 lb. To Denver the minimum loading is 40,000 lb., while to the Pacific Coast on all iron and steel products, except structural material, the minimum is 50,000 lb. On the latter item the rate applies to a minimum of 50,000 lb., and there is an extra charge of 5c. per 100 lb. on carloads of a minimum of 40,000 lb. On shipments of wrought iron and steel pipe to Kansas City, St. Paul, Omaha and Denver the minimum carload is 46,000 lb. On iron and steel items not noted above the rates vary somewhat and are given in detail in the regular railroad tariff.

Rates from Atlantic Coast ports (i.e., New York, Philadelphia and Baltimore) to Pacific Coast ports of call on most steamship lines, via the Panama Canal, are as follows: Pig iron, 55c.; ship plates, 75c.; ingot and muck bars, structural steel, common wire products, including cut or wire nails, spikes and wire hoops, 75c.; sheet and tin plates, 60c. to 75c.; rods, wire rope, cable and strands, \$1. wire fencing, netting and stretcher, 75c.; pipe, not over 8 in. in diameter, 75c.; over 8 in. in diameter, 25c. per in. or fraction thereof additional. All prices per 100 lb. in carload lots, minimum 40,000 lb.

Structural Material

I-beams, 3 to 15 in., channels, 3 to 15 in., angles, 3 to 6 in., on one or both legs, 1/4 in. thick and over, and zeos, structural sizes, 1.40c. to 1.50c.

Sheared plates, 1/4 in. and heavier, tank quality, 1.40c. to 1.50c.

Wire Products

Wire nails, \$2.40 to \$2.50 base per keg; galvanized, 1 in. and longer, including large-head barbed roofing nails, taking an advance over this price of 1 1/2c. and shorter than 1 in., \$1.75; bright Bessemer and basic wire, \$2.15 to \$2.25 per 100 lb.; annealed fence wire, Nos. 6 to 9, \$2.15 to \$2.25; galvanized wire, \$2.65 to \$2.75; galvanized barbed wire, \$3.00 to \$3.15; barbed wire, \$2.55 to \$2.65; polished fence staples, \$2.55 to \$2.65; cement-coated nails, per count keg, \$1.90 to \$2.00, these prices being subject to the usual advances for the smaller trade, all f.o.b. Pittsburgh, freight added to point of delivery, terms 60 days, net, less 2 per cent off for cash in 10 days. Discounts on woven-wire fencing are 10 1/2 per cent off list for carload lots; 6 1/2 per cent for 1000-rod lots, and 6 1/2 per cent for small lots, f.o.b. Pittsburgh.

Bolts and Nuts

Machine bolts, small, rolled threads, 70, 10 and 10 per cent off list

Machine bolts, small, cut threads, 70 and 10 per cent off list

Machine bolts, larger and longer, 70 and 10 per cent off list

Carriage bolts, 1/2 in. x 6 in., 70 and 10 per cent off list

Smaller and shorter rolled threads, 70 and 10 per cent off list

Cut threads, 70 and 10 per cent off list

Longer and larger sizes, 70, 10 and 5 per cent off list

Lag bolts, 70, 10 and 5 per cent off list

Plow bolts, Nos. 1, 2 and 3 heads, 60 and 10 per cent off list

Other style heads, 20 per cent extra

Machine bolts, c.p.c. and t. nuts, 1/2 in. x 4 in., 65, 10 and 5 per cent off list

Smaller and shorter, 65, 10 and 5 per cent off list

Larger and longer sizes, 65 and 10 per cent off list

Hot pressed sq. or hex. blank nuts, \$5.50 off list

Hot pressed nuts, tapped, \$5.25 off list

C.p.c. and t. sq. or hex. blank nuts, \$5.25 off list

C.p.c. and t. sq. or hex. blank nuts, tapped, \$5.00 off list

Semi-finished hex. nuts:

1/4 in. to 9/16 in. inclusive, 80, 10 and 10 per cent off list

Small sizes S. A. E., 80, 10 and 10 per cent off list

1/2 in. to 1 in. inclusive, U. S. S. and S. A. E., 70, 10, 10 and 10 per cent off list

70, 10, 10 and 10 per cent off list

Stove bolts in packages, 80 and 3 tens and 5 per cent off list

Stove bolts in bulk, 80, 3 tens and 2 1/2 per cent off list

Tire bolts, 70, 10 and 5 per cent off list

Track bolts, carloads, 3c. to 3.25c. base

Track bolts, less than carloads, 4c. to 4.25c.

Upset and Hex. Head Cap Screws

1/4 in. and under, 80 and 10 to 80, 10 and 10 per cent off list

9/16 in. to 1 in., 80 and 10 to 80, 10 and 10 per cent off list

Upset Set Screws

1/4 in. and under, 80, 10 and 5 to 85 per cent off list

9/16 in. to 1 in., 80, 10 and 5 to 85 per cent off list

Milled Square and Hex. Cap Screws

All sizes, 75 and 10 to 80 per cent off list

Milled Set Screws

All sizes, 70, 10 and 10 per cent off list

Rivets

Large structural and ship rivets, \$2.10

Large boiler rivets, 2.20

Small rivets, 75 and 10 off list

Wire Rods

No. 5 common basic or Bessemer rods to domestic consumers, \$35 to \$36; chain rods, \$35 to \$36, screw stock rods, \$40 to \$41, rivet and bolt rods and other rods of that character, \$35 to \$36; high carbon rods, \$42 to \$46, depending on carbons.

Railroad Spikes and Track Bolts

Railroad spikes, 2 1/2-in. and larger, \$2.15 to \$2.20 base per 100 lb. in lots of 200 kegs of 200 lb. each or more; spikes, 1 1/2 in., 3/4 in. and 7/16 in., \$2.25 to \$2.30 base; 5/16-in., \$2.25 to \$2.30 base. Bolt and nut spikes, \$2.25 to \$2.30 base per 100 lb. in carload lots of 200 kegs or more, f.o.b. Pittsburgh. Track bolts, 3/4 to 3 1/2 in. base per 100 lb. The plates, \$2 per 100 lb. Angle bars, \$2.10 per 100 lb.

Terne Plates

Prices of terne plates are as follows: 8 lb. coating, 200 lb., \$9.40 per package; 8 lb. coating, 1, C., \$9.60; 15-lb. coating, 1, C., \$11.80; 20-lb. coating, 1, C., \$13.25; 25-lb. coating, 1, C., \$14.25; 30-lb. coating, 1, C., \$15.25; 35-lb. coating, 1, C., \$16.25; 40-lb. coating, 1, C., \$17.25 per package, all f.o.b. Pittsburgh, freight added to point of delivery.

Iron and Steel Bars

Steel bars, 1.40c. from mill. Refined bar iron, 2c. to 2.10c.

Welded Pipe

The following discounts are to jobbers for carload lots on the Pittsburgh basis card:

Butt Weld			Iron

8 1/2 to 10	59	44 1/2	8 1/2 to 10	35 1/2	18 1/2

To the large jobbing trade the above discounts are increased by one point, with supplementary discounts of 5 and 2 1/2 per cent.

Boiler Tubes

The following are the discounts for carload lots f.o.b. Pittsburgh:

Lap Welded Steel		Charcoal Iron	
1 1/2 in.	26 1/2	1 1/2 in.	5
2 to 2 1/2 in.	41	2 1/2 to 3 in.	15
2 1/2 to 3 in.	52	3 to 3 1/2 in.	25
3 1/2 to 4 in.	57	3 1/2 to 4 in.	32

To large buyers of steel tubes, a supplementary discount of a per cent is allowed.

Standard Commercial Seamless Boiler Tubes

New discounts have been adopted on standard commercial seamless boiler tubes, but manufacturers are not yet ready to announce them for publication, and for that reason we publish no discounts this week.

Sheets

Prices for mill shipments on sheets of standard gage in carloads, f.o.b. Pittsburgh, follow:

PERSONAL

Huntington Downer, who for the past two years has been district sales manager in Philadelphia for the Lackawanna Steel Co., Buffalo, has resigned that position to become manager of the iron and steel department of the Iron Trade Products Co., Pittsburgh.

HUNTINGTON DOWNER

Mr. Downer has had a thorough training in the steel business. After his graduation from Yale University, he entered the operating department of the Lackawanna Steel Co., learning the business from the mining of ore to the production of semi-finished and finished steel. He then entered sales work and was in the general sales department of the company at the time of his appointment to the position in Philadelphia. The Iron Trade Products Co., with which Mr. Downer becomes identified, is engaged on a brokerage basis in the sale of ore, pig iron, alloys, fluorspar and other materials used in the iron and steel trade.

Lewis D. McClaren, for a number of years on the sales force of Rogers, Brown & Co., pig iron brokers at Chicago, has resigned to become sales manager of the coke department of the Wisconsin Lime & Cement Co., Conway Building, Chicago. This company has the Chicago agency for the sale of Roberts by-product coke, manufactured by the St. Louis Coke & Chemical Co., Granite City, Ill. C. E. Trommer, sales representative Rogers, Brown & Co., at St. Louis, has been transferred to Chicago to take the place made vacant by Mr. McClaren.

Lester G. Sigourney has recently been chosen secretary of the New Departure Mfg. Co., Bristol, Conn., manufacturer of ball bearings, etc. He has been with the company for several years.

John D. Ryan, chairman of the board of directors of the Anaconda Copper Co., Cornelius F. Kelley, president of the same company, and Benj. B. Thayer, vice-president of the company, were all elected directors of the American Brass Co., Waterbury, Conn., at the recent meeting of the latter company. They were also chosen on the executive committee of the American Brass Co.

Hollinshead N. Taylor, president N. & G. Taylor Co., manufacturer of tin plate, Philadelphia, who was elected a member of the board of directors of the Philadelphia Chamber of Commerce to succeed James B. Bonner of the Carnegie Steel Co. on the latter's removal to Washington, has been appointed a member of the executive committee of that organization. He is also chairman of the industrial committee and a member of the committees on public utilities and aviation.

C. W. Forcier, 433 Union Arcade Building, has been appointed Pittsburgh district sales representative the Tacony Steel Co., Philadelphia.

Lorenz Maisel has disposed of his interest in the Madison, Wis., Tool & Stamping Works, and retires as treasurer and general manager. Mr. Maisel in November, 1920, resigned as general superintendent Burgess Battery Co., Madison, to take an important interest in the tool works, which he reorganized. He has not made public plans for the future.

C. L. Dewey, who was associated with Carl Akeley in the invention and development of the cement-gun, and who has done extensive cement-gun contract work under the names of the Dewey Cement-Gun Co. and the Traylor-Dewey Contracting Co., Allentown, Pa.,

has joined the forces of the Cement-Gun Construction Co., Chicago. He will devote his time exclusively to the development of cement-gun contract work.

Justus Egbert, director of purchases, American Radiator Co., Buffalo, has resigned, effective March 1, and will be succeeded by L. H. Beyer. In conjunction with Ralph Waldo of Rogers, Brown & Co., and W. J. McClain, Buffalo sales representative of Republic Iron & Steel Co., Mr. Egbert is forming a company to be known as Waldo, Egbert & McClain, Inc., with headquarters at Buffalo, to sell pig iron, coke, steel, various alloys, fire brick, molding sand, etc.

Ritchie Gill, of the International Sales Corporation, Victoria Street, London, S. W., has taken up his quarters at the Gotham Hotel, New York, and is desirous of getting in touch with substantial houses handling ironmongery in the United Kingdom and Europe.

Elliot D. Drury, formerly sales representative Greenfield Tap & Die Corporation, Greenfield, Mass., is now assistant sales manager American Wringer Co., Woonsocket, R. I.

J. T. Brierly, formerly general manager and treasurer Brierly-Lombard Co., Worcester, Mass., mill supplies, was elected president of the Thompson-Copeland Co., that city, lock washers, nuts, etc., at the annual stockholders' meeting last week. E. A. Copeland is vice-president, and Harry C. Thompson treasurer.

Charles C. Boyden, who resigned his position with the Alan Wood Iron & Steel Co., Philadelphia, a few months ago and went on a trip to California, has returned. His present address is Foxbury, Mass.

Paul L. Battey, formerly vice-president of the Arnold Co., Chicago, and for years chief engineer in charge of various industrial enterprises, including the large Willys-Overland establishment at Elizabeth, N. J., has established himself at 123 West Madison Street, Chicago, as consulting engineer for industrial plants.

Decision Favors U. S. Steel Products Co.

WASHINGTON, Feb. 21.—In a tentative opinion handed down to-day, Attorney Examiner Charles F. Gerry recommends that the Interstate Commerce Commission direct the Director General and the railroads involved to waive the collection of demurrage and storage charges assessed against the United States Steel Products Co. on shipments of iron and steel products delivered at Seattle and Tacoma, Wash., for export to the Philippine Islands, Japan and other Far Eastern destinations during the period from July 1, 1918, to Sept. 9, 1919.

It is held in the tentative report that the charges were legally applicable to the shipments, but that the defendants failed, in conformity with tariff provisions, to notify anyone that the shipments had arrived at Seattle or Tacoma or that they were ready to make delivery at such ports of exit and that therefore the charges were illegal. Charges for the detention of the shipments in excess of free time at those ports remain unpaid and delivering carriers have brought actions at law which are pending.

The Steel Products company took the case to the commission and by the tentative report has been upheld in its claims that the charges have been assessed without tariff authority and if found legally applicable are unjust and in violation of the Federal Control Act. Because of this, the Steel Products company has sought waiver of payment.

Steel Corporation Stock Subscriptions

It was announced at the office of the United States Steel Corporation, Monday, that the stock subscriptions to date this year were by 84,432 employees who subscribed 94,258 shares. Last year up to March 1, 81,710 employees subscribed for 255,325 shares, while in 1920, 66,407 employees subscribed for 167,407 shares. The periods of depression and prosperity have thus been reflected in subscriptions.

OBITUARY

JOSEPH E. SCHWAB, brother of Charles M. Schwab, chairman of the Bethlehem Steel Corporation, and himself prominent for many years in the steel industry, died last Friday afternoon at the Hotel Collingwood, New York, where he had made his home for some time past. The cause of death was given as diabetes, from which he had been suffering for nearly a year. Joseph E. Schwab was born at Loretto, Pa., on Feb. 23, 1864. He joined the engineering department of the Carnegie Steel Co. in 1883, two years after Charles M. Schwab became associated with that company. He continued his service in the engineering department until 1894, when he was made manager of the company's Duquesne Works and he remained there until the formation of the United States Steel Corporation, when he came to New York as assistant to Charles M. Schwab, who had become president of the corporation. Two years later Joseph E. Schwab was made president of the American Steel Foundries, but after a few years he retired from all business activities. He leaves a wife and two children, the elder a son, Charles M. Schwab, who was born on his uncle's birthday and named for him, and a daughter, Dorothy; also two brothers and two sisters, Charles M. and Edward H. Schwab, Mrs. David Barry of Johnstown, Pa., and Sister M. Cecilia of Seton Hill College, Greensburg, Pa. The funeral services were held privately at Loretto, Pa., on Monday.

WILLIAM C. SARGENT, for 22 years secretary and also a director of Chain Belt Co., Milwaukee, died suddenly on Feb. 5 as a result of heart failure. He was 73 years of age and had been in ill health for several years. Mr. Sargent, prominent in industrial circles of Milwaukee and St. Paul, had a wide national acquaintanceship. He was born at Troy, N. Y., Feb. 2, 1849. In 1871 he moved West, locating at St. Paul, where he organized the De Cou, Corliss & Sargent Co., manufacturer of sash and doors. He later became affiliated with the St. Paul Harvester Co. and met C. W. Le Valley, who later founded the Chain Belt Co. of Milwaukee. This meeting was the beginning of a long business association, for in 1900 Mr. Sargent went to Milwaukee to become secretary and later a director of the Chain Belt Co. He was also a director of the Federal Malleable Co., West Allis, Wis. His father was one of the founders of the Terre Haute, Alton & St. Louis Railroad.

JAMES M. ATCHESON, 73 years old, agent for the H. C. Frick Coke Co., with offices in the Carnegie Building, Pittsburgh, died Feb. 14, in St. Petersburg, Fla., where he was spending the winter. Mr. Atcheson had been in failing health for almost a year. He was born in Allegheny, Pa., and had been in the employ of the H. C. Frick Coke Co. more than 30 years.

LOUIS FRANCIS PHIPPS, chairman of the board of directors of the American Frog & Switch Co., Hamilton, Ohio, died suddenly at his home in Cincinnati on Feb. 14. Mr. Phipps was 70 years old and had been identified with the Hamilton company for the past 15 years. Before that time he was connected with the old Globe Rolling Mill. He is survived by a widow and six sisters.

WILLIAM R. KINNEAR, founder of the Kinnear Mfg. Co., Columbus, Ohio, died at his home in Indianapolis on Feb. 12, aged 75. Mr. Kinnear established the Kinnear Mfg. Co. 25 years ago, but sold out his interests 15 years ago and since that time has resided in New York and Indianapolis.

SIR GEORGE J. CARTER, managing director of the Birkenhead Works of Cammell, Laird & Co., Ltd., Sheffield and Birkenhead, England, died Feb. 11 at the age of 62.

R. K. DANA, manager York Insulated Wire Works of General Electric Co., New York, died Wednesday, Feb. 1.

Railroad Rate Hearings to Be Concluded This Week

WASHINGTON, Feb. 21.—Hearings in connection with the general rate investigation before the Interstate Commerce Commission will be concluded on Saturday of the present week. They have been under way for almost six weeks and shippers in every line have appeared before the commission and urged substantial reductions in rates as a means looking to the restoration of normal economic conditions. The iron and steel interests were vigorous in their expression of such an attitude. But from the first the railroads have combatted proposed general reductions, claiming that it would result in so depleting their revenues that they would be bankrupted. The contention of shippers has been that the increased traffic arising from lower rates would more than offset the present high rates and bring about larger net returns for the railroads.

It obviously is a question as to what the decision of the commission will be. It is evident, however, that the prevailing opinion of those who have followed the hearings is that the commission, if it makes any reductions, will content itself with lowering rates on raw products, and perhaps order certain readjustments in some lines. They do not think a general reduction is likely in the near future, but will be left to work itself out gradually. For one thing, it is believed by some that coal will be among the products whose rates will be cut. In this connection, significance is attached to the fact that discussion about coal freight rates engaged the attention of the cabinet meeting last Friday. It also is recalled that Secretary of Commerce Hoover urged reductions on raw products including several manufactured lines, among them metals and metal products, but opposed a general reduction in rates and urged an investigation as to the possibility of increasing some class rates.

Southern Iron Now Competitive in Chicago Territory

CHICAGO, Feb. 18.—The recent advance of local pig iron to \$20 base, Chicago, puts the delivered prices on that product above Southern iron at numerous points in Chicago territory. The comparative figures appended below, which were recently sent out in a circular letter to the trade by the local office of the Matthew Addy Co., are figured on a Birmingham base of \$15.50. The difference in favor of the South would be even greater if the base were placed at \$15 at which price, or its equivalent, some iron has been sold in that territory recently. Those Southern producers which are able to take advantage of combination river and rail rates are in even a better position to compete in the Chicago district. The Matthew Addy figures are as follows:

	Chicago	Birmingham
Battle Creek, Mich.	\$23.36	\$22.56
Benton Harbor, Mich.	22.94	22.17
Crown Point, Ind.	22.10	21.90
Dowagiac, Mich.	22.94	22.44
Grand Haven, Mich.	23.36	22.84
Grand Rapids, Mich.	23.36	22.84
Hastings, Mich.	23.36	22.84
Holland, Mich.	23.36	22.84
Kendallville, Ind.	22.94	22.17
Lansing, Mich.	23.50	22.56
LaPorte, Ind.	21.96	22.17
Manistee, Mich.	25.60	24.03
Mishawaka, Ind.	22.94	22.17
Muskegon, Mich.	23.36	22.84
Owosso, Mich.	23.50	23.10
South Bend, Ind.	22.10	22.17

Complaint of Furnace Co. Discussed

BUFFALO, Feb. 21.—Federal Judge John R. Hazel of United States Court has dismissed the complaint of the Buffalo Union Furnace Co. in its suit against the United States Shipping Board to collect payments for the undelivered portion of a tonnage of 1200 tons of pig iron contracted for in 1918. The Shipping Board canceled the contract after the signing of the armistice. Judge Hazel ruled the Board has the right to so cancel. Other actions growing out of similar cancellations have been held pending this decision.

*Reference quotation

New York

NEW YORK, Feb. 20.

Some of the markets are more active than others, but demand in general is not heavy. The copper market continues to decline on light demand and offerings from dealer. The tin market has been active, but prices have declined. Good business has been done in lead and prices are firm. There has been no improvement in the zinc market except that prices have remained stationary.

Copper.—Consumers are no more interested in purchases of copper now than they have been for the last few weeks, and as a result the market has again declined because of the light demand and because of offerings from dealers and small producers. Electrolytic copper is quoted from 13c. to 13.25c. delivered, or 12.75c. to 13c., refinery, at which levels some business has been done. Most of the large producers will not meet these prices but are comfortably booked, at least for the first quarter. The opinion prevails that the market cannot go much lower because it has probably reached a level at which dealers bought their stocks, but this view may not prove to be true. The Lake copper market is quotably lower in sympathy with the electrolytic.

Tin. The feature of this market has been the sharp break in the London market to-day because of the liquidation on a fairly extended scale of a large Dutch syndicate. It is stated that Banca tin has been offered for shipment from England and Holland at an equivalent of 29c., delivered, New York. As a result of this the spot Straits market to-day is lower at 29.62 1/2c., New York, and the London market is £7 to £8 per ton lower than a week ago, at £114 for spot standard, £146 for future standard and £146 15s. for spot Straits, with sales of 1200 tons of standard tin. Previous to to-day's developments, on Feb. 15, 16 and 17, there were fairly good sales in this market of Straits tin to consumers. On the first of those days about 100 to 500 tons, mostly future shipment, changed hands and on the other two days about 300 tons was sold, mostly to consumers, although dealers were fair purchasers on the last day. Arrivals thus far this month have been 2260 tons, with 7825 tons reported afloat.

Lead.—Very good business is reported to have been done in the last week and several thousand tons were sold to consumers, probably for March delivery, various consuming interests being the buyers. Prices have not changed and the leading interest continues to quote 4.70c., New York and St. Louis, while independents are selling at 4.40c., St. Louis, or 4.70c. to 4.75c., New York and Eastern points.

Zinc.—Fundamental conditions are unchanged and the market is neither active nor weak. Consumers still buy small lots for early delivery to cover immediate light needs and prime Western for February-March delivery is unchanged at 4.50c., St. Louis, or 4.85c., New York, with the market regarded as firm by some sellers and slightly weak by others. Sales below these levels are, however, not heard of and it is significant that this price has been shaded but once in the last four weeks.

Antimony.—The market continues quiet with whole-

sale lots for early delivery quoted at 4.40c., New York, duty paid.

Aluminum.—The leading interest continues to quote virgin metal, 98 to 99 per cent pure, in wholesale lots for early delivery at 19c. to 19.10c., f.o.b. plant, depending on the quantity, with the same grade offered by importers at 17c. to 18c., New York, duty paid.

Chicago

FEB. 20.—All of the metals are exceedingly quiet and weak, further reductions being recorded in copper and tin. We quote in carload lots: Lake copper, 13.25c.; tin, 31c.; lead, 4.50c.; spelter, 4.55c. to 4.60c.; antimony, 6.50c., in less than carload lots. On old metals we quote: Copper wire, crucible shapes and copper clips, 9.50c.; copper bottoms, 7.50c.; red brass, 7.50c.; yellow brass, 6c.; lead pipe, 3.25c.; zinc, 2c.; pewter, No. 1, 22c.; tin foil, 23c.; block tin, 25c.; all buying prices for less than carload lots.

Low Output of Canadian Iron in December

The production of pig iron in Canada during last December declined to the lowest level for the year, according to a recent issue of the *Monetary Times*. The total pig iron made amounted to only 39,917 long tons, all of which was made in blast furnaces. By kinds of iron produced the December output was: Basic, 30,698 tons; foundry, 2,948 tons; and malleable, 6,271 tons. Ferroalloys to the amount of 846 tons were produced. On Dec. 31 there were only two furnaces in blast, although the Dominion had at least five furnaces active throughout the greater part of the year. The average monthly output of pig iron during the 12 months ending December was 50,000 tons, or less than the average monthly record for any year since 1908. Throughout the entire period, during which a total of 595,000 long tons of pig iron were made, the market was decidedly quiet and the suspension of interest in iron was general.

Production of Steel Ingots and Castings

The output of steel ingots and castings for the months of November and December were, respectively, 75,039 tons and 42,653 tons. Of the December output 41,100 tons consisted of basic open-hearth steel ingots, made by the producers for their own further use in manufacturing. A total of 1,551 tons of direct steel castings was made, of which 1,458 tons were produced for direct sale, comprising 657 tons of basic open-hearth castings, 97 tons Bessemer castings, and 704 tons of steel castings from electric furnaces.

The production of steel ingots and castings during the 12 months ending December, 1921, was 667,484 long tons, as compared with 1,109,000 tons made during 1920. Of the total 1921 production, 645,075 tons were in the form of direct steel ingots, comprising 641,882 tons of basic open-hearth steel, 239 tons acid open-hearth steel, 94 tons Bessemer, and 2,860 tons made in electric furnaces.

At the Detroit meeting of the National Safety Congress during the week of Aug. 28 to Sept. 21 the sessions will be held entirely within the new Cass Technical High School, wherein are self-contained foundries, chemical laboratories, steel heating plants, machine shops and complete power machinery equipment, which will provide facilities for all of the sectional meetings.

The Bureau of Supplies and Accounts, Navy Department, Washington, is taking bids until Feb. 21 for 100, 700 lb. of steel plates and I-beams for use at the local navy yard.

The Purchasing Agent, office of the Board of Commissioners, District of Columbia, Washington, is taking bids until March 2 for 17,000 ft. of wire cable for the electrical department.

FERROMANGANESE SUPPLIES

1921 Output Lowest in Ten Years—Available Supplies—Small Production of Spiegeleisen

The sharp decline in pig iron production in 1921 has been paralleled by that of ferromanganese and spiegeleisen. According to the monthly blast furnace returns of THE IRON AGE, the production of ferromanganese last year was the lowest in 10 years. Still more striking was the fall in the output of spiegeleisen, which reached figures lower than any recorded in many years.

From an average in the first quarter of the year of 19,178 gross tons per month, the ferromanganese production declined to only 3758 tons per month in the fourth quarter. The total for the year was only 98,439 tons or 8203 tons per month or about the same as the production in the 5 years 1910 to 1914 of 8280 tons per month. In 1911 the total was 74,482 tons or 6207 tons per month. In 1918 the output was 345,306 tons or 28,775 tons per month, the high average.

Of spiegeleisen only 56,139 tons was made in 1921 which compares with 65,391 tons in 1919. In 1918 the production was 249,002 tons or nearly four times as much.

The following table gives the output of ferromanganese and spiegeleisen for 1921, compared with previous records:

Ferromanganese and Spiegeleisen Output in the United States in Gross Tons

	Ferromanganese	Spiegeleisen	Total	Average Per Month
First quar., 1921, av per mo.	19,178	11,667	30,845	...
Second quar., 1921, av per mo.	5,814	5,311	11,128	...
Third quar., 1921, av per mo.	2,892	1,338	4,230	...
October, 1921	3,902
November, 1921	3,575
December, 1921	3,817
Fourth quar., 1921, av per mo.	3,758	...	3,758	...
Total, 1921	98,439	56,139	154,578	12,881
Total, 1920	82,681	103,148	185,829	15,485
Total, 1919	179,029	65,391	244,420	20,368
Total, 1918	315,306	249,002	564,308	47,025
Total, 1913	119,196	196,081	315,277	26,273
January, 1922	5,614	1,230	6,844	...

For the first time since last July, spiegeleisen was produced in January, this year, and the output of ferromanganese advanced almost 2000 tons over the rate at the end of the year.

Available Supplies

The available supplies of ferromanganese for 1921 and previous years, as obtained from an analysis of the output, imports and exports were as follows:

Ferromanganese Output, Imports and Exports, and Available Supplies, in Gross Tons

	Output	Imports	Exports	Available
Average per month				
1921.....	8,203	755	37	8,901
1920.....	23,557	4,941	288	28,210
1919.....	14,923	2,752	255	17,420
1918.....	28,775	2,264	298	30,741
1917.....	21,486	3,703	*776	25,413
1916.....	17,365	7,577
1915.....	12,021	4,605
1913.....	9,958	10,672
1911.....	6,207	6,688	...	12,895
5-yr. aver (1910-14)				
per month	8,280	8,399

*First half only.

Available supplies fell in 1921 to only 8901 tons per month or to the lowest figure in many years. This was intensified by the low rate of imports of only 755 tons per month, a figure probably never reached before. Exports have never been a factor of magnitude but they were only one-fifth in 1921 of what they were in 1920.

Manganese Ore Imports

Manganese ore imports last year, while not the lowest in recent years, were down to 33,446 tons per month as compared with 27,779 tons per month in 1919, the lowest since 1913. In the last quarter of last year these imports had fallen to 20,093 tons per month. Im-

ports for the last quarter of 1921 and for the last few years are given in the following table:

Manganese Ore Imports in Gross Tons

	Total	Average Per Month
October, 1921	36,766
November, 1921	8,620
December, 1921	14,900
Fourth quarter, 1921	60,286	20,093
Total, 1921	391,351	32,613
Total, 1920	606,937	50,578
Total, 1919	332,314	27,779
Total, 1918	431,305	35,942
Total, 1917	629,972	52,498
Total, 1916	376,321	31,360
Total, 1915	370,784	30,898
Total, 1913	314,084	26,173

British Supplies and Manganese Ore

The decline in the imports into Great Britain of manganese ore was much more severe last year than in the case of the American imports. The following table shows these imports for various periods and years:

British Imports of Manganese Ore

	Total	Average Per Month
First half, 1921	112,038	23,673
Third quarter, 1921	11,559	4,853
October, 1921	3,161
November, 1921	6,174
December, 1921	6,921
Fourth quarter, 1921	16,259	5,419
Total, 1921	175,856	14,655
Total, 1920	152,613	12,718
Total, 1919	265,800	22,150
Total, 1918	365,606	30,467
Total, 1917	341,264	28,439
Total, 1916	139,509	11,625
Total, 1915	375,324	31,277
Total, 1914	479,135	39,928
Total, 1913	601,177	50,098

These data show that the imports have gradually declined, almost each year since 1913, until for 1921 they are only 14,655 tons per month or about one third of the 1913 receipts. At the end of last year, they had fallen to only 5419 tons per month or about one quarter of the American imports for the same period.

Supplies and Needs in 1921

In the last review of this nature in THE IRON AGE, Nov. 17, 1921, it was estimated that theoretically 147,000 tons of ferromanganese would be needed, if the steel ingot and castings output totalled 21,000,000 tons. Later estimates placed the steel output at 20,000,000 tons, which would require 140,000 tons of ferromanganese. To meet this theoretical need there was 98,439 tons produced and 9059 tons imported which with the exports at 684 tons would leave available 106,814 tons. At the end of last year therefore, there was an apparent deficiency of about 33,000 tons, but heavy supplies carried over from 1920 probably amply cover this apparent deficiency.

More Shipments by River

WHEELING, Feb. 20.—Use of the inland waterways in the shipment of steel products as a means of offsetting the advantage of freight which Middle Western mills now have on business in the South and Southwest, is extending. The Wheeling Steel Products Co., the sales subsidiary of the Wheeling Steel Corporation, last week made a shipment of 1600 tons of steel pipe from the tube works at Benwood, W. Va. This is understood to be the first step toward the establishment of a regular river transportation service by the company. It has been found that water shipments take little, if any, more time than rail freight deliveries and the cost is considerably less.

The Barrio Metals Corporation, New York, will commence at once the installation of a new alloy melting department including the installation of four electric melting furnaces. The contract for the complete melting department has been awarded to F. J. Ryan & Co., industrial furnace engineers, Wesley Building, Philadelphia.

BOOK REVIEWS

Hardware Buying Directory. Pages 722, 7 x 10½ in. Published by Hardware Age, 239 West Thirty-ninth Street, New York.

Hardware Buyers Directory is a substantially bound reference book which is designed to acquaint the wholesale and retail hardware dealers with the names, addresses and trade names of manufacturers of products in the hardware and allied lines. The January issue contains about 2500 headings of products under which are listed approximately 35,000 names, addresses and trade names.

Many manufacturers show illustrated and descriptive data of their products, which in connection with the listings enhance the value of the directory as a reference book. Distribution is made quarterly to 40,000 wholesale and retail hardware dealers in the United States, Canada and to foreign countries where English is the commercial language.

Mineral Land Surveying.—By James Underhill, mining engineer, U. S. Mineral Surveyor for Colorado. Pages 237, 5½ by 7¾. Published by John Wiley & Sons, Inc., New York.

This is the third edition, and several additions have been made, especially in the treatment of the direct solar observation. The specimen field notes, to illustrate the requirements of the office of the United States Surveyor General for Colorado, have been entirely rewritten, a different group of claims being used, and they represent the practice at the present time in the survey of mineral lines in the Western portion of the United States.

Mechanical World Year Book for 1922. Reference book; thirty fifth year of publication. Published by Emmott & Co., Ltd., 65 King Street, Manchester, England. Size, 4 x 6 in., with 348 pages of text, 267 pages to a buyers' directory and 54 pages for diary and memoranda. Price, 2s. 6d.

Conventional engineers reference book, giving considerable space to power plant equipment, including steam, oil and gas engines, boilers, condensers, turbines and other apparatus. Several pages are devoted to the properties of metals and alloys and also to structural iron and steel work. A comparatively large section is given to toothed gearing and several pages to grinding, screw cutting, indexing on the universal milling machine, limit gages and allied subjects. Space is also devoted to ball and roller bearings, friction and lubrication, hydraulic work, and the heating and evaporating of liquids. A section on pipes and tubes contains a concise collection of data on pipes of cast iron, wrought iron, steel and copper, with many tables of dimensions and details of tees, bends, etc.

The volume includes many useful mathematical and other tables. The subject classifications in the buyers' directory are given in English, French, Spanish and Russian.

The Ship Compendium and Year Book 1922. published by Compendiums, Ltd., 18 Old Compton Street, London, W. 1, England, is a volume of 1008 pages claimed to be the first international reference book on ship construction, equipment, ownership and maintenance. It supplies in 800 sections the names and addresses of 30,000 firms whose interests are germane to ships and shipping. Book is published at £2 9s. 6d., post free for foreign delivery.

New Books Received

Mineral Resources of the United States, 1918. Part I., Metals, G. F. Loughlin, geologist in charge; Part II., Nonmetals, R. W. Stone, geologist in charge. Pages vol. I., 1096; vol. II., 1557, 9 x 5½ in. Published by Government Printing Office, Washington.

Burning Liquid Fuel. By William Newton Best. Pages 341, 9 x 6 in.; illustrations 316. Published by U. P. C. Book Co., 243 West Thirty-ninth Street, New York. Price \$5.

NEW TRADE PUBLICATIONS

Oil Burners.—Denver Fire Clay Co., Denver, Col. A 32-page booklet covering the advantages and operation of oil burners, composition and heating value of various brands of oils, their viscosity, specific gravity and other information, accompanied by tables and charts. The process of oil combustion in the burner is explained and illustrated with drawings. Sectional drawings show oil burners applied to various types of boilers and forges. There is also an illustrated page of refractories manufactured by this company.

Grinding Machines.—Cincinnati Grinder Co., Cincinnati. Booklet illustrating automotive parts grinding machine and power feed and hand feed machines, together with type of work. Illustrations of sections and parts are accompanied by brief descriptions.

Steel Tanks.—Ferguson-Allan Co., 504 Bailey Avenue, Buffalo. Bulletin No. 101, dealing with oil and gasoline storage tanks. Lane drawings and tables of dimensions, weights and capacities of tanks are included and drawings of compartment truck and wagon tanks and steel dump bodies.

Stokers. Under-Feed Stoker Co. of America, Book Building, Detroit. Bulletin describing the Jones standard side-dump stoker, a new type. Construction, capacity, automatic air and fuel control and mechanical features are covered with numerous illustrations.

Crawl Tread Crane.—Industrial Works, Bay City, Mich. Catalog No. 113 illustrating type RC crawling tractor crane of 20,000 lb. capacity, designed for road contractors, lumber and coal dealers, foundries and railroad reclamation and storage yards.

Milling on Locomotive Repairs.—Cincinnati Milling Machine Co., Cincinnati. Booklet of 32 pages, compiled to prove to railroad shops the economy of milling their parts. Line drawings show many of the parts which may be milled and there is a listing of 49 parts which come into a railroad repair shop that should be milled.

Industrial Plant Construction.—W. W. Lindsay & Co., Inc., Harrison Building, Philadelphia. Booklet containing views of industrial plants built by the company.

Machine Tools.—Triplex Machine Tool Corporation, 18 East Forty-first Street, New York. Catalog No. 1 describes this company's bench machine, adaptable to turning and boring, angular and vertical milling, thread cutting and drilling.

Waterproofing.—Truscon Laboratories, Detroit. A 32-page booklet dealing with the "Science and Practice of Integral Waterproofing." Specifications are given for waterproofing mass concrete, general masonry by using the cement plaster coat method and waterproofing cement stucco. A section covers the application of the cement plaster coat.

Testing.—Dorr Co., engineer, 101 Park Avenue, New York. Illustrated booklet describing company's plant at Westport, Conn., and methods in handling a test or analysis and the scope of this work are explained.

Fire Alarms.—United States Automatic Fire Alarm Co., Kansas City, Mo. A 32-page booklet of automatic fire alarms illustrating circuit panels, transmitters, circuit breakers, thermostats, punch registers, generators, etc.

The monthly stock list of Joseph T. Ryerson & Son, Sixteenth and Rockwell streets, Chicago, has been enlarged from 64 to 128 pages with the January-February issue and will hereafter bear the title "Ryerson Journal and Stock List." Besides the usual stock list the machine tools handled by the company are illustrated and there are several brief articles and news notes.

The Wetmore Reamer Co., 62-66 Twenty-seventh Street, Milwaukee, recently consolidated with the Wisconsin Tool & Supply Co., 210 Second Street, has increased its working schedules and force and is now operating at approximately 95 per cent of capacity on orders for reamers, gages, tools, dies and fixtures. New business is developing on a broader scale, especially in the East and in automotive centers, according to E. J. Waltzer, president and general manager.

A reduction of 10 per cent in wages for all employees has been approved by the employees of the Commonwealth Steel Co., Granite City, Ill. The Commonwealth company has been paying more than the union scale. Under the reduction molders will receive 90c. an hour as against the union scale of 75c. an hour, and laborers 35c. an hour, as against the union scale of 40c.

First Sectional Meeting of the American Society for Steel Treating

The first sectional meeting of the American Society for Steel Treating will be held at the Hotel McAlpin, New York, on Friday, March 3. The program is as follows:

- 11:00 a.m. to
- 1:30 p.m.—Registration.
- 1:30 p.m.—Address of welcome.
- 2:00 p.m. to
- 4:30 p.m.—Technical session. Chairman, George L. Norris, chairman New York Chapter; vice-chairman, Irving H. Cowdrey, chairman Boston Chapter.
- "Cold Headed Bolts—Their Metallography and Heat Treatment" (illustrated), by V. E. Hillman, metallurgist Crompton & Knowles Loom Works, Worcester, Mass.
- "New Developments on the Influence of Mass in Heat Treatment," by E. J. Janitzky, metallurgist Illinois Steel Co., South Chicago.
- "The Magnetic Testing of Small Case Hardened Chain" (An actual demonstration of the process and results of the testing will be given by the author), by A. V. DeForest, metallurgist American Chain Co., Bridgeport, Conn.
- "Stainless Steel in Cutlery Use" (illustrated), by R. G. Hall, research engineer R. Wallace & Sons Mfg. Co., Wallingford, Conn.
- "Callite—A New Heat-Resisting Alloy" (illustrated), by G. R. Brophy, metallurgist research laboratory General Electric Co., Schenectady, N. Y.
- 6:00 p.m. to
- 7:30 p.m.—Informal dinner, Yates' Restaurant, Forty-third Street, near Broadway.
- 8:00 p.m. to
- 10:00 p.m.—Technical session. Chairman, A. W. F. Green, chairman Philadelphia Chapter. Presentation of certificate of honorary membership to Dr. John A. Mathews.
- "Perfecting a Drop Forging" (illustrated), by J. H. G. Williams, assistant works manager Billings & Spencer Co., Hartford, Conn.
- "The Manufacture of Steel" (illustrated), by B. H. DeLong, metallurgist Carpenter Steel Co., Reading, Pa.

Nearly all of the technical papers in this program have been published in the February *Transactions* of the society and both members and non-members are urgently requested to participate in the discussions. This sectional meeting will serve the membership of 14 of the Eastern and New England chapters of the society and any one, interested in the art of steel treating but not members of the society, is cordially invited to attend.

The second sectional meeting will be held at Pittsburgh in the Bureau of Mines auditorium, May 25 and 26.

The annual exposition and convention of the national organization will be held in the General Motors Building, Detroit, Oct. 2 to 7 instead of in September as originally planned.

Meeting of Electric Steel Founders' Research Group

Officers and operating representatives of the Electric Steel Founders' Research Group held their last regular meeting in Milwaukee on Feb. 6, 7 and 8. This group was formed about two years ago for the systematic prosecution of co-operative technical work which could be directly applied in improving the manufacture of steel castings.

The idea back of this co-operation originated from the realization that the technical experts who are usually found directing the operating departments of steel foundries are prevented by routine work from concentrating on the investigations. These could be prosecuted more effectively if they would engage the exclusive attention of one individual and if he would co-ordinate the technical activities of a few plants whose processes and products place the companies in the same class.

The members of the group are the Electric Steel

Co., Chicago; the Ft. Pitt Steel Casting Co., McKeesport, Pa.; the Lebanon Steel Foundry, Lebanon, Pa.; the Michigan Steel Casting Co., Detroit, and the Sivyer Steel Casting Co., Milwaukee. The group's headquarters are at 639 Diversey Parkway, Chicago, where Major R. A. Bull, research director of the organization, maintains his office.

At the Milwaukee meeting reports were made by the operating heads of plants on comprehensive investigations into important foundry problems that had been delegated by the group to the several companies. It is stated that much progress is being made through these group investigations and that prospects for future accomplishments are most encouraging. The group researches which were reported in detail at the Milwaukee meeting included those on the subjects of annealing, core practice, facing sands, furnace practice and pouring practice.

An inspection was made by all members of the group of the processes employed at the plant of the Sivyer Steel Casting Co.

Roberts Coke Oven Discussed

The Roberts coke oven was the subject of a paper presented at Pittsburgh before the Eastern States Blast Furnace and Coke Oven Association at the William Penn Hotel on the evening of Feb. 16, by M. W. Ditto, consulting engineer of the American Coke & Chemical Co., Chicago. Mr. Ditto covered construction features and also the experience with the use of the coke in the blast furnace of the National Enameling & Stamping Co. at Granite City, Ill. The coke plant comprises 80 Roberts recuperative by-product coke ovens in two batteries built by the St. Louis Coke & Chemical Co., a subsidiary of the American company.

About ninety members and guests were present. A dinner preceded the technical session and seated with President West of the association and with Mr. Ditto was C. A. Meissner, as guest of honor, of the United States Steel Corporation.

The twenty-fifth annual convention of the American Mining Congress will be held in Cleveland, Oct. 9 to 14. The National Exposition of Mines and Mining Equipment, which attracted attention at the annual meeting in Chicago last fall, will again be a feature of this industrial gathering. The exposition will be staged in the Public Hall in Cleveland—a modern convention building recently completed by the city.

COMING MEETINGS

February

American Association of Engineers. Feb. 22. Congress Hotel, Chicago. Secretary C. E. Drayer, 63 West Adams Street, Chicago.

March

American Society for Steel Treating. March 3. Sectional meeting, Hotel McAlpin, New York. Secretary, W. H. Biscumman, 4600 Prospect Avenue, Cleveland.

Refractories Manufacturers' Association. March 15, 16 and 17. Annual meeting, Chicago. Secretary, F. W. Donahoe.

April

National Metal Trades Association. April 19 and 20. Annual meeting, Hotel Astor, New York. Secretary, Louis W. Fischer, Peoples Gas Building, Chicago.

American Supply and Machinery Manufacturers' Association and Southern Supply & Machinery Dealers' Association. Joint Meeting. April 24 to 26, Birmingham. F. D. Mitchell, 233 Broadway, New York, is secretary of the American association and A. M. Smith, Smith-Courtney Co., Richmond, Va., is secretary of the Southern association.

Society of Industrial Engineers. April 26 to 28. Spring meeting, Hotel Statler, Detroit. George C. Dent, business manager, 327 S. La Salle Street, Chicago.

American Electrochemical Society. April 27 to 29. Spring meeting, Baltimore. Acting secretary, Dr. Colin G. Fink, 110 Park Avenue, New York.

Trade Changes

Coto Bros. Mfg. Corporation, maker of the "Simplicity" refillable fuse with general offices at 1125 First National Bank Building, Chicago, has established branch offices during the past month in New York, Philadelphia, Boston, San Francisco, Cleveland, Tampa and Denver.

The Eclipse Stove Co., Mansfield, Ohio, has changed its name to the Tappen Stove Co. The new name was adopted owing to the fact that members of the Tappen family have been permanently identified with the Eclipse Stove Co. during the 19 years that it has been in existence.

The Carey-Hobson Co., Chicago, will remove its business to Chelsea, Mich., occupying the No. 8 plant, power plant and foundry of the Lewis Spring & Ash Co. This property will be purchased from F. H. Lewis.

George W. Cravens, formerly of Westfield, N. J., has been elected president of the Climax Engineering Co., Clinton, Iowa, a subsidiary of the Dulaney Trust. G. W. Dulaney, Jr., has been president of the Dulaney Trust since its organization in 1915 and also chairman of the board of trustees of the trust. The business of the Climax Engineering Co. has grown so as to require the presence of a president who could give more time than Mr. Dulaney could give, hence the election of Mr. Cravens. Mr. Dulaney was re-elected president of the board of trustees, C. B. Stebbins was re-elected vice president, Mr. R. D. Upton, re-elected treasurer, and Mr. J. M. Thompson was re-elected secretary. Mr. Cravens, the new president, was for many years with the General Electric Co.

Oliver Machinery Co., Grand Rapids, Mich., has established a new branch office at 716 Lincoln Bank Building, Minneapolis. George C. Rainer, who has had extended experience in the sales department, will be in charge.

McMullen Machinery Co., 61-66 Iowa Avenue, Grand Rapids, Mich., has been appointed exclusive representative by the Drumont Tool & Mfg. Co. Inc., 91-97 Runyon Street, Newark, N. J., in connection with the sale of Diamond standard punch and die sets in the territory covered by all of the northern peninsula of Michigan and the southern peninsula of Michigan west of the counties of Bay, Saginaw, Shiawassee, Ioshton, Jackson and Hillsdale.

The Wackoff Dr. Iron Steel Co., Brick Building, Pittsburgh, announces the appointment of the recently organized Carnegie-Schraeder Steel Co., with general offices and warehouse at 619 Greenwood Avenue, Detroit, as its exclusive sales representative and distributor in the Michigan territory.

The Andrews rust proofing process used extensively during the war by the British Government is now available to manufacturers for forming an ebony rust proofed finish on ferrous metals. It is claimed that this rust proofing process has stood the Government "salt spray" test with 100 per cent success. The Surface Combustion Co., Inc., industrial furnace engineer and manufacturer, 366-368 Gerard Avenue Bronx, New York, has secured the exclusive license for exploiting this process in this country and foreign countries.

The Hesse-Martin Iron Works and the Ersted Machinery Mfg. Co., Portland, Ore., have been consolidated under the name of the Hesse-Ersted Iron Works Co., with \$150,000 capital stock. The merged company will operate at the Hesse-Martin plant, 468 East Taylor Street, which will be enlarged and improved. The incorporators of the new company are Fred Hesse, A. J. Ersted and A. M. Mears.

The Reeves Pulley Co., Columbus, Ind., has appointed the Dodge Sales Engineering Co., Mishawaka, Ind., general sales agent for the "Reeves" variable speed transmission at the Dodge branches in Pittsburgh, Cincinnati, Atlanta, Minneapolis and Chicago.

Effective March 1, the name of the Medart Patent Pulley Co., St. Louis, will be changed to the Medart Co.

The Commercial Shearing & Stamping Co., Youngstown, Ohio, has moved its general offices to new quarters in connection with its plant in the Logan Avenue district, Youngstown.

The Argo Iron & Metal Co., Chicago, has moved its scrap iron and metal yards to 1640-52 Elston Avenue, where it is located on a siding of the Chicago & Northwestern Railroad.

The Chicago office of the Matthew Addy Co., pig iron brokers, will be moved from the McCormick Building to 1901 People's Gas Building, effective May 1.

The Max Ams Machine Co., New York, expects to state that it will not open the Rochester office at this time, as stated in a previous announcement.

Plans of New Companies

The Efficient Electrical Display Co., Inc., 26 Court St., Brooklyn, is in the market for factory equipment to increase its output to 100 good sized signs per month. In about five or six weeks, it will be in the market for 15,000 two-piece sign receptacles and also 20,000 ft. of No. 14 rubber covered wire. The only contract awarded thus far has been for the alterations of a building purchased for the manufacture of signs.

Sundh Engineering & Machine Co., Philadelphia, manufacturer of finishing machinery for brass, copper and steel strip mills, has closed its branch office at Eleventh Avenue and Twenty-sixth Street, New York and opened a Philadelphia downtown office in the Otis Bldg., Sixteenth and Sansom Streets.

East Chicago Mfg. Co., East Chicago, Ind., expects to do some of its work by contract and some in its own plant. It is not yet ready to name the material which it will manufacture.

The Detroit Marine-Aero Engine Co., 4186 Bellevue Avenue, Detroit, has completed the construction of a steel and corrugated iron building containing 12,500 square feet.

The Beaver Enameling Co., Ellwood City, Pa., has taken over the business of the Crichton Curl Enameling Co. It does not intend to build and is not in the market for equipment.

The Hackney Iron & Steel Co., Enid, Okla., is putting in a stock of reinforcing bars, structural steel and is doing some fabricating. It also has a foundry which is in operation.

G. B. Wickersham, secretary-treasurer of the Muncie Steel Supply Co., has organized G. B. Wickersham & Co., Keenan Building, Pittsburgh, to handle scrap and conduct a general business as auctioneers, appraisers and liquidators. The firm expects to open a yard equipped for economical handling of scrap. Mr. Wickersham retains his interest in the position with the Muncie Steel Supply Co.

Bayonna Steel Products Co. is located at 216-218 Jelliff Avenue, Newark, N. J. This is only temporary quarters, as the company intends to build a fine warehouse in Newark the coming spring or early summer.

L. T. Petersen, former vice-president and general manager of the Republic Rubber Corp., Youngstown, Ohio, is engaged in the organization of a company to manufacture a new type of conveyor belting. The belting has been patented by Mr. Petersen and is claimed to be especially adaptable for use in conveying ore, limestone, coke, metal, grain and other heavy materials.

Schraeder, Gocher & Co. Organized

G. A. R. Schraeder, formerly a partner with J. W. Sanders Co., New York, and Donald Gocher, formerly with sales department of Certain-teed Products Corporation's Philadelphia office, have formed a sales organization as Schraeder, Gocher & Co., 1218 Chestnut Street, Philadelphia, which has assumed the management of the sales department of the Bridesburg Foundry & Engineering Co., Inc., Frankford, Philadelphia, founder of brass, bronze and aluminum castings, both rough and machined.

This company is also selling the product of Atlas Foundry Co., Irvington, N. J., cast-iron welding rods and miscellaneous iron castings. In conjunction with the J. W. Sanders Co., New York, also manufacturers' representative, this company is covering the Philadelphia territory for the Crosby Co., Buffalo, sheet metal stampings; Elliott-Blair Steel Co., New Castle, Pa., manufacturer of fine cold-rolled strip steel, and the Lakeside Forge Co., Erie, Pa., on miscellaneous drop forgings and wrenches.

The Amalgamated Metals Selling Co., Ltd., 42 Broadway, New York, has been appointed sole representative in the United States of the Erftwerke A. G., Grevenbroich, Cologne, Germany. This company is known as the largest and most important producer of virgin aluminum in Germany.

The Interstate Commerce Commission opened a hearing on an application for revised rates on scrap iron and steel at Washington on Feb. 20. The contention is that scrap rates are too high, especially when pig iron rates are used as a standard for comparison.

IRON AND INDUSTRIAL STOCKS

Better Demand for Steel and Equipment Issues During the Past Week

Under the leadership of such issues as United States Steel common and the locomotive shares, there was a better demand and generally higher prices for steel and equipment securities. The buying possibly is based on the greater activity in buying of railroad equipment and in steel mills. Investors in a great many instances, however, are satisfied with developments dealing with the bonus question, and the accompanying higher prices for war bonds. The recovery in sterling exchange is another constructive feature that has encouraged renewed buying of domestic industrial securities. Higher prices quoted for pipe securities reflect better buying of that product.

The range of prices on active iron and industrial stocks from Monday of last week to Monday of this week was as follows:

Allis-Chalm. com.	44 - 45 1/2	Int. Har. pf.	105 1/2 - 106 1/2
Allis-Chalm. pf.	92 - 93	Lack. Steel	46 1/2 - 48 3/4

Annual Financial Statements

The report of the Thomas Iron Co., Hokendauqua, Pa., for 1921 shows a net loss for the year of \$69,536.50, this including the operation of its subsidiary, the Ironton Railroad Co. At the close of last year the inventories of pig iron and iron ore were marked down \$89,714.18 to present-day values. The company's total production of iron in 1921 was only 18,169 tons.

Earnings of the Pressed Steel Car Co. for 1921 were much lower than in the previous year. Last year's surplus totalled \$681,906, compared with a surplus of \$2,531,305 at the close of business in 1920. The 1921 earnings provide for \$5.45 a share on \$12,500,000 preferred stock, as compared with a 1920 surplus which not only took care of the preferred stock dividend but left \$13.25 a share for the common stock.

The Baldwin Locomotive Works earned net profits in 1921 amounting to \$5,044,096, equivalent, after payment of preferred dividends, to \$18.22 a share on the \$20,000,000 common stock, as compared with net profits of \$4,428,518, or \$15.14 a share, on the same amount of common stock in 1920.

Earnings of the Albia-Chalmers Mfg. Co. for 1921 show a net profit of \$2,215,467, equal to \$4.11 a share on the common stock after deducting preferred dividends. The 1920 net profits were \$3,564,248, or \$9.35 a share on the common stock.

The annual report of the American Can Co. for the year ended Dec. 31, 1921, shows net earnings of \$7,020,261, as compared with \$9,851,876 in the previous year. The surplus after preferred dividends of \$1,141,530 compares with \$1,944,587 in 1920.

The Continental Can Co., Inc., for 1921, reports a surplus after depreciation and federal taxes of \$811,004, equivalent after preferred dividends to \$3.75 a share on the outstanding \$13,500,000 common stock. In 1920 the company showed a surplus of \$1,548,620, or \$9.19 a share.

A special stockholders' meeting of the Walworth Mfg. Co., Boston, wrenches, fittings, etc., has been called for Feb. 27 to act on a proposed \$7,500,000 bond issue. The purpose of the proposed issue is to raise funds to retire outstanding bonded indebtedness and to provide additional working capital.

Stockholders of the Saco-Lowell Shops, Boston, textile machinery, have ratified the proposed increase of \$1,762,500 in the common stock for the purpose of paying a 50 per cent stock dividend to common shareholders.

The Truscon Steel Co. last year, after charges, depreciation and dividends, showed a loss of \$338,000. The company wrote off \$380,000 on its inventory and plant depreciation. At the annual meeting President Kahn stated that business in January and so far in February was 30 per cent ahead of that for the corresponding period last year.

The Truscon Steel Co., Youngstown, Ohio, has declared the regular quarterly preferred dividend of \$1.75 per share, payable March 1 to stockholders of record Feb. 18.

The Composite Metal Lath Co., Hobart, Ind., has been declared bankrupt. The liabilities of the company are listed at \$117,119, while the assets are placed at \$16,448.

The Fred Medart Mfg. Co. has increased its capital stock from \$150,000 to \$750,000, of which 58 3/10 per cent is paid. The company has assets of \$1,053,936.21 and liabilities of \$380,962.41.

Study of Income Tax Returns

Washington, Feb. 21.—Statistical study of the economic data compiled from the returns of the net income of individuals, corporations and partnerships, for the calendar year ended Dec. 31, 1919, by the office of the Commission of Internal Revenue, reported to the Secretary of Treasury, was made public yesterday and reveals the large portion of total taxes paid by manufacturers of metal and metal products, including iron and steel makers and allied lines.

The figures also reveal, through deficits reported, the general slump in business for that year. The number of corporation income tax returns for 1919, other than those of personal service corporations, was 320,198, of which 209,634 reported net incomes amounting to \$9,411,418,458; income tax, \$743,535,888; war profits and excess profits taxes, \$1,431,805,690, making the total taxes \$2,175,341,578. For the calendar year 1918, the number was 317,579 of which 202,061 reported net income of \$8,361,511,249, and taxes aggregating \$3,158,764,422.

The number of individuals who filed income tax returns for 1919 amounted to 5,332,760. The total amount of net revenue reported by these returns was \$19,859,491,448, and the normal tax and surtax amounted to \$1,269,630,104. As compared with 1919, these figures show a growth of 907,646, in the number of returns filed, and an increase in the total net income reported amounting to \$3,934,852,093. Likewise, an increase of \$141,908,269 is noted in the total tax.

The total number of producers of metal and metal products reporting in 1919 was 13,118, of which 9,689, or 73.86 per cent, reported net incomes amounting to \$1,789,212,574. The gross income was \$12,616,661,680, and the total deductions aggregated \$10,827,449,106. The total number of corporations reporting was 67,852, of which 51,903, or 76.49 per cent, reported net income amounting to \$5,219,334,985. The gross income of all the manufacturing interests was \$45,704,873,968, with total deductions aggregating \$40,485,528,983.

It will be seen that the net income of producers of metal and metal products for the year was 30 per cent of the total for all manufacturers. The income tax paid by makers of metal and metal products was \$142,561,320, and the war profits and excess profits taxes \$314,690,473, making a total tax of \$457,251,793, which constituted 21.02 per cent of the distribution of the total taxes paid by all industrial groups, or 25.55 per cent of the total tax compared with the net income. The income tax paid by all manufacturing interests was \$414,891,763, and the war profits and excess profits tax aggregated \$944,306,603, making a total tax of \$1,359,198,366, or 62.48 per cent of the distribution of the total taxes paid by all industrial groups, or 26.04 per cent of the total tax as compared with the net income.

There were 3,429 producers of metal and metal products who reported deficits in 1919. This represented 26.14 per cent of the total number of producers of metal and metal products. The deficit reported aggregated \$119,834,070. The gross income of these manufacturers was \$897,478,703, while total deductions were \$1,017,312,773. The total number of manufacturers reporting deficits was 15,949, or 23.51 per

cent of all manufacturers. The aggregate deficit was \$266,745,733. Their gross income was \$6,548,702,815, while their total deductions amounted to \$6,951,448,548.

Showing the distribution of corporation income by industrial groups and by nature of deductions, the study of the Commissioner reports that including both those reporting net income and those reporting no net income, the total gross income of the 13,118 producers of metal and metal products was \$13,514,140,383. This cost of goods was \$9,044,525,883. The compensation of officers was \$203,724,391, the interest paid being \$122,444,338, while the domestic tax was \$126,560,917; exhaustion, amortization and depletion, \$334,825,764; miscellaneous expenses, \$2,012,677,586; total deductions, \$11,844,761,879; net income before deducting \$1,669,378,504, while the net income after deducting the taxes was \$1,212,126,711. The cost of goods or producers of metal and metal products was 66.93 per cent of the total gross income; the compensation of officers

1.51 per cent; interest paid 0.91 per cent; domestic tax, 0.94 per cent; exhaustion, amortization and depletion 2.48; miscellaneous expenses 14.88; total deductions 87.65; net income before deducting taxes 12.35; income tax, war profits and excess profits taxes, 3.38, and net income after deducting taxes 8.97.

The table shows that the net income of manufacturers of metal and metal products was 17.65 per cent of the invested capital of those paying taxes, while the total taxes was 25.55 per cent of the net income.

The 373 metal mining interests making returns in 1919 reported an invested capital of \$443,920,533, with a net income of \$72,192,392, on which an income tax of \$6,469,539 was paid, while the war profits and excess profit taxes amounted to \$2,690,155, making a total tax of \$9,159,694. Their total tax was 16.26 per cent of the invested capital and 12.69 per cent of the total net income.

UNEMPLOYMENT

Study Suggested by President's Conference— Kenyon Bills Have Rough Skidding

WASHINGTON, Feb. 21.—Study of the fundamentals of unemployment, and especially the methods for controlling the business cycle, was begun yesterday at a meeting at the Department of Commerce. A tentative plan drawn by Dr. Wesley C. Mitchell, of the National Bureau of Economic Research, was presented and a discussion of the subject was made. The meeting was addressed by Secretary of Commerce Hoover. Owen D. Young is chairman of the committee which has charge of the study. The meeting was inaugurated under the President's recent conference on unemployment, and its purpose is to illuminate the subject of cyclical unemployment.

Secretary Hoover is of the opinion that more information is necessary before the problem is solved, and indicated that until a more thorough understanding of the question is obtained, legislation on the subject is not timely. Because of this, the Administration is not disappointed at the failure of the Senate to pass the bill prepared and introduced by Senator Kenyon of Iowa to press public works during times of depression and to retard them during periods of industrial activity. After a two-day discussion, the bill was referred by the Senate last Thursday to the Committee on Education and Labor. This is considered to be equivalent to killing the measure for this season, at least.

Senators attacked the bill on the ground that it would give too much power to executive officials of the Government who would be empowered by the measure to control employment on public works by the method suggested.

Senator Sterling, of South Dakota, declared the bill was paternalistic in spirit and was supported by "big business." Senator Kenyon asserted that he had presented the bill chiefly in the interest of labor and that it had the endorsement of the American Federation of Labor, the Chamber of Commerce of the United States, and other organizations, and contended that it was a concrete result of the conference on unemployment and embodied principles recommended. In this connection, however, members of the conference feel that more information on the subject is necessary.

Senator Kenyon's bill to control the coal mining industry, details of which were explained in THE IRON AGE of Feb. 2, was also introduced last week and appears to have little support either in Congress or in Administration circles. Its passage at the present session, at least, does not appear at all likely. It had been hoped by Senator Kenyon, who has resigned from the Senate, effective Feb. 24, to become a judge of the United States Circuit Court, that the bill could be passed in time to set up the proposed coal mining board, so that the latter would be functioning, in an effort to prevent the threatened coal strike set for April 1.

To Prevent Jurisdictional Strikes

WASHINGTON, Feb. 21.—The Associated General Contractors of America, the American Institute of Architects, the Engineering Council, the National Building Trades Employers' Association, and the Building Trades Department of the American Federation of Labor through the National Board for Jurisdictional Awards which has just concluded its regular quarterly meeting in Washington, have reached a national agreement through a resolution heavily penalizing union workmen who refuse to abide by the decisions of the board.

The resolution provides that local building trades councils of union labor shall suspend unions and refuse to recognize or support those unions which refuse to abide by decisions of the National Board; it also provides that general contractors and sub-contractors who employ only union labor shall incorporate in their agreements with labor a provision that will secure compliance with all the decisions of the board and that they shall refuse employment to members of local unions which do not abide by such decisions and further that architects and engineers shall insert in all their specifications and contracts a clause that such decisions shall be followed.

This resolution is of far reaching consequence to settle those jurisdictional disputes, which have caused many strikes, with resulting delays and economic losses.

Flurry in Coal and Coke Markets

UNIONTOWN, PA., Feb. 20.—A flurry in both the coal and coke markets has been evident in the Connellsville region this week. This is attributable, in a measure, to the threatened strike in the union fields on April 1. Most observers, however, believe they see in the present situation an improvement which will be sustained and improved from month to month.

Several deals for furnace coke were closed this week for March requirements at \$3.25. A number of coal sales covering March requirements also have been made during the week. The Pittsburgh and Lake Erie Railroad has bought considerable coal during the week.

Frick Coke Co. operations in both coal and coke were strengthened this week.

Harry I. Worman, superintendent of motive power of the St. Louis & San Francisco Railroad, Springfield, Mo., has announced that the shops there will be leased to contractors and operated on a piece-work basis if the car workers reject the proposal to return to the piece-work basis.

A. E. Crockett, manager of the Bureau of Instruction of Jones & Laughlin Steel Co., Pittsburgh, gave an illustrated lecture on the manufacture of steel before the members of the Rotary Club of St. Louis on Feb. 18.

Machinery Markets and News of the Works

LULL IN INQUIRIES AND SALES

Market Spotty and Orders for Most Part Are for Single Tools

Otis Elevator Co. Issues List for Nine Machines and a Textile Interest a List for Ten

A lull in inquiry and sales is reported quite generally. In view of the hopes aroused by events of December and January, business so far this month has been disappointing. Orders are for the most part for single tools and competition is keen on each inquiry that appears. There is a fair degree of interest shown in used tools and in this connection it is reported from Cincinnati that used machines are coming into the market freely and at extremely low prices. A Massachusetts textile interest came into the market during the week with a list of 10 tools and miscellaneous equipment.

The Otis Elevator Co. has issued a list calling for four lathes of 14, 18 and 24-in. size; two drilling machines; two double-end grinders, and one cold cut-off saw.

Except for a revival of an old list of the Sewell Valley Railroad involving a 36-in. planer, a 250-ton wheel press, a 1200-ton steam drop hammer and a universal milling machine, no railroad inquiries have ap-

peared nor has any action been taken on pending lists.

During the week the Hammond, Ind., Board of Education awarded the list of tools reported last week to a local dealer in Chicago. The Kelly Valve Co., Muskegon, Mich., placed an order in the Chicago district for four No. 2 turret lathes and miscellaneous equipment. Part of the list recently issued by the H. B. Smith Co., Westfield, Mass., and involving a fairly heavy equipment, has been placed with a Worcester machine-tool builder.

Machine-tool builders in other districts are taking a hopeful view of the future. Although still far from active, machine shops in New England are showing more signs of life. Makers of road machinery are beginning to secure substantial orders and in the Pittsburgh district makers of steel mill equipment note better inquiry. In this connection it is reported that expenditures of a considerable sum for new equipment in one of the Pittsburgh district units of the Steel Corporation is under consideration. In Chicago the trade is encouraged by the opening of the new tractor works of the International Harvester Co. and the Milwaukee plant of that company is expected to resume in the near future.

The price situation remains substantially the same, the only change noted being a reduction averaging 15 per cent on hack saws by the Racine Tool & Machine Co. and a 25 per cent cut on turret lathes by the Warner & Swasey Co.

New York

NEW YORK, Feb. 21.

This month has been a great disappointment to those who expected that improvement in business, which was promised by events of December and January, has not materialized. Sales in this market for February will probably fall below those of the two preceding months. A large machine-tool company which keeps a chart of its sales reports that the curve was upward beginning in November and continuing to the end of January, but that the line will probably take a dip downward for February unless considerably more business should develop before the end of the month.

A fair degree of interest in used tools is shown by some buyers, but orders for new tools are at very low ebb and prospects are not numerous.

From the viewpoint of sales the crane market is dull, but there is an increasing number of inquiries pending. Few new inquiries are reported in the market this week. Russell, Burd-sall & Ward, Portchester, N. Y., are receiving quotations on a 2-ton transfer crane. The Wallingford Steel Co., Wallingford, Conn., reported to have purchased 10-ton and 3-ton overhead traveling cranes last week, placed this order with the Niles-Bement-Pond Co. The U. G. I. Contracting Co., Philadelphia, has purchased a 40-ton power house crane for Syracuse, N. Y., from the Niles-Bement-Pond Co. The L. B. Foster Co., Pittsburgh, Pa., has purchased a 20-ton, 50 ft. boom, used, Browning locomotive crane from Philip T. King, 30 Church Street, New York. The Milwaukee Electric Railroad & Light Co., Milwaukee, Wis., has purchased a 12½-ton, 15-ft. and 30-ft. boom locomotive crane from the Industrial Works. The electric tramway division of the Cleveland Crane & Engineering Co. recently sold a 2-ton, 1200-ft. tramway and 24 trolleys to the Hydro-United Tire Co., Pottstown, Pa., four 1-ton electric hoists for this installation being furnished by the Shepard Electric Crane & Hoist Co.

The Yonkers Electric Light & Power Co., 9 Manor Square, Yonkers, N. Y., has completed plans and will soon commence the erection of a new one-story power house on Columbus Avenue, estimated to cost about \$250,000, including equipment. Thomas E. Murray, 55 Duane Street, New York, is engineer.

The Columbia Ice Corporation, New York, care of Ophuls, Hill & McCreery, 112 West Forty-second Street, engineers, has completed plans for a two-story, reinforced-concrete ice manufacturing plant at Whitlock and Bryant avenues, estimated to cost about \$225,000, including machinery.

Seven electrically operated centrifugal pumps, electric motors and other equipment will be installed at the new pumping plant and filter station at the municipal waterworks, Newburgh, N. Y. Bids for the construction and equipment are being received up to March 20 by the city manager. W. Johnston McKay, George W. Fuller and James C. Harding, 170 Broadway, New York, are engineers.

The New York Edison Co., 120 East Fifteenth Street, New York has completed plans for the erection of a new two-story power house at 33 Attorney Street, 25 x 100 ft., estimated to cost about \$75,000. William Whitehall, Sixth Avenue and Forty-first Street, is architect.

The George Haass Mfg. Co., Canal Place, New York, manufacturer of coal handling machinery, wagon loaders, etc., has filed plans for a new one-story building, 75 x 95 ft. It will be owned by the Haass Realty Co., a subsidiary organization.

A vocational department will be installed in the new high school to be erected at Hornell, N. Y., estimated to cost about \$350,000, and for which bids will be asked early in March. Tooker & Marsh, 101 Park Avenue, New York, are architects.

The Witherbee Storage Battery Co., 643 West Forty-third Street, New York, will discontinue operations at its local plant, as well as at North Bergen, N. Y., and will concentrate production in its new works at Belleville, N. J., totaling about 30,000 sq. ft. of floor space. Machinery from the present plants will be used and additional equipment installed. The entire works will be used for electric battery manufacture.

The Board of Water Commissioners, Scarsdale, N. Y., will install three new centrifugal pumps, electrically operated, switchboard and other equipment at the municipal waterworks. Bids will be received until Feb. 27 for the machinery. The George A. Johnson Co., 150 Nassau Street, New York, are consulting engineers. George W. Field is clerk for the board.

William C. Hespe, Vienna, N. J., has acquired the local foundry of Daniel D. Wolfe, manufacturer of plows, castings, etc., and will remodel and improve the structure for the manufacture of stoves and ranges.

The U-Need Ice Co., Inc., 2150 Amsterdam Avenue, New York, has completed plans and will take bids for a two-story ice-manufacturing plant at Mt. Eden and Inwood Avenue, estimated to cost about \$75,000. Koch & Wagner, 32 Court Street, Brooklyn, are architects.

The Parklap Construction Corporation, 84 Pine Street, New York, is planning for a new hydroelectric power plant at Diamond Creek, Ariz., estimated to cost about \$10,000,000, including transmission system and dam, 400 ft. high. It will

have an initial capacity of 150,000 hp. Parsons, Klapp, Brinckerhoff & Douglas, 84 Pine Street, New York, are engineers.

A vocational department will be installed in the three-story high school to be erected by the Board of Education, Jersey City, N. J., at Bergen and Bostwick avenues, estimated to cost \$800,000. Plans have been completed by John T. Rowland, Jr., architect, 100 Sip Avenue.

The Tidewater Oil Co., Constable Hook, Bayonne, N. J., will make additions in the tankage department at its refinery, including steel tanks, piping, etc., estimated to cost approximately \$275,000.

The Lock Joint Rule Co., Cornelia Street and Albert Avenue, Newark, has filed plans for a number of shop buildings, including power looms.

The County Board of School Directors, Newark, has voted in favor of a bond issue of \$500,000 for the proposed vocational school at Bloomfield, N. J., and the proposition has been referred to the Board of Freeholders for approval. Preliminary plans for the school have been prepared by Guilbert & Detelle, 516 Broad Street, architects.

Anton Franz Mottel, Nurnberg, Germany, desires to get in touch with American manufacturers of machinery for making cloth in round and square shapes for writing purposes.

The power house and other buildings at the plant of the Conin Chemical Works, River Road, East Paterson, N. J., were destroyed by fire, Jan. 27, with loss estimated at about \$150,000, including equipment. Frederick Conin is head.

Philadelphia

PHILADELPHIA, Feb. 20.

The Guard Cycle Stores, 1022 West Guard Avenue, Philadelphia, will take bids at once for a new two-story service and repair works, 50 x 66 ft., at Hutchinson and Thompson streets, estimated to cost about \$32,000. I. W. Levitt, 1011 Chestnut Street, is architect.

Fire, Feb. 13, destroyed the main portion of the plant of the Ritter Can & Specialty Co., 1517-45 North Hutchinson Street, Philadelphia, manufacturer of cans, metal signs, etc., with loss estimated at about \$100,000, including equipment. William H. Ritter is president.

Freight-handling machinery, loading and unloading equipment, etc., will be installed by the Department of Wharves Philadelphia, on the new piers at Wolf and Porter streets. Each of the piers will be 300 x 900 ft., and will cost in excess of \$2,000,000. Work has been commenced.

The Board of Trustees, Presbyterian Hospital, Thirtieth and Filbert streets, Philadelphia, will build a power house in connection with the new group of buildings to be erected at Saunders and Powelton avenues, estimated to cost about \$3,000,000, complete. Dr. H. G. Paul is president of the board.

A new one-story power house will be erected at the plant of the Bloch Go Cart Co., 1136 North American Street. W. E. S. Dyer, Land Title Building, is engineer.

The United States Shipping Board Emergency Fleet Corporation, Bristol, Pa., has placed the local plant of the Merchants' Shipbuilding Corporation on the market, and all buildings, plant machinery, etc., will be sold within the next few months. The equipment to be disposed of includes 18 15-ton tower cranes, 9, 10 and 15-ton gantry cranes, and one 15-ton portal pier crane; also, power house complete, with turbo-generators, boilers, pumps, etc., and machine and tool shop equipment.

Martin H. Walrath, Philadelphia, operating a general millwork factory at Park and Glenwood streets, has taken bids for a new plant, including power house, at Sixteenth and Indiana streets. Eugene A. Stopper, 1507 Arch Street, is architect and engineer.

The Pierce, Butler & Pierce Mfg. Corporation, Broad and Race streets, Philadelphia, manufacturer of boilers and radiators, with plant at Syracuse, N. Y., has leased a portion of the two-story building to be erected at Oxford and Thirtieth streets by the Nelson Redley Construction Co. for a local branch.

Fire, Feb. 14, destroyed a portion of the plant of the Berry Engineering Co., 610-28 Crosby Street, Chester, Pa., manufacturer of machinery and parts, with loss estimated at close to \$100,000.

The Standard Tank & Seat Co., 316 North Front Street, Camden, N. J., has awarded contract to Barclay, White & Co., 1713 Sansom Street, Philadelphia, for a new three-story plant, 32 x 78 ft., to cost close to \$30,000.

Sydney L. Wright, president New Jersey & Pennsylvania Traction Co., West Hanover Street, Trenton, N. J., and other officials of the company are organizing a company under the name of the Plumstead Township-Bucks County Electric Co. to operate a power plant and furnish light and power

service at Point Pleasant, Pa., and vicinity. Active operations will begin at an early date.

Arnold Orr, Slatington, Pa., formerly operating a machine and welding repair works at Plymouth, Pa., has acquired the Morgan property on McDowell Street, for the establishment of a similar plant. The building will be remodeled.

The Consumers' Auto Supply Co., 375 Bennett Street, Luzerne, Pa., has filed plans for a new one-story automobile service and repair building, 70 x 130 ft., on Main Street, estimated to cost about \$50,000. James Corgan is president.

The Board of Directors, Montgomery School, Wynnewood, Pa., has acquired the Hooper Estate property, totaling about 56 acres of land, as a site for a new school. An adjoining structure will be used for vocational work, to include machine and repair shop, electrical and other departments. Plans will be prepared at once by Arthur H. Brockie, 254 South Fifteenth Street, Philadelphia. Percy H. Clark is president of the school board.

The Superintendent of Public Grounds and Buildings, Capitol Building, Harrisburg, Pa., will receive bids until Mar. 14, for the installation of equipment at the power house for the new state highway garage building, Twelfth and State streets, comprising two 80-hp. return tubular boilers, with steel breechings and stack, vacuum pumps, blowers and auxiliary equipment. T. W. Templeton is superintendent.

The Harrisburg Taxicab Co., Harrisburg, Pa., will make extensions and improvements in its garage and repair works to double the present capacity, providing facilities for about 75 cars.

The Westmoreland Hospital, Greensburg, Pa., will build a new power house in connection with an addition to the institution. Edward L. Tilton, 141 East Forty-fifth Street, New York, is architect.

The coal reclaiming plant of the Milton Mfg. Co., Milton, Pa., manufacturer of nuts, etc., near Snyderstown, Pa., was partially destroyed by fire, Feb. 11, with loss estimated at about \$17,000. It will be rebuilt.

The Pennsylvania Power & Light Co., 802 Hamilton Street, Allentown, Pa., has arranged for a large increase in capital, the proceeds to be used for extensions and improvements to power plants and system. The company is operated by the Electric Bond & Share Co., 71 Broadway, New York.

The Short Mountain Colliery Co., Lykens, Pa., has perfected plans for the immediate reconstruction of its pulverizing plant. New equipment will be installed. The McClintic-Marshall Co., Pottstown, Pa., has the construction contract.

A vocational department will be installed in the new three-story high school to be erected at Pottstown, Pa., J. H. Carey, secretary. Ritter & Shay, North American Building, Philadelphia, architects, have been commissioned to prepare plans.

The Triumph Motor Truck Co., Medina, N. Y., has completed plans for a new plant on property recently acquired at DuBois, Pa., and will commence work at an early date. Charles A. Melkle is president.

Vocational departments will be installed in connection with the three new junior high schools and one combination junior-senior high school to be erected by the Board of Education, Philadelphia. The structures are estimated to cost about \$3,225,000. Bids for two will be received in March, and for the other two at some time prior to June.

The Lansdale Foundry Co., Lansdale, Pa., manufacturer of gray iron castings, has added numerous improvements to its plant in the last four months and is again manufacturing a full line of calorific steam and hot water heaters.

The Inter-State Safety Appliance Co., Beech and Noble streets, Norristown, Pa., which was recently organized, will engage in manufacturing and jobbing of all kinds of safety devices. It will soon be in the market for foundry equipment, wood-working and stamping machinery.

George Shearmann, Atlantic City, N. J., care of Haining & Pallister, Guarantee Trust Building, architects, will soon take bids for a one-story machine shop at Pennsylvania and Adriatic avenues, 36 x 70 ft.

Baltimore

BALTIMORE, Feb. 20.

The Continental Garage & Service Corporation, 715 Gaither Building, Baltimore, has awarded contract to the Consolidated Engineering Co., Calvert Building, for a five-story service, repair and parts manufacturing plant, estimated to cost about \$350,000, including equipment. A complete machine shop will be installed. John C. Tolson heads the company.

The Bureau of Supplies and Accounts, Navy Department, Washington, will receive bids until March 2 for lathes, drills, grinders and other machine tools for use at the Norfolk, Va., navy yard.

The Central of Georgia Railway, Savannah, Ga., is having plans prepared for a new coaling plant at Columbus, Ga. C. K. Lawrence is chief engineer.

Freight handling and conveying machinery, hoisting equipment, etc., will be installed on the new piers to be constructed by the Port Development Commission, Baltimore. A fund of \$10,000,000 has been arranged for the entire project, and the initial expenditure will approximate \$2,200,000.

The American Belting Co., Baltimore, has acquired property at 1624-26 Bank Street, and will remodel the building for a new plant. M. C. Raslin is president.

A vocational department will be installed in the new two-story and basement high school to be erected at Leesburg, Va., bids for which are being taken until March 8. G. R. Ragan, Terry Building, Roanoke, Va., is architect.

The Southern Toy Co., Hickory, N. C., will take bids at once for a new plant at West Hickory, comprising three buildings, 40 x 100 ft., 40 x 50 ft., and 20 x 50 ft., respectively. A list of equipment is being arranged. G. E. Ivoy is president.

A vocational department will be installed in the new two-story and basement high school to be erected at Reidsville, N. C., estimated to cost about \$300,000. W. C. Northup, Winston-Salem, N. C., architect, will prepare plans.

The Dublin Veneer Mill, Dublin, Ga., is planning for the installation of new machinery to increase its capacity about 50 per cent. T. C. Alexander is head.

The Town Council, Dillon, S. C., is planning for extensions and improvements in the municipal electric light and power plant.

A vocational department will be installed in the new two-story and basement high school, 165 x 265 ft., to be erected at Gastonia, N. C., estimated to cost about \$300,000. White, Streeter & Chamberlain, Gastonia, are architects.

Chicago

CHICAGO, Feb. 20

The local market is spotty, some dealers reporting practically no new business, while other houses have booked a number of fair sized orders. One local dealer was awarded most of the machine tools on a list just purchased by the Hammond, Ind., Board of Education. This inquiry was published in this column last week and the purchases just made amount to about \$15,000. Another order was placed locally by the Kelly Valve Co., Muskegon, Mich., which bought four No. 2 turret lathes and miscellaneous equipment. On the whole, current orders are for single machines and competition is exceedingly keen on each inquiry that appears. Purchases by industries are confined to the addition of a machine or two to round out present equipment. Large industries which have been important buyers in past years are notably absent from the market. The trade is encouraged, however, by the fact that the local tractor works of the International Harvester Co. started up with 1200 men last week after a long period of idleness. The Milwaukee tractor plant of that company is also expected to resume operations in the near future. No new railroad inquiries have appeared and action on the extensive lists pending has not been taken. New construction is confined largely to garages for which some equipment is being bought from time to time. No auction sales have been held recently, but the equipment of the Obenberger Drop Forge Co., Milwaukee, is to be sold soon to satisfy the claims of the creditors. This consists largely of forging equipment.

The price situation remains substantially the same, the only changes being a reduction on hack saws by the Racine Tool & Machine Co., averaging 15 per cent and a 25 per cent cut on turret lathes by the Warner & Swasey Co.

The crane market remains quiet, the only order reported being a 3½-ton motor-driven traveling overhead Shaw crane bought by the Tuthill Building Materials Co., Blue Island, Ill.

The Damascus Steel Products Corporation, 1500 Fourteenth Ave., Rockford, Ill., recently incorporated with \$50,000 capital stock to manufacture cutlery and small tools, has leased 6000 sq. ft. of floor space for manufacturing purposes and has purchased the following equipment to date: Three trip hammers, six grinding and polishing stands, one shaper, one engine lathe, two forges and three gas furnaces. The officers include C. F. Maitland, president; J. R. Hughes and A. T. Hayes, vice-presidents; C. P. Twomey, secretary, Jacob Aaron, treasurer, and H. M. Hanson, assistant treasurer.

The Cabrange Mfg. Co., has increased its capital stock from \$250,000 to \$750,000 and will remove its plant from Easterville, Ill. to Granite City, where a site has been secured and buildings are now being erected at a cost of

make and prepare all parts in its new plant, which will include a foundry and an enameling department.

Ronneberg, Pierce & Hauber, architects, 10 South La Salle Street, Chicago, are receiving bids on a machine shop, 75 x 96 ft., at 2704-10 West Lake Street, for J. Nielsen, to cost \$20,000.

The Briskin Mfg. Co., sheet metal manufacturer, 218 South Hoyne Avenue, Chicago, has let contract for a two-story factory, 50 x 127 ft., to cost \$10,000.

Ignatz Engel, 3056 Palmer Square, Chicago, is taking bids on a garage, 100 x 125 ft., at Milwaukee Avenue, near Crawford Avenue, to cost \$15,000.

E. T. Davis, 133 West Washington Street, Chicago, is taking bids on a one-story garage, 50 x 100 ft., at Wilmette, Ill., to cost \$20,000.

The Hudson Motor Co. of Illinois is taking bids through Alfred S. Aischuler, Chicago, on a three-story salesroom and service building, 100 x 300 ft., fronting on Michigan Avenue and extending back to Wabash Avenue, adjoining the Marmon building.

R. O. McDonald is equipping a machine shop in the west room of the Hancock Implement Co. building, Tekamah, Neb., and will be prepared to do all kinds of automobile repair work.

Bids have been taken on a power plant for St. Joseph's College, Rensselaer, Ind. It will contain boiler room, machine shop, engine room, pump room, etc., and will be two stories, the first, 73 x 110 ft., and the second, 32 x 72 ft.

The Lake City Utility Co., Lake City, Iowa, has been incorporated with \$10,000 capital stock to construct a light and power plant. H. D. Yetter is president.

The F. P. Smith Wire & Iron Works, 2316 Clivbourn Avenue, Chicago, will break ground at once for the erection of a three-story, rear addition, 25 x 40 ft.

In connection with an appropriation of \$4,035,000 for the purchase of new rolling stock, improvements, etc., the Pere Marquette Railroad Co., South Wells and West Harrison streets, Chicago, will build a number of car and locomotive shops, estimated to cost approximately \$500,000, including equipment.

The Denver Gas & Electric Light Co., Denver, Colo., has arranged for a bond issue of \$3,000,000, a portion of the proceeds to be used for power plant extensions and improvements.

The Chicago, Burlington & Quincy Railroad Co., 547 West Jackson Boulevard, Chicago, has plans under way for the erection of a new electric power house at Broadway and Clark streets, Aurora, Ill., estimated to cost about \$100,000. William T. Krausch, 517 West Jackson Boulevard, is architect.

A vocational department will be installed in the new high school to be erected at Waseca, Minn., and for which William B. Ittner, architect, Board of Education Building, St. Louis, Mo., will prepare plans.

The Speeder Machinery Co., Fairfield, Iowa, is considering preliminary plans for the erection of a new factory.

The Illinois Traction Co., Champaign, Ill., is planning the erection of a new power plant at Decatur, Ill., estimated to cost about \$100,000, including equipment.

A new one-story power house will be erected by the Roth Packing Co., Waterloo, Iowa. The installation will comprise two 500-hp. boiler and auxiliary operating machinery.

A vocational department will be installed in the new two-story high school to be erected at Clear Lake, Iowa, estimated to cost about \$150,000. G. L. Lockhart, 1353 University Avenue, St. Paul, Minn., is architect.

New England

BOSTON, Feb. 20.

It is the consensus of opinion among local dealers that machine-tool sales in this district the past week were smaller than for any previous seven-day period this year. At the same time evidence suggesting better business later is noted. The General Electric Co., West Lynn, Mass., has not, as was anticipated, closed on its list of 42 machine tools for special production work, nor on its list of other equipment, and the Maine Central Railroad failed to take expected action on the three large machines wanted. A Massachusetts textile interest came into the market the past week with a list of 10 miscellaneous tools. These and other inquiries bring the aggregate number under consideration by local dealers up to more than 100. It does not, however, include several inquiries for used machinery, developed this week, as prospective buyers' ideas of prices are too low to be taken seriously, but it does include a considerable number of used tools under negotiation.

Several New England cities contemplate the purchase of machine shop equipment, but only a few have begun to make up lists. The report that Lowell and Quincy, Mass., are in

Pittsburgh

PITTSBURGH, Feb. 20.

here, is incorrect. Both cities intend at some future date to buy, but lists have not been completed.

Local machine-tool dealers take a hopeful view of the future. Machine shops throughout New England are showing more signs of life, but are still far from active. Some of the largest industrial plants also are growing busier, which leads machinery dealers to believe equipment will be purchased sooner or later, especially by those having tools under consideration. A Westboro, Mass., machine tool builder has secured a contract for 15,000 large carbonators. Operations at other plants show little, if any, expansion. Makers of road machinery are beginning to secure some substantial orders.

Sales the past week include part of a list recently issued by the H. B. Smith Co., Westfield, Mass., heaters and radiators, and involve fairly heavy production equipment by a Worcester machine tool builder, and a Boston representative of a builder closed on some half dozen machines, subject to shipping instructions to be issued later. The Eastern Nail Co., Providence, bought a 16-in. used shaper, and a Brockton, Mass., manufacturer a miller tool. A local sheet metal concern closed on four power shearing shears, a Providence firm on a 15-in. x 6-ft. lathe, a Maine garage on two 9-in. x 4-ft. lathes, a Weymouth, N. H., garage on a one-spindle drill, all new tools, and perhaps a half dozen other miscellaneous small tools have changed hands, most of them costing less than \$100 each.

In connection with greater activity among machine shops, larger sales of hand hoists are noted, business in such lines being more active than in months.

The Phillips Mfg. Co., overhead trolley equipment, will locate in Easthampton, Mass. It recently purchased three heavy shears and punches.

The property and equipment of the Wompatucket Ship Yard, Inc., Chelsea, Mass., will be sold at public auction by J. E. Conant & Co., Lowell, Mass., on March 1, 2 and 3.

The Eastern Malleable Foundry Co., Naugatuck, Conn., is considering the erection of a one-story foundry, 50 x 250 ft., at Watervliet, N. Y.

Plans are being drawn for the Dennison Mfg. Co., Framingham, Mass., paper novelties, etc., for a four-story factory, 70 x 300 ft., in Southboro, Mass.

The Boston Elevated Railway Co. is having plans drawn for a one-story, 50 x 500 ft. shop to be erected at its Forest Hill station, Edward Dana, 108 Massachusetts Avenue, Boston, is general manager.

The Thompson Copeland Co., Vine Street, Worcester, Mass., lock washers, steel cotter and screw machinery, has purchased the assets, including machinery, of the Worcester Nut Co., which will be removed to Vine Street.

The Victor Page Motors Corporation, New York City and Farmingdale, L. I., automobiles, will erect a manufacturing plant at Stamford, Conn.

The Bureau of Yards and Docks, Navy Department, Washington, has had plans prepared for new coal-handling equipment to be installed at the Boston Navy Yard, and will call for bids at an early date. The work will be handled under specification 4552.

Superstructure erection of the new power house of the Cambridge Electric Light Co., 46 Blackstone Street, Cambridge, Mass., will be commenced at an early date. It will be 80 x 180 ft. and 40½ ft. high.

A vocational department will be installed in the new four-story high school, 145 x 180 ft., to be erected at Danbury, Conn., estimated to cost about \$150,000. Sunderland & Watson, Main Street, are architects.

A one-story power plant, 50 x 60 ft., will be erected by the Mason & Hamlin Co., 492 Boylston Street, Boston, in connection with its new piano factory at Broadway and Third streets, Cambridge, Mass. Monks & Johnson, 99 Chauncey Street, Boston, are engineers.

A vocational department will be installed in the new three-story high school to be erected on Greenfield Street, Hartford, Conn., estimated to cost close to \$1,500,000. Bids will be asked at an early date. The F. I. Cooper Corporation, 33 Cornhill Street, Boston is architect. W. H. Scoville is chairman of the school board.

The E. Howard Clock Co., Eustis Street, Roxbury, Mass., has purchased the three-story factory, 60 x 200 ft., of the Peabody Leather Co., Peabody, Mass., with power plant, and will remove its works to this location. Employment will be given to about 300.

The Amesbury Body Co., Amesbury, Mass., manufacturer of automobile bodies, has acquired a brick factory at Clark's road, Amesbury, where it will remove its present works. New equipment will be installed.

The Director of State Institutions, Middlebury, Vt., has had plans prepared and will soon take bids for a one and two-story automobile service and repair building, 55 x 240 ft., at the State School for Feeble Minded, Brandon, Vt., estimated to cost about \$75,000. Lyman Austin, 240 College Street, Burlington, Vt., is architect.

Business in machinery and tools is moderate in the extreme. Some of the small shops in this district are occasional buyers, but demands from the larger units are few and far between. A few fair-sized inquiries are before the trade. Some of the foundries which bid on the segments for the New York and New Jersey vehicular tunnel have made tentative inquiries for tools, but ordering them is contingent on their getting some of the segment business. The Sewell Valley Railroad, Rinaldo, W. Va., has revived an old list and again is asking bids on a 36-in. planer, a 250-ton wheel press, a 1200-ton steam drop hammer and a universal milling machine. Little is going on in the crane market, but something should develop in the next few weeks in view of the many inquiries recently received. Steel mill equipment manufacturers note a better inquiry, and while current orders are few the impression prevails that better business is not far off. Expenditures of a considerable sum for new equipment in one of the Pittsburgh district units of the Steel Corporation is under consideration. This work was originally projected four or five years ago and now seems in a fair way of going ahead. The Allis-Chalmers Mfg. Co. recently took an order for three 24,000-hp. oil pumps for the Gulf Refining Co. for installation at Port Arthur, Tex.

The Westinghouse Electric & Mfg. Co. reports a marked increase in the sale of large power apparatus this year. January sales reached a total value of \$1,500,000 in turbine generators and condensers. Some of the buyers were the Pennsylvania Edison Co., Easton, Pa.; Madison Gas & Electric Co., Madison, Wis., and the North Carolina Light & Power Co. Most of the business was included in ten units. Takata & Co., Japan, have ordered another large turbine generator for one of its new plants. Fifty steam auxiliary units were sold during the month for a wide range of application, many purchasers being industrial power plants.

J. C. Forster & Son, 2519 Penn Avenue, Pittsburgh, manufacturers of stamped ware, tin products, etc., have awarded contract to R. E. Murray, 310 Iron Exchange Building, for a new two-story and basement plant, 50 x 100 ft., estimated to cost about \$25,000. J. L. Forster is head.

Fire, Feb. 16, destroyed a portion of the plant of the Enterprise Foundry Co., Manhattan and Nixon streets, Northside, Pittsburgh, manufacturer of iron and steel castings, with loss estimated at about \$50,000, including equipment.

The Butler Buick Co., Main Street, Butler, Pa., is completing plans for a new three-story automobile service and repair building, 85 x 110 ft., estimated to cost about \$150,000. The Hunting-Davis Co., Century Building, Pittsburgh, is architect.

The Citizens' Light & Power Co., Oil City, Pa., has arranged for a bond issue of \$43,000, for extensions and improvements in power plant and system.

Scoble & Parker, Pittsburgh, agricultural machinery, have leased the eight-story building, 30 x 120 ft., at 427 Liberty Avenue, for a five-year period, for its local works and headquarters.

The Negley Avenue Garage Co., Pittsburgh, has filed plans for a one-story service and repair building at South Negley Avenue and the Pennsylvania Railroad, estimated to cost about \$50,000.

The H. C. Frick Coke Co., Pittsburgh, is planning for the erection of a new coal tipple at its mines at Whitney, Pa. Work to commence early in the spring.

The Westinghouse Electric & Mfg. Co., East Pittsburgh, has rejected all bids for its four-story addition, 100 x 200 ft., and will call for new bids later. Bernard H. Prack, Keystone Building, Pittsburgh, is architect. The company has acquired about 1220 acres of coal properties in Stowe and West Deer Townships from the Monarch Fuel Co., for a consideration of \$733,000, and plans for extensive developments and operations on the land.

Fire, Feb. 12, destroyed the plant of the Blystone Mfg. Co., Cambridge Springs, Pa., manufacturer of machinery and parts, with loss estimated at about \$100,000, including equipment.

The Gilbert Water & Light Co., Gilbert, W. Va., recently organized, is planning for the erection of a local power house. J. A. Berry is treasurer and general manager.

The Mountain State Motor Car Co., McFarland Street, Charleston, W. Va., has preliminary plans under way for a new two-story service and repair works, estimated to cost about \$100,000, including equipment. A. D. Ellison is president.

A vocational department will be installed in the new high school to be erected by the East River District Board of Education, Princeton, W. Va., estimated to cost about \$135,000. Bids will be taken up to March 15. Wysons & Jones, Princeton, are architects.

The Bluefield Ice & Cold Storage Co., Bluefield, W. Va.,

will commence the immediate erection of a new ice-manufacturing plant at Bluefield Avenue and Poplar Street, estimated to cost about \$60,000.

The County Road Department, Clarksburg, W. Va., S. L. Coyle, County Road Engineer, will build a one-story automobile service and repair shop for county cars.

Milwaukee

MILWAUKEE, Feb. 20.

Machine-tool inquiry is becoming more active and sales more frequent, but the call is limited to one or two tools. Indications are that more business will open up before long and some foundries have received orders that justified taking on more men. The motor parts and accessory group is overcoming a temporary slowing up, although it is yet too early for automobile producers to know what to bank on in the spring selling season. The manufacture of trucks is making slow progress. That the outlook is growing more promising is indicated by the establishment of a number of new concerns in the metal-working industry.

The American Brass Co., since Feb. 1 under the ownership of the Anaconda Copper Co., has made public tentative plans for a considerable extension of production at the Western branch works in Kenosha, Wis. George H. Allen, formerly general manager at Kenosha, and now a vice-president of the company, spent the week in Kenosha to survey the works. It is planned to establish a new mill for drawing fine copper wire. This involves no new construction, as the mill will be installed in the former plant of the Kenosha Refrigerator Co., which was acquired by the American Brass Co. in 1916.

The Richards Iron Works, Manitowoc, Wis., has been converted into a corporation without change of name. The capital stock is \$125,000 and the incorporators are Henry and Reuben Richards and John W. Barnes. It does a general foundry and machine shop business and also is a fabricator of rolled steel products.

Cahill & Douglas, consulting engineers, 217 West Water Street, Milwaukee, are engaged in surveys contemplating the electrification of the power plant and factory drive of the Interior Woodwork Co., 521-529 Park Street, Milwaukee, and additional power plant and boiler house facilities for the Rhinelander Paper Co., Rhinelander, Wis.

The H. & D. Mfg. Co., Racine, Wis., has been incorporated with a capital stock of \$25,000, and will establish a plant for the production of pistons, piston rings and similar gas engine and automotive parts, accessories and specialties. The incorporators are Martin Horeth, William C. Draeger, Joseph F. Dodd, Walter R. Draeger and Charles Jenista, all of Racine.

Harry W. Bolens, president and general manager Gilson Mfg. Co., Port Washington, Wis., has purchased at public auction the plant, equipment and other property of the defunct Globe Metal Products Co., Sheboygan, Wis., for \$65,700. It consists of a gray iron foundry and machine shop. The Gilson company manufactures gas engines, implements, and farm tools and also does a large jobbing business in chair and furniture castings. Mr. Bolens expects to make a statement later relative to the use to which the former Globe works are to be put, and intimated that the production of a new type of power hoe and lawn mower tractor, recently developed at Port Washington, may be transferred to the newly acquired works.

The Wisconsin Electric Appliance Co., Menasha, Wis., has been organized with a capital stock of \$75,000 by Victor M. Gombert, G. E. Lewis and H. E. Ballard, all of Menasha. It will establish a factory for the manufacture of a general line of electric appliances and devices, but the incorporators are not ready to make details public.

The Norman Motor Car Co., Hurley, Wis., has plans for a two-story public garage and machine shop, 50 x 155 ft., estimated to cost \$30,000. Alvin J. Norman is president and manager.

The Milwaukee-Western Fuel Co., 120 Wisconsin Street, Milwaukee, sustained an estimated loss of \$150,000 by the destruction by fire of the anthracite coal shed at Canal Street and Sixth Avenue on Feb. 13. The building was 175 x 400 ft., and contained hoisting machinery and other equipment which is a total loss. It will be rebuilt immediately and inquiry is now being made for new equipment. William F. Ardern is vice-president and general superintendent.

The Board of Education, Durand, Wis., will take bids after March 15 for a new high school and vocational training institute, to cost about \$120,000. The architects are Oppenhamer & Obel, Wausau, Wis. H. H. Miles is secretary of the board.

The Borges-Baker Co., 551-553 Edison Street, Milwaukee, manufacturer of metal shears and similar metal-working devices, has incorporated with a capital stock of \$10,000. The owners are William F. and Arthur F. Borges and

Charles Baker, who also own and operate the W. R. Shaver Co., doing automotive repair work, repainting, trimming, body construction, etc. The two plants occupy the same buildings.

The Board of Education, Whitehall, Wis., has plans by Oppenhamer & Obel, architects, Wausau, Wis., for a new combination high and industrial training school, 72 x 150 ft., two stories and basement, estimated to cost \$130,000, with school and shop equipment. A. D. Peterson, clerk of the board, will take bids about March 20.

The Tomah Iron Works, Tomah, Wis., which for some time past has conducted a public garage, machine and automotive repair shop in connection with its foundry and general machine shop business, has incorporated as the Tomah Iron Works Garage, Inc. The capital stock is \$30,000. The owners are Robert S. Murray, Carl A. Sweet and Harry M. Warren.

The Stoughton, Wis., works of the Mohline Plow Co., has resumed the operation of its gray iron foundry for a limited period to turn out a number of orders for parts for new material as well as replacement parts. According to George Ford, general manager at Stoughton, it is impossible to predict if conditions will permit the continuance of production after present specifications have been filled.

Cincinnati

CINCINNATI, Feb. 20.

Local manufacturers report a slight falling off in inquiries and orders the past week. There are, however, still a few inquiries of some size being worked on. Orders booked were confined almost exclusively to single machines and while the past week showed a slight decline the general situation continues to improve and manufacturers in this district are confident that the industry is definitely on the upturn. Makers report difficulty in closing on inquiries and much shopping is being done by prospective purchasers in the hope of receiving substantial reductions in price. Very little success is being met with, however, but used machines are coming on the market more freely at very low prices.

The Breese Brothers Co., Cincinnati, metal manufacturer, has placed contract with the Fisher-Breese Construction Co. for the concrete work for its new building on Hunt Street, to replace the one destroyed by fire in December. Zettl & Rapp, Mercantile Library Building, are the architects.

The National Protecto Pump Co., Dayton, Ohio, has purchased the plant formerly owned and occupied by the Dayton Metal Body Co., North Dayton, and will make alterations preparatory to moving its plant from its present location in West Dayton.

The Expression Player Piano Co., Columbus, Ohio, has purchased property near Dana Avenue and West Broad Street and is having plans prepared for a modern two-story factory, 48 x 240 ft. It will manufacture electric reproducing player piano actions. Charles E. Tard is president.

The Sterling Stove Co., Portsmouth, Ohio, has been incorporated with a capitalization of \$100,000 to manufacture gas cooking and heating stoves, with plant at Tenth and Scott streets. Henry Scott and B. W. Hopkins head the company.

The Jones Machine Tool Co., Cincinnati, is in the market for a used No. 23 New Britain automatic machine, 2-in. capacity, for brass work.

Detroit

DETROIT, Feb. 20.

The Hirsch Mfg. Co., Sturgis, Mich., manufacturer of metal products, will soon take bids for a three-story and basement addition, 130 x 200 ft., estimated to cost about \$100,000. E. S. Patterson, 405 Hanselman Building, Kalamazoo, Mich., is architect. C. Hirsch is president.

A. O. LeGrande, Ferndale, Mich., operating a sheet metal works at 393 Woodland Avenue, is planning for the installation of additional equipment.

The Holley Carburetor Co., Vancouver Avenue, Detroit, manufacturer of carburetors and other ignition equipment, has awarded a contract to Culbertson & Kelly, 872 West Milwaukee Street, for the erection of a one and two-story plant addition at Vancouver and Military avenues.

The Consumers Power Co., Jackson, Mich., has plans nearing completion for a new two-story power house at Powers, Mich., estimated to cost about \$400,000, including equipment. It will replace a generating station recently destroyed by fire.

A one-story power plant will be constructed by the Michigan Canned Food Co., 817 Book Building, Detroit, in connection with its proposed new factory at Greenville, Mich., estimated to cost about \$150,000. The Industrial Construction Co., Eau Claire, Wis., is preparing plans.

A vocational department will be installed in the new high school to be erected by the board of education, Albion, Mich., estimated to cost about \$150,000. R. A. LeRoy, 102 Pratt Building, Kalamazoo, Mich., is architect. Donald Harrington is superintendent of schools.

A vocational department will be installed in the new East Junior high school to be erected at Lansing, Mich., estimated to cost about \$150,000. J. N. Churchill, 514 Oakland Building, is architect. I. W. Cooper is secretary of the board.

The city of Bath, Mich., will spend this year approximately \$5,000 for new equipment at the Verona water pumping station. It will include air lift pumps and engines.

Buffalo

BUFFALO, Feb. 20.

The Buffalo Chemical Fire Extinguisher Co., 67 Carroll Street, Buffalo, manufacturer of fire extinguishers and general fire fighting equipment, has acquired about two acres of land at Central Avenue and the Erie Railroad as a site for a new plant, 100 x 300 ft., with two story office building. This will comprise the first unit and will give employment to about 125. A second unit of like size will be built later. George R. Stephens is president.

The Niagara Power Co., Buffalo, will expend about \$11,000,000 for its new electric generating plant at Niagara Falls, N. Y., foundation and tunnel work for which has been commenced. A steel tower transmission line will be constructed to Buffalo. The plant will have an initial capacity of 200,000 hp.

A vocational department will be installed in the new high school to be erected at Medina, N. Y., estimated to cost about \$125,000. H. W. Robbins is chairman of the board. Plans have been prepared.

Fire, Feb. 13, destroyed a portion of the plant of the New Conklin Wagon Co., 420 East State Street, Olean, N. Y., with loss estimated at about \$300,000, including buildings and machinery. It is planned to rebuild.

Vocational departments will be installed in the two new junior high schools to be erected at Niagara Falls, N. Y., estimated to cost about \$1,000,000. Bids will be asked immediately.

The Clipper Tool Co., Buffalo, N. Y., has reduced its prices on clamp vises and oval slide vises, saw sets and machinists' hammers.

The Central South

ST. LOUIS, Feb. 20.

J. M. Kurn, president St. Louis & San Francisco Railroad has announced that a 200-ton crane will be purchased for the company's main shops at Springfield, Mo., and that other equipment will be purchased at a total cost of \$205,000. No bids have been issued by the purchasing department.

The Columbian Steel Tank Co., Kansas City, Mo., has acquired property adjoining its plant for proposed extensions. A. A. Kramer is head.

Fire, Feb. 8, destroyed the Dardanelle Machine Works plant, Dardanelle, Ark., with loss estimated at about \$18,000.

The City Council, St. Joseph, Mo., has called a special election, April 11, to vote bonds for \$300,000, for the construction of a municipal electric light and power plant.

J. M. Griffin, Laurel, Miss., and associates, have acquired about 25,000 acres of timber property in the vicinity of Hattiesburg, Miss., and plans the erection of a lumber mill, estimated to cost in excess of \$150,000, including machinery. It will have a capacity of over 50,000 ft. per day.

The Common Council, Charleston, Ark., has granted permission to E. C. Lanley, Charleston, for the erection of an electric light and power plant for local service. Plans will be prepared at once.

Fire, Feb. 11, destroyed a portion of the plant of the Kentucky Veneer Mills, Louisville, with loss estimated at about \$75,000, including machinery.

W. B. Haarstick, Vandalla, Mo., and associates, are perfecting plans for the organization of a new company to construct and operate a plant at Jefferson City, Mo., for the manufacture of chains. It will be two stories and is estimated to cost about \$75,000.

The Baldwin Garage Co., Columbus, Kan., has plans under way for the erection of a new one-story service and repair works, 120 x 150 ft., estimated to cost about \$50,000.

A vocational department will be installed in the new three-story and basement junior high school, 110 x 124 ft., now being constructed by the Board of Education, El Reno, Okla., estimated to cost \$215,000.

J. G. Allin Construction Co., 1445 Syndicate Trust

Building, St. Louis, is making inquiries for about 15,000 lb. of standard brass pipe, sizes 1/2 to 3 in.

The Crab Tree Corporation, Johnson City, Tenn., Frank R. Scott, president, is planning for the erection of a new grinding mill at its feldspar and mica properties in Mitchell County, N. C. A housing development for employees will also be built.

A vocational department will be installed in the new junior high school to be erected at Sapulpa, Okla., estimated to cost about \$100,000. Plans will be prepared at an early date.

The Common Council, McCracken, Kan., will take bids early in March for a new power plant and equipment. The Buckel Engineering Co., Hutchinson, Kan., is engineer. L. L. Ryan is city clerk.

D. C. Hale, Paducah, Ky., and associates, are organizing a company to construct and operate a crushing and grinding plant at properties in the vicinity of Bowling Green, Ky. About 1,600 acres has been acquired. The plant is estimated to cost about \$75,000.

The Kot-N-Wood Products Co., Memphis, Tenn., will equip a portion of its new plant, now in course of erection, for the manufacture of disk wheels for automobiles. George B. Stryker is president.

Indiana

INDIANAPOLIS, Feb. 20.

The Haskell & Barker Car Co., Michigan City, Ind., has plans under way for a two-story addition to its shops to cost about \$150,000. Howard Shaw, 39 South State Street, Chicago, is architect.

The plant of the Buckeye Mfg. Co., Anderson, Ind., manufacturer of engines, has been sold by Linfield Myers, receiver, to James W. Sansberry, Anderson, and associates, for a consideration of \$45,100, including buildings and equipment. The property was appraised recently at \$170,000.

A power plant will be constructed by the Board of Trustees, Indiana Village for Epileptics, Newcastle, Ind., in connection with new institutional buildings on a site near the city.

Motors and other electrical equipment, ovens, etc., will be installed in the new four-story baking plant to be erected by the Craig Biscuit Co., 115 Montgomery Street, Fort Wayne, Ind., estimated to cost about \$150,000. The McCormick Co., Inc., 41 Park Row, New York, is architect and engineer.

A power plant will be installed in the new fifteen-story hotel to be erected by the Keenan Hotel Co., Fort Wayne, Ind., care of the Anthony Hotel, 128 West Berry Street, estimated to cost about \$900,000. C. R. Weatherhogg, Citizens' Trust Building, is architect.

Freight-handling and conveying machinery will be installed in the new seven-story and basement terminal warehouse, 195 x 245 ft., to be erected at Pennsylvania and Georgia streets, Indianapolis, by the Terminal Building Corporation, Albert E. Metz, president, Fletcher Savings & Trust Building, estimated to cost about \$250,000. Plans will be prepared at an early date.

R. O. Bright, president Arvac Mfg. Co., Anderson, Ind., announces the necessity of additional equipment owing to increased demand for its chief products, disk universal joints for automobiles. The manufacture of the company's original line, metal universal joints, will be continued.

The Gulf States

BIRMINGHAM, Feb. 20.

The Common Council, Altoona, Ala., is planning for the construction of a municipal electric light and power plant.

The Owens Boll Weevil Exterminator Co., Weatherford, Tex., is planning for the operation of a local plant to manufacture a special machine for boll weevil extermination in the cotton fields. J. P. Owens is president and general manager.

The Douglass Drilling Co., Rockdale, Tex., is completing plans for a new oil refinery with an initial daily output of about 50 bbl., to be increased later.

The Ocklawaha Reclamation Farms, Leesburg, Fla., is planning for the construction and operation of a new hydro-electric generating plant in the vicinity of Moss Bluff, Fla. J. D. Young, Leesburg, is engineer.

The Board of City Commissioners, Vernon, Tex., is having plans prepared for the construction of a municipal electric light and power plant. It is expected to start the work in the near future.

The McGraw-Hill Co., 1221 Ave. of the Americas, New York

is recently organized with a capital of \$250,000, is planning for the establishment of a local plant for the manufacture of oil well drilling and other tools. Wade E. Hampton is president and treasurer, and J. F. McDowell, secretary.

The Bedell Structural Steel Works, fabricator and erector, 3620 Boudin Street, New Orleans, is in the market for the following used equipment: Machine to shear $\frac{3}{4}$ -in. plates, punch $1\frac{1}{4}$ -in. holes, cut $\frac{3}{4}$ x 6 x 6-in. angles; compressor complete; drill press and screw cutter for machine bolts up to 2 in., also for threading pipe.

The Malone-Harrison Motor Co., Dothan, Ala., recently incorporated, has completed plans and will take bids at once for a new one-story service and repair building, 100 x 200 ft. J. V. Harrison, 118 North St. Andrews Street, is secretary and general manager.

The W. L. Lemly Foundry Co., Bessemer, Ala., manufacturer of cast iron pipe, is planning for enlargements in its local plant. It recently acquired the Columbus Foundry Co., Columbus, Ga.

James P. Owens, Weatherford, Tex., in co-operation with the Chamber of Commerce, Rockdale, Tex., is arranging for the erection of a new plant to manufacture special machinery to be used in connection with cotton plantation work.

The Miranda City Refining Co., Miranda City, Tex., has perfected plans for a new refinery to handle crude oil from the Laredo district.

The Miami-Cadillac Co., Miami, Fla., has awarded contract to P. J. Davis, Miami, for a one-story automobile service and repair works, 50 x 120 ft. J. E. Junkin is president.

The Switzer-Parke Co., 105 Paige Street, Houston, Tex., recently organized, has awarded contract to the H. H. Sparks Co., 1606 Bingham Street, for a new plant to manufacture electro-plated ware, enameled products, metal ware, etc. It will approximate about 11,000 sq. ft. of floor space, and the installation will include ovens, generators, motors, boilers and other equipment. Willard M. Parke is president, and Homer E. Switzer, secretary and treasurer.

The Oklawaha Farms & Reclamation Co., Ocala, Fla., has preliminary plans under way for the construction of a new hydroelectric generating plant on the Oklawaha River.

The Texas & Pacific Railroad Co., Marshall, Tex., is completing the erection of a new three-story building on its local shop grounds, to be equipped for instruction and study in car and locomotive work for apprentices. Facilities will be provided for about 150 men and boys.

The Pacific Coast

SEATTLE, Feb. 14.

The Mineral Metal & Hyproducts Co., American National Bank Building, San Francisco, has plans under way for the first unit of its new works at San Mateo, Cal., in property recently acquired, comprising about 1370 acres of tidelands.

The Power Implement Machine Works, Modesto, Cal., has acquired property on San Fernando Road, Glendale, Cal., 113 x 400 ft., as a site for a new plant to cost about \$25,000. J. J. Ferlin is president.

The James Graham Mfg. Co., Newark, Cal., manufacturer of stoves, ranges, etc., is planning the erection of a new reinforced-concrete factory to cost about \$50,000.

The City Council, Santa Ana, Cal., is planning for the installation of an electric power plant at the municipal waterworks, estimated to cost about \$75,000. Bonds in this amount will be arranged at an early date.

The Santa Fe Railway Co., Kerckhoff Building, Los Angeles, has awarded a contract to A. C. Fellows, Central Building, for its one-story machine shop at San Bernardino, Cal., 65 x 510 ft., estimated to cost about \$250,000, including machinery, cranes, etc.

The A. Meister Sons Co., Sacramento, Cal., manufacturer of automobile bodies, street car equipment, etc., is planning the erection of new works at Fresno, Cal., to cost about \$150,000, including machinery.

M. Eisane, 130 Montgomery Street, San Francisco, Cal., has awarded a contract to MacDonald & Kahn, San Francisco, for a new one-story machine shop at Fourth and Washington streets, Alameda, Cal.

The Los Angeles Automotive Co., Los Angeles, has awarded a contract to the Moran Co., Los Angeles, for a new one-story plant, 50 x 250 ft., for assembling electrically-operated automobile trucks and for parts manufacture.

The Wasserman Water Heater Mfg. Co., Burton Street, Los Angeles, has filed plans for an addition, 40 x 65 ft.

The Wasserman Water Heater Mfg. Co., recently organized

with a capital of \$200,000, to manufacture special turbine pumps, parts, etc., has selected a site for the erection of a new plant. Dean H. Thompson, president and general manager, is inventor of the pump.

The Kimball Motor Truck Co., 1265 American Avenue, Long Beach, Cal., will commence immediately erection of a plant at Spring Street and the line of the Pacific Electric Railway, Willowville section, to manufacture motor trucks. It will be one-story and approximate 24,000 sq. ft. of floor space. M. O. C. Hull is general manager.

The Northern Pacific Railway Co., Seattle, Wash., is considering the erection of new car and locomotive shops at South Tacoma, Wash., and extensions in local yard facilities, estimated to cost about \$350,000.

Cleveland

CLEVELAND, Feb. 20.

Machine-tool dealers and manufacturers report a slight lull in orders and inquiries from week to week. Orders are almost wholly for single machines and come from widely scattered sources. The Otis Elevator Co., New York, has issued a list of some machines for its Cleveland and Detroit plants which is the only inquiry of any size that came out the past week. Manufacturers of automatic screw machines report an improvement in single tool orders and a better volume of inquiry. An order from Japan for a large turret lathe was placed with a Cleveland machine manufacturer during the week, which is the first Japanese order taken by this company in a year.

The Warner & Swasey Co., Cleveland, has announced a 25 per cent reduction on its line of turret lathes. This follows a 16 per cent cut made by the company last year.

The Otis Elevator Co. has issued the following list of machines, all motor driven, for its Cleveland and Detroit plants. One 14-in. geared head engine lathe; two 18-in. geared head engine lathes; one 24-in. geared head engine lathe; two $\frac{3}{4}$ -in. single spindle high speed drill presses; two double-end dry grinders and one cold cut-off saw.

Canada

TORONTO, Feb. 20.

During the past week a decided change for the better has appeared in the Canadian machine tool market. The automobile industry is the chief factor in the betterment of the demand and some dealers state that orders the past ten days have been much better than for any like period this year. In general, industrial activity throughout the Dominion has been making steady progress and both dealers and manufacturers are receiving orders from many unexpected sources. Municipalities which carried over the first of the year for large expenditure on waterworks, sewage and electric plants are now making preparations to carry out these undertakings and are asking for information and ordering the required equipment. Renewed activity is reported in the mining fields of northern Ontario and dealers are receiving inquiries for equipment from this source. Improved manufacturing conditions is likewise having a good effect on the demand for small tools, practically all lines of which are moving in increased volume. Prices on machinery and small tools are showing a little more strength, and no announcement of any revision has been made during the week.

The Waterworks Commission, Brantford, Ont., is having plans prepared for an addition to the pumping station to cost \$250,000, including the installation of three gage centrifugal pumps with electric motors.

The City Council of Goderich, Ont., plans improvement to the waterworks system, including the erection and equipment of a new pump house to cost about \$50,000.

The town of Warton, Ont., plans the installation of electric pump and engine for the waterworks plant to cost \$10,000.

The International Burr Co., Watertown, N. Y., is establishing a manufacturing plant at Belleville, Ont.

Plans for hydroelectric development in the Calumet channel of the Ottawa River at Bryson, Que., have been deposited by the Ottawa & Hull Power & Mfg. Co. with the Minister of Public Works at Ottawa, Ont., and the Land Registry Office at Quebec, Que., disclosing the fact that the company is considering future expansion of its power development.

The Acme Pattern & Tool Co., Buffalo, N. Y., has leased the Thorpe factory on Courtright Street, Bridgeburg, Ont., where it will establish a Canadian branch factory.

The city of St. Thomas, Ont., plans to install new transformers and equipment to cost \$25,000. Mr. Miller is engineer.

The York Sandstone Brick Co., East Toronto, is asking for prices on a horizontal return tubular boiler, 72 x 18, 150 lb. pressure, drum and tubes only.

Current Metal Prices

On Small Lots, Delivered from Merchants' Stocks, New York City

The following quotations are made by New York City warehouses.

As there are many consumers whose requirements are not sufficiently heavy to warrant their placing orders with manufacturers for shipment in carload lots from mills, these prices are given for their convenience.

On a number of articles the base price only is given, it being impossible to name every size.

The wholesale prices at which large lots are sold by manufacturers for direct shipment from mills are given in the market reports appearing in a preceding part of THE IRON AGE under the general heading of "Iron and Steel Markets" and "Non-ferrous Metals."

Iron and Soft Steel Bars and Shapes

Bars:	Per Lb.
Refined bars, base price	2.53c.
Swedish bars, base price	10.00c.

Open-Hearth Furnace Design

Calculations for Hearth Area, Depth of Metal,
Incline of Parts and Velocity
of Gases

BY A. D. WILLIAMS

DESIGN computations for an open hearth furnace do not require any large amount of mathematical knowledge, for the principles involved are comparatively simple. As in all other engineering and chemical propositions, it involves compromising a number of different requirements, and co-ordinating them in the right manner to secure a desired result. All elements of the problem are closely inter-related, and

of the computation being to illustrate the formulae used and their application.

Reactions in the open hearth furnace are well known. Their main effect as far as the flue gases are concerned, is an increase in CO_2 and the moisture content, the latter in the first part of the heat, and the former during the boil and after adding limestone. The fuel consumption will vary with the method of working

Fig. 1 Gas and Air Curves for Combustion with Varying Supply of Air

changes and modifications at one point necessitate carrying a corresponding modification through the entire system which it affects.

To establish a base for departure, it has been assumed that a furnace having a nominal capacity of 100 tons is to be built, that it is to be fired with producer gas and that the actual hearth area will be 650 sq. ft. The computations will be limited to those required to establish the design lines. Certain factors may be more or less arbitrarily fixed, without regard to current practice or whether they are desirable or not, merely for the purpose of furnishing a working base, the purpose

the furnace, etc., ranging from 185 lb (220 kg.) per ton when using molten pig, up to 770 lb (350 kg.) per ton and higher. The fuel consumption is not uniform during each furnace cycle, from charge to charge, but varies about as follows:

Percentage of Cycle (Time)	Percentage of Fuel Consumed
63.0	18.0
17.0	15.2
14.0	8.4
1.0	0.4
5.0	
100.0	100.0

For the case in hand it is assumed that the

consumption will be about 560 lb. (250 kg.) per ton, converted into producer gas of the following percentage composition: H_2 , 12.10; CH_4 , 2.60; C_2H_4 , 0.40; CO , 21.78; O_2 , 0.02; CO_2 , 5.68; H_2O , 3.82; N_2 , 53.60; having a thermal value of 142 B.t.u. per cu. ft. (1261 calories per cu. m.) low value. The heat capacity of this gas, and the air supply required for its combustion and for the products of combustion, are shown by the curves, Fig. 1, which are similar to those shown on

Table 1 Combustion of Producer Gas

Volumetric Composition of Gas, Per Cent	B.t.u. Per Cu. Ft. of Element	Per 100 Cu. Ft. of Gas	Percentage of Gas Volume			
			O_2 Required	Products of Complete Combustion		
				CO_2	H_2O	N_2^*

page 1225, THE IRON AGE, April 29, 1920. Table I gives the combustion and air supply data for this gas.

One pound of coal produces 70 cu. ft. of this gas, its specific weight being 0.07024 lb. The products of combustion, with 40 per cent excess air, weigh 0.08241 lb. per cu. ft. At the maximum rate of working, the gas will be burnt at the rate of 188 cu. ft. per second, requiring 300 cu. ft. of air, and the products of combustion will be 451 cu. ft. These are the volumes at 82 deg. Fahr. and 29.92 in. barometer. As the volu-

Fig. 2. The Parabolic Curve of an Inclined Jet

metric correction for pressure is comparatively small, it will be neglected in the computation, and temperature corrections alone used.

As the capacity of the furnace is to be 100 tons, the metal volume will be 523 cu. ft. With a hearth area fixed at 650 sq. ft., the approximate depth of the bath will be:

$$d = \frac{80}{\pi} \times \frac{3 \times 523}{650} = 2.41 \text{ ft.} = 29 \text{ in. of metal}$$

As the bottom will slope toward the tap hole, and be banked at both ends and sides, the actual maximum metal depth will depend upon the way this is done. As there will be at least 12 in. of bottom, the depth to the brick will be about 42 in. from the sills of the charging doors, and the port sill or bridge will be fixed 1 in. higher, making the total maximum depth that the flame must drop below the port, 48 in.

The brick lines of the hearth will have to be fixed

outside of the bath area to allow for the slope. The inside width between walls will be made 18 ft. (5 m. 00) and the length between port sills 44 ft. 8 in. (13 m. 50), giving an area of 726 sq. ft. (67 m.² 80). If the length is cut to 42 ft. 8 in. (13 m. 00) the area will be reduced to 700 sq. ft. (65 m.² 00). Or, the width might be reduced slightly by increasing the length. There are advantages in reducing the span of the roof, as well as disadvantages in making the furnace too long; but it is possible that a length of 46 ft. (14 m. 00), with a width of 15 ft. 3 in. (4 m. 650), giving an area of 701 sq. ft. (65 m.² 11), would be satisfactory.

The temperature in the heating chamber will be 3275 deg. (1800 deg. Cent.) for the gases, the roof being 100 to 200 deg. (55 to 110 deg. Cent.) cooler and

Fig. 3. The Inverted Parabola of a Flame in Making Bottom.

the bath from 270 to 450 deg. (150 to 250 deg. Cent.) cooler. The height of the chamber may be approximated by Yesmann's formula:

$$h_t = A \sqrt{\frac{Q_t^2}{B - t}}$$

In which,

h_t = the thickness in ft. of the moving gas layer;
 Q_t = the volume of gas in cu. ft. at t deg. (Cent.) temperature;
 B = the width of the furnace in ft.;
 A = a coefficient which varies for each value of h_t and B in accordance with the following table.*

h_t	Values of B				
	3 ft.	6 ft.	9 ft.	12 ft.	16 ft.
1 ft.	2.275	2.36	2.4	2.42	2.48
1.5 2.0	2.215	2.32	2.38	2.4	2.41
2.5 3.0	2.15	2.28	2.35	2.38	2.39
	2.08	2.245	2.32	2.36	2.38
	2.01	2.2	2.3	2.35	2.375

The metric formula, together with many others used herein, will be found in "The Flow of Gases in Furnaces," by W. E. Groume-Grjmailo. For the case in hand:

$$Q_t = Q_0 (1 + \alpha t) = 451 \times 7.606 = 3430 \text{ cu. ft.} \\ (= 97 \text{ m}^3 \cdot 14) \\ t = 3275 \text{ deg. Fahr. } (= 1800 \text{ deg. Cent.}) \\ B = 16.4 \text{ ft. } (= 5 \text{ m. 00}) \text{ or } 15.25 \text{ ft. } (4 \text{ m. 650}) \\ A = 2.37 \text{ and } 2.34, \text{ approximately.}$$

The formula may now be written with these values, as follows:

$$\text{For } B = 16.4 \text{ ft. } h_t = 2.37 \sqrt{\frac{(3430)^2}{(16.4)^2 \times 1800}} = 6.88 \text{ ft.} \\ \text{For } B = 15.25 \text{ ft. } h_t = 2.34 \sqrt{\frac{(3430)^2}{(15.25)^2 \times 1800}} = 7.11 \text{ ft.}$$

This will be the distance from the surface of the bath to the center of gravity of the roof segment. It will give an approximate height of the skewbacks, above the door sills, of 5 ft. 4 in. (1630 mm.) for the wider chamber, and 5 ft. 7 in. (1700 mm.) for the narrower chamber.

With a chamber area of 700 sq. ft. (65 m.²) the chamber volume will be approximately 5087 cu. ft. (144 m.³) for the wider chamber and 5280 cu. ft. (149 m.³ 50) for the narrower chamber. The gases will remain in the chamber approximately $1\frac{1}{2}$ seconds; which, with a temperature drop of 360 deg. (200 deg. Cent.) per second means a temperature of approximately 2715 deg. (1500 deg. Cent.) for the gases leaving the chamber. Referring to the curve, Fig. 1, and allowing for a drop in calorific intensity of about 360 deg. (200 deg. Cent.) it will be seen that a preheat of the air and gas of between 1470 and 1830 deg. (800 and 1000 deg. Cent.)

*Using metric units throughout, the table of values is as follows:

h_t	Values of B				
	1.00 m.	2.00 m.	3.00 m.	4.00 m.	5.00 m.
0.3 m.	2.42	2.48	2.5	2.52	2.58
0.5 0.7	2.215	2.32	2.38	2.4	2.41
0.9 1.1	2.15	2.28	2.35	2.38	2.39
	2.08	2.245	2.32	2.36	2.38
	2.01	2.2	2.3	2.35	2.375

will be required. Allowing for a possible loss of temperature in the necks, cinder pockets and on the checkerwork will be proportioned to supply a preheat of 2200 deg. (1200 deg. Cent.).

The distance the jet of flame must drop below the bridge or port sill, to permit the sintering of the bottom, has been fixed at 48 in. (1200 mm.). An assumed resultant velocity of the air and gas will fix the resultant angle of the two jets. The higher the assumed resultant velocity, the less the resultant angle will be, and the further beyond the center of the chamber the point of maximum depression of the jet of flame.

High velocities, in addition, cause the incoming end of the chamber to work cold and the outgoing end to work hot, while the desirable condition is that both ends of the chambers shall work, as nearly as possible, uniformly. High velocities for either the gas or the air mean reduced port areas, and high velocities for the outgoing products of combustion, which in turn call for an increased draft depression to pull the gases through the ports. This draft depression creates a suction acting to pull air in through the valves, flues and chamber walls. At the same time, it is necessary to have sufficient draft to draw the waste gases out of the chamber and down through the checkerwork, but the lower this draft depression, the less the tendency to induce air leakage or infiltration.

As the flame has to drop 48 in. in one-half the 46-ft. (14 m. 00) length of the furnace, an angle somewhat greater than 10 deg. must be allowed for the trajectory of the jet. Yesmann's formula for this case is:

$$H = \frac{v^2 \sin^2 \alpha}{2g} \times \frac{459 + t_1}{t_m - t_1}$$

In which,

H = the middle ordinate of the parabola, in this case 4 ft.;
 v = the resultant velocity of the two jets uniting to form the flame;
 $\sin \alpha$ = the sine of the resultant angle of the two jets;
 $2g$ = gravitational constant = $2 \times 32.2 = 64.4$;
 t_1 = the temperature of the gases within the chamber;
 t_m = the temperature of the gases in the jet.

When a furnace is heating up, the stream of flame tends to follow the roof until the interior of the cham-

ber becomes heated to a temperature sufficient to permit it to drop, and the drop of the flame is an index of the progress made in heating the furnace. It is likewise desirable to be able to sinter the bottom, when the furnace for any reason may be cooler than usual, or the ports eroded. The temperature of the jet of flame, t_m , may be assumed as 3275 deg. (1800 deg. Cent.) and the gases in the chamber as 1475 deg. (800 deg. Cent.) = t_1 . Velocities of $v = 50, 65$ and 80 ft. (15, 20 and 25 meters) per second, tried out in the formula and solving for $\sin \alpha$, give a resultant angle as follows:

$$\begin{aligned} \text{For } v &= 50 \text{ ft. per second } \alpha = 18^\circ 34' \\ v &= 65 \text{ ft. per second } \alpha = 14^\circ 11' \\ v &= 80 \text{ ft. per second } \alpha = 11^\circ 29' \end{aligned}$$

In solving to obtain these angles:

$$\begin{aligned} t_1 &= 1475 \\ 459 + t_1 &= 1834 \\ t_m - t_1 &= 3275 - 1475 = 1800 \\ H &= 4 \quad 2g = 2 \times 32.2 = 64.4 \end{aligned}$$

The formula can now be written:

$$H = 4 = \frac{v^2 \sin^2 \alpha \times 1834}{64.4 \times 1800}$$

which becomes

$$\sin \alpha = \sqrt{\frac{253.5}{v^2}} = \frac{15.92}{v}$$

$$\begin{aligned} \text{For } v &= 50 \text{ ft. per sec., } \sin \alpha = 0.3184 \\ \text{For } v &= 65 \text{ ft. per sec., } \sin \alpha = 0.2449 \\ \text{For } v &= 80 \text{ ft. per sec., } \sin \alpha = 0.1990 \end{aligned}$$

Should t_1 be given a higher value than 1475 deg. (800 deg. Cent.) the angle will be less. Two components may be selected to suit the resultant angle and velocity, but this cannot be intelligently done until the pressures available for impressing velocity upon both the gas and the air have been approximated. For the air, the pressure available will be entirely due to the chimney effect of the system, diminished by the resistance to the flow of the air, unless a fan is used. The same pressure is available, in the case of the gas, plus the pressure in the gas main, which is more or less under control through the steam blower on the producer. To determine this chimney effect, it is necessary to arrive at the regenerator height.

Industrial Conditions in Belgium

WASHINGTON, Feb. 28.—The revival of Belgian industries during the last quarter of 1921 was largely artificial, being caused by a combination of temporary factors, especially the decline of German competition, says Acting Commercial Attache Cross in a cable to the Department of Commerce. Since Jan. 1 this improvement has been abruptly checked, especially in the window glass, coal and metallurgical industries. The rise in French exchange, price reductions on British coal, iron and steel, and American window glass, have been chiefly responsible for the reaction, and Belgian manufacturers are finding drastic measures necessary in meeting foreign competition. Wage reductions are under negotiation in the coal mines and window glass plants. Coal prices have been cut from 6 to 10 francs per ton to meet the British competition, and price reductions in window glass are being considered to meet the American cuts. Colliery stocks are increasing, and the tendency toward the combination of coal mines and purchase of collieries by metallurgical interests is continuing. Coke production has been greatly stimulated by the foreign demand and all ovens are working to capacity.

On Feb. 1, 18 blast furnaces were operating as compared with 15 a month previous. These are now producing 546 tons of foundry iron and 2470 tons of basic pig per 24 hours. The increased production has resulted in a marked price reduction which has been further hastened by the low British quotations which have occurred in all metallurgical lines during the past few weeks, representing decreases ranging from 10 to 20 francs on billets and from 50 francs on billets and 100 francs on open hearth steel and

generally are down 1 franc per kilo. From the Belgian standpoint, further reductions are both probable and essential, owing to the persistent low offers of British pig iron and semi-finished productions in the local centers.

The Sambre et Moselle works have recently received an order for 40,000 tons of rails from Argentina, and Brazil has placed an order for 32,000 tons with the Usines de la Providence. Other important rail orders have been received from Holland and Bulgaria.

Corporations Granted Extension of Time

WASHINGTON, Feb. 28.—Commissioner of Internal Revenue Blair has granted a general extension of time to domestic corporations for completing returns of income for the calendar year 1921, the fiscal year ended Jan. 31, 1922, and the fiscal year ending Feb. 28, 1922. The extension is conditional upon the filing of tentative returns with the Collector of Internal Revenue on or before March 15, April 15 and May 15, 1922, respectively, accompanied with at least one-fourth of the estimated amount of tax due, together with a statement setting forth the reason why the return cannot be completed within the prescribed time, and a formal request for the extension.

This permission was granted on the plea of corporations which insisted that it was a physical impossibility to make the returns on the date required in the revenue act of 1921. The tentative returns must be so labeled and only the name and address of the taxpayer and the estimated amount, if any, of the tax due need be stated. The law provides for a levy of 6 per cent in the event of a deficiency in the first installment.

Roberts Type of By-Product Coke Ovens

Granite City Batteries Produce Metallurgical Coke from
Illinois and Indiana Coals—Design and
Operation—Results Secured

BY M. W. DITTO

Editor's Note: The successful production of metallurgical coke from the high volatile coals of the Illinois and Indiana fields has long been regarded as impossible. Yet by-product ovens, designed for that very purpose, have been in operation for a year. The blast furnace of the new plant of the St. Louis Coke & Chemical Co., Granite City, Ill., was described in an illustrated article in THE IRON AGE of Jan. 6, 1921. The first published description of the Roberts type coke ovens of that company is appended below. The author is consulting engineer of the St. Louis Coke & Chemical Co., and also of the American Coke & Chemical Co., of which the former is a subsidiary. The outstanding difference between the Roberts oven, as constructed at Granite City, and other by-product installations lies in the baffled structure of the wall, which permits the heat to be absorbed from the heating gases in the combustion chamber at a higher rate than in the flue type of oven. The heating walls are always maintained at a temperature above the heat requirements of the coal, eliminating the variation in temperature resulting from heat absorption by fresh coal, and thereby preventing the volatilization of the binding elements.

PIG iron was produced in and about St. Louis in some quantity before it was produced in the Chicago district and other places that have since become famous as iron producing centers. What pig iron was produced in this district was mostly from native Missouri ore with charcoal as fuel. The production of iron gradually decreased, however, as other producing centers, such as Pittsburgh, the Valley district and Chicago, grew up, until it ceased entirely. At the meantime St. Louis became one of the largest iron melting towns in the United States, and depended entirely upon iron shipped in from other districts.

In view of the fact that St. Louis was contiguous to one of the largest coal deposits in the world, and that freight rates on ore were on an equitable basis with other iron producing points, there seemed to be only one thing that prevented St. Louis from becoming a permanent iron producing center, and that was the inability to utilize the coals contiguous to it. Previous to the time that the Steel Corporation was formed, John W. Gates and Levi Z. Leiter of Chicago became interested in the production of coke from these coals on a large scale. Mr. Leiter carried out some early experiments that indicated that it was possible to use these coals if apparatus that could be economically operated could be devised. Unfortunately Mr. Leiter died before the conclusion of his earlier plans, and the development work on the use of Illinois coal for the production of metallurgical coke lay dormant for several years.

Development work was undertaken again, however,

and finally concentrated itself around the organization built up by Arthur Roberts of Chicago and his associates, and crystallized in the construction of the St. Louis Coke & Chemical Co. plant at Granite City, Ill. This plant was completed and put into operation in January, 1921. It consists of one 500-ton blast furnace, designed by Freyn, Brassert & Co., Chicago, and 80 Roberts by-product coke ovens, arranged in two batteries of 40 each.

The furnace is of standard design of the following dimensions: Height, 86 ft.; hearth, 17 ft.; bosh, 20 ft. 6 in.; bosh angle, 80 deg. 5 min. The furnace has been successfully operated since its installation on coke made from Illinois and Indiana coal. It is operated in conjunction with the National Enameling & Stamping Co., which has ten open-hearth furnaces and produces practically all of the steel used in its enameling and stamping departments. The iron is transmitted from the furnace to the open-hearth furnaces in the hot metal form in Treadwell ladles, and the furnaces are heated with coke oven gas and tar.

As it is anticipated that the successful coking of Illinois coals will lead to great expansion of the steel industry in the St. Louis district, the plant at Granite City was laid out for an ultimate daily capacity of 3000 tons of pig iron and 8000 tons of coal, consisting of six blast furnaces and 320 ovens. The initial installation is so arranged that the two units closest together are now built, and the extensions will be made in both direction from these units.

As stated, the coke ovens are arranged in two bat-

consists of 24 ovens each, supplied from one coal storage bin, having a capacity of 1900 tons. All of the equipment of the coke oven plant is standard, the only peculiarity of the plant being the design of the coke ovens themselves.

Before building this plant, the only installation of Roberts ovens that was used for producing coke from high volatile coal for blast furnace purposes was a group of 24 at Dover, Ohio, in conjunction with the M. A. Hanna Co. furnace there. The practice established at that point was the basis for the Granite City design. The Dover ovens used the common regenerators for preheating the air, similar to the old Otto-Hoffman type, but aside from the regenerative feature the ovens are practically the same as in St. Louis.

Considerable interest was created when it was announced that the Granite City ovens were to be equipped with recuperators made of silica brick and covering the entire space underneath the ovens, similar to the individual regenerative type of oven. A brief description of the ovens will clearly show how the design differs from what has been known as common practice in coke oven construction up to the present time.

Construction features of the oven are shown clearly in the skeletonized model view. It will be noted that the recuperators are divided into two individual independent sections, and occupying all of the space underneath the ovens with the exception of the dividing wall. The waste gases make two passes in each of these sections and each section is made up of 16 flues of 4 tiers each. The gases pass through the flues, and the air flows countercurrent upward on the outside of the flues. The entire recuperator is constructed of silica brick.

Each oven has a capacity of 600 cu. ft. of coal, and an average width of 14 in. The coal is charged within one foot of the top of the coke oven chamber, through five charging holes. The products of distillation are taken off on the pusher side through a single ascension pipe, and both batteries are equipped with duplex foul gas mains, so that the gas can be separated. All of the fuel gas is introduced at the top of the oven, the primary gas being introduced at a point about 12 in. below the coal line, and the secondary, half way down the wall.

The primary and secondary gas headers or manifolds at the top are independent. These headers are rectangular in shape, with a partition in the center, one side being for the primary gas and the other side for the secondary. The primary gas goes through a

4-in. hole lined with fire clay tile, having a 3-in. hole in it.

Air coming out of the top of the recuperators rises through the center wall to practically the top of the coke oven chamber. There it is transferred across the wall and passes down through ports on each side of the port through which the primary gas is introduced. All of the air is introduced at this point and our common practice is to introduce only 50 to 60 per cent of the gas required for the carbonizing of the coal at the orifices of the primary gas. The balance of the gas enters through the secondary ports, which are reached by ducts coming from the top of the wall through the center wall, and enters the combustion chamber through inclined slots in the side of the brick.

All of the products of combustion, accumulating in the upper sole flue, are allowed to go through ports, regulated by slide brick, into the lower sole flue, where they are all brought to the end of the oven and thence downward to the first pass into the top of the recuperator. After passing through the lower section of the recuperator they are discharged into the waste gas offtakes, in which a butterfly valve is inserted to regulate the draft on each oven.

There are seven ducts in the concrete foundation supporting the oven structure. The air comes into these ducts from the ends of the foundations at both extremities of the battery, and passes through the ports on top of the first course of fire clay brick into the base of the recuperator. These ports have cast iron slide dampers over them to regulate the quantity of air. This has proved a very satisfactory way of introducing the air, because we have been able to maintain the concrete work underneath the ovens at practically atmospheric temperature, so that there have been no expansion problems involved in that part of the installation.

In designing this oven the principal things we kept in mind were the fact that we wished to produce a large tonnage of coke, per dollar invested in the plant, and to simplify the operation of the ovens to as high a degree as possible. Therefore, there are no points in the oven where regulation of both air and gas or products of combustion is dependent upon a combination of regulator dampers. The draft is regulated by the butterfly valve in the waste gas offtakes. The distribution of the draft is regulated by the slide brick on the ports at the bottom of the upper sole flue.

The amount of air going to each primary burner is regulated by the slide brick at the top of the wall, and the amount of gas passing into the wall at any one

Coke Being Pushed into the Receiving Car

point is regulated by the adjustment of the cocks coming off of the distribution manifolds along the top of the oven. The gas is regulated by drilling a predetermined size hole in the plug that goes into each individual cock. These holes vary in size according to the width of the oven, and the quantity of gas that each oven gets is determined by the pressure carried upon the main header, based upon the well-known fact that a given quantity of gas at constant pressure will flow through a given size orifice in a unit of time.

To vary the quantity of gas being burned per unit of time requires merely the changing of the pressure on the main headers, which is done by setting a governor instead of changing the sizes of the orifices in the individual cocks. After having determined the quantity of gas required for a given coking time and having placed the proper size orifice in the cocks, the only function of the heater from that time on is inspection of burners to see that they do not become clogged.

The secondary gas is regulated in the same way. On the ends of the gas manifolds there is an auxiliary pipe connection coming from a separate header, in which air at 1 lb. pressure is supplied by an ordinary high-speed blower.

Our practice is to cut off the gas entering the

naturally arises as to the relative value of introducing gas into a coke oven wall at more than one point in its elevation does not present any operating difficulties, and in our opinion the advantages gained by these means are worthy of serious consideration.

The height of the walls of the Roberts oven is 13 ft. 9 in. The ordinary lean coke oven gas running high in hydrogen necessarily burns with short flame. Hence by using the method of distributing and burning the gas described, we have no difficulty in maintaining a uniform temperature on the high wall, thereby getting the benefit of the greater tonnage with narrower coke oven chambers.

The brick work in the coke oven wall is of standard Roberts type, making a combustion chamber that is intercommunicating throughout its entire length, with the exception of the baffles, partially isolating the three end burners. These baffles are put in to make it possible, by draft regulation, to compensate for the extra heat required to keep the ends at the same temperature as the balance of the wall.

The action of the gas being introduced into a coke oven wall of this type is interesting. It has always been assumed that, by satisfying the given quantity of gas with all of the air necessary to burn it, this

Coke Discharge Side of Ovens

secondary gas ducts every 6 or 8 hr., and allow the air at 1 lb. pressure to pass through them. In this space of time there will be from 1/16 to 1/8 in. of carbon formed on the walls of the duct, which is 1 1/2 in. in diameter. As this carbon is red hot the admittance of air into the duct starts combustion immediately, and in the space of from 10 to 15 min. the carbon is all burned out. We do not consider that there is any heat loss from this, because observation shows that the temperature of these ducts is hotter at the end of the decarbonization period than at the beginning, and the products of combustion resulting from burning the carbon are hot enough so that there is no deleterious effect upon the heating conditions in the lower part of the wall.

As a result of this practice, we have had no trouble from introducing the gas through the secondary gas ducts, and, by the arrangement used, it requires very little of the heater's time, the only important thing being that this operation is carried on regularly at stated intervals.

The benzol equipment has not yet been installed at this plant, and we are using the lean gas for fuel without the benzol being taken out. Our experience showed at Dover that, when the gas was debenzolized, it was not necessary to decarbonize these ducts more than once every two or three days. So the question that

would localize the heat at the point of combustion. This is not entirely true, according to our practice, because of the fact that only 50 per cent of the gas is introduced at the point where all of the air comes in.

As it is necessary to raise the excess of the 50 per cent of air up to flame temperature, the latter is reduced or tempered by the excess air; and as the point where the air and gas first meet is a mixing chamber, which might be termed a short flue, the rate of heat extraction is lower than it is further down in the wall. There is no question that by interrupting the flow of gas, as in this type of wall, the rate of extraction of heat from the flame is higher than in a flue structure.

When we come to the point where the secondary gas is introduced, it mixes with the products of combustion resulting from the primary introduction, and the air at that point is diluted to such an extent that the rate of combustion is materially slowed down.

All of this gas passes through the section of the wall in which it is being constantly impeded by that part of the brick which crosses the combustion chamber. We have found it to be an arbitrary problem whether either the top or the bottom of the coke oven wall should be carried at a uniform temperature, or hotter or cooler; and it is our practice to carry the bottoms a little hotter than the top, particularly on the fast coking times.

Plan of the Brick Forming the Baffled Structure of the Heating Wall, Being a Section Through the Heating Wall and Combustion Chamber

Construction of the Ovens Is Well Shown by Skeletonized Model

The comparison of the function of this wall with similar problems in heat disposal or absorption is often made with the air cooled gasoline motor. In this instance fins are cast upon the walls of the engine cylinder to dispose more rapidly of the heat, as it is absorbed by the inner surface of the wall. In the Roberts coke oven this condition is reversed, that is, we might say the fins are cast on the inside of a cylinder wall and act as heat absorbing elements instead of heat disposing elements.

By likening the checker brick combustion chamber to the fins on the engine cylinder, with the fins exposed to the heating gases, there is a more rapid absorption of heat than if the walls were smooth. While this analogy is not an entire measure of the function of this type of construction, it is a comparison that is interesting.

The oven was designed to have a waste gas temperature of 750 deg. Fahr. at the point where it left the lower pass of the recuperator, when operating the ovens at 15 hr. coking time. The operation of the plant has proved the figures on which we based these calculations to be accurate, and when operating at the slower coking time the waste gas temperatures run very much lower; that is, when operating on 18 to 22 hr. coking time, the waste gas temperatures are from 350 to 400 deg. Fahr., and by the same token, when operating at 12 to 13 and 14 hr. coking time, the waste gas temperatures go up to 850 deg. Fahr.

As this was the first installation utilizing a recuperator of this type, it was not our desire to seek the maximum gas economy, as there were some unknown factors that had to be worked out before the design could be adopted as standard. We now have that information, and feel that it will be possible to build an oven according to this design as economical in gas consumption as any regenerative oven that has been designed or put in operation to date.

When operating at the normal coking time of 15 hr., the air leaving the top of the recuperator is heated to a temperature of from 1670 to 2000 deg. Fahr. As this air passes up through the brick work between the two heating walls, it also increases in temperature to that of the brick through which it passes, increasing from 100 to 250 deg. Fahr., depending upon the operating conditions.

This heat is not lost, however, because it is a closed system going back to the heating wall on its re-

In This Section Are Shown Corresponding Curves Representing (A) the Ideal Condition with Heat Transferred to the Coal at Uniform Rate through Entire Height of Oven; (B) the Heat Effect Actually Present in Roberts Wall, (K, L and R) Theoretical Extremes to Which the Gases Would Go if Not Influenced by the Conditions Existing in the Oven

turn with new products of combustion; so that there is a continuous flow of heat of uniform temperature, which is the reversed condition of a reversing type of regenerator, and the average overall efficiency is just as high as could be secured with a regenerative design.

The oven is supported on two 18-in. silica brick walls that are corbelled in at the top to bridge over the top of the recuperator, so that the expansion of the recuperator can be taken care of independently of the oven structure. If, in the future, it is found necessary to reset the brick in this section of the oven, this can be done without interfering with the upper part of the structure.

There are independent buckstays on the bulkheads forming the insulating brick in front of the recuperators, controlled by screws from the main buckstays, so that the position of these small buckstays can be placed at the required point, regardless of where the main buckstays go.

The question of the difference in expansion between

(Continued on page 624)

Motor-Driven Portable Disk Sander

A 15-in. motor-driven, portable disk sander for use in pattern shops and wood-working plants in general has been brought out by the Oliver Machinery Co., Grand Rapids, Mich. It is suitable also for sanding hard rubber, fiber, leather, and in machine shops, for medium and light metal work. The machine is designated as the No. 182 and is shown in the illustration.

The disk, is a steel plate 15 in. in diameter and is mounted on a disk shaft hub. It is removable for renewing sand paper. The speed of the disk is 1725 r.p.m. The disk head is a one-piece iron casting, containing the disk, disk shaft, ball-bearing end thrust and exhaust fan and system, forming one complete unit.

The table is 9 1/4 in. wide, 21 in. long and 37 in. from floor. It can be tilted 45 deg. down or 25 deg. up by the

Disk Sander for
Wood, Metal and
Other Material

hand wheel shown, a graduated index being provided to show the exact angle of tilt. The table has a 6-in. vertical adjustment and can be swung to the right to permit taking off of the disk. The angle gage, operating in the table slot, is graduated from 0 to 45 deg., both to right and left, for accurate setting.

The machine is equipped with a combination gage to enable circular, segment and duplicating work to be done. This gage consists of a plate with a hinged strip pivoted to the bottom, which rides in a slot on the table. The plate has a series of holes to take center pins for circular work and the fence part of the angle gage for duplicating work. There is also a stop gage and segment pin for segment sanding which is operated by a handle cast to the plate. An adjusting screw acts as a stop or set for amount of cut to be taken.

The motor is single, 2 or 3 phase, 60 cycle, 110 or 120 volt alternating current or 110 or 220 volts direct current, coupled to the disk shaft. A 25, 30, 40 or 50 cycle motor can be provided at extra cost. The motor runs in ball bearings and rotates the disk shaft, but does not take load of thrust. A plug connector permits of attachment to any light socket. The switch is of the push button type, located as shown.

Circular work up to 15 in. in diameter and duplicating work up to 7 in. wide can be handled. Garnet-paper disks are provided for wood sanding and aloxite or emery-cloth disks for metal grinding and polishing. The exhaust system deposits the dust within the column. The weight crated is 400 lb.

Blast Furnace Activities

Carnegie Steel Co. now is operating 28 of its blast furnaces, 27 on pig iron and one on spiegelheisen. The latest addition to the active list is one of the three stacks at the Clairton works, all of which have been down for about a year, and one at Duquesne works. One of the Lucy furnaces which has been making Bessemer iron will soon go on to ferromanganese. LaBelle Iron Works recently started up its second furnace at Steubenville, Ohio, and the furnace of the Wheeling Steel & Iron Co. at Martins Ferry, Ohio, will be blown in before long. The number of active furnaces in the territory bounded by Johnstown, Pa., Portsmouth, Ohio, and Warren, Ohio, now is 60 out of a total of 140. Only five merchant furnaces and 25 steel stacks are in blast.

Duplex Hand Milling Machine

A duplex hand milling machine for slitting piston rings of the step type has been placed on the market recently by the Superior Machine & Engineering Co., Detroit. It is also intended for use in sawing apart babbit-lined bearings for automobile crank shafts and for milling two keyways or slots at the same time or any similar operation.

The grinding surfaces are long in proportion to their width, which enables the slides to move freely without cramping. Sliding members can be clamped in position without disturbing the adjustment of the gibs.

The machine is driven directly from the line shaft, but can be arranged for motor drive, in which case a

The Table Is Oper-
ated by the Hand
Lever Shown,
Through a Rack
and Pinion

1 1/2-hp. motor is mounted on a bracket at the base of the machine. On the end of the main-driving shaft there is a change pulley which is belted to an upper pulley mounted on the lower spindle, as shown in the accompanying illustration. The drive to the upper spindle is through helical gears and a vertical shaft. The helical gears are hardened and run in oil. The spindles are of high-carbon steel and run in bronze bearings.

Graduated dials are provided on all adjusting screws. The table is operated by the hand lever, shown, through a rack and pinion. The machine weighs approximately 900 lb.

Dilworth, Porter & Co., Pittsburgh, maker of and track equipment, plant of which has been in several weeks, resumed

New Machine

A new 20-in. high-duty drilling machine having a capacity for driving a 1½-in. high-speed drill through steel has been brought out by the Foote-Burt Co., Cleveland. It is designated as the No. 23, and was designed to take the place of the former machine bearing the same number.

The machine is shown in the accompanying illustration. The features include simplicity in general design, there being no loose brackets or other bolted-on

Design of Head and Uprights Permits Bolts to Be in Shear Instead of in Tension

parts, and in the interior mechanism, which has resulted in the elimination of many parts. All parts are readily accessible for inspection and adjustment. The use of a telescoping screw under the table is also eliminated, the single screw provided permitting vertical table adjustment of 12 in. without the necessity of providing a hole in the floor. Control is centralized, all operating levers being within easy reach from the operator's working position in front of the machine.

The design of the head and column permits bolts to be in shear instead of in tension. Bending stresses due to high-drilling pressures are taken up by the rigid upright, which is also reinforced by the head. It is claimed that this method of construction is better suited to the modern practice of using high speeds and heavy feeds than a design in which the upright is split horizontally at the point of maximum stress. The base, upright and jack-screw support are all cast integral, which is intended to add to the rigidity of the machine.

The drive is by a single pulley through a friction clutch, no counter shaft being required. Nine spindle speeds from 75 to 610 r.p.m. are provided, and three geared feeds, 0.006, 0.012 and 0.026 in. per revolution of the spindle. Speed and feed changes are made through sliding gears, no clutches or sliding keys being used. Helical gears are used for driving the spindle, transmitting power to the tool evenly and smoothly. Speed and feed change gears are of heat-treated steel. The machine has the "Footeburt" double rack feed to the spindle intended to eliminate side friction on the spindle sleeve. The spindle is counterbalanced by a weight. The driving-shaft bearings are Hyatt or taper roller bearings, Hyatt bearings being used for radial loads and the taper roller being for the combined radial and thrust load. Heavy ball-bearing takes the thrust of the spindle.

All parts of the feeding and driving mechanism are entirely inclosed. The speed change gears run in an oil

bath and the feed gears are lubricated by a positive splash oil system. The upper driving helical gear and other bearings are packed in grease, a sufficient supply being stored in caps to last several months. gear-driven pump is provided for cutting compound.

The principal dimensions are as follows: Center spindle to face of column, 10 in.; nose of spindle to top of table, 28½ in.; length of power feed, 12 in.; Morse taper No. 4; working surface of table, 20 x 16 in.; vertical adjustment of table, 12 in.; face of square locking table bearing on column, 10 in.; length of square locking bearing on table, 12 in. The net weight is 2700 lb.

Hacksaw Machine Using Light-Gage Blades at High Speed

A metal-cutting machine for medium-duty work, incorporating the positive draw-cut principle and designed to use light-gage blades at high speeds, has been added to the line of the Racine Tool & Machine Co., Racine, Wis. It is known as the Racine Junior and is a moderately priced machine intended for the average shop. Its production approximately double that usually obtained is claimed.

The use of light-gage blades is permitted because of the automatic-lifting device incorporated. The lift is positive and takes place on the non-cutting stroke, giving free clearance to the blade on the back stroke, under all pressures. This is said to eliminate drag back, heating, bending and binding in the cut, effectively preventing quick wearing off of the teeth of the blade.

The feed is by gravity. An automatic knockout is provided to stop the saw when the cut is finished. The saw-frame guide holds itself automatically at any height and adjustment for wear is provided. The frame slides on V-ways, giving maximum bearing surface. The machine is designed to take stock 4 by 4 in., although by simple adjustment stock up to 6 by 6 in. can be handled

Right Hand View, Showing Cutting Position

The speed is given as from 60 to 100 r.p.m. and the stroke 6 in. The floor space occupied is 38 by 12 in. The height to top of the table is 20 in. and overall height 28 in. Blades 10 to 12 in., 21 gage, are used. The weight is 150 lb. net.

"Reducing Power Bills on Mine Fans with Synchronous Motors," is the subject of a paper to be presented before the Association of Iron and Steel Electrical Engineers, by Frank W. Cramer, engineer of tests Cambria Steel Co., and A. A. McDonald, chief engineer Union Coal & Coke Co., at its regular monthly meeting to be held at the Chatham Hotel, Pittsburgh, March 18. The authors will show that with the use of a synchronous motor, together with a magnetic clutch, more than \$500 per month was saved in driving a mine fan which delivered 500,000 cu. ft. of air per minute. Another phase which this paper takes up is the replacement of a steam engine by an electric motor. The meeting is open to all engineers interested in these applications.

Mining and Metallurgical Engineers

Discuss Open-Hearth, Electric and Rolled Steel Problems
at Annual February Meeting—Important Drill Steel
Session—Enthusiastic Non-Ferrous Meetings

AN attendance which ranks among the largest was a feature of the one hundred and twenty-fifth meeting of the American Institute of Mining and Metallurgical Engineers last week, Feb. 20 to 23, in New York, at its headquarters in the Engineering Societies Building. The symposiums on mining, on foreign oil possibilities, on petroleum and gas were unusually well attended. The iron and steel section held two meetings generally regarded as some of the best; a feature was the unannounced appearance on the floor of the eminent British metallurgist, Harry Brearley. The sessions of the Institute of Metals Division were characterized by liberal attendance and marked enthusiasm. A meeting of the committee on breakage and heat treatment of drill steel recorded important progress in this field. The report covering the activities and business condition of the institute revealed a large increase in membership, the largest except in 1920, and a financial condition decidedly more satisfactory than in some years.

The Sessions on Iron and Steel

THE first of the two sessions on iron and steel, held Wednesday morning, Feb. 22, was in memory of Prof. Joseph W. Richards, who died last October. The chairman, Bradley Stoughton, spoke of Doctor Richards as for many years chairman of the iron and steel committee and as one of the chief authors of the institute's constitution and by-laws. The iron and steel committee of the institute had therefore decided to designate this session as one in memory of him as an old friend and benefactor. Due to the fact that several memorial meetings had been held and biographies printed, it was suggested that the testimonial at this meeting consist of those present standing in silent tribute to the memory of Doctor Richards.

Acid Open-Hearth Practice

The most important paper on the iron and steel program was entitled "Acid Open-Hearth Process for the Manufacture of Gun Steels and Fine Steels," by Col. W. P. Barba and Dr. Henry M. Howe. The paper, which covers 39 printed pages, is of large importance as a contribution to the literature of this subject and discusses the details of all phases of the process. It was presented in abstract by Colonel Barba.

The chief cause leading up to the formulation of this paper, which is essentially a committee report growing out of the war, was pointed out by Mr. Barba as the sore need of finding some way to stop the rejections of finished gun and other material, which developed in 1918. These conditions are clearly presented by an introduction to the paper by Prof. Comfort A. Adams, chairman of the engineering division of the National Research Council, which is in part as follows:

When this country went into the war, but two companies, the Bethlehem Steel Co. and the Midvale Steel & Ordnance Co., knew how to make steel fit for great cannons and at these concerns there were relatively few men who knew the whole art. Fortunately, certain of these men put their knowledge at the service of the Government, and proceeded to instruct the metallurgists at the arsenals and at various steel works.

The then chairman of the engineering division of the National Research Council, Doctor Howe, suggested that this work might be facilitated, and the number of effective gun-steel makers thereby increased, if a detailed description of the best practice could be written, giving the reasons for the various steps, and issued with the indorsement of a committee composed of those who were evidently the most competent authorities. It was thought that something would be gained by a clarification of the subject, and something by the eminent authority of the members of the committee. To that end, the engineering division appointed a committee, consisting of the gentlemen whose names follow, to mention only those who retained their connection with it.

At this time there were serious difficulties in the manufacture for the Government, of aircraft and high-speed engine crankshafts, of certain ordnance forgings and of shells for both the Army and Navy. This committee was asked to study and report upon these, with a view to betterment of them. There were indications that the source of some of

the difficulties went back to the melting of the steel and the production of the ingot. Hence, the committee first studied steel melting and ingot production, in order to guide the war-time manufacturers to an even larger percentage of useful production from the steel initially melted. The committee referred to above was as follows:

W. P. Barba, chairman, ordnance dept., U. S. Army (formerly vice-president and general manager Midvale Steel Co., Philadelphia).

George K. Burgess, division of metallurgy U. S. Bureau of Standards, Washington.

Henry M. Howe, then chairman engineering division National Research Council.

H. E. Kenney, metallurgical engineer Midvale Steel & Ordnance Co., Philadelphia.

Dorsey A. Lyon, Bureau of Mines, Pittsburgh.

Theodore W. Robinson, vice-president Illinois Steel Co., Chicago.

A. A. Stevenson, Standard Steel Works Co., Philadelphia.

Bradley Stoughton, then secretary American Institute of Mining and Metallurgical Engineers, New York.

W. R. Walker, assistant to the president, U. S. Steel Corporation, New York.

Frank D. Carney, Carney & Lindemuth, consulting engineers, New York.

The committee deputed the authors of the paper to prepare the proposed report, which they did forthwith. This was a few weeks before the armistice in 1918. The paper was completed soon after, so that it represents the work of the authors in the autumn and winter of 1918, but its publication has been delayed by several causes.

Anything like an adequate presentation of the contents of this paper is not possible in these columns. It embodies the results of a research into all phases of the metallurgy of acid open-hearth practice and the best opinions of the authorities on the committee. In his presentation of it Colonel Barba declared that it is impossible to transmit this metallurgical practice into the spoken word or the printed page. A broad idea of the paper in his opinion was comprised in the statement that adequacy of melting equipment was essential—an equipment which will insure the completion of all necessary reactions. With such equipment as a starting point, the following essentials must be observed: Selection of material; melt hot; refine hot; pour cold; use mold of a shape and design suited to the size of ingots best adapted to the finished product. Mr. Barba stated that Doctor Howe had worked prodigiously over this paper. It was also his opinion that American steel-makers are capable of producing as good steel as any foreign maker but there is necessary a program of education as to what grade or kind of steel is suitable for certain purposes. When this is appreciated, the consumer can obtain what he wants; at present in many cases he does not know this.

Discussion by Harry Brearley

Bradley Stoughton, in commenting on the paper, said that so much detailed information had been brought out it would be necessary to revise every text book at present dealing with the

The feature of the discussion was the appearance on the floor, unannounced, of Harry Brearley of Sheffield, England, the eminent British metallurgist whose name is so widely identified with the giving to the world of stainless steels. When his identity was realized, he was given a hearty reception.

Mr. Brearley laid special emphasis on the role which the casting temperature plays, pointing out that this temperature is not the temperature of the steel in the ladle but is determined by the temperature of the metal in the ingot mold. He was of the opinion that very hot Bessemer steel could be poured into good ingots if the temperature is not above the casting temperature in the molds and that the control of the casting temperature is accomplished by observing the temperature in the mold.

He affirmed his preference for the bottom cast ingot molds and explained his reasons by sketches on the blackboard. He acknowledged as one of the disadvantages the possible presence of certain dirt but affirmed that steel making is not a clean operation; in fact his practice, he said, was to clean all molds thoroughly with compressed air before pouring. As another advantage of bottom poured ingots, Mr. Brearley cited the fact that the interior of the mold shapes the ingot. He also recited what he regarded as a splendid measure of the cleanness of a steel and related his experience with a comparison of notched bar impact tests with ordinary tensile tests, the former being at once sensitive to any "dirt" when a progressive series of test bars is cut at various angles from a bar or plate of steel.

Electric Steel for Guns

Another paper along similar lines was that of W. J. Priestley, steel superintendent U. S. Naval Ordnance Plant, Charleston, W. Va., entitled "Sulphur and Oxides in Ordnance Steel." This was presented in abstract by the author but unfortunately was postponed from the morning session to the end of the afternoon, much to the disadvantage of securing discussion. The paper was published substantially in full in THE IRON AGE, Dec. 29, 1921, and commented on editorially. The author, in presenting the paper, gave his views on some of the points brought out in the discussion of the two steel papers presented at the morning session and displayed test bars of some German steel, which showed excellent physical properties from longitudinal tests and very poor ones from tests at right angles to these bars. It was brought out, however, by Colonel Barba that in material such as armor plate, there is a third dimension test which is equally important and the results of which mean much as to the quality of the material for certain purposes.

Chemical and Mechanical Properties of Rolled Steel

A paper, originally scheduled for the meeting of the institute at Wilkes-Barre, Pa., last September, entitled "Application in Rolling Effects of Carbon, Phosphorus and Manganese on Mechanical Properties of Steel," by William R. Webster, Philadelphia, was presented in abstract by A. A. Stevenson. A résumé of the paper was published in THE IRON AGE, April 14, 1921. It is a discussion of the relation between chemical and physical specifications for rolled material, and the question as to whether both are necessary to insure steel of desirable qualities.

In opening the discussion Bradley Stoughton characterized the results in the paper as a triumph for the author, who has maintained the possibility of producing steel of desirable qualities, made to specification, if one has enough data.

Dr. George B. Waterhouse, Lackawanna Steel Co., Buffalo, N. Y., was called upon and in response said he recognized it as a practical paper of wide interest and that his company would be glad to put at the disposal of Mr. Webster any formula or data they possess.

Ralph E. Sweeter, assistant to vice-president, American Rolling Mill Co., Columbus, Ohio, speaking from the blast furnace viewpoint, raised the question of dirty steel due to some peculiar quality of the pig iron; that in rolling steel some of it possessed good and some of it poor properties, although made from batches of pig iron of the same chemical analysis. The presence of oxide of iron had been suggested as the cause.

A. A. Stevenson, speaking on this point, said that it had been his experience that certain qualities in certain pig iron had seemed to persist throughout the making and rolling of the steel, poor qualities which could not be removed.

H. T. Morris, consulting engineer Bethlehem Steel Co., Bethlehem, Pa., cited the fact that analyses of the same steel from different laboratories did not always agree and declared the specification of physical properties and not chemical to be sound. It was his experience that the same chemical composition does not always give the same results in some cases.

Dr. George K. Burgess, Bureau of Standards, Washington, called attention to the great number of variables at work when attempting to make steel to both chemical and physical specifications and to formula, but that an important point

to be considered was the gas content of the steel. There should be suitable temperature control of operating conditions.

Quality of Steel and Case-Carbonizing

The afternoon session of the steel program was presided over by C. P. Perin, of Perin & Marshall, New York. "The Effect of Quality of Steel on Case-Carbonizing Results," by H. W. McQuaid and E. W. Ehn, metallurgists Timken Roller Bearing Co., Canton, Ohio, was presented in abstract by Mr. McQuaid. The paper presents the experience of the authors in their use of basic open hearth steel of the same analysis as their own electric steel and that the latter would not produce as good results. The authors concluded that, as a result of many experiments, the segregation of solims in the ghost lines was a contributing cause.

An interesting discussion of the paper was presented by H. J. French, Bureau of Standards, Washington, and illustrated with lantern slides. It was a comparison of open hearth and electric steel under various heat treatments, showing particularly the highest content of nitrogen in the electric steel.

"The Electrolytic Deposition of Iron for Building Up Worn or Undersized Parts" was presented by the author, David R. Kellogg, research engineer Westinghouse Electric & Mfg. Co., Pittsburgh. It is a recital of that company's experience in applying this practice in its own shops and many successful results are outlined. A paper, "Effect of Time in Reheating Quenched Medium Carbon Steel Below the Critical Range," was read by one of the authors, Prof. C. R. Hayward, but not discussed.

New Iron and Steel Committee

At this session the new committee of the iron and steel section was elected as follows:

Bradley Stoughton, chairman, John H. Hall secretary; Dr. G. K. Burgess and Enrique Tomico, vice-chairmen.

Since the death of Doctor Richards, the chairmanship has been filled by J. V. W. Reynders, but his election as first vice-president of the institute prevented his continuing in this capacity.

Session on Drill Steel Breakage

A meeting of considerable importance was held on Monday morning, Feb. 20, on the drill steel problem. It was a public session of the committee on breakage and heat treatment and drill steel with B. F. Tillson,

(Continued on page 623)

ARTHUR S. DWIGHT

Machine for Threading Large Pipe

The 12-in. pipe threading and cutting machine shown in the accompanying illustration is a recent addition to the line of the Landis Machine Co., Waynesboro, Pa.

The new machine can be used for threading oil-well casing and hydraulic pipe, in addition to ordinary line pipe. It has a range from 4 to 12 in. and can be equipped to thread and cut pipe as small as 2½ in. Two die heads are employed, a 6-in. head for pipe from 4 in. or 2½ in. to 6 in., and a 12-in. head for pipe from 6 to 12 in. The entire range of each of these heads is covered by one set of chasers. The length of the machine is 11 ft. and the width, 5 ft. It weighs 13,000 lb.

The carriage which supports the die head, the cutting-off tool, and the reaming tool is moved either by power or by hand, the power traverse being controlled by a lever on the operating side of the carriage. Automatic stops prevent the die head from coming in contact with the chuck in the forward movement, and the carriage from running off the guides in the backward movement. The reaming tool is set

to position and locked by a lever and the reamer fed to the pipe by rotating the cutting-off feed hand wheel in a counter clock-wise direction.

The drive is from a single pulley. Eight variations in speed are provided, and are obtained by shifting the levers on the side of the gear box, which is located under the main spindle. The machine is started and stopped through a friction clutch, levers for this purpose being placed at each end of the head stock, permitting convenient starting and stopping when threading or when fitting up flanges. The chucks for gripping the pipe have three jaws, which are geared and have universal adjustment. They are also self-centering to the pipe. The rear chuck is equipped with flange grips for fitting up flanges.

All gears are fully inclosed, and with the exception of the main drive gear and pinion all gears run in an oil bath. The main bearings are lubricated with flat link chains which run in oil contained in large reservoirs. The driving-pinion shaft and the reverse shaft are lubricated by sight feed oilers. In converting to motor drive a sprocket is substituted for the driving pulley and a plate fitted to the side of the machine for mounting the motor. The company's stationary pipe die heads are employed, as well as the Landis long life chaser. A silent chain is used to drive from the motor.

Stainless Non-Ferrous Alloys

The commercial development of stainless steel and iron appears to be causing perturbation among firms (British) interested in non-ferrous metals and alloys, which are perforce beginning to recognize that the new material threatens to supersede copper, brass, nickel, and aluminum for a number of purposes, says the *London Ironmonger*. A good deal of research work has been carried out lately with the object of evolving a stainless non-ferrous alloy, and is already bearing fruit in the shape of the introduction of improved forms of nickel-silver, containing a much larger percentage of nickel than ordinary nickel-silver, and being therefore harder, more durable, and of a color more nearly approaching that of silver. To assert that these metals are untarnishable and stainless may be to claim more

than the facts justify, but they undoubtedly represent a distinct advance in that direction, and, in the price should be about one-third less than that of stainless steel and iron. The additional percentage of nickel employed in these metals necessarily increases their cost, but as it gives extra strength it is possible to save expense by using sheets of thinner gage than are supplied in nickel-silver.

Apart from the question of stainlessness, the research has resulted in the production of a more homogeneous metal than formerly, and as this means greater ductility it will now be possible, for the first time, to make deep stampings and pressings from sheets of alloys with a high nickel content.

It is anticipated that the new metals will, to a considerable and increasing extent, supersede electro

silver plate for spoons, forks, cruets, table hollowware, wire, and numerous other purposes. The color may not be equal to that of silver, but restaurant-keepers and others whose table furniture gets rough treatment, and costs much money to keep in repair, may consider the appearance quite good enough for their purposes. The new metal certainly has solid advantages. Owing to

its strength, goods made of it are not easily damaged, they carry no surface of silver liable to wear off, and can be repaired without necessitating the costly operation of replating. Spoons and forks made of these alloys can be produced at less than half the cost of such goods made of stainless steel or iron.

Ore-Carrying Corporation a Common Carrier

WASHINGTON, Feb. 28.—The Interstate Commerce Commission has handed down a decision finding the Ore Carrying Corporation to be a common carrier which may lawfully receive from its trunk line connections divisions of joint interstate rates. The opinion is the result of a complaint filed by the Ore Carrying Corporation against the Central Railroad Co. of New Jersey, in which the complainant contended that it participates in tariffs published by the defendant, containing joint rates for the continuous carriage of iron ore by water and rail from Port Henry, N. Y., to interstate destinations. It was also contended that formerly the complainant received agreed divisions of the joint rates which were fair and reasonable in amount, but that since the increase of 40 per cent in those joint rates authorized on July 29, 1920, the defendant has refused to grant the complainant a corresponding increase in its division. In finding that the Ore Carrying Corporation is entitled to divisions of joint interstate rates, the commission points out that if the complainant and defendant cannot agree upon proper divisions, the matter may be brought to the commission for determination.

Opposed to Bonus

WASHINGTON, Feb. 28.—Seventy-two per cent of the membership of the Chamber of Commerce of the United States oppose a cash bonus for soldiers, according to the result of the referendum vote recently taken. The vote was intended to put the chamber's membership definitely on record and to supplement a declaration by resolutions adopted previously at two annual meetings. The decision represents the opinions of business organizations in 375 cities throughout the country.

Traverse of the Carriage Is by Hand Power. To advance the lever is pulled and held. To reverse, the lever is pushed forward and held. Releasing the lever stops the carriage.

Liquidation of Iron and Steel Prices

About 90 Per Cent of 1920 Excess Wiped Out—No Principal Product Now More Than 35 Per Cent Above the Average of Ten Pre-War Years

AS THE IRON AGE composite for finished steel is now lower than at any time since the last month of 1915, and the composite for pig iron lower than at any time since September, 1916, a study of the course of prices of the component elements, out of which these composites are made up, should be interesting. The basis for this study represents the average price

Course of Prices of Finished Steel Items

of the individual product, and of the composite, during the ten years from July 1, 1904, to June 30, 1914. This covers a period long enough to evaluate the ups and downs of varying financial conditions. It covers the panic of 1907-08 and the intense activity of 1905, 1906, the early part of 1907 and all of 1910, 1912 and 1913—all of these latter being years of high production. Analyses based on such data therefore stand on a firm foundation.

The high spot shown in each diagram represents the maximum reached during any part of the business boom of 1920. Most of these came in April to September,

Course of Prices of Steel Specialties, with Spread Over Intermediate Products

but wire nails were high in January and February. No account is taken in this study of the fantastic figures reached by some products in the summer and early fall of 1917, during the first flush of the war period, and before governmental regulation called a halt to the sky-rocketing tendencies of prices. The third point of interest is the price to-day of each of the individual items and of each composite.

Each of the three units of measurement is shown on the charts. The first chart shows the relationship of these various prices for the seven separate items making up the finished steel composite, and shows at the right the composite itself. The pre-war average is taken as 100 per cent in each case; the other two figures being related to that, as shown graphically. It will be noted that steel bars, beams and plates are now lower than before the war, and that the composite is above the pre-war average by only 18.7 per cent.

Similarly, in the second chart are shown the items of pig iron making up the pig iron composite, which is also shown. The first three items are the Philadelphia, Chicago and Birmingham foundry irons, the next being the average of the three. Next is the basic iron which averaged with the foundry average, gives the composite.

In the third chart are shown figures for subsidiary products not included in either composite, these including wire nails, tin plate and galvanized sheets. In addition to the products enumerated are shown the spread of tin plate over black sheets, the spread of galvanized sheets over black sheets and the spread of

Course of Prices of Pig Iron Items

wire nails over plain wire. It will here be noted that, at present prices, the spread of galvanized sheets over black sheets is less than it was before the war.

A comparison of the diagrams shows at once that pig iron was more responsive and more sensitive to local trade conditions than was the case with finished steel. The highest composite figure for pig iron in 1920 was 3.013 times the average before the war, while the corresponding average for steel was 2.353 times the pre-war period. Consequently a smaller percentage recession from 1920 peak prices on the part of steel products than that covered by pig iron will produce a return of pre-war conditions. As a matter of fact, the present recession of finished steel is 49.55 per cent, and the corresponding figure for pig iron 62.3 per cent. This leaves finished steel 18.7 per cent above pre-war and pig iron 14.6 per cent "up."

As a direct measure of liquidation of the 1920 peak excess over the pre-war average, it is found that in finished steel 86.2 per cent of the excess has been wiped off. Similarly, for pig iron, 92.85 per cent of the excess has been wiped out. Taking the two together, therefore, the progress of liquidation in the iron and steel industry may be stated roughly at 89 per cent. Aside from agricultural products, it is doubtful

ful if any other major industry can show a liquidation even approaching this.

There is a remarkable uniformity in the liquidation of various grades of pig iron. Chicago foundry leads with 98.3 per cent; Philadelphia foundry iron shows the least liquidation of any of the four grades covered in our composite. But even here it is 89.1 per cent. With finished steel the items of bars, beams and plates

have shown a liquidation in excess of 100 per cent, because their prices are now below those of the ten pre-war years. Of the other items, black sheets show 86.1 per cent; wire and black pipe about 71 per cent and open-hearth rails 63 per cent. Of the subsidiary items, galvanized sheets have liquidated 88.2 per cent, while tin plate and wire nails have liquidated about 78 per cent each.

Welding as Applied to Boilers and Other Pressure Vessels*

Mutually Antagonistic Attitudes of Proponents of Various Types of Welding - Lack of Confidence in Welds

BY E. R. FISH

AFTER several years' experience with the boiler code itself, the Boiler Code Committee of the American Society of Mechanical Engineers found that there was beginning to be a demand for a code covering unfired pressure vessels, of which there are a great variety. We did not know there were so many until we came to look into it. Many of these vessels are made by boiler manufacturers, and a great many of them are made, not by boiler manufacturers, but by tank builders as such. It also became apparent that the States were gradually tending toward improving such tanks in their rules, bringing such pressure containers under their jurisdiction, making them subject to inspection, and that if the great chaos that existed in the boiler trade was to be avoided in the case of tanks, it was desirable to have a code covering the construction of such pressure vessels.

It was with that idea in mind that the Boiler Code Committee appointed a sub-committee on unfired vessels, to look into the question and, if possible, draw up a code. The inspectors of many of the States expressed a very definite desire for a specific code of that sort which, if drawn up, would tend to become the uniform basis of construction, just as the boiler code has become a uniform basis of construction for boilers. That sub-committee was appointed almost three years ago, and gradually it got under way. A code was suggested and a hearing was held at the spring meeting of the society in St. Louis in May, 1920.

At that meeting it developed that the question of welding was really the paramount one. It was the crucial point on which the code really depended. I was not aware myself that so much welding was done on pressure vessels. Everyone knows, of course, that there have been many failures of pressure vessels, particularly of the welded type, and it was the failure of these that stimulated the activity on the part of many municipalities and States to include such vessels in their inspection requirements.

The question was finally referred to a sort of a coalition committee of the American Welding Society, the Welding Committee of the Boiler Code Committee and the Unfired Pressure Vessel Committee. The matter dragged along it developed that there was great difficulty in getting the interests together. The electric welding fellows were tremendously antagonistic to the oxy-acetylene men, and vice versa, and the forge welding people came into it, and finally the people who make brazed tanks, so that it got to be exceedingly complicated; and it was with great difficulty that any sort of an agreement or understanding of any kind could be arrived at as to what specifications, what limitations, should be imposed upon welded construction.

The final upshot of it was that we had another hearing at the annual meeting of the society in New York, last December, and the code as it had been submitted was published, and some tentative requirements for covering welding were written out. It was all put in pamphlet form and put in circulation and

distributed as widely as possible. The hearing drew the largest audience of any of the hearings that were held, indicating the tremendous interest that people had in it. Incidentally, I might say that it provoked, perhaps, the greatest difference of opinion and discussion of any of the hearings that were held.

My information on welding is not at all that of an expert. But I have heard enough to know that those who think they know all about it do not themselves know very much about it. It is entirely in a formative state. There is going to continue to be a great deal of it; there is going to be more of it; it is going to be improved, and one of these days we shall be using it to a much greater extent than now.

So far as boilers are concerned, the code committee at present shows no disposition to permit welding in the construction of boilers, where the pressure is not carried by some other means than the welding itself. It is not at all likely that the committee will change that position for some little time to come.

One of the principal considerations in connection with welded work, it seems to me, is that the welded part is not homogeneous. It has not the same physical characteristics as the plate. In the case of any pressure vessel in which there are changes in temperature, changes in pressure, or weaving actions of any sort, in the course of time the weld is bound to fail, not because of lack of inherent strength under a constant tension, but because of the fatigue of metal that is concentrated at that point.

That, perhaps, may give you a general idea of what the committee has been up against in trying to evolve a code for the unfired pressure vessels. It is easy enough, outside of welding, but unfortunately welding seems to be the principal stumbling block that is holding back the final promulgation of the code.

Farm Machinery Reduced

A reduction of approximately 40 per cent on all lines of farm machinery is announced by the United Grain Growers, Ltd., Winnipeg, Man. In making the announcement, C. Jones, general manager of the company said: "These new prices are not based on manufacturers' prices, but on what we consider a reasonable price for machinery compared with the price of farm products. Manufacturers' prices have not come down yet to a corresponding extent, but the United Grain Growers believe that by next year such a level for farm machinery prices generally will be established. We have based the spring price on the price prevailing in 1915. Generally speaking the prices of farm products are down to the 1915 level."

The United States Hoffman Machine Co., Inc., 101 Fourth Avenue, New York, manufacturer of clothespressing machinery, etc., with plant at Syracuse, has been merged with the United States Hoffman Machinery Co., organized under Delaware laws, with capital of \$11,250,000. E. D. Stocker is president.

*Abstract of paper read at Pittsburgh, Feb. 13, before American Boiler Manufacturers' Association.

NEW FOUNDRY EQUIPMENT

Stationary Machine for Filling Flasks—Five Molds Per Day Increased to Fifteen

A recent addition to foundry labor-saving equipment is a self-contained stationary flask-filling machine being placed on the market by the Osborn Mfg. Co., Cleveland. It is designed to take sand from the floor and place it in the flask on the molding machine.

With the outfit shown in the accompanying illustration it is claimed that it took two men $1\frac{1}{4}$ hr. to shovel sand into the flask, the same work being done by the machine in $1\frac{1}{4}$ min. It is further claimed that tests demonstrated that when the sand was shoveled by hand 5 molds a day were produced against a possible 15 molds with the aid of the flask-filling machine.

The machine is made up of structural shapes with suitable mechanism at each end for supporting sprocket

The Discharge Chute is Flexible and Distributes Sand to All Corners of Flask. Push-button control is a feature

wheels, upon which standard link chains are mounted. Buckets of special design are employed. A flexible discharge chute designed so that sand can be distributed into all corners of the flask is provided, as shown. The entire outfit stands alone without support. The drive is by an electric motor the capacity of which is determined by the amount of sand to be handled, a 15-hp. being required to handle 2 cu. yd. per min.

In addition to its ability to elevate and evenly distribute a large amount of sand in a short time, a feature of the machine is the ease of control. Control is by push buttons located at the end of the discharge chute, and under the operator's thumb. When not in use the machine may be completely shut off.

The machine may be placed either so that the receiving buckets will be at the floor level or below the floor. Placing several feet below the floor with an open grating at the floor level is recommended, and also that an opening be provided between the flask loader and the foundation pit. It is intended that as the sand is being cut by a sand-cutting machine that it be worked gradually into a heap around the loader, where preferably a clam-shell bucket could be used to good advantage. A portable machine is planned.

Electric Brass Furnace Investigation

The electric melting of brass has been studied by the Bureau of Mines for the past 10 years from the points of view of decreasing the losses of the constituent metals in brass, especially zinc; improvement in labor conditions; aiding in the conservation of fuel oil by substituting electric heat generated by water power or by coal; improving the quality of the brass and decreasing the cost of melting. In the course of the work a furnace type was developed by the Bureau

which has found wide use in the industry, both in foundries and rolling mills, more than half of the electric brass kilowattage of the country being connected to furnaces of this type. The Bureau has kept in close touch with makers and users of all other types of electric brass furnaces as well, and a comprehensive bulletin on the design, operation and commercial performance of all the furnaces is awaiting publication. Close contact will be maintained with this problem, but unless developments call for it, no active laboratory work is contemplated because electric melting has already become well established in the brass industry. Contact will also be maintained with developments in the use of electric furnaces for melting aluminum and other non-ferrous metals and alloys, and to a certain extent, with their use for melting gray iron, since some of the furnaces primarily designed for brass melting, including that designed by the Bureau of Mines, are to be tried out in such work.

Improved Specifications for the Composition and Heat Treatment of Gage Steels

An informal meeting was held in New York on Jan. 10 for the purpose of considering improved specifications of composition and the heat treatment of gage steels. The meeting was arranged by the ordnance department of the U. S. Army and was well attended by steel makers, gage makers and gage users. A subcommittee was appointed to arrange and carry out a comprehensive program with a view to determining, first, the physical characteristics required of gage steel and, second, the composition and heat treatment necessary to produce these characteristics. The active co-operative of Government research agencies, standardizing bodies, gage makers and users is contemplated by the committee in the program to be undertaken.

Hearing on Export Bill of Lading

WASHINGTON, Feb. 28.—The Interstate Commerce Commission has reopened proceedings regarding the export bill of lading and assigned March 4 as the date for further hearing. This is due to a communication received by the commission from the Shipping Board, in which the latter recommends that certain amendments which it considers essential be made in the export bill of lading prescribed by the commission on Oct. 21, 1921. Without these amendments the Shipping Board said it is unable to give its approval pursuant to the provisions of Section 19 of the merchant act of 1920, for the reason, among others, that the Shipping Board intends to promulgate a port bill of lading in the near future and believes that there should be no variance in essential particulars between the bills.

Allowances for Switching Not Required

WASHINGTON, Feb. 28.—Independent iron and steel manufacturers in Alabama have been unsuccessful in their efforts to compel trunk line railroads to make allowances for the performance by the former of switching services on inbound and outbound carload traffic to and from steel plants. The Interstate Commerce Commission in a decision made public last Friday held that failure of the railroads to move cars between interchange tracks and points within the steel plants, or to compensate the steel companies, does not result in payment by the steel companies of transportation charges which were or are unreasonable, unjustly discriminatory or unduly prejudicial. As a result, the complaint was dismissed. The case, entitled Gulf States Steel Co. et al. vs. Director General as agent, Louisville & Nashville Railroad Co. et al., included practically all of the larger independent iron and steel manufacturers in the northern part of Alabama, excepting the Woodward Iron Co.

Most of the inbound traffic moves under intrastate rates, and therefore the jurisdiction of the commission as to such rates and allowances was limited to cases falling within the provisions of Section 206 (C) of the transportation act of 1920. The commission held that the question before it was not the measure of the line

haul rates, but the character of the movement of inbound and outbound cars between the interchange tracks and points within the plants. Contention was made by the steel companies that the movement is a part of the transportation service and entitled them to allowances from the trunk lines. The commission said

that the steel companies have always made the movement at their own convenience and cost and were satisfied to do so without allowance until the rates were increased on June 25, 1918, and were willing to forego compensation if the rates in effect June 24, 1918, were restored.

Develops Multiple Shaper for Internal Gears

Down-Stroke Model Supplements Previous Machine of Stevenson Company Essential Features Retained

A DOWN-STROKE model of the multiple-shaper described in THE IRON AGE of July 28, 1921, page 197, has been brought out by the Stevenson Gear Co., Indianapolis. The machine previously described was of the up-stroke type, for plain external spur gears which can be passed through the tool head. The down-stroke machine is for use on internal gears, internal splines, external cluster and other gears, which cannot be passed through the tool head.

The new machine is known as model 6-A and resembles a vertical shaper or slotting machine in general appearance and principle of operation. Like the up-stroke model, the principal unit of mechanism is a special tool head which consists of a series of radially disposed tools spaced about the blank to be cut. Operation is the same as an ordinary vertical shaper except that the tools are held stationary and the work reciprocated past them. The ram carries a blank-supporting arbor. Other units are a mechanism for feeding the tools in to depth gradually to take successive cuts, as in a shaper, and a mechanism for indexing the gears being cut, a space equal to one tooth at every stroke of the ram.

Arbor Changed at Completion of Cutting

The advantages afforded by the new machine, as well as the up-stroke type previously described, lie in the changing of the work arbor at the completion of each arbor full of gears, which is said to be an exclusive feature of these machines. As the actual cutting time of the average arbor of gears is from 1 to 2 min., every second spent in changing blanks and in other non-productive operation, constitutes a considerable per cent of the operating time. To reduce non-productive time to a minimum a hardened and ground spindle and arbor are provided, which permit of quick and accurate removal and replacement. The design of the entire machine is said to be arranged to facilitate this operation. It takes about $\frac{1}{2}$ min. longer to change arbors on the down-stroke machine and therefore whenever possible the up-stroke machine is recommended. There are certain classes of work, however, that can only be handled by the down-stroke machine.

In cutting a gear the blanks are first placed on an arbor. The ram is then elevated to a distance sufficient to permit the tapered shank of the arbor to be inserted in the socket of the ram spindle. The operator then engages a power clutch by means of a lever, which causes a draw bolt, passing through the center of the spindle, to revolve, thereby drawing the arbor securely into the socket. The draw-bolt clutch has an automatic over-load throw-out for disengaging it as soon as the arbor has been tightened. The ram is then lowered by power to the cutting position, automatically stopping in the proper place. The machine is then started by an electric push-button switch. The entire cycle of motions in the tooth-cutting operation is automatic, permitting the operator to load a second arbor while the machine is cutting. When the cutting is finished the machine is stopped by the push-button switch, which operates an electric brake. The ram is then elevated to the position shown and the draw-bolt lever reversed, which ejects the arbor. The arbor of uncut blanks is then inserted and a new cycle of operation begins.

The tool head used is almost identical with that on the up-stroke machine, the tool bits and important parts

being said to be completely interchangeable. Two tool-heads are provided, one in use and one in reserve. The tools of the latter may be sharpened and reset to be in readiness to replace the one in use when the tools in operation become dull. The work arbor is interchangeable with those of the up-stroke machine.

Successive feeding movements are imparted to the tools by an annular sectional cam ring. As in the

Fig. 1 Up-Stroke Multiple Shaper for Internal Gears

model previously described the individual cam lugs are mounted on a large ring which surrounds the tool bits and spacing plates. The tool bits are adjusted individually along the T-slot relative to the cam ring and each other. Rotary feeding movements are given the cam ring through a gear train, seen at the left side of the tool head in Fig. 1, and are produced by a feed mechanism located on the left side of the machine, as shown. The final depth to which the tools are fed is determined by a micrometer stop, which limits the rotary feed movement of the cam ring.

A reverse feeding movement is imparted to the cam ring to provide relief to prevent the tools from dragging on the back stroke of the ram. The cover plate on top of the tool plate intermittently clamps and releases the tool bits during the cutting. The clamping is by means of an eccentric which is oscillated by a cam on the main crankshaft.

The feed mechanism is shown in Fig. 1 and Fig. 2 consists of the cams and levers for producing the feeding and relief movements. The spiral cam seen

near the center is rotated slowly and intermittently by a ratchet through a worm and wheel connection. The rotary movements of this cam gradually forces the fulcrum stud of the feed arm forward, which in turn produces a longitudinal movement of a sort of rack slide which is connected by a gear train to the

Fig. 2. Relief of Tools Is from Cam on Crankshaft, at Left

feed-cam gear on the tool head. This feed rack is made in the form of a worm engaging a worm wheel so that adjustments may be made by rotating the worm, thus advancing or withdrawing the position of the tool bits without change in the longitudinal position of the feed rack itself.

The relief movement of the tools is derived from a cam on the crankshaft and a rocker arm, seen at left of Fig. 2. This movement is transmitted by a connecting rod to a stud at the upper end of the feed rocker arm. The relief-cam rocker arm has a T-slotted extension which actuates the feed ratchet through a bevel gear segment and pinion. By adjusting the feed connecting-rod stud along the T-slot, any desired fineness of feeding may be obtained. A strong spring attached to the relief rocker arm serves to hold the follower roller in contact with the relief cam on the crankshaft.

Fig. 3. Details of Indexing Mechanism

Another spring, somewhat weaker, is attached to the feed rack slide and serves to hold the feed rocker arm in contact with the spiral feed cam.

The indexing mechanism—Fig. 1 and 3—consists of two semi-cylindrical guides, one of which is attached to the ram spindle, the other to a revolving drum on which is mounted a large spur gear. This is driven through change gears by a pair of intermittent Geneva gears, encased in an oil-tight housing, which are driven in turn from the crankshaft by a long connecting shaft—Figs. 4 and 2. The intermittent shaft driven gear and the compound gear shaft driven gear are used as change gears, and by varying their ratio any number of divisions desired may be indexed. A differential washer is incorporated as a driving member between the intermittent shaft and its gear, to provide an angular adjustment for cutting gears which have keyways, etc.

The ram mechanism consists of a crank which

drives a reciprocating rack slide which in turn transmits its motion to the ram through two gears on a rock shaft. The rack slide is in the form of a worm and engages one of the gears on the rock shaft which is made in the form of a worm wheel. When elevating the ram for changing arbors the rack slide is held stationary and given a rotary movement which rotates the worm wheel and rock shaft and moves the ram. This rotary movement is obtained through a gear train seen in Fig. 4, and derived from a small motor which also furnished the power for actuating the draw bolt. The elevating and lowering motion of the ram is limited by stop collars on the shifting rod which engage and disengage the driving clutches. The crank head is slotted and the crank pin made in the form of a T-bolt. It may be adjusted for any length of stroke from 0 to 6½ in., graduations on the crank head indicating the various lengths of the cutting stroke. The graduations provide for the extra length of stroke needed to give the necessary over travel before and after the cut begins, for indexing, feeding, etc.

To set the ram and work in proper relative vertical

Fig. 4. Side View Showing Drive and Part of Indexing and Ram Mechanisms

position to the tools, a stationary pointer is attached to the machine frame. A corresponding mark is made on the crank head in such an angular position to the crank pin that when the mark on the crank head is set opposite the pointer the ram may be adjusted downward until the lower side of the blanks is even with the cutting edge of the tools. The elevating control stops are then set to correspond. This feature is a great convenience to the operator.

These machines will be built in various sizes and models according to the size and nature of the product, from the smallest watch pinion to large circular saws. Where the number of pieces of one kind is great enough to warrant it, special machines or standard machines with special attachments will be built.

Insufficient attention has been given to the role which standardization is playing in German industrial reconstruction, it is declared by E. C. Peck, general superintendent Cleveland Twist Drill Co., chairman of the standardization committee of the American Society of Mechanical Engineers. "In no other country, except Great Britain," says he, "is standardization work being carried on upon a scale, or with an intensity, comparable to that in Germany." He points out that mass production is no longer primarily an American development, but that the lesson of the war has brought home to European countries realization of its significance. The mechanical engineers will also take up the question of standardization and research at the Atlanta meeting.

Four-Way Drilling Machine

The four-way drilling machine shown in the accompanying illustrations was developed by the Reed-Prentice Co., Worcester, for drilling the four holes in the rear-axle housing of a well-known tractor. Several of these machines are said to be in operation in various classes of automotive work, the makers claiming large output and high standard in quality of work produced.

There are four spindles, operated simultaneously by a feed mechanism inside the base, and engaged by the movement of lever A. When the drills have been fed through the work, an automatic trip releases the feed to the four spindles simultaneously. The trip cam is shown at B on the drum C. The cam comes in contact with the plunger D, thereby automatically tripping the feed.

The drive to the spindles is by belt. The spindles are advanced or withdrawn by turning hand wheel E, which controls the action of all the spindles. When the drills become short, the inner spindle, F, may be adjusted longitudinally and finally clamped to the main spindle by means of the closer, G. Forced lubrication is provided for all bearings inside of the machine, sight feed oilers being used for the main-spindle bear-

guide the drills, assuring close accuracy as to the plane of the holes and their angularity.

The machine is 96 in. long, 85 in. wide and 49½ in. high, overall. The maximum spindle travel is 3¼ in. The distance between opposing spindle chucks is 26 in. maximum, and from the flat of the table to the spindle center is 6 in. The weight is approximately 7560 lb. Motor drive can be incorporated when desired.

Another machine of somewhat smaller proportions covers lighter classes of work such as universal-joint rings and differential spiders; drilling the four holes simultaneously in the ring or turning the four arms simultaneously on the crosses. The smaller machines are not as heavy as the one described, although embodying the same features.

Cost of Living Slightly Lower

Monthly figures of the Bureau of Labor Statistics show the wholesale prices of all commodities during January to be 48 per cent above the average for 1913, compared with 49 per cent in both December and November. Only one of the nine individual groups showed a rise in January compared to December, this being farm products, with 8 points. All of the others showed

Four Spindles Are Operated Simultaneously by a Feed Mechanism in the Base. Detail view above shows the holding fixture

ings. The force system is also supplied for furnishing cutting compound to each drill.

The holding fixture is an outstanding feature, several novel arrangements being necessary to enable quick handling of the work, as well as properly locating it relative to the four working spindles. The fixture is clearly shown in the separate illustration. For guiding the work centrally four hardened steel strips, H, are located inside the fixture. Guiding pins in the lower part of the fixture engage two of the holes in the housings, as at J and K; these holes locating the bearings in the proper position for the drills.

The lower half of the housing is dropped into position first, after which four plungers in the bearings, 90 deg. apart, as at L, are forced toward the center by means of the lever M. The upper half of the housing is then dropped into position and set by means of the guide pins on the plunger, which are now in proper position, controlling the position of the housing by four holes in the flanges, as J, K, N and P. By means of the center bolt which passes through both of the housings, the work is clamped tight to the slatted portion of the plungers. This rigidly supports the work during the drilling operation.

After drilling, the upper part of the housing is removed and after withdrawing the four main plungers, the lower is raised by lever Q. This actuates four vertically-operated plungers, and brings the lower half into position for lifting out of the fixture. Hardened-steel bushings in the main body of the fixture serve to

decreases of from 1 to 5 points. In metals and metal products, which now stand at 17 per cent above the 1913 average, the decrease was 2 points. This item is only 1 point above farm products, and is far below any of the others. The highest item on the list still continues to be housefurnishing goods, which, together with building materials, are more than double their 1913 prices.

Our table shows the figures for the two most recent months and for January, 1921, and the peak in 1920. It shows also the amount of liquidation, between the 1920 peak prices and the present, of the excess of the peak prices over the average of 1913. Metals have been liquidated to a greater extent than any other group, except the farm products.

Index Numbers of Wholesale Prices, by Groups of Commodities					
	(1913 equals 100)				Liquidation, Per Cent

of March 3, 1879.

A Railroad Reservoir

Remote though a collapse of the railroads may seem, close students of transportation do contend that it will not take a great expansion of shipments to produce paralysis, more or less partial. A way out is suggested and this will probably interest business in general, as it involves buying of equipment. The drawback is that it is not clear that the power to help the situation will be exercised.

The proposal is to establish what may be called a national reserve of rolling stock and motive power to carry any or all of the railroads over a peak demand. The Esch-Cummins act provides the finances, as it is believed that the excess earnings over the 5½ per cent belonging to each road could be diverted toward establishing the reserve. It is estimated that on the 1921 account \$12,000,000 of excess earnings will accrue to the Government, as even under the adverse conditions of 1921, some railroads were capable of surpassing the 5½ per cent minimum.

The argument for the national reserve is, of course, that providing for the peak load burden should not be the concern of a few of the large railroads, and it follows that none of the large 100 nor of the 3000 large and small railroads is expected to provide the emergency capacity. It remains for railroad executives to ascertain just how under the transportation act they may establish, if they choose, railroad equipment to be used for the common good, so to speak; it seems clear that Government agencies are not likely to take the initiative.

If the railroads are left to drift, a car shortage will by that fact be surer. There will then be the renewed cry for Government ownership. Should the shippers put the onus on the private managements and should they turn an ear to the Government ownership propagandists, it would be difficult to save the railroads. The national reservoir of transportation facilities certainly looks theoretically attractive; indeed it appears as essential. The demand is for railroad leadership, which can now undoubtedly count on Gov-

ernment assistance in the executive departments, assuming no special legislation is necessary.

Employment in Coal Mining

It is a deplorable condition when the public is required to pay an excessive price for an article because there is an excess of capacity for producing the article. We are often told that the great law of supply and demand controls prices and this "law," as commonly interpreted, means, if it has any practical meaning at all, that the greater the productive capacity the more likely is the thing produced to be cheap.

What is the condition in coal mining that coal must be sold at a higher price, on account of the great productive capacity in existence, than would be requisite if the industry were efficiently aligned, with a smaller capacity?

Discussion is now rife as to conditions that will obtain at the union bituminous coal mines after April 1. The discussion is as to whether the United Mine Workers will negotiate with part of the former central competitive field, now that it is established that operators in certain districts, including the Pittsburgh district, refuse to take part in such negotiations, as to whether the miners individually will be disposed to strike to maintain the check-off, and as to various similar matters. The discussion takes no thought in the direction of the economic problem involved.

Yet there is a great economic problem. The miners demand a relatively high mining rate per ton because, as they say, they are not fully employed. They deny that citations of high earnings by certain miners furnish reason for reducing the tonnage rate, because those miners worked nearly if not quite full time, and the average miner is not permitted to do that.

No one denies that the miner should be paid a higher rate per ton than it would be fair and equitable to pay him if he worked full time. Thus we are as a matter of bare fact recognizing the principle of the minimum wage, however objectionable that principle may be. Surely we all know that the principle of the minimum wage

cannot be universally applied without producing confusion, disorganization and eventually a much worse condition than the one it would be aimed to improve. In general, the total amount of money received for goods sold or services rendered is divided 70 to 80 per cent for wages and salaries and 30 to 20 per cent for capital and direction.

If it were decreed that all wages and salaries should be raised to certain amounts, one of two things or a combination of the two would occur. Prices would advance so that the new income of the individual would buy no more than before, or part of the adjustment would be made by capital receiving less, whereupon a readjustment would begin through expansion in industry being stopped and the share of the capital already invested would increase, through buyers competing for the product of that capital. The scheme, generally applied, simply would not work. If applied to a small group of workers it could be made to work by laying the cost upon the other workers. That idea is repugnant. Why do we consider the practice natural and tolerable because coal mining is the field in which it prevails?

The inefficiency of the coal mining industry has been universally recognized and some little abortive attempts have been made to find means for improving the situation, such as the seasonal coal freight rate suggestion. There were very practical objections to that proposal, and at best it could not have done much good. It aimed to distribute employment of coal miners over the year, but that would leave the difficulty that the total employment in a year is not enough. Even if there were what by the common concept is considered full employment, there would be only one-third employment of the capital investment, for the highest objective is an eight-hour day. The crux of the matter, of course, is simply that the time of the miner is not efficiently employed. In recent years the miner has been indisposed to seek other employment for his spare time, the operators are indisposed to engage in new lines of business that could employ him, and the very thought is abhorrent to the labor leaders.

An extreme case of post-war liquidation is afforded by the market for 50 per cent ferrosilicon. While deflation in most materials playing a rôle in the iron and steel industry has been marked, there has been no parallel to that in ferrosilicon. In 1913 and 1914 this ferroalloy, so important in basic open-hearth practice, was selling at \$73 to \$75 per ton and at \$71 to \$73 per ton, delivered, in the two years respectively. During the war the price gradually advanced until in 1917 as high as \$250 was obtained for prompt delivery. Since 1920 there has been a gradual decline from a delivered selling price around \$80 to one ranging at present from \$55 to \$60 per ton, or a liquidation of over 25 per cent from the 1920 level and of about 22 per cent from the pre-war price. War demand was an incentive to the installation of new plants to make this alloy and the stocks left over after the 1920 boom have been one factor in the severe price recessions. It is a fact, however, that uses have been developed for the alloy in

other lines than in basic open-hearth steel making, and post-war conditions find it, if anything, a raw material of increased importance.

Again a Stainless Metal

Developments in stainless metals are following fast, one upon another, in Great Britain. The appearance of the so-called "stainless iron," and its possibilities, have spurred the non-ferrous producers to new achievements. If all reports are to be given credence, important results to industry may be the outcome.

The production of "stainless iron" and its properties were called attention to in these columns, Sept. 22, 1921. It is really low-carbon stainless steel which can be rolled and forged into sheets, wire and other products, a property not characteristic of the regular stainless steel. The principal drawback is its cost because of the expensive low-carbon ferrochromium necessary to its production. According to the latest reports, however, a new process has been discovered by an Englishman whereby this important low-carbon ferroalloy can be produced at around 20c. per pound and with a carbon content of about 0.25 per cent as compared to about 55c. to 60c. for the present product made here. The inventor has recently been in the United States looking after the rights in this country. Wide interest, amounting to enthusiasm, prevails in England because the possibility of cheap commercial production of a low-carbon, stainless steel is believed to open up wide uses for it as sheets, wire and many other materials, the results of which are obvious.

In the non-ferrous field, British research is reported to have developed a stainless alloy which threatens to supersede copper, brass, nickel and aluminum for many purposes. More details of this appear elsewhere in this issue. It is an improved form of nickel-silver containing a much larger percentage of nickel than ordinary nickel-silver and therefore harder, more durable and more nearly approaching silver in color, with the added claim that its price can be reduced to about one-third that of stainless steel or iron as now made.

These developments, and other similar ones more familiar, may not lead to the general use of stainless products but they bring visions of a possible "stainless metal age," when these or similar materials will find a thousand and one uses where rusting products now cause untold expense and trouble. The enthusiasts in England are predicting just such happenings, largely as a result of the recent discovery referred to. It is not wise to throw cold water on this belief, for only a few years ago stainless steel was unknown. One may safely take the position of watching developments, as sooner or later, each new thing, heralded and unheralded, finds its proper place in the scheme of things.

For an illustration of drastic slumping in American exports in 1921, one needs only to look to zinc statistics. It was probably without a parallel in that or any other metal. Foreign de-

mand for American zinc as pig, slabs, etc., in 1913 was 15,565,324 pounds. This totaled 243,830,248 pounds in 1919 and over 204,000,000 pounds in 1920, exceeding any of the war years. But in 1921 only 4,785,653 pounds were exported, less than one-third of the 1913 outgo and less than 2 per cent of the peak year. Were it not for the unprecedented demand last year from Japan, amounting to 2,645,355 pounds or over one-half of the total, American zinc exports would have reached almost the vanishing point. While the American zinc industry has never depended on foreign demand in normal times, the conditions last year of poor domestic demand, coupled with small exports, set down 1921 as one of the lean years in the industry.

Sound Principles Opposed

The recent decree agreed upon by representatives of the National Government and of the Bricklayers', Masons' and Plasterers' International Union of America is an indication of what a labor union will do under compulsion. Members of the union were facing prosecution and the evidence apparently was very strong against them. Under these conditions, it is not surprising that the decree proposed by the attorney general was agreed upon. But it should be noted that the ink on the decree had hardly dried when the executive council of the American Federation of Labor at a regular session at Washington adopted resolutions reaffirming its opposition to injunctions as a weapon against labor strikes and calling upon organized labor to ignore such orders when issued by the court. The resolution is militant in tone and calls upon organized labor to make a flat refusal "to recognize or abide by the terms of the injunction which seems to prohibit the doing of actions which the workers have a lawful right to do or which seeks to compel workers to do those things which they have a lawful right to refuse to do."

The principles laid down by Attorney General Daugherty to which the union agreed provided that there should be no limit to the productive capacity of the individual workman; that the right of the employer to purchase his material wherever and whenever and from whomever he may choose whether these materials be union made or otherwise should not be restricted; that there should be no favoritism shown by organized labor toward employers or trade associations or contractors' associations and no discriminations indulged in against the independent employer who may not be a member of such an association; and finally that the labor organization is not to be used as an instrument for the collection of debts or enforcement of the payment of alleged claims. All of these principles and particularly the first named are in direct conflict with the practices of many labor unions, and the statement of the Department of Justice set forth very clearly the abuses which have assumed various forms under the domination of the unions, often in co-operation or in conspiracy with contractors' associations. It would seem that a fair labor union would not

hesitate to adopt the principles, but it is too much to hope that this will become the case generally. On the contrary, the action of the executive committee above referred to indicates that a fight for the old abuses may confidently be expected.

Something, however, has been accomplished in fixing sound principles to govern, for a time at least, over 100,000 members of a prominent union, and courts have been furnished a fine example of what can be done toward the regulation of obstreperous union labor leaders.

Steel Ships Offered for Sale

Advertisements of the United States Shipping Board, published in papers in New York and elsewhere, list for sale a total of 1490 vessels, varying from 100-ft. tugs to ocean liners of 20,765 deadweight tons. The magnitude of this sales effort may be appreciated from the fact that the total deadweight tonnage of the 1406 ships listed by tonnage amounts to 9,972,195. This is greater than the total tonnage in 1914 of the German mercantile marine—then the second largest merchant fleet in the world. It is heavier than the combined tonnage to-day of the three largest merchant fleets outside those of Great Britain and the United States.

The principal group consists of 1294 steel cargo ships, varying from 2625 tons to 13,312 tons. More than 5,000,000 tons represent steel cargo ships of 8000 tons each and upward—a magnificent fleet of heavy duty cargo carriers which alone is far in advance, in point of tonnage and capacity, of the entire American merchant fleet of 1917. Steel tankers numbering 83, together with eight concrete tankers, account for a total of more than 800,000 tons additional. There are also 23 of the new 13,000-ton passenger and cargo liners designed for service to South American ports, and 20 steel passenger and cargo vessels seized from enemy nations at the beginning of the war. What will be the effect of the realignment of ownership of these ships, assuming that few will be bought for destruction or for use as monuments, is difficult to suggest, but the thought of the volume involved begets thought on the distribution.

Claims Board Dissolves

WASHINGTON, Feb. 28.—Its work having been practically completed, the War Claims Board of the War Department will be dissolved to-morrow. More than 30,000 claims against the Government in connection with war-time contracts, many of them made with iron and steel manufacturers, were recorded, only 31 of which remain undisposed of by the board, according to Acting Secretary Wainwright. The latter are of such a nature that they can be disposed of through the regular legal machinery of the War Department.

The Automatic Machine Co., Bridgeport, Conn., machinery manufacturer, held its annual meeting recently and elected the following officers for 1922: President, Frederick J. Kingsbury, New Haven; vice-president, James Coulter; treasurer and general manager, Norman Leeds; secretary, A. J. Porter. The directors are: Henry A. Bishop, M. F. Burns, William E. Burnham, James Coulter, Stiles E. Goodsell, F. J. Kingsbury, Norman Leeds and William R. Webster.

CORRESPONDENCE

Mr. Peters Replies to Mr. Roberts

To the Editor: I have read with interest the open letter by Frank C. Roberts, C. E., of this city, on pages 538-539 of your issue of Feb. 23, in which he criticises certain statements in the article on the Warwick Furnaces which appeared in THE IRON AGE of Feb. 2. As I happened to prepare the article in question, I deem it proper to ask that I may be permitted to point out to Mr. Roberts through your columns that he is hardly justified in definitely asserting that my statement "is incorrect" wherein I said that "the lines of the new (No. 2) furnace were obtained by proportionate enlargement of those of the older stack."

This information was given to me by the late Edward B. Cook, son of Edgar Cook, and as the procedure was rather unique to me, I made a note of it at the time. Fortunately for the defense of my statement and my memory, the facts are confirmed by Mr. Cook himself in his discussion of the paper on "Modern American Blast Furnace Practice" presented by H. A. Brassert at the May, 1914, meeting of the American Iron and Steel Institute.

Mr. Cook's remarks were confined to the practice at the Warwick furnaces and may be found on pages 102-113 of the year book of the institute for 1914, from which I quote as follows, the italics being mine: "First blast, 1901 to 1904.—*The lines of the first blast were obtained by practically making an enlarged photograph of the No. 1 furnace 70 ft. high, which had done satisfactory work on merchant pig iron of various grades, using the usual materials commonly employed in the East. The records show that the first blast was extremely unsatisfactory. Passing through the period of organization on a new plant would account for some of the trouble, but the management felt that there were serious difficulties with the furnace itself.* * * * The lines of the second blast were copied from the Edgar Thompson standard at that time."

I believe that a careful study of the records of the several blasts as shown on pages 112 and 113 of the publication above mentioned will to a degree substantiate my statement that "these lines did not give the desired results" as the change from the first lines resulted in marked improvement in daily output, fuel and stone consumption with a noticeable reduction in top heats.

I heartily subscribe to what Mr. Roberts has to say concerning Mr. Cook's ability as a furnace manager, and endeavored to convey this thought in the story as I wrote it, at the same time giving facts which seem to be a matter of record.

RICHARD PETERS, JR.

1008 Real Estate Trust Building,
Philadelphia, Feb. 25, 1922.

Casting Steel Pipe Centrifugally

To the Editor:—I have read with great interest your editorial in THE IRON AGE, Feb. 9, on the subject, "Progress in Centrifugal Casting."

I note that you mention, as still somewhat unsettled, the subjects of temperature control of the metal and proper speed for centrifugal casting. As a matter of fact, however, both of these have been pretty well determined, experimentally and proper rules for the temperature control have been established. The matter of speed is controlled by a simple formula of the type K/\sqrt{r} , where K is a constant that varies for different metals, and r the radius of the casting in inches. The full derivation of this formula, together with the rest of the mathematics of centrifugal casting will be given in my paper before the American Society of Mechanical Engineers, at Atlanta, Ga., in May.

L. CAMMEN.

New York, Feb. 14.

The Berwick Car Works, Berwick, Pa., has received an order to repair 500 cars for the Delaware, Lackawanna & Western Railroad.

Mechanical Engineers' Spring Meeting

The program of the meeting which the American Society of Mechanical Engineers is to hold in May in Atlanta, Ga., is planned to put special emphasis on engineering phases of Southern industries. Incidentally there will be excursions to Birmingham, Greenville, S. C., Mussel Shoals, Ala., and Pensacola, Fla. The society held a spring meeting in 1916 in New Orleans and it is emphasized that in the interval the increase in industrial activities promises especial interest in the meeting.

A business session will be held on the morning of May 8 and on the morning of May 9 will be held a session on machine shops, one on material handling in the steel industry, and one on the power test code.

On the morning of May 10 the subject of machine shops will be continued and the matter of fuels will be discussed. On Thursday, May 11, the sessions will cover management, power and welding.

Officers of American Engineering Standards Committee

At the adjourned annual meeting of the American Engineering Standards Committee held in New York on Feb. 9, Albert W. Whitney, a representative of the National Safety Council, was elected chairman, and George C. Stone, a representative of the American Institute of Mining and Metallurgical Engineers, was re-elected vice-chairman. Mr. Whitney is associate general manager of the National Bureau of Casualty and Surety Underwriters. A. A. Stevenson, the retiring chairman, is a representative of the American Society for Testing Materials.

COMING MEETINGS

March

American Society for Steel Treating. March 3. Sectional meeting, Hotel McAlpin, New York. Secretary, W. H. Bischoff, 1600 Prospect Avenue, Cleveland.

Refineries Manufacturers' Association. March 15, 16 and 17. Annual meeting, Chicago. Secretary, F. W. Donahoe.

Taylor Society. March 16 to 18. Midwinter meeting, City Club, Philadelphia. Managing director, Dr. H. S. Person, 29 West Thirty-ninth Street, New York.

April

National Metal Trades Association. April 19 and 20. Annual meeting, Hotel Astor, New York. Secretary, Louis W. Fischer, Peoples Gas Building, Chicago.

American Supply and Machinery Manufacturers' Association and Southern Supply & Machinery Dealers' Association. Joint Meeting, April 24 to 26, Birmingham. F. D. Mitchell, 233 Broadway, New York, is secretary of the American association and A. M. Smith, Smith-Courtney Co., Richmond, Va., is secretary of the Southern association.

Society of Industrial Engineers. April 26 to 28. Spring meeting, Hotel Statler, Detroit, George C. Dent, business manager, 327 S. La Salle Street, Chicago.

American Electrochemical Society. April 27 to 29. Spring meeting, Baltimore. Acting secretary, Dr. Colin G. Park, 119 Park Avenue, New York.

May

Iron and Steel Institute. May 4 and 5. Annual Meeting, Quarters of Institution of Civil Engineers, London, England. Secretary, George C. Lloyd, 28 Victoria Street, S. W., London.

American Society of Mechanical Engineers. May 8 to 10. Spring meeting, Atlanta, Ga. Secretary, Calvin W. Rice, 29 West Thirty-ninth Street, New York.

National Foreign Trade Council. May 10 to 12. Convention, Philadelphia. Secretary, O. K. Davis, 1 Hanover Square, New York.

National Sheet Metal Contractors' Association. May 15 to 19. Convention and exposition, Cadle Tabernacle, Indianapolis.

National Association of Purchasing Agents. May 15 to 20. Annual convention and exposition, Exposition Park, Rochester, N. Y. Secretary, H. R. Heydon, 19 Park Place, New York.

American Iron, Steel & Heavy Hardware Association. May 23 to 25. Annual meeting, Hotel Washington, Washington. Secretary, A. H. Chamberlain, Marbridge Building, New York.

HIGHER RATE ASKED

More Protection for Pig Iron Proposed—Slow Progress in Tariff Bill

WASHINGTON, Feb. 28.—Greater tariff protection for the American pig iron industry than is afforded in the Fordney bill, which carries the rate of \$1.25 per ton, was urged before the Senate Committee on Finance last week by a delegation of manufacturers. The rate asked was not made known. At present pig iron is free. Under the Payne-Aldrich tariff it carried a duty of \$2.50 per ton.

In asking that the rate in the House bill be increased, it was contended that the increased cost of labor and fuel, together with foreign competition, made a higher tariff rate necessary. It was further contended that if the bill is enacted as it now stands, the existence of the merchant iron industry in this country is endangered. It was stated that there is no probability of excessive prices because of a higher tariff rate, for domestic competition would take care of that phase. In order to keep the industry intact, pig iron must have the same degree of protection as that which is given to steel articles, it was stated.

The delegation was presented to the Finance Committee by Senator George Wharton Pepper and was accompanied by Harry S. McDevitt, Secretary to Gov. William C. Sproul, of Pennsylvania. The delegation consisted of Felton Bent of the Lebanon Iron Co.; Frank G. Kennery, of Philadelphia; John Milligan, of Dover; David Thomas of the Logan Iron Works, Philadelphia; Frank Richardson of Pittsburgh and William Clarke Mason of Philadelphia, counsel for the Philadelphia & Reading Coal & Iron Co.

Two Valuation Plans

The House Committee on Ways and Means and the Senate Committee on Finance have held conferences during the past week in an effort to wipe out their differences regarding the determination of a basis for tariff valuation. According to a tentative agreement, the Ways and Means Committee has scored a victory over the Finance Committee. This is contrary to the usual legislative history, for it is traditional that the Finance Committee does the disposing after letting the Committee on Ways and Means of the House do the proposing. The present success of the Committee on Ways and Means is attributed largely to the firm insistence of Chairman Fordney for an American valuation plan. Whether his attitude will prevail in the end

or not, is a question, but sentiment in Congress seems to be supporting him.

The plan as now worked out calls for the basing of duties on the American wholesale selling price of imported articles where there are no comparable domestic articles and on the straight American valuation plan where there are comparable articles. In view of the fact that iron and steel products made in this country are comparable with practically all of those manufactured abroad, the straight American valuation plan would apply to iron and steel imports if the tentative agreement as to a valuation plan is made permanent.

The agreement is said not to be relished by Senator Smoot, of the Finance Committee, whose proposal to base duties upon a foreign valuation had been tentatively determined upon by the committee through a vote of 5 to 4. The Smoot proposal also took into account depreciated exchange and the idea of flexible tariffs, the latter providing that the President might proclaim minimum decreases of not less than, and maximum increases of not more than, 50 per cent. The idea of flexible tariffs might still be adopted, as the Administration has gone on record in favor of this plan.

Switching of One Vote

The change in the attitude of the Finance Committee in favor of the American valuation plan or its equivalent, for Chairman Fordney considers that the basing of duties on American wholesale selling prices is American valuation, was due to the switching of one vote in the Finance Committee. The result has been that while the first vote was 5 to 4 in favor of the foreign valuation plan, the latest test vote was 5 to 4 in favor of the American valuation plan. There still is said to be considerable feeling between some of the Republican Senators of the Finance Committee and the Republican Representatives of the Ways and Means Committee.

Members of Congress are hoping to adjourn in June and that is one reason why the Finance Committee cannot hold out as firmly as it would otherwise, for it recognizes that if the bill is to be passed by that time there would be a great deal of work to be done in the way of rewriting rates if the foreign valuation basis were adopted. On the other hand, if the House American valuation plan is continued, the rewriting of rates would be a much simpler matter. There is no assurance, however, that Congress will be able to adjourn in June and many seriously doubt that the tariff can be enacted by that time. Undoubtedly, it will be the object of heated and prolonged discussion in the Senate.

Gompers Plan Not Practical

WASHINGTON, Feb. 28.—Secretary of the Navy Denby, in a letter addressed to President Samuel Gompers of the American Federation of Labor, says that the Navy Department, upon investigation, has found it impossible to comply with suggestions recently made by a committee headed by Mr. Gompers for the relief of employees "furloughed" from the Navy Yard as a result of stopping work upon ships, effected by the Conference on the Limitation of Armaments. Secretary Denby points out that the Navy Department has no funds available for the scrapping of vessels and also that it has neither funds nor authority to proceed with an auxiliary building program to provide employment for the employees who have been dismissed.

Passing upon the proposal that the Government yards be used to supply the needs of other Government departments, Secretary Denby said that should such a plan be adopted and the yards converted into industrial instead of Government plants, "it is difficult to see how the national unemployment situation will be in any way alleviated, even if it is found feasible to compete in the open market with industrial plants on the outside. As to this I have very serious doubt, for I know of no industrial plant in private life where such liberality is shown employees thereby increasing the overhead, as in the Government yards of the United States."

The Secretary said, however, that the suggestions made by Mr. Gompers would be presented to President Harding, as suggested.

Making New Records

Production records are being established by the new 600-ton blast furnace of the Trumbull-Cliffs Iron Co., joint subsidiary of the Trumbull Steel Co., Warren, Ohio, and the Cleveland-Cliffs Iron Co., Cleveland. For the first 15 days of February, the average output was over 600 tons on an average of 1850 lb. of coke per ton of iron.

The stack was lighted Jan. 16 and in 36-hr. produced its first run of iron. In one week it was averaging over 500 tons each 24-hr. period. One day subsequently it produced 711 tons of iron on an average of 1675 lb. of coke per ton of iron, this production being attained without use of borings—on iron ore only.

The furnace supplies hot metal to the open hearth department of the Trumbull Steel Co., directly across the Mahoning river at Warren.

The Charter Oak Machine Co., 438 Asylum Street, Hartford, Conn., on or about April 1 will move into its new plant in East Hartford.

LEGAL POINTS DECIDED

Federal Trade Commission Makes Rulings in Basing Point Case

WASHINGTON, Feb. 28.—Denial was made last Saturday by the Federal Trade Commission of all of the motions presented by the counsel for the United States Steel Corporation with regard to the procedure of hearings in the so-called Pittsburgh base case. The motions were argued by the Steel Corporation through its general solicitor, W. W. Corlett, and Counsel Charles A. Severance. At the same time, the commission granted a motion by its own counsel, H. K. Steinhauer, to amend the complaint by including a statement that the Pittsburgh base practice is used by the steel producers other than the Steel Corporation and also to make one or two other minor changes, the object of which, it was stated, was to clarify the record. The commission directed John W. Bennett, before whom the hearings are being held, to admit all evidences such as the Steel Corporation asked to be excluded, but to note on the record all objections made by the Steel Corporation's counsel. Arguments were made on the motion before the commission last Friday.

The motions argued on behalf of the Steel Corporation which the commission denied were as follows:

1. For the commission to specifically instruct Examiner Bennett to exclude the introduction by the Federal Trade Commission of contracts, invoices, correspondence or other evidences of purchases, agreements as to purchases, quotations or offers to sell, made by corporations or individuals other than the respondents to purchasers and prospective purchasers of any of the rolled steel products involved; and further that all evidences of the same heretofore introduced be stricken from the record.

2. That the examiner exclude admission of testimonials, resolutions, etc., to State legislatures, chambers of commerce and other public bodies as to the method of marketing steel through the Pittsburgh base system.

3. That the Federal Trade Commission direct the examiner to admit evidences from the commission's witnesses regarding cost figures, etc.

The ruling of the commission means that Examiner Bennett will admit evidences such as has been heretofore put into the record but will be required to use discretion in the matter of permitting questions by the respondents directed to commission's witnesses as to cost figures, etc., of the steel consumers.

The noting of exceptions by the examiner is required evidently in anticipation of the well-known fact that the case before coming to final conclusion will be contested through the courts and perhaps will finally reach the Supreme Court of the United States.

While the ruling by the commission makes it clear that the past procedure in the hearings can be continued but in a sense may clarify the record as suggested, it is plain that the record will be made extremely cumbersome because of the large volume of testimony that may be introduced, but to which exceptions may be noted by counsel for the Steel Corporation. The ruling of the commission also is interesting in view of the argument made by its general counsel, W. H. Fuller, that the commission did not have jurisdiction to rule on the motion. He contended that jurisdiction rests with Circuit Court of Appeals and therefore that the commission to attempt to pass on the motion would be to usurp the authority of the courts. This argument, however, was combatted by Mr. Severance.

The hearing will be resumed at Minneapolis this week.

Tensile Properties of Some Structural Alloy Steels at High Temperatures

In Technologic Paper No. 205 of the Bureau of Standards, the results are given of a number of determinations of tensile strength, proportional limit, elongation, reduction of area, and strength at fracture throughout the range 20 to 500 deg. C for four steels containing about 0.38 per cent carbon as follows: (a) Plain carbon steel; (b) 3.50 per cent nickel steel; (c) 3 per cent nickel and 1 per cent chromium steel, and (d) one per cent chromium 0.2 per cent vanadium steel. Brief reference is made to the types of fractures made in testing steels at various temperatures, and particular attention is paid to comparison of the tensile properties of these alloys at 550 deg. C. Of the four steels tested in normalized conditions, it appears that the two alloys containing chromium show greater resistance to weakening by increase in temperature to about 550 deg. C than either the plain carbon or 3.50 per cent nickel steels, and at this high temperature the chromium-vanadium steel is to be preferred from the standpoint of high tensile strength and limit of proportionality. The carbon and 3.50 per cent nickel steels behaved alike with rise in temperature above that of the room and at about 550 deg. C the addition of 3.50 per cent nickel appears to have but little effect upon the strength of the carbon steel.

Glenwood Motor Car Co.'s Plans

The Glenwood Motor Car Co., organized by Cleveland interests, has purchased a 15-acre tract along the Youngstown & Austintown Railroad in Youngstown, Ohio, where it plans to build a plant in the spring for production of a six-cylinder automobile. Initial unit will be a standard structural steel factory building 90 x 750 ft. During the first year of production, the company plans to turn out 500 cars, and at the end of the first 12 months to go on a five-car-a-day basis.

The company, organized under the laws of the State of Delaware, has an authorized capitalization of \$5,000,000 preferred stock and 200,000 shares of non-par

value common. Officers are: B. J. Cline, president and general manager; Capt. R. L. Quiesser, president of the R. L. Quiesser Co., Cleveland, secretary, and T. D. Lamb, president of the Hess Body Co., Cleveland, treasurer. Mr. Cline has had 22 years' experience in the automobile industry, and was formerly identified with the Chandler and Chalmers interests.

Railroad Operation in 1921

According to figures issued by the Association of Railway Executives, the total operating revenue of the 201 Class I roads for 1921 was \$5,569,888,000, or 10.6 per cent less than for 1920. The corresponding operating expenses are given as \$4,602,425,000, or 21.1 per cent less than in 1920. The operating ratio works out at 82.63 per cent, compared with approximately 70 per cent normal in pre-war times.

After taking care of various fixed charges, the net operating income available for interest, dividends, rentals and surplus amounted to \$615,625,619, or 3.31 per cent of the \$18,600,000,000 tentative valuation of the roads. Returns became better throughout the year, the December estimate being at the rate of 3.44 per cent.

Frey, Brassert & Co.'s Foreign Connections

In the interview with H. J. Freyn, president Freyn, Brassert & Co., Chicago, in THE IRON AGE, Feb. 16, it should have been made clear that the Chicago company has a working agreement with the German steel company, Gutehoffnungs Hütte, to represent its interests in Germany and other Central European countries; that the American rights to the McKune open-hearth furnace belong to the Miami Metals Co., Chicago, and not to Freyn, Brassert & Co., but that the latter company has secured an option on certain foreign rights to this invention. An error was made in stating that the cost of living and wages in Germany are respectively 25 and 30 per cent higher than before the war; they are 25 and 30 times higher respectively. Also German combinations are now becoming vertical instead of horizontal as before the war.

Iron and Steel Markets

OPERATIONS EXPANDED

Industry at 55 Per Cent Basis

Backlogs Obtained at Expense of Prices — Railroad Purchases Notable

Further expansion of steel making activities marked the last days of February. The gradual increase in production has been larger than tonnage sales would have indicated and shows how pressing are the necessities of the stock-bare consumers.

The increase of bookings has been accompanied by fresh weaknesses in price. The resultant unsettlement is thus still holding back a large volume awaiting evidence of price stabilization.

The United States Steel Corporation is making between 60 and 65 per cent of its capacity in steel; the independent makers, as a whole, are operating at nearly 50 per cent, and March opens at a 55 per cent rate for the whole country.

There is practically no contracting for future needs; there is little extension of delivery dates, and business is chiefly for prompt shipment, about the only buying for second quarter needs being in sheets and in pig iron.

Attempts are being made to stiffen prices, partly by refusal to bid at current quotations. In the case of wire a 10c. advance is general, reducing the spread between plain wire and wire nails.

Current activities of wire plants are not fully accounted for by mill bookings. Pipe mills, likewise well engaged, are in some cases stocking production. There is an unusually full engagement of tin plate mills, largely on old contracts. About 75 per cent of the sheet mill capacity of the country is in operation and sheet prices are among the few remaining firm, though buyers are not overlooking the weakness in other products.

The considerable number of price reductions with the broadening in consumption are accounted for in part by the concern shown by mills over building up backlogs. In the heavy tonnage products 1.35c., Pittsburgh, for bars, plates and shapes has been established. Tin plate is obtainable at \$4.50 and \$4.60 per box, against recent quotations of \$4.75. Frequent steep price concessions in steel pipe point to the possibility of a new card of discounts to bridge the difference between quoted and actual selling prices.

An inquiry of the New York Central for 40,000 to 50,000 spikes brought out a price of \$2 per 100 lb., against \$2.15 recently obtaining. Heavy rivets have been done at \$2 and \$2.10, though quoted 10c. higher. Cold-finished bars are now readily obtained at 1.90c., and \$2 concessions are noted on hoops and \$3 on bands.

The pig iron market in the East has shown a decided increase in activity. Sales of foundry iron in the Philadelphia district have amounted to fully 40,000 tons, largely to cast iron pipe and soil pipe manufacturers, while in New York the sales were about 25,000 tons of foundry grades to cast iron pipe and other consumers. Concessions of about \$1 a ton were made, but the prices

have since recovered. Charcoal iron has declined about \$4 per ton in the Chicago district, and owing to strong competition between Northern and Southern foundry grades, the recently named price of \$20 has been shaded 50c.

Increased melting has been an important factor in the pig iron buying, but so has the fear of a coal strike, with an upward tendency in the price of furnace coke and an actual advance in foundry coke.

In the large tonnage business the railroads are still conspicuous. Fresh rail purchases total 65,000 tons, including 20,000 for the Reading, 10,000 for the Atlantic Coast Line, 10,000 for the Santa Fe and 5000 for the Northern Pacific, and releases on existing contracts have been increasingly liberal. Upward of 15,000 tons of tie plates and splice bars, mostly for the Burlington, was bought in the West.

New car orders total 5300, again all business for Western car builders. Included are 500 more for the Burlington (completing its purchases of 7300 cars), 3300 for the Pacific Fruit Express and 1000 for the Great Northern. Of new business in locomotives the Burlington bought 55 of the 60 placed.

In the broadening market in which freer buying is noted from the automobile industry and even from the agricultural implement manufacturers, alloy steel is in notably better demand.

Pittsburgh

PITTSBURGH, Feb. 28.

Business in steel is better, but seemingly there is more anxiety on the part of manufacturers for orders than there is urgency about the demand, because the larger bookings have been accompanied by fresh weakness in prices in which few products have escaped, and which is really pronounced in the heavy tonnage lines. Some describe the price situation as more unsettled now than it has been at any time since the reaction began late in 1920.

Most of the recent developments of a character affecting the demand for steel have been favorable and there has been some actual broadening in the demand, but some mills evidently have been more concerned about the building up of a back log than in maintaining prices and have not hesitated about naming figures that would bring the orders. It is reported that a large tonnage of structural steel recently was placed in the East, at less than 1.30c., Pittsburgh, while a Pittsburgh maker of bolts and nuts is mentioned as having closed for a substantial tonnage of bars at 1.30c., base and 1.35c. has come to be regarded as a maximum instead of a minimum price on plates, shapes and bars.

Price concessions in steel pipe have been so frequent and so steep lately as to give rise to expectation of the issuance of a new card bridging the differences which now exist between quoted and actual selling prices. Tin plate prices are weaker and increased orders for most other finished products have been accompanied by weakness in prices. There is a firmer stand by wire manufacturers who, however, have given public recognition to a base of \$2.40 per keg for nails, and to the lower prices they recently were quietly accepting on other products from preferred customers. No important price cutting is noted in sheets, but it is not

Composite Price, Feb. 28, 1922, Finished Steel, 1.998c. Per Lb.

Based on prices of steel bars, beams, tank plates, plain wire, open-hearth rails, black pipe and black sheets	These products constitute 88 per cent of the United States output of finished steel.	Feb. 21, 1922, 2.005c. Jan. 31, 1922, 2.048c. Mar. 1, 1921, 2.793c. 10-year pre-war average, 1.689c.
---	--	---

Composite Price, Feb. 28, 1922, Pig Iron, \$18.10 Per Gross Ton

Based on average of basic and foundry irons, the basic being Valley quotation, the foundry an average of Chicago, Philadelphia and Birmingham	Feb. 21, 1922, \$18.36 Jan. 31, 1922, 18.31 Mar. 1, 1921, 26.14 10-year pre-war average, 15.72
---	---

denied that the weakness in other lines constitutes a menace to the sheet price structure.

Plant activities still are on a rising scale in this and nearby districts, but the gain has been greatest among the independent units, it being noted that some of the Steel Corporation subsidiaries have not done so well in the past week as in the week before. Independent plants as a whole easily are operating 50 per cent and some are running practically full, among the latter being the Weirton Steel Co., and the Trumbull Steel Co., while the Republic Iron & Steel Co. has 10 of its open-hearth furnaces on, and to-morrow will light another one. The Carnegie Steel Co. has turned the blast on two furnaces and now is operating 28 out of a total of 59 stacks. Sheet mill operations are close to 75 per cent of capacity, taking the industry as a whole, and there is unusual full engagement of tin plate mills, in this and nearby districts. Pipe mills also are well engaged, but there is some stocking of this product and current activities of wire plants are not fully accounted for by the mill booking.

The threatened strike of union coal miners also is something of a factor in present operations.

This market has grown slightly firmer on foundry pig iron, but there has not been enough done to establish changes in other grades. The coke market finds support from the fact that there is a market for coal at slightly better returns than are netted by coke at current prices. The market distinctly is stronger on the steel works grades of scrap, largely as a result of purchases by mills outside Pittsburgh which have not been adding to pig iron production.

Pig Iron.—There is a fair amount of activity in foundry iron, sales by one furnace interest over the past week having amounted to about 4000 tons, and prices have stiffened slightly. Practically all of the business placed has been at \$19, furnace, for No. 2 grade, and seemingly no more iron is available at a lower figure. It develops that the recent purchase of 1000 tons of basic by a Pittsburgh district sheet maker was from a Valley steel works furnace and that the price was \$17.75. Most producers now are quoting \$18 as a minimum, but there has been no business up

to determine whether that price can be obtained. Furnance interests generally are holding Bessemer iron at \$19.50, but this price is merely nominal and it is doubtful if it could be obtained on sizable tonnages. Stocks of this grade, however, are pretty light and since production is nil, there is not much pressure to sell. Carload lot sales have been done anywhere from \$19 to \$19.50. W. P. Snyder & Co. make the average price of basic iron from Valley furnaces for February \$17.75 as compared with \$18.1875 in January, and of Bessemer \$19.50, as against \$19.594 in January.

We quote Valley furnace, the freight rate for delivery to the Cleveland or Pittsburgh district being \$1.56 per gross ton.

Basic	\$17.75 to \$18.00
Bessemer	19.00 to 19.50
Gray to gray	18.75
No. 2 foundry	19.00
No. 3 foundry	18.75
Malleable	19.00

Ferroalloys.—Principal activity centers in spiegelisen. The purchase of a Valley steel maker turns out to be 600 tons instead of 100 tons as first reported. This was 16 to 19 per cent material and the price was approximately \$30 delivered, Youngstown. The source of the supply is not disclosed. A central Ohio steel maker has closed for about 1000 tons of the same grade, but this interest paid \$30 furnace, or slightly more than \$37 delivered, the seller being a commercial producer. Both sales were spot tonnages for prompt delivery, and because of meager stocks, the market is stronger for early than future deliveries. It is currently reported that an Eastern maker has booked a considerable tonnage of 20 per cent material for future shipment around \$25 furnace, and will start up a furnace shortly. A central Ohio consumer has an inquiry out for 500 tons of 80 per cent ferromanganese, and claims to have a quotation of \$2 per ton below the price now quoted by American and English producers. It is hard to establish \$62.50 seaboard, for this material because so many consumers were covered prior to the advance. German makers have not yet advised sales agents of any change in prices and we continue the quotation of \$58.35 seaboard, for 80 per cent. The market for 50 per cent ferrosilicon is quiet. A requirement contract covering the remainder of this year is said to have been made by a Pittsburgh consumer at \$57 furnace, freight allowed. Spot tonnages are available at \$55 to \$56 for domestic material.

We quote 78 to 82 per cent ferromanganese, \$62.50 c. f. Atlantic seaboard for domestic and English and \$58.35 for German. Average 20 per cent spiegelisen, nominal; 16 to 18 per cent, \$30 to \$35, delivered Pittsburgh or Valleys; 50 per cent ferrosilicon, domestic, \$55 to \$60 furnace, freight allowed. Bessemer ferrosilicon is quoted f.o.b. Jackson and New Stratsville, Ohio, furnaces as follows: 10 per cent, \$36.50; 11 per cent, \$39.80; 12 per cent, \$43.10; 13 per cent, \$47.10; 14 per cent, \$52.10; silvery iron, 6 per cent, \$25; 7 per cent, \$26; 8 per cent, \$27.50; 9 per cent, \$29.50; 10 per cent, \$31.50; 11 per cent, \$33; 12 per cent, \$36.50. The present freight rate from Jackson and New Stratsville, Ohio, into the Pittsburgh district is \$1.06 per gross ton.

Billets, Sheet Bars and Slabs.—There is a larger movement against contracts but open market transactions still are few and small. The market is not quotable above \$28, Pittsburgh or Youngstown, with freight equalized to point of consumption, for large billets. The last reported business in sheet bars was at \$29, Pittsburgh, but the difference in freight between Pittsburgh and Youngstown to destination was absorbed by the seller. There is an impression that on a sizable tonnage \$28 could be done on billets, sheet bars and slabs.

We quote 4 x 4-in. soft Bessemer and open-hearth billets at \$28; 2 x 2-in. billets, \$29; Bessemer and open-hearth sheet bars, \$29; slabs, \$28; forging billets, ordinary carbons, \$32, all f.o.b. Youngstown or Pittsburgh mills.

Wire Rods.—Makers who recently went as low as \$35 for the base size of soft rods appear to be unwilling to longer entertain that price and now are quoting \$36, while some claim to have turned down business at the latter figure. There is little business and the market is interested at the new price. Prices are given on page 617.

Steel Skelp.—Hardly enough is being done to establish prices, but it is admitted by some makers that an order carrying a price of 1.40c. would not be declined. Indeed, that price has been named on some recent in-

quiries and there seems to be no justification for quoting a higher price with plates readily available at 1.40c. and most makers in a position to roll skelp.

Wire Products.—Recent developments in connection with prices have been along the line of setting up double quotations, with the result that there now is one list for the quantity buyers and another and higher one for the small or intermittent purchaser. Nails are quoted publicly at \$2.40 base per 100-lb. keg, to the large buyer, while to those buying only occasional carloads an effort is being made to hold to \$2.50. There is a like spread in other products. Business is better than it was earlier in the year, but by comparison with other years, even prewar years, it makes a rather poor showing for this season, unusually marked by heavy orders and by the mills being several weeks behind in their deliveries. Today's situation is that the mills are well abreast of their orders and some actually could anticipate the needs of their customers.

We quote wire nails at \$2.40 base per keg, Pittsburgh, and bright basic and Bessemer wire at \$2.25 base per 100 lb., Pittsburgh.

Steel Rails.—There is more activity in light rails, due to the fact that the union coal mine operators, anxious to get out as much coal and to do as much development work as possible prior to April 1, are buying. Orders run small individually, but reach a fair aggregate. There has been no betterment in prices, because business is not sufficient to give all a share and competition between makers still is sharp. Light sections rolled from billets are quoted at 1.40c. to 1.45c. base, but the lower figure is more common, because re-rolled rails can be bought at 1.35c. base or less, and frequently from mills having favorable freight rates to destination.

We quote 25 to 45-lb. sections, rolled from new steel, 1.40c. to 1.45c. base; rolled from old rails, 1.35c. base; standard rails, \$40 per gross ton mill for Bessemer and open-hearth sections.

Iron and Steel Bars.—Demand for steel bars is better and includes some tonnages of fair size, one being for 300 tons from a Pittsburgh maker of railroad track tools, but accompanying the revival of interest on the part of buyers has been an effort on the part of some makers to accumulate a back log and considerably lower prices than recently prevailed have been named. An unconfirmed report has it that a Pittsburgh maker of bolts and nuts was able to place a fair sized tonnage at 1.30c., Pittsburgh. This appears to be below the average price idea of most makers, although in conjunction with plates and shapes that price is known to have been made on bars. There still is talk of 1.40c., but it is regarded as a negotiation quotation and applicable only on resale lots. The going market is 1.35c. base on both mild and reinforcing bars, but is weak and less can be done on large lots. Makers of iron bars here have made no change in prices.

We quote steel bars rolled from billets at 1.30c. to 1.40c.; reinforcing bars, rolled from billets, 1.30c. to 1.40c. base; reinforcing bars, rolled from old rails, 1.25c. to 1.30c.; refined iron bars, 2c. to 2.10c. in carloads, f.o.b. mill, Pittsburgh.

Structural Material.—Fabricating interests in this district continue to report a good inquiry, it being the experience of one that inquiries over the past week have been most numerous of any week in fully a year. Awards, however, are not in keeping with the inquiry, as there have been only a few involving more than 100 tons. The Pittsburgh-Des Moines Steel Co. has taken 150 tons for a school in Stowe township, Pa., while the Jones & Laughlin Steel Co. has the order for 125 tons for a shop building for the Columbus Mill & Mine Supply Co., Columbus, Ohio, and will fabricate 100 tons for the National Brick Co., Chicago. As intimated in these columns a few weeks ago, the Mellon-Stuart Co., Pittsburgh, has been awarded the general contract for the construction of a new four-story building for the Mellon National Bank, Pittsburgh, and the order for the steel aggregating between 1600 and 1700 tons is expected to be let shortly. On the bulk of current business in plain material, this market is quotable 1.35c. to 1.40c., but there is an impression that sizable projects will bring out a lower price. Prices are given on page 617.

Sheets.—Business continues to gain and there is a better engagement of mill capacity than before since last fall. The great bulk of the orders are for early shipment, but some second quarter deliveries are requested in the orders recently received by the Steel Corporation sheet making subsidiaries. Galvanized sheets figure prominently in the orders, and there also have been some good bookings of blue annealed sheets. In the main, there is pretty close observance of regular quotations, and it is claimed that even on the heavier gages of blue annealed sheets the regular base of 2.25c. is obtained more frequently than recently was the case. Buyers, however, are not overlooking the weakness in other products and continue their efforts to depress sheet prices. Quotations are given on page 617.

Plates.—Fair demand is coming out from tank builders, but competition among mills for a share of the business is resulting in low prices. We note one sale of 750 tons at about 1.35c., Pittsburgh, but on account of the milling and transit privilege the net cost to the buyer will fall well under that figure. Makers still are quoting 1.40c., Pittsburgh, for tank quality plates, but 1.35c. is the more common price against inquiry involving fair sized tonnages.

We quote sheared plates, $\frac{1}{4}$ in. and heavier, tank quality, at 1.35c. to 1.40c., f.o.b. Pittsburgh.

Iron and Steel Pipe.—There is a gradual, but steady improvement in orders for steel pipe, but the gain seems to go hand-in-hand with lower prices than recently have prevailed. The usual supplementary discounts on merchant pipe of one point and 5 and 2½ per cent have been extended by additional concessions of 2½ to 5 per cent. In oil country goods and line pipe, the competition for orders is even keener than in merchant pipe and prices are largely in favor of buyers. It will be no surprise if a new card naming lower prices soon is issued. Lower prices seem immediately ahead for wrought iron pipe as the present great spread between it and steel pipe retards business. Card discounts are given on page 617.

Boiler Tubes.—Business is better but not good and as far as prices of steel tubes are concerned the market is very unsatisfactory. Competition is so sharp that quotations have only a remote relationship to actual selling prices. Card discounts are given on page 617.

Tin Plate.—Independent mills in this and nearby districts are running at an extremely high rate. Full engagement is noted of the mills of the Jones & Laughlin Steel Co., the Weirton Steel Co., the McKeesport Tin Plate Co., the Standard Tin Plate Co., the Trumbull Steel Co. and almost full occupation of some of the smaller units. Specifications on old contracts rather than new business account for this condition. There has not been much foundation in recent important sales for a quotation of \$4.75, this being an "official" or basing quotation, and the large tonnage orders having been placed at around \$4.60. Even less than this is reported to have been done on Pacific Coast Business, while the export market lately has been around \$4.

We quote standard production coke tin plate, \$4.60 per base box f.o.b. Pittsburgh for carload lots.

Cold-Finished Steel Bars and Shafting.—The market is holding fairly well at around 1.90c. base, Pittsburgh, despite the fresh weakness in hot-rolled bars, and the fact that demand for cold-finished bars is of moderate proportions. Buyers merely are replacing stocks sold and no very large orders are coming out. Ground shafting is unchanged at 2.25c. base, mill, for carload.

Hoops and Bands.—Business is slightly better, but by no means good, buyers still being cautious on account of the uncertainty of prices. Makers are asking 1.90c. on both hoops and bands, but concessions of \$2 per ton on hoops and of \$3 on bands are not hard to obtain.

Hot-Rolled and Cold-Rolled Strips.—Cold-rolled strips still are fairly firm at \$3.50 base, Pittsburgh, but the market in hot-rolled strips leans in buyers' favor. The official quotation on the latter is 2c. base, Pittsburgh, but the bulk of the business is carrying prices, of from 1.80c. to 1.90c., and preferred buyers are able to place their orders below the lower figure. Business as a whole shows improvement.

Nuts and Bolts.—Makers in this district fail to

detect any appreciable improvement in either the demand or orders. Buyers still are taking on only their actual needs. Discounts are given on page 617.

Rivets.—The market still is dull and weak. Large makers still are holding to \$2.25 to \$2.35 for heavy rivets, but this seems to be solely for the purpose of protecting outstanding contracts, for business recently has been done as low as \$2 and \$2.10. A full range of prices now is \$2 to \$2.25 on large structural rivets and \$2.10 to \$2.35 on large boiler rivets. Some still are quoting small rivets at 70, 10 and 10 off list. Prices and discounts are given on page 617.

Spikes.—The recent inquiry of the New York Central Lines for 40,000 to 50,000 kegs of standard spikes brought out a quotation of \$2 per base 100 lb., and this now is regarded as the market for large lots. On smaller tonnages the common quotation is \$2.10 base per 100 lb. Small spikes also are weaker by about \$2 per ton. Prices are given on page 617.

Coke and Coal.—Stocking of coal in anticipation of a strike of the union miners on April 1 continues, and while prices have not advanced materially as a result, it is more profitable for Connellsville operators to ship coal than coke. Since a number of Connellsville ovens which started up on the recent flurry in coke prices have been put out, there is a dearth of spot tonnages of coke, and prices show considerable firmness. Little furnace coke now is obtainable as low as \$3.25 per net ton, oven, and the more common price range is from \$3.40 to \$3.50. The New Jersey Zinc Co. recently closed for 6000 to 9000 tons a month for the remainder of this year. This company is about to start up one of its furnaces at Hazard, Pa., on spiegeleisen. Spot tonnages of foundry coke now range from \$4.25 to \$4.50 per net ton, ovens, with the demand good and offerings light. The coal market now is quotable from \$1.50 to \$1.85, and mine run non-union steam coal from \$2 to \$2.10 for union coal of this grade and \$1.65 to \$2 for mine run by-product coal, and from \$2.25 to \$2.40 for mine run gas coal.

Old Material.—Prices of open-hearth grades have moved up sharply in the past week. Valley steel makers, in receipt of larger orders, have not been adding to their pig iron output, but rather have been increasing their melt of scrap and lately have been rather free buyers, paying up to \$5.50 for heavy melting grade. Other mills outside of Pittsburgh also have been buying and paying prices well above the Pittsburgh levels. The result is that little material has been coming through and the entrance of a Pittsburgh independent into the market for a round tonnage developed that nothing was available at less than \$15. Sales actually have been made at \$15.50 and the advance in this grade has sympathetically strengthened other open hearth material. Machine shop turnings are up slightly with some business noted at \$10.25 this district. Compressed sheets of the Westinghouse Electric & Mfg. Co. for shipment next month, are reported to have been sold at \$11.75, East Pittsburgh.

We quote for delivery to consumers' mills in the Pittsburgh and other districts taking the Pittsburgh freight rate, as follows:

Heavy melting steel, Steubenville, Follansbee, Brackenridge, Monessen, Midland and Pittsburgh.....	\$15.00 to \$15.50
No. 1 case, cupola size.....	16.00 to 16.50
Re-rolling mills, Newark and Cambridge, Ohio; Cumberland, Md.; Huntington, W. Va., and Franklin, Pa.....	15.00 to 15.50
Compressed sheet steel.....	12.50 to 13.00
Bundled sheets, slabs and ends.....	11.50 to 12.00
Railroad knuckles and couplers.....	15.50 to 16.00
Railroad coil and leaf springs.....	15.50 to 16.00
Low phosphorus standard bloom and billet ends.....	17.00 to 17.50
Low phosphorus plates and other grades.....	16.50 to 17.00
Railroad malleable.....	13.00 to 13.50
Iron car axles.....	23.00 to 24.00
Locomotive axles, steel.....	21.00 to 22.00
Steel car axles.....	15.50 to 16.00
Cast iron wheels.....	15.50 to 16.00
Rolled steel wheels.....	15.50 to 16.00
Machine shop turnings.....	9.75 to 10.25
Sheet bar crop ends.....	14.50 to 15.00
Heavy steel axle turnings.....	11.50 to 12.00
Short shoveling turnings.....	11.00 to 11.50
Heavy breakable cast.....	14.50 to 15.00
Stove plate.....	12.50 to 13.00
Cast iron borings.....	11.00 to 11.50
No. 1 railroad wrought.....	11.50 to 12.00

Chicago

CHICAGO, Feb. 28.

A slow but steady betterment in demand is dissipating the gloom which has hung over the steel market for many months, and is causing the trade to look forward to the future with confidence. Purchases by railroads and industries serving the railroads such as car builders and various supply manufacturers show no signs of letting up. New orders for cars placed with Western shops within the past fortnight total 5300. Heavy purchases of track materials are being made and rail specifications are increasingly liberal. New orders for rails include 10,000 tons for the Santa Fe and 5000 tons for the Northern Pacific, both of which were placed with the Colorado mill. A number of the carriers are in the market for bridge steel and a current inquiry from the Great Northern calls for 1000 tons of reinforcing bars.

Demand from other consumers of steel is also broadening, indicating increasing industrial activity and greater confidence in current prices. While most of this buying is for replenishment purposes, it is to be noted that mill deliveries are not quite so prompt as heretofore and some users are buying as far as 60 days ahead. Manufacturers serving the automobile industry are buying more freely and even farm implement makers are placing some orders, although they still have hang-over stock of raw material. The latter are in a much more cheerful mood because of the advance in the grain market.

The mills have maintained the gains in operation reported last week and further improvement is looked for. The Illinois Steel Co. has 12 active blast furnaces and is producing steel at 55 per cent of ingot capacity. The Inland Steel Co. is on a 60 per cent basis, but will increase its active capacity this week when its rail mill starts.

Pig Iron.—The market is on an uncertain footing. On the one hand, a number of orders have been taken at the new local price of \$20, base, furnace, notable among them being 300 tons of foundry for a Fox River Valley melter and 500 tons of foundry for second quarter shipment to a Michigan plant. On the other hand, Northern iron has come into competition with the Southern furnace which is now shipping by water and rail, and in a few instances concessions below the local price have resulted. Thus a local melter bought 150 tons of foundry at \$19.50, base, or \$20.20 delivered, estimating the switching charge at 70c. On this same inquiry the Southern furnace quoted \$20.27, delivered. The latter producer, however, has since advanced its price 50c., bringing the Chicago delivered price up to \$20.77, delivered. On 300 tons of foundry for delivery at Omaha, the delivered price figured back to \$18.50, base, Chicago furnace. This sale also was made in competition with Southern iron. Even those Southern furnaces which do not enjoy the benefit of a combination water and rail rate are making sales in certain parts of Chicago territory, notably Indiana and Michigan. One producer took four orders in Indiana during the past week, totaling 900 tons, at \$15.50, base, Birmingham. Inquiry is rather liberal, but buying is on the whole limited. Some melters who have put out inquiries are apparently unconvinced that the recent advance in local iron will hold and are therefore delaying their purchases. The Chain Belt Co., Milwaukee, wants 2000 tons of malleable and the Manufacturers' Foundry Co. and the Koehring Machine Co. of the same city are inquiring for 2000 tons and 500 tons of foundry respectively. The Walworth Mfg. Co. is in the market for 1600 to 2400 tons of foundry, and a Chicago company with plants at various points wants 3500 tons of foundry and malleable. A sale of 500 tons of resale, copper free low phosphorus was made at \$34.50, delivered. Furnace prices on low phosphorus, however, are firm. Charcoal iron has receded to \$22.50, base, furnace, a large producer having named this price. This reduction puts the charcoal product on a strictly competitive basis with coke iron at numerous consuming points.

Quotations on Northern foundry, high phosphorus malleable and basic irons are f.o.b. local furnace and do not include a switching charge averaging 70c. per ton. Other

prices are for iron delivered at consumers' yards, or when so indicated, f.o.b. furnace other than local.

Lake Superior charcoal, averaging	
sil. 1.50, delivered at Chicago.....	\$26.00
Northern coke, No. 1, sil. 2.25 to 2.75.....	\$20.00 to 20.50
Northern coke, foundry, No. 2, sil. 1.75 to 2.25.....	19.50 to 20.00
Northern high phos.....	20.00
Southern foundry, sil. 1.75 to 2.25.....	20.77
Malleable, not over 2.25 sil.....	20.00
Basic.....	20.00
Low phos., Valley furnace, sil. 1 to 2 per cent copper free.....	30.00
Silvery, sil. 8 per cent.....	32.82

Ferroalloys.—Except for a few carload sales the market is inactive.

We quote 78 to 82 per cent ferromanganese, \$70.90, delivered; 50 per cent ferrosilicon, \$56 to \$57.50, delivered; spiegelisen, 16 to 18 per cent, \$40.10, delivered.

Railroad Equipment.—The Pacific Fruit Express has placed orders for 2600 refrigerator cars with the Standard Steel Car Co., and 700 cars of the same type with the General American Car Co. The Great Northern has made the following additional purchase: 500 gondola cars from the Western Steel Car & Foundry Co., and 500 stock cars from the Pullman Co. The Chicago & North Western is expected to issue a formal inquiry this week for 3000 or more cars, including box, flat, gondola and refrigerator cars. The Burlington has placed 500 automobile cars with the Pullman Co., this being the last purchase against its inquiry for 7300 cars. This road has also ordered 47 locomotives from the Baldwin Locomotive Works and eight from the Lima Locomotive Co. A formal inquiry for 1000 box cars has been put out by the St. Paul.

Steel Castings.—The placing of 3300 cars by the Pacific Fruit Express and 1500 cars by the Great Northern will result in considerable business for castings manufacturers. The steel castings for the Burlington cars have not yet been placed. Outside of railroad car business, there is little castings work in prospect. An Eastern steel foundry owned by a shipbuilding concern has shut down. Although some instances of shading on the Eastern seaboard are reported, prices are rather generally on a parity with those published on pages 348 and 350 of THE IRON AGE of Feb. 2.

Bars.—Demand continues to broaden, embracing a greater diversity of manufacturing consumers. This buying is still largely for replenishment purposes, although in some cases 60-day contracts have been closed. It is to be noted that railroad equipment manufacturers are buying more freely and that plants serving the automobile industry are taking an active interest in the market. Even the farm implement makers are in a more cheerful mood and are placing a few orders, although they still have considerable stocks of raw material. Reinforcing projects continue to call for round tonnages. The Concrete Steel Co. will furnish 300 tons for the Popular Mechanics Building, Chicago, and 120 tons for highway work in Bureau County, Ill. The Concrete Engineering Co. has the contract for 300 tons for the Churchill Hotel, Chicago. Pending projects include a viaduct at Ironwood, Mich., for the Chicago & Northwestern and the Soo Line, 300 tons, on which bids are due March 1, the Indianapolis Athletic Club, 180 tons, and two junior high schools, Dubuque, Iowa, 120 tons. No material change is to be noted in going prices on mild steel bars and it is significant that prompt deliveries are not so easily obtainable as heretofore. Demand for bar iron is still subnormal and mill operations are intermittent. The Great Northern divided an order for 150 tons among several mills.

Mill prices are: Mild steel bars, 1.50c. to 1.60c., Chicago; common bar iron, 1.55c. to 1.60c., Chicago; rail carbon, 1.50c., mill or Chicago.

Jobbers quote 2.53c. for steel bars out of warehouse. The warehouse quotation on cold-rolled steel bars and shafting is 3.40c. for rounds and 3.90c. for flats, squares and hexagons. Jobbers quote hard and medium deformed steel bars at 1.90c. base. Hoops and bands, 3.18c.

Sheets.—Domestic demand is picking up and prices appear firm.

Mill quotations are 8c. for No. 28 black, 2.25c. for No. 10 blue annealed and 4c. for No. 28 galvanized, all being Pittsburgh prices, subject to a freight rate to Chicago of 88c. per 100 lb.

Jobbers quote: Chicago delivery out of stock, No. 10 blue annealed, 3.38c.; No. 28 black, 4.15c.; No. 28 galvanized, 5.15c.

Wire Products.—Mills emphatically deny that rumored purchases of nails at \$2.25 and plain wire at \$2.15 have any foundation in fact. So far as this district is concerned at any rate, the minimum going price on nails appears to be \$2.40 while plain wire is firm at \$2.25. Demand has appreciably improved and while jobbers still hesitate to pile up stocks, they are placing orders more frequently. Manufacturers also are buying more freely. Inquiries for 1000 tons of rods are in the market. For mill prices see finished iron and steel, f.o.b. Pittsburgh, page 617.

We quote warehouse prices f.o.b. Chicago: No. 9 and heavier black annealed wire, \$3.13 per 100 lb.; No. 9 and heavier bright basic wire, \$3.28 per 100 lb.; common wire nails, \$3.25 per 100 lb.; cement coated nails, \$2.65 per keg.

Rails and Track Supplies.—The Railroads continue to make heavy purchases of track supplies. The Burlington has bought 10,500 tons of tie plates, of which 3500 tons each went to the Illinois and Inland mills and the remaining 3500 tons were divided between the Interstate and other mills. This road also divided an order for splice bars between two local mills, one of which got 2400 tons and the other a smaller amount. The Union Pacific has placed 1500 tons of tie plates with the Colorado mill, 350 tons of track spikes with Inland, and 200 tons of track bolts with the Kansas City Bolt & Nut Co. Tie plates, spikes and bolts are slightly weaker as reflected in the quotations below. The Gary mill has booked 3000 tons more in rail orders and continues to receive liberal specifications against old contracts. The Inland rail mill will start operations this week.

Standard Bessemer and open-hearth rails, \$40; light rails rolled from new steel, 1.50c. to 1.60c., f.o.b. makers' mills. Standard railroad spikes, 2.05c. to 2.10c., Pittsburgh; track bolts with square nuts, 3.05 to 3.10c., Pittsburgh; tie plates, steel and iron, 1.65c. to 1.75c., f.o.b. mill; angle bars, 2.40c., f.o.b. mill.

Plates.—Railroad car construction continues to account for the major part of the demand for plates. Recent orders for cars by the Pacific Fruit Express and the Great Northern, together with an additional purchase of 500 cars by the Burlington, will result in the placing of fully 53,000 tons of steel on mill books. From general sources also, the demand for plates has improved, orders from boiler manufacturers being particularly encouraging. Although tank fabricators are not buying as heavily as some time ago, local mills are figuring on 2500 tons of plates for storage tanks to be built for the Sinclair Oil Co. in the Southwest. No material change is to be noted in the price situation.

The ruling mill quotations range from 1.50c. to 1.60c., Chicago. Jobbers quote 2.63c. for plates out of stock.

Bolts and Nuts.—Demand has improved and discounts are no weaker. Jobbers are placing some orders and automobile manufacturers are buying on a broader scale as their operations improve.

Jobbers quote structural rivets, 3.43c.; boiler rivets, 3.53c.; machine bolts up to $\frac{3}{4}$ x 4 in., 60, 10 and 10 per cent off; larger sizes, 60 to 10 off; carriage bolts up to $\frac{3}{4}$ x 6 in., 60 and 10 off; larger sizes, 55 and 5 off; hot pressed nuts, square and hexagon tapped, \$3.75 off; blank nuts, \$4 off; coach or lag screws, gimlet points, square heads, 65 and 5 per cent off. Quantity extras are unchanged.

Cast Iron Pipe.—Demand is active and prices are strengthening. The United State Cast Iron Pipe & Foundry Co. is low bidder on 1350 tons for Chicago. Moulton, Iowa, has let 250 tons of the National Cast Iron Pipe Co. and Stratton, Col., has awarded 200 tons to the American Cast Iron Pipe Co.

Toledo, Ohio, 1500 tons, bids in March 15.

Elyria, Ohio, 300 tons, March 1.

Ottumwa, Iowa, 250 tons, March 8.

Fremont, Neb., 330 tons, March 2.

Lucas County Commissioners, Toledo, Ohio, 1500 ft. of 6-in. and larger, April 8.

Detroit, 75 tons of 6-in., March 7.

We quote per net ton, f.o.b. Chicago, as follows: Water pipe, 4-in., \$45.60 to \$46.60; 6-in. and above, \$41.60 to \$42.60; class A and gas pipe, \$3 extra.

Coke.—Demand for foundry coke is steadily improving, with spot purchases more liberal and contracting ahead less infrequent. Connellsville prices continue to advance, but the local by-product price remains unchanged at \$10.75, delivered in Chicago switching district.

Structural Material.—Building prospects are improving, but it is to be noted that much more work is being figured on than is actually let. As spring approaches, it is hoped that the propensity to delay action on pending projects will diminish and fabricators will accumulate enough bookings to put their plants on an efficient operating basis. Prices on plain material are no weaker; in fact, the backlogs which railroad car orders have enabled the mills to build up have given the market some semblance of firmness. Fabricating awards include:

Kansas City Power & Light Co., power plant addition, Kansas City, Mo., 1700 tons, to Kansas City Structural Steel Co.

Diocesan Seminary for Catholic Church, New Orleans, 664 tons, to Ingalls Iron Works, Birmingham.

First National Bank, Albuquerque, N. M., 527 tons, reinforced construction substituted for structural steel.

Henderson Public School, Chicago, 500 tons, to Morava Construction Co.

Murat Shrine Auditorium, Indianapolis, 350 tons, to Rochester Bridge Co.

Milwaukee Electric Railway & Light Co., Milwaukee, addition to Lakeside Steam Generating plant, 160 tons, to Worden-Allen Co.

State highway span, Tomahawk, Wis., 300 tons, to Worden-Allen Co.

Standard Oil Co., 50 horizontal tanks, Whiting, Ind., 268 tons, to unnamed fabricator.

Klamath River Bridge, Hornbrook, Siskiyou County, Cal., 243 tons, to Minneapolis Steel & Machinery Co.

Biltmore Hotel, Los Angeles, 7000 tons.

Detroit Medical Building, Detroit, 1250 tons, bids in March 1.

Snowden Building, a 22-story structure, Memphis, Tenn., to be part reinforced and part structural steel, tonnages not yet estimated.

The mill quotation on plain material ranges from 1.50c. to 1.60c., Chicago. Jobbers quote 2.63c. for plain material out of warehouse.

Old Material.—Consumers are buying more freely and sellers are absorbing railroad offerings at advancing prices. While the change in the market situation is by no means pronounced, prices are generally firmer and sentiment is more optimistic. In addition to the recent orders placed by steel mills, an iron mill has bought 1000 tons of No. 1 wrought at from \$11 to \$11.25 per net ton delivered. The smaller gray iron foundries are placing orders for cast scrap. Railroad offerings include the Grand Trunk, American Lines, 4000 tons; the Pennsylvania Northwestern Region, 2000 tons; the Monon, 500 tons, and the New York Central, the Big Four, the Erie and the Michigan Central, blank lists.

We quote delivery in consumers' yards, Chicago and vicinity, all freight and transfer charges paid, as follows:

Per Gross Ton

Iron rails	\$16.00 to \$16.50
Relaying rails	20.00 to 25.00
Cast iron car wheels	15.00 to 15.50
Rolled or forged steel car wheels	13.25 to 13.75
Steel rails, rerolling	12.00 to 12.50
Steel rails, less than 3 ft.	13.00 to 13.50
Heavy melting steel	11.50 to 12.00
Frogs, switches and guards cut apart	11.50 to 12.00
Shoveling steel	11.00 to 11.50
Low phos., heavy melting steel	13.50 to 14.00
Drop forge flashings	7.50 to 8.00
Hydraulic compressed sheet	8.00 to 8.50
Axle turnings	8.50 to 9.00

Per Net Ton

Iron angles and splice bars	14.25 to 14.75
Steel angle bars	11.00 to 11.50
Iron arch bars and transoms	15.50 to 16.00
Iron car axles	19.50 to 20.00
Steel car axles	13.00 to 13.50
No. 1 busheling	8.50 to 9.00
No. 2 busheling	6.00 to 6.50
Cut forge	10.25 to 10.75
Pipes and flues	7.00 to 7.50
No. 1 railroad wrought	10.75 to 11.25
No. 2 railroad wrought	10.25 to 10.75
Steel knuckles and couplers	11.25 to 11.75
Coil springs	12.75 to 13.25
No. 1 machinery cast	13.50 to 14.00
No. 1 railroad cast	13.00 to 13.50
Low phos. punchings	11.00 to 11.50
Locomotive tires, smooth	10.00 to 10.50
Machine shop turnings	5.00 to 5.50
Cast borings	6.50 to 7.00
Stove plate	12.50 to 13.00
Grate bars	10.50 to 11.00
Brake shoes	10.50 to 11.00
Railroad malleable	11.75 to 12.25
Agricultural malleable	11.75 to 12.25

New York.

NEW YORK, Feb. 28.

Pig Iron.—A larger tonnage of pig iron was sold last week than for many weeks, the total amounting to about 25,000 tons. The principal buyers were the Warren Foundry & Machine Co., 7500 tons for second quarter; the Central Foundry Co., 7700 tons, delivery March to June; Essex Foundry Co., 2500 tons, delivery March to June; a heater company, 1000 tons, second quarter; special iron, 2000 tons; a wheel company 2500 tons, and other buyers small tonnages amounting to about 2000 tons. Some lower railroad prices are understood to have been made, but the market is firmer now and it is difficult to buy at less than \$20, eastern Pennsylvania, or \$18.25, Buffalo, for No. 2 plain. Very little attention is being paid to silicon, and one can buy No. 1 iron at almost the same price as No. 2 plain. No very large tonnages are pending this week, one of the principal inquiries being for 1000 tons of malleable. The pig iron market is no doubt affected by the uncertainty in regard to the coal strike, as no one knows to what extent the cost of manufacturing iron will be increased.

We quote delivered in the New York district as follows, having added to furnace prices \$2.52 freight from eastern Pennsylvania, \$3.46 from Buffalo and \$6.16 from Virginia:

East. Pa. No. 1 fdy., sd. 2 75 to 3.25	\$23.52
East. Pa. No. 2X fdy., sil. 2 25 to 2.75	23.02
East. Pa. No. 2 fdy., sd. 1 75 to 2.25	22.52
Buffalo, sd. 1 75 to 2.25	\$23.46 to 23.71
No. 2 Virginia, sd. 1 75 to 2.25	28.16

Ferrolloys.—The ferromanganese market is quiet, with business confined to the sale of carload lots for early delivery, both British and domestic, at prevailing quotations. There is an inquiry from an Ohio consumer for 500 tons. The scarcity of spiegeleisen of all grades is the feature and it is probable that this situation will result in the blowing in of at least one producer's furnace in the near future; there is also the incentive of fairly large orders for future delivery for both the 20 per cent and the 16 to 19 per cent grades. The 20 per cent grade has been exhausted and one producer has nothing left except some alloy analyzing about 13 per cent manganese. For the 16 to 19 per cent, the quantity available is still low, but the quotation is unchanged. There have been no developments in the manganese ore market and there seems to be no interest on the part of consumers. There is an inquiry for 300 tons of 50 per cent ferrosilicon before the market, and it is stated that Swedish 50 per cent alloy is being offered at \$4.50, delivered, but this is discredited in some quarters, as more than this can be obtained in European markets and also because sales are being made in this market for delivery in Europe. Quotations are as follows:

Ferrolloys

Ferromanganese, domestic, seaboard, per ton	\$62.50
Ferromanganese, British, seaboard, per ton	\$62.50
Spiegeleisen, 16 to 19 per cent, furnace, per ton	\$30.00
Ferrosilicon, 50 per cent, delivered, per ton	\$55.00 to \$60.00
Ferrotungsten, per lb. of contained metal	40c. to 50c.
Ferrotungsten, 6 to 8 per cent carbon, 60 to 70 per cent Cr., per lb. Cr., delivered	12c. to 14c.
Ferrovandium, per lb. of contained vanadium	\$4.00
Ferrocobaltititanium, 15 to 18 per cent, net ton	\$200.00
Ferrocobaltititanium, 15 to 18 per cent, 1 ton to carload, per ton	\$220.00
Ferrocobaltititanium, 15 to 18 per cent, less than 1 ton, per ton f.o.b. Niagara Falls, N. Y.	\$250.00

Ores

Manganese ore, foreign, per unit, seaboard, 25c. to 26c.	
Tungsten ore, per unit, in 60 per cent concentrates	\$2.00 up
Chrome ore, 40 to 45 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard	\$20.00 to \$25.00
Chrome ore, 45 to 50 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard	\$25.00 to \$27.00
Molybdenum ore, 85 per cent concentrates, per lb. of MoS ₂ , New York	50c. to 60c.

Cast-Iron Pipe.—The market continues to show improvement, with fair activity maintained by private purchasers. No new municipal contracts are reported, but one, calling for 2000 tons of various sizes for the Newburgh Water Department, was opened March 1. The City of Ilion, N. Y., is reported to have purchased 1000 tons of cast-iron pipe. Prices are unchanged and, if anything, inclined to stiffen. We quote per net ton, f.o.b. New York, carload lots, as follows: 6-in. and larger, \$47.30; 4-in. and 5-in., \$52.30; 3-in., \$62.30, with \$4 additional for Class A and gas pipe.

High-Speed Steel.—This market continues extremely weak and prices, which are difficult to base upon actual transactions, are largely nominal. Resales of various recognized brands have brought low prices, but producers are still quoting 80c. to 85c. per lb. for 18 per cent tungsten high-speed steel, with special brands of some companies bringing up to as high as \$1.05 per lb.

Old Material.—Present activity in the market is confined largely to steel mill buying. Prices during the past week have evidenced a slight stiffening, but the situation is not considered in the light of any distinct improvement over previous weeks. The Midvale Steel & Ordnance Co., which recently bought a small tonnage of No. 1 heavy melting steel for the Cambria Steel Co., at Johnstown, Pa., paying \$13.50, delivered Johnstown, came into the market again last week, purchasing a much heavier tonnage at \$14 per ton, Johnstown, which was probably partly the reason for a slight stiffening in the price of heavy melting steel, now quoted up to \$8.50 per ton, New York. A small tonnage of locomotive grate bars to Warren, Pa., was made at \$13.50 delivered. In general the market is not active.

Buying prices per gross ton, New York, follow:

Heavy melting steel, yard	\$8.00 to \$8.50
Steel rails, short lengths, or equivalent	8.25 to 9.00
Revolving rails	9.25 to 9.75
Relaying rails, nominal	27.00 to 28.00
Steel car axles	10.00 to 10.50
Iron car axles	17.50 to 18.50
No. 1 railroad wrought	9.50 to 10.00
Wrought iron track	8.25 to 9.00
Forge fire	5.25 to 5.75
No. 1 yard wrought, long	9.00 to 9.50
Cast borings (clean)	7.00 to 7.50
Machine-shop turnings	5.25 to 5.75
Mixed borings and turnings	4.50 to 5.00
Iron and steel pipe (1 in. diam. not under 2 ft. long)	7.75 to 8.25
Stove plate	10.00 to 10.50
Locomotive grate bars	9.00 to 9.50
Malleable cast (railroad)	8.00 to 8.50
Cast-iron car wheels	10.50 to 11.00

Prices which dealers in New York and Brooklyn are quoting to local foundries, per gross ton, follow:

No. 1 machinery cast	\$16.50 to \$17.00
No. 1 heavy cast (columns, building materials, etc.), cupola size	15.50 to 16.00
No. 1 heavy cast, not cupola size	14.50 to 15.00
No. 2 cast (radiators, cast boilers, etc.)	10.00 to 10.50

Finished Iron and Steel.—Keen competition for business has established another decline in prices of plates, shapes and bars. They are now to be had from some mills, when the tonnages are fairly attractive, at 1.35c., Pittsburgh. Even this price has been shaded in the case of large buyers, such as the car companies, which are said to be able now to cover their requirements at a 1.30c. basis. The break is ascribed largely to competition for 8000 tons of structural shapes and universal plates for the addition to the Macy department store, New York. The Levering & Garrigues Co., which was the successful bidder on the steel work, is reported to have placed the entire order with a leading independent at 1.275c., Pittsburgh. The effect of the new price situation has been to divert a fairly large amount of business to this same independent but at the same time fabricators which have recently closed contracts for steel buildings are now hesitant about placing orders for steel except at comparative prices. It is stated that the low price on the Macy work may not be duplicated, as the specification was unusually attractive. Some independent steel companies have notified their district sales offices not to go below 1.40c., Pittsburgh, on plates, shapes and bars, but it is reported to be difficult at the moment to close any business of attractive character at above 1.35c. Weakness in prices seems to affect other finished steel products, with the possible exception of sheets, which, considering the general situation, remain quite firm at 2.25c. for blue annealed, 3c. for black and 4c. for galvanized, all f.o.b. Pittsburgh. Wire nails are quoted at \$2.40 per 100 lb. keg, but there has been so much talk of \$2.25 that little business is being done at the higher figure. Some mills which reduced wire nails \$2 a ton did not change the price on plain wire, which they still quote at \$2.25 per 100 lb. Wire nails are active. There is keen competition for orders for cold finished steel bars and shafting, and though the nominal quotation of leading makers is 1.90c., Pittsburgh, this has been shaded as much as \$3 a ton. Some of the weakness in steel prices was in evidence in the export market prior

to the change in domestic prices. Plates, shapes and bars have been sold for export at 1.25c., Pittsburgh, while tin plate for export has gone as low as \$4 per 100 lb. base box. The nominal domestic price is \$4.75, but this is now seldom obtained and \$4.60 is being done on carload lots, while a fairly attractive tonnage can be placed at \$4.50. February sales, with some companies, have surpassed the tonnages booked in January. Export business shows some pick-up, Japan continuing as the leading buyer. Its wants, which had been largely confined to sheets, tin plate and galvanized wire, have extended within the past week or two to small bars and structural shapes. Inquiries for steel buildings are fairly numerous, giving promise of a fairly active building year. Among the new inquiries are the following:

National Academy, Washington, D. C., 500 tons.
Subway construction for the Southern Pacific at Houston, Tex., 650 tons.
Extension to power station at New Bedford, Mass., 400 tons.
Church of Christ Scientist, Park Avenue, New York, 400 tons.
Public School No. 67, Brooklyn, 500 tons.
Lackawanna Railroad, 2000 tons for bridges, of which 1500 tons is optional.
Office building, Sun Oil Co., Philadelphia, 400 tons.
High school building, Philadelphia, steel and reinforced concrete.
New bids to be opened this week on baseball stadium for New York American League club.

Awards which have been made include the following:

Two flats and an apartment building in New York to Hink's Iron Co., 2400 tons total.
Apartment building in Jersey City to American Bridge Co., 1100 tons.
Union High School in Elizabeth, N. J., to Hedden Iron Construction Co., 600 tons.
Mill building at Holyoke, Mass., to American Bridge Co., 400 tons.
Union Memorial Hospital, Baltimore, Md., to Dietrich Brothers, 750 tons.

Fabricated work continues to go at fairly low figures. A recent large job in New York is reported to have been placed at \$56, erected. Included in construction work now being figured on are several reinforced concrete jobs requiring a total of several thousand tons of bars. For New York State highway work 1700 tons of bars will be required. General contracts were awarded last week. Oil companies are still active in tank work. The Sinclair Consolidated Oil Corporation, New York, is asking bids on 20 tanks for Kansas, requiring about 6500 tons. Railroads are not active, but an inquiry from the Chicago & Northwestern for 3000 new cars will be issued shortly. Distribution of 1500 cars for the Great Northern has been completed. In addition to 500 refrigerator cars placed with the General American Car Co., as reported last week, the Pullman Co. was awarded 500 stock cars and the Pressed Steel Car Co. 500 general service cars. The New York Central Railroad has obtained prices on 5000 to 10,000 tons of tie plates. The Buffalo, Rochester & Pittsburgh Railroad closed bids last Friday at Rochester, N. Y., on 5000 tons of heavy rails, also angle bars, bolts, nuts and spikes. The Pacific Fruit Express has ordered 700 refrigerator cars from the General American Car Co. and 2600 from the Standard Steel Car Co.

We quote for mill shipments, New York, as follows: Soft steel bars, 1.73c. to 1.78c.; plates, 1.73c. to 1.78c.; structural shapes, 1.73c. to 1.78c.; bar iron, 1.78c. to 1.88c. On export shipments the freight rate is 28.5c. per 100 lb. and the domestic rate 38c.

Warehouse Business.—The situation in this district is generally unchanged, although a few warehouses report a continued improvement in business. Price shading on many items is still prevalent, and there is the usual activity in structural material. Cold-rolled bars have been reduced 10c. per 100 lb., which is in the nature of a revision to bring them down proportionate with other steel items. Brass and copper warehouses report transactions as fairly numerous, but extremely small and unprofitable. Prices here have weakened slightly, being off from ¼c. to ½c. per lb. on most brass and copper products. Wrought iron and steel pipe is without noteworthy features, but warehouses expect some revision of prices by mills within

the next few weeks. Prices in general are evidently weaker. We quote prices on page 636.

Coke.—Foundry coke has now advanced to \$4.50 and there is not much available at that figure, as large sales have been made in the past week on account of the fear of a strike of coal miners. Still higher prices are expected on both foundry and furnace grades. The price of by-product coke has not been advanced except that the \$8.59 price is now confined to points on the Pennsylvania, Erie and Lackawanna railroads, while the price delivered in New Jersey points on the Central of New Jersey is \$9.15. Higher prices on all grades are probable.

Cleveland

CLEVELAND, Feb. 28.

Iron Ore.—Figures prepared by the Lake Superior Iron Ore Association show that on Feb. 1 there was 25,257,000 tons of Lake Superior ore at interior and lake front furnaces. On that date there was at furnaces and on docks 33,480,000 tons as compared with 34,445,000 on the same day last year. Lake Superior ore consumption during January amounted to 2,493,000 tons, falling off slightly as compared with December, when the amount consumed was 2,577,000 tons. In January, 1921, the amount consumed was 3,701,000 tons. With stocks in furnace yards generally large, shipments from docks continue very light.

We quote delivered lower lake ports: Old range Bessemer, 55 per cent iron, \$6.45; Old range non-Bessemer, 51½ per cent iron, \$5.70; Mesabi Bessemer, 55 per cent iron, \$6.20; Mesabi non-Bessemer, 51½ per cent iron, \$5.55.

Pig Iron.—The demand showed a further gain during the week and February sales and shipments will aggregate a larger tonnage than during any previous month for some time. There was an increase in the number of small orders the past week and a fair number of large lots up to 800 tons were placed. The firmness that was noted a week ago is still in evidence with \$19 as the usual minimum quotation on foundry grades, although the market is apparently not established at this price for shipment to competitive points. Cleveland and Valley furnaces appear to be holding firmly to \$19. A fair improvement is noticed in the Michigan territory, this evidently being largely due to the increased activity of the automotive industry. One producer during the week sold 9000 tons including two 500-ton lots of malleable iron, one lot to an Indiana melter and another to an Ohio foundry. An Indianapolis consumer is inquiring for 500 tons of malleable iron. One Cleveland selling agency reports sales during February in excess of 35,000 tons and with four out of eight blast furnaces in operation, is now shipping as much iron as it is making. Other producers report a fair gain in shipments over January. Pickands, Mather & Co. blew in their Perry furnace, Erie, Pa., Feb. 25, this being the second merchant stack operated by Cleveland interests to go in blast during the month and the Otis Steel Co. is planning to blow in one of its Cleveland furnaces about April 1. Detroit, Toledo & Ironton Railroad has made a 20 per cent freight rate reduction on pig iron from Toledo to Detroit, or from \$1.54 to \$1.23 per ton.

Quotations below are f.o.b. local furnace for Northern foundry iron, not including a 56c. switching charge. Other quotations are delivered Cleveland, being based on a \$1.96 freight rate from Valley points, a \$3.36 rate from Jackson and a \$6.67 rate from Birmingham:

Basic	\$19.71
Northern No. 2 fdy., sil. 1.75 to 2.25	\$19.00 to 20.00
Southern fdy., sil. 1.75 to 2.25	21.67 to 22.17
Ohio silvery, sil. 8 per cent	30.86
Standard low phos., Valley furnace	32.00

Finished Material.—Orders continue to show an increase both in number and size and the tonnage booked during February represents a fair gain over January. Some of the mills that have been able to make almost immediate deliveries cannot now promise shipments under about two weeks. The improvement applies to about all finished products, although the demand for structural material has not improved as much as other lines. Some of the mills seem inclined to stiffen a little on prices. One Youngstown producer has shut down a plate mill, being unwilling any longer to meet the 1.40c. price and is quoting 1.60c. on the sizes that

are still being made. Ohio tank shops are figuring on a new inquiry for oil tank work requiring 1500 tons of plates. A local mill is adhering to a minimum of 1.40c., Pittsburgh base price on steel bars. The demand for alloy steel has improved as the result of buying by the automotive industries and the United Alloy Steel Corporation, Canton, is now operating 10 open-hearth furnaces or over 50 per cent capacity. Highway work has stimulated the demand for reinforcing bars. Hard steel bars are unchanged at 1.45c. The structural outlook continues to improve. The Austin Co. has taken the sintering plant for the McKinney Steel Co., requiring 950 tons of structural steel and Mt. Vernon Bridge Co. has taken bridge work for the Baltimore & Ohio Railroad requiring 400 tons, which has been placed with a Pittsburgh mill. Bids have been taken for an addition to the Gilsey Hotel, Cleveland, requiring 900 tons, for the Detroit Medical Building, Detroit, 1250 tons and for the Lakewood Market, Cleveland, 200 tons. The Hamilton Furnace Co., Hamilton, Ohio, has an inquiry out for its new blast furnace requiring 1400 tons of plates and structural material. New bids have been taken for the Philadelphia Free Library, requiring 4000 tons. The Lima Locomotive Works has taken five locomotives for the Clover Leaf Railroad and eight for the Burlington Railroad, the remaining 45 for the latter road being taken by the Baldwin Locomotive Works. The Carnegie Steel Co. has taken 1000 tons of rails and splice bars for the Cleveland Railway Co.

Jobbers quote steel bars, 2.36c.; plates and structural shapes, 2.16c.; No. 9 galvanized wire, 3c.; No. 9, annealed wire, 2.50c.; No. 28 black sheets, 3.75c.; No. 28 galvanized sheets, 4.75c.; No. 10 blue annealed sheets, 3.10c.; hoops and bands, 2.96c.; cold-rolled rounds, 3.25c.; flats, squares and hexagons, 3.75c.

Sheets.—There is an improved demand from the automobile industry for full finished sheets. Some fair size orders have been placed with the Cleveland mill by body builders who are buying only for early requirements. New inquiries have come from Japan for 1500 tons of No. 29 and No. 30 gage sheets. Regular sheet prices are being well maintained.

Steel and Cast Iron Pipe.—The Cleveland Water Works Department will receive alternative bids about April 1 for nine miles of 60-in. pipe for extensions. The work will require 22,500 tons of cast iron pipe or 13,000 tons of steel pipe. Bids for 2100 to 3000 tons of small cast iron pipe will be received about May 1. The department requirements will also include 1200 tons of special cast iron fittings. Seattle will take bids March 10 for 17 miles of 66-in. pipe, requiring 15,000 tons of $\frac{1}{2}$ -in. plates.

Old Material.—The market became more active during the week and also grew firmer, particularly on steel making grades. Youngstown and Warren mills came in the market for fair-sized tonnages and are reported to have purchased heavy melting steel at \$15, compressed steel at \$12.50 and mixed flashings at \$11.50 to \$11.75. Dealers are offering \$14.50 to \$14.75 for heavy melting steel to fill these new orders and it is reported that as high as \$15 has been offered by some dealers. There is some demand for scrap to fill orders for Cleveland delivery and dealers are offering \$13 for heavy melting steel and \$9.50 for borings and turnings, delivered at consumer's plants in Cleveland.

We quote per gross ton, f.o.b. Cleveland, as follows:

Heavy melting steel	\$12.25 to \$12.50
Steel rails, under 3 ft.	12.75 to 13.25
Steel rails, rerolling	14.50 to 15.00
Iron rails	12.00 to 12.50
Iron car axles	18.00 to 19.00
Low phosphorus melting	13.50 to 14.00
Cast borings	9.00 to 9.25
Machine shop turnings	8.75 to 9.00
Mixed borings and short turnings	8.75 to 9.00
Compressed steel	9.25 to 9.75
Railroad wrought	12.00 to 12.50
Railroad malleable	12.50 to 13.00
Light bundled sheet stampings	7.00 to 8.00
Steel axle turnings	9.50 to 10.00
No. 1 cast	15.00 to 16.00
No. 1 bushing	9.00 to 9.25
Drop forge flashings, over 10 in.	9.00 to 9.25
Drop forge flashings, under 10 in.	9.25 to 9.75
Railroad grate bars	12.75 to 13.00
Stove plate	13.00 to 13.25
Pipes and flues	8.50 to 9.00

Bolts, Nuts and Rivets.—The improvement in nut and bolt orders as previously noted, is holding up. Some export business has come out, including a two-car lot

taken by a local maker for shipment to England. Prices on semi-finished hexagon nuts have been established at lower prices than have appeared in recent regular quotations. The demand for rivets continues quiet, the \$3 a ton price reduction noted last week not having stimulated buying.

Coke.—Considerable activity has developed in Wise County foundry coke, the possibility of a coal strike evidently having stimulated the demand. Several sales at \$5.50 are reported, including 1500 tons to a sanitary interest. Connellsville foundry coke is firm at \$4 to \$4.50.

Cincinnati

CINCINNATI, Feb. 28.

Pig Iron.—The market was again quiet during the past week, though a few sales of over 100 tons were reported. A Cleveland district melter took 250 tons of silvery at the schedule, and a Dayton melter closed for a similar amount of Southern iron at a price reported to be on the basis of \$15.10, Birmingham. Several sales of 100-ton lots of both Northern and Southern were made to melters in this district, prices in practically all cases being on the basis of \$18.50, furnace, for Northern and \$15.50 for Southern. A sale made during the previous week is also reported, this being 4000 tons of Southern iron to a radiator company's Western plant. This iron was sold at a delivered price and both river and rail will be used in making shipment. The radiator company making the purchase is reported to have closed on 27,000 tons for its various plants, this being in addition to 15,000 tons placed in January. The market is, if anything, firmer, one lake interest which has been making low prices having advanced its price from 50c. to 75c. a ton. The lowest quotation reported in this market during the week was \$18.50, this being done in strongly competitive territory. Several inquiries are before the trade. The Link-Belt Co. is inquiring for 500 tons of malleable for Indianapolis plants, and the Indiana Reformatory is asking for 400 tons of various grades. The National Cash Register Co. is inquiring for four cars and the Home Stove Co., Indianapolis, for five cars. There is a fair market for alloys and several carload sales are reported. A local agency also reports a sale of 1500 tons of fluorspar. Belfont furnace at Ironton is scheduled to blow in shortly on Bessemer iron.

Based on freight rates of \$4.50 from Birmingham and \$2.52 from Ironton, we quote f.o.b. Cincinnati:

Southern coke, sil. 1.75 to 2.25 (base)	\$19.50 to \$20.00
Southern coke, sil. 2.25 to 2.75 (No. 2 soft)	20.00 to 20.50
Ohio silvery, 8 per cent sil.	30.02
Southern Ohio coke, sil. 1.75 to 2.25 (No. 2)	21.52 to 22.02
Basic, Northern	21.02
Malleable	22.02 to 22.52

Finished Material.—During the past week more orders were received for finished materials than has been the case for many weeks past. While it is true that the larger number of the orders are for single car loads, the fact that they came from many different sources is a source of gratification, as it indicates that more manufacturing plants are in the market for their needs. An inquiry for 1000 tons of bars is current, as are several tentative ones for structural material for buildings, which are expected to be awarded during the next week or so. Some fair sized orders are booked, including one for 300 tons of plates and another for 300 tons of shapes. More orders are also reported for sheets, and while these are all being booked for immediate delivery, the total tonnage is very satisfactory. Orders for wire products, while fairly numerous, show a falling off as compared with previous weeks, this, no doubt, being accounted for by expectations on the parts of buyers that lower prices will shortly develop. Bids will close on Feb. 27 for approximately 100,000 tie plates for the Big Four Railroad, and it is likely an award will be made later in the week. In the structural field, no new projects appeared during the week. Bids will close on March 1 for the Business Men's Club, Cincinnati, and the Athletic Club at Indianapolis, both taking substantial tonnages. A number of projects involving considerable tonnages for reinforcing bars

will likely be awarded this week, the chief of which is a new high school building at Middletown. Samuel Hannaford & Sons, Cincinnati, will receive estimates until May 14 for the construction of a reinforced concrete building for the Y. M. C. A. in Middletown. The building will be of four stories, 90 x 200 ft. Plant operations will show an increase; the American Rolling Mill Co. at Middletown contemplates putting in operation its Central Works in addition to its East Side Works, which has been running full time for some weeks past. This company will also operate its Ashland steel plant full time, although the sheet mills will not be put on at the present time. At the plant of the Newport Rolling Mill Co., where a strike is in progress, conditions are much improved and the company is operating at about 40 per cent in its sheet mill department.

Warehouse Business.—Jobbers continue to report an improved tone to the market and while orders are being taken only for immediate needs, the number is constantly increasing. Local jobbers of wire products have made reductions of approximately \$5 per ton in their prices. Common wire nails are now quoted at \$2.75 per keg base and No. 9 annealed wire at \$2.60 per 100 lb. The old prices were \$2.95 and \$2.85 respectively.

Iron and steel bars, 2 7/8c. base; hoops and bands, 3.35c. base; shapes and plates, 2 8/10c. base; reinforcing bars, 2 8/10c. base; cold rolled rounds, 1 1/2 in. and larger, 3.50c. base; under 1 1/2 in. and flats, squares and hexagons, 4c. No. 10 blue annealed sheets, 3.60c.; No. 28 black sheets, 4.25c.; No. 28 galvanized sheets, 5.25c.; wire nails, \$2.75 per keg base; No. 9 annealed wire, \$2.60 per 100 lb.

Coke.—February was the heaviest month for coke since the depression set in 18 months ago, according to most sellers, and prospects are equally good for March. The threatened coal strike is responsible for a great many consumers stocking up, although many orders are also being booked for second quarter. Prices while firming are quotably unchanged.

Old Material.—Scrap dealers report a much improved tone to the market. The Cincinnati district is still quiet, but many more inquiries are received from Valley points. While there is a tendency to buy against a threatened coal strike, dealers believe that present low prices are also attracting buyers and are looking for some good business. The Big Four Railroad is ordering 4000 tons. Prices, while unchanged, are much firmer and a moderate buying movement would in the opinion of dealers result in an advance.

We quote dealers' buying prices, f.o.b. cars:

Per Gross Ton	
Bundled sheets	\$3.50 to \$4.00
Iron rails	11.50 to 12.00
Relaying rails, 50 lb. and up	24.50 to 25.00
Revolving steel rails	10.00 to 10.50
Heavy melting steel	8.50 to 9.00
Steel rails for melting	8.50 to 9.00
Car wheels	11.50 to 12.50
Per Net Ton	
No. 1 railroad wrought	8.00 to 8.50
Cast borings	3.00 to 3.50
Steel turnings	2.00 to 2.50
Railroad cast	11.50 to 12.00
No. 1 machinery	13.00 to 13.50
Burnt scrap	7.00 to 7.50
Iron axles	15.00 to 15.50
Locomotive tires (smooth inside)	9.00 to 9.50
Pipes and flues	3.50 to 4.00

Buffalo

BUFFALO, Feb. 28.

Pig Iron.—The price of \$18.50 quoted by several Buffalo furnaces continues to attract inquiry from points outside the district, and the general run of small business is good in consequence. One furnace has sufficient tonnage booked to take all the product of one stack now blowing on foundry iron, and this situation will likely keep it out of the market for a time: Internal needs will not permit changing over the blast of the furnace now engaged in basic iron. Furnace operation is now likely to be changed in the near future and there is no disposition to blow in any additional stacks while the price situation remains where it is. Much of the inquiry is from points in New York State outside Buffalo and the East, particularly New England. An inquiry for 5000 tons from a buyer in Westfield, Mass., though not out, is expected soon, as indications have reached sellers that this interest may consider Buffalo iron. Out of a total of 5500 tons

inquired for at a Buffalo furnace, the largest single request was for 1000 tons. Sales for last week are well inside 5000 tons and \$19 was the exception rather than the rule. Much lower prices are reported in competitive territory, particularly New England, and little attention is being paid to differentials.

We quote f.o.b. per gross ton Buffalo as follows:

No. 1 foundry, 2.75 to 3.25 sil.	\$19.00 to \$19.50
No. 2X foundry, 2.25 to 2.7 sil.	18.50 to 19.00
No. 2 plain, 1.75 to 2.25 sil.	18.00 to 19.00
Basic	18.00 to 18.25
Malleable	19.00 to 19.50
Lake Superior charcoal	27.75

Coke.—Lively demand has developed a stronger market and best grades are now quoted at \$4.50 to \$5 f.o.b. ovens. A number of small buyers are buying ahead, having in mind the strike possibility.

Finished Iron and Steel.—Wire business represents the bulk of trade in finished materials. Bars, plates and shapes are quiet, and in the first named material it is obvious that \$1.40 price is more freely quoted. All materials on which prices are asked carry the additional condition that prompt shipment is a factor in the purchase. One mill has gathered sufficient bar orders to justify the putting in of an additional open-hearth furnace, bringing its total battery up to four. Electric welded fabric, spring wire, wire rope, are up to normal. Inquiry for small quantities of structural shapes for use in the spring is beginning to appear, and on larger operations architects promise some good-sized jobs will be out within the month of March. The Dellwood Elevator Co., which has a branch here, will erect an addition to its present facilities in Buffalo and the general contract has been given to the Pegels Construction Co., Minneapolis, Minn. The structural requirements have not been made known, but the job will require a large tonnage of reinforcing bars.

We quote warehouse prices f.o.b. Buffalo as follows: Structural shapes, 2.65c.; plates, 2.65c.; plates, N. 8 gage, 3.35c.; soft steel bars and shapes, 2.50c.; hoops and bands, 3.15c.; blue annealed sheets, No. 10, 3.40c.; galvanized steel sheets, No. 28, 5.25c.; black sheets, No. 28, 4.25c.; cold-rolled strip steel, 5.00c.; cold-rolled round shafting, 3.40c.

Old Material.—While the demand for all grades is good, expected advances in prices have not developed. Sales of heavy melting steel at \$13.50 have been made but are confined to 500 and 1000 ton lots. Production is far short of demand at the price.

We quote dealers' asking prices per gross ton f.o.b. Buffalo as follows:

Heavy melting steel	\$13.00 to \$14.00
Low phos., 0.01 and under	17.00 to 18.00
No. 1 railroad wrought	15.00 to 16.00
Car wheels	16.50 to 17.50
Machine shop turnings	7.50 to 8.00
Cast iron borings	7.00 to 8.00
Heavy axle turnings	10.50 to 11.50
Grate bars	12.00 to 13.00
No. 1 bushing	10.00 to 11.00
Stove plate	15.00 to 16.00
Bundled sheet stampings	8.00 to 9.00
No. 1 machinery cast	17.00 to 18.00
Hydraulic compressed	10.50 to 11.50
Railroad malleable	13.00 to 14.00

Birmingham

BIRMINGHAM, ALA., Feb. 28.

***Pig Iron.**—At close of February, Birmingham pig iron was stronger than it had been since the price and production slump began more than a year ago. The base was \$15.50, lower than at one time during the month, but demand was decidedly better, in greater volume, from a wider territory and from greater variety of melters than in many weary months. Practically all business was done on a \$15.50 base except under peculiar circumstances with an occasional car lot going at \$16. The strength of the market consists principally of the sold-up condition of more than one interest through March and inability to book more business for prompt delivery. One active interest withdrew from the market for March delivery last week because it was overbooked and had exhausted yard stocks with exception of a small quantity already cared for. Toward the end of the week it turned down a steady influx of orders, as many as a dozen in a day, on account of their being for prompt delivery and the company's inability to make that delivery on additional tonnage. Another maker was booked to capacity for March just about at week's close. The week-end witnessed what might almost be termed a clamor for small

San Francisco

SAN FRANCISCO, Feb. 23.

lots for prompt delivery over the South. One day's bookings by one maker included deliveries for Virginia, Louisiana, Texas, East St. Louis, Indiana and Ohio and involved 900 tons in lots of various sizes. Buying seems to be very general by all kinds of interests. Pipe interests are buying again and are figuring on large tonnages. Iron makers are inclined to look for a stiffening of prices following the healthy state of the demand. Lots of 300 to 500 tons have been sold in St. Louis and Chicago territory at \$15.50. Birmingham iron is once more on a footing in competitive territory.

We quote per gross ton f.o.b. Birmingham district furnaces as follows:

Foundry, silicon 1.75 to 2.25	\$15.50
Base	14.50
Chicago water blast	32.00

Finishing Mills. The Tennessee company went to capacity production in its open-hearth department this week. This follows one of 77 per cent for three consecutive weeks and one of 50 to 60 per cent for some time prior to that. The fifth blast furnace at Ensley resumed making basic iron for the ingot mills. The rail mill, which for months produced 6000 tons a week and latterly 8000 tons, went this week on a 10,000-ton schedule. Plate, girdle and bar mills are on double turn. Atlantic Coast Line has placed 10,000 tons of rails with the Tennessee company and it is believed Ensley will roll the 10,000 tons booked by the United States Steel Products Co. for the Imperial Japanese Government. A vessel is now headed to Mobile to take rails for Japan. American Steel & Wire and Gulf States Steel companies are credited with 60 per cent of production. Steel sheets are strong in demand in the Southeast owing to structural activity.

Cast Iron Pipe.—The American Cast Iron Pipe Co. and National Cast Iron Pipe Co. are on practically full turn and three plants of the United States Cast Iron Pipe Co. are gradually increasing production. All three interests made sizeable bookings in the past two weeks, especially in the Middle West. Base is \$33. Sanitary pipe was still hanging fire last week, but makers are not worried. Demand seems assured. Cutting below the \$37 base is understood to have about ceased. Shops are averaging four days a week.

Coal and Coke.—Foundry coke makers were borrowing from one another last week to fill the acute spot demand. Toward the end of the week, all were taxed to supply the prompt shipment orders from all around, including Illinois, Kansas and Pacific Coast. The base remains at \$5.

Old Material.—Scrap dealers feel more hopeful than in a long time following the general toning up of the iron and steel markets and are holding rather firmly to the present scale.

We quote per gross ton f.o.b. Birmingham district yards as follows:

Steel rails	\$11.00 to \$12.00
No. 1 steel	10.00 to 11.00
No. 1 cast	14.00 to 15.00
Car wheels	13.00 to 14.00
Tramcar wheels	12.00 to 13.00
No. 1 wrought	12.00 to 13.00
Stove plate	11.00 to 12.00
Cast iron borings	6.00 to 7.00
Machine shop turnings	6.00 to 7.00

Boiler Sales in 1921

At the annual meeting in Pittsburgh, Feb. 13, of the American Boiler Manufacturers' Association, it was announced that 1921 sales of boilers, amounting to 547,505 h.p., represented between 25 and 30 per cent of normal. Sales, by quarters, and expressed in h.p., were as follows:

	Water Tube	Horizontal Return Tubular	Loco- motive	Vertical Tube	Total
1921					
First quarter...	57,987	38,054	10,058	12,258	118,357
Second quarter...	80,982	40,021	4,764	7,811	133,578
Third quarter...	77,771	53,717	7,018	7,953	146,459
Fourth quarter...	93,498	40,432	4,900	10,280	149,111
Year	310,239	172,224	26,740	38,302	547,505

Total January sales will slightly exceed 57,000 h.p. This is the highest total since November, 1920, and is at a rate 25 per cent greater than 1921 sales, and 15 per cent greater than sales during the fourth quarter of that year.

Pig Iron.—Though there has been but little improvement in actual business during the past two weeks, opinion seems to be that the movement of the trade is upward. Foundries have been inquiring more of late, and there has been a little better demand for castings. Interest is now divided between domestic and foreign material, the price basis of the former being a near approximation to that of imported iron. There has been a good deal of offerings for Gulf shipment in this market, but the business consummated has not been large. Perhaps the best deal was that involving 500 of basic domestic pig iron, which sold at a figure something under \$30, delivered San Francisco. Most of the business has been in small lots, and one large handler reports having disposed of about three cars all told at around \$33, ex ship, San Francisco, for foreign.

Coke.—The auxiliary Kobenhavn a few days ago delivered about 5000 tons of mixed coke and pig iron from Newcastle-on-Tyne. The large part of this cargo has already been sold to several of the local consumers, for the most part in small quantities. Business in coke continues steady, although the volume yet is not of great importance.

Finished Iron and Steel.—During the past fortnight there has been a better outlook in manufactured products, although even at present it cannot be said that the market is active; in fact, most makers report a slow condition. Prospects for constructions of various kinds have not been wanting, but so far many do not pass the primary stage, with the result that actual offerings of consequence are not numerous. There is, however, a better feeling, and jobs of smaller dimensions, involving from about 150 to 250 tons, are picking up. This seems to indicate that building construction work is showing some betterment. The most conspicuous prospect in this connection is that of the proposed Biltmore Hotel in Los Angeles, costing in the neighborhood of \$5,000,000. It is estimated that about 3600 tons of steel will be required on this job. Bids open March 8. A notable contract just closing is that for a State building at Sacramento, involving approximately 2750 tons of steel materials. The American Bridge Co. had the lowest bid. There is a prospect of 1000 tons of plates pending, but it has not assumed a very definite shape. The market for plates, shapes and sheets is moderately steady, although in the case of plates, undercutting prevails. One large interest reports having sold around 500 tons of sheets last month, and doing a fair business at present. One of the most active outlets for steel at present is the street railroads. Throughout the State and in those adjoining California, there is good activity in this line, and many are buying special work in better volume than for months past. A contract just awarded involves 2000 tons of 7-in. girder rails for a Southern street line. A traction company of Oakland is in the market for 250 tons of girder rails. A Portland street railway is inquiring for 525 tons of girder rails and for 700 tons of standard section T rails.

Cast Iron Pipe.—Relative quietness prevails in this market, although private business appears to be of good volume, large interests having several hundred tons each on their books. Prices remain about steady at around \$32, base. Practically the only municipal offerings are for 300 tons of 4-in. pipe, Glendale having readvertised; and for 50 tons of 6-in. pipe for Sacramento.

Old Material.—Melting grades continue to move in fair volume at about the standing basis of \$10 a gross ton, delivered at consumers' works. Cast iron scrap is an uninteresting line at from about \$20 to \$22. Owing to the heavy selling of melting steel during the past month, the market at present is congested and lower prices are anticipated. A 2000-ton sale was made recently, and one or two others averaged from about 1000 to 1500 tons. Desire of holders to liquidate seems to be the chief reason for this trading.

St. Louis

St. Louis, Feb. 28.

Pig Iron.—Several large sales of Northern pig iron were made during the last week, including 2000 tons of foundry iron for nearby shipment, 1000 tons of foundry iron for shipment over the next 90 days and 200 tons of malleable for immediate shipment. Sales of carloads and up to 100 tons continue to make up the greater part of the business, and these are for immediate shipment. These smaller orders seem to be on the increase. The Northern market is firm at \$20, Chicago, which price is being followed by the Granite City producer. The market for Southern iron is still at \$15.50, Birmingham. Most of the orders for Southern iron here are going to a producer who is moving it by water and rail from Sheffield. Previous to this week no business was accepted for this movement for less than a barge load, 300 tons, but now orders are being taken for as small amount as 50 tons, with the result that 1200 tons were sold in this market by this producer in the last week. This pig iron is being sold on the basis of \$16, Sheffield, to which is added the all-rail freight to St. Louis from that point, \$4.94, which is 80c. less than from Birmingham, making \$20.94, f.o.b. St. Louis, all rail, with an allowance of \$1.50 for barge shipment, thus reducing the price to \$19.44, f.o.b. St. Louis by barge and rail delivered to customer on railroad cars at his switch. Most of the purchasers were stove foundries, whose business is improving. Inquiries for Northern iron include 2000 tons reported last week and still pending for an Illinois melter, 2000 tons from a Southwestern melter, and several for from 300 to 500 tons for delivery over the next 90 days. The Eighth Federal Reserve bank reports that jobbing foundries are operating at about 22 per cent of capacity, and the larger steel plants at from 18 to 40 per cent. Manufacturers of heating apparatus have been operating at full time, and implement makers report a seasonal increase. There is an inquiry for a car of ferromanganese.

We quote delivered consumers' yards, St. Louis, as follows, having added to furnace prices \$2.80 freight from Chicago and \$5.74 from Birmingham:

Northern foundry, sil. 1.75 to 2.25	\$22.80
Northern malleable, sil. 1.75 to 2.25	22.80
Basic	22.80
Southern foundry, all rail, sil. 1.75 to 2.25	21.24
Southern foundry, sil. 1.75 to 2.25, rail and water	19.44

Finished Iron and Steel.—The market for finished iron and steel is quiet. There is hardly anything being done in structural steel because of the wage situation. All bids for the Jewish Hospital at Memphis, involving 300 tons of reinforcing bars, have been rejected and new bids will be asked for after a year. Owen, Payson & Carswell, Kansas City, are the architects for a new school to be erected at Fort Madison, Iowa, to cost \$265,000. Railroads are putting out no inquiries of consequence.

For stock out of warehouse we quote: Soft steel bars, 2.62½c. per lb.; iron bars, 2.62½c.; structural shapes, 2.72½c.; tank plates, 2.72½c.; No. 10 blue annealed sheets, 3.47½c.; No. 25 black sheets, cold rolled, one pass, 4.15c.; cold drawn rounds, shafting and screw stock, 3.65c.; structural rivets, \$3.52½ per 100 lb.; boiler rivets, \$3.62½; tank rivets 7/16-in. and smaller, 65 and 5 per cent off list; machine bolts, large, 60-10 per cent; small, 60, 10 and 10 per cent; carriage bolts, large, 55-5 per cent; small, 60 and 10 per cent; lag screws, 65-15 per cent; hot pressed nuts, square or hexagon blank, \$4; and tapped, \$3.75 off list.

Coke.—The demand for coke is increasing, although still largely confined to carload orders for immediate shipment. Consumers are content to buy only for immediate needs, and the fear of a coal strike has not as yet developed any desire to stock up. There has been an advance of 25c. to 50c. a ton, and the best brands of Connellsville are selling at from \$4.50 to \$5 a ton.

Old Material.—A decidedly better feeling has prevailed in the old material market during the last few days, owing to the large orders for cars and equipment reported placed by the railroads, but this sentiment has not yet reached the consumers, as they are still out of the market. Owing to the recent advance of \$2 a ton in Northern pig iron prices, cast iron scrap has suddenly become very scarce and the price on this com-

modity has stiffened considerably. Scrap couplers and knuckles and railroad springs are also in demand and these items are much stronger. The only railroad offerings reported is a list from the Louisville & Nashville Railway aggregating about 10,000 tons, and an open list issued by the Big Four, which closes to-day, also an open list issued by the New York Central, which closes on March 2.

We quote dealers' prices f.o.b. consumers' works, St. Louis industrial district and dealers' yards as follows:

Per Gross Ton	
Old iron rails	\$14.00 to \$14.50
Steel rails, retooling	10.50 to 11.00
Steel rails, less than 3 ft.	12.50 to 13.00
Relay lg rails, standard section	25.00 to 28.00
Cast iron car wheels	13.50 to 14.00
No. 1 heavy railroad melting steel	10.00 to 10.50
No. 1 heavy shoveling steel	9.75 to 10.00
Ordinary shoveling steel	9.50 to 10.00
Progs, switches and guards, cut apart	10.00 to 10.50
Ordinary bundle sheet	4.00 to 4.50
Cast steel bolsters	9.50 to 10.00

Per Net Ton	
Heavy axles and tire turnings	6.00 to 6.50
Iron angle bars	13.00 to 13.50
Steel angle bars	9.00 to 9.50
Iron car axles	18.00 to 18.50
Steel car axles	12.50 to 13.00
Wrought iron arch bars and transoms	11.00 to 15.50
No. 1 railroad wrought	9.50 to 10.00
No. 2 railroad wrought	8.50 to 9.00
Railroad springs	11.00 to 11.50
Steel couplers and knuckles	11.00 to 11.50
Locomotive tires, 42 in. and over	
Smooth inside	8.00 to 8.50
No. 1 dealer's forge	8.00 to 8.50
Cast iron borings	5.50 to 6.00
No. 1 busheling	8.00 to 9.00
No. 1 boilers cut in sheets and rings	6.00 to 6.50
No. 1 railroad cast	13.50 to 14.00
Stove plate and light cast	11.50 to 12.00
Railroad malleable	8.50 to 9.00
Agricultural malleable	9.00 to 9.50
Pipes and flues	7.50 to 8.00
Heavy railroad sheet and tank	5.50 to 6.00
Light railroad sheet	3.50 to 4.00
Railroad grate bars	9.50 to 10.00
Machine shop turnings	3.00 to 3.50
Country mixed iron	6.00 to 6.50
Uncut railroad mixed	7.00 to 7.50
Horseshoes	9.50 to 10.00
Railroad brake shoes	9.50 to 10.00

Buys Steel Rails

St. Louis, Feb. 28.—Missouri Pacific Railway bought 200,000 tons of 85 and 90-lb. steel rails, the bulk of the business going to the Colorado Fuel & Iron Co. and the remainder to the Illinois Steel Co. and Inland Steel Co. The same road has an inquiry out for 14,000 angle bars for 90-lb. rails and 39,000 angle bars for 85-lb. rails.

Boston

Boston, Feb. 28.

Pig Iron.—More activity is noted in this territory. The Draper Co., Hopedale, Mass., wants 1000 tons silicon 3.25 to 3.75, 100 tons prompt delivery and the balance as soon as possible, and a car of charcoal iron. The General Fire Extinguisher Co., Providence, R. I., wants 100 tons silicon 2.25 to 2.75, and 200 tons, silicon 2.75 to 3.25, March delivery, and equal amounts, April and May deliveries. The Milford Iron Foundry, Milford, Mass., is inquiring on 200 tons, silicon 2.75 to 3.25; the E. D. Jones & Sons Co., Pittsfield, Mass., for 150 tons No. 2 plain; the Portland Stove Co., Portland, Me., for 50 to 150 tons No. 2X; the Old Colony Foundry Co., Bridgewater, Mass., the Clinton Foundry Co., Clinton, Mass., and other melters for small tonnages, the aggregate active business amounting to 3000 to 4000 tons. The H. B. Smith Co., Westfield, Mass., indicates it shortly will be in the market for 5000 to 7500 tons, and the Gurney Heater Co., Framingham, Mass., 2000-ton inquiry again shows life. Few sales of round tonnages were made this week. They include 400 tons of special analysis eastern Pennsylvania to a Connecticut melter, 300 tons No. 2X Buffalo to a Maine foundry, and three 50-ton lots, one malleable, to the Sullivan Machinery Co., Clairmont, N. H. Eastern Pennsylvania furnaces continue to quote \$20, furnace base, or higher, but are not important factors in this territory due to lower prices quoted by other iron makers. It is still possible to buy No. 2 plain and No. 2X eastern Pennsylvania iron at \$19 furnace. One furnace this

week quoted \$18.75 furnace, or \$22.81 delivered, on silicon 2.75 to 3.25. Buffalo No. 2 plain, No. 2X and No. 1X generally is quoted at \$18 to \$18.50 furnace. One interest this week quoted \$17.75 Buffalo or \$23.21 delivered on No. 1X. The Virginia market consists of small lots of high manganese iron on a \$22.50 furnace base, and the Alabama of a car here and there at \$15.50, furnace base. Lake charcoal iron, heretofore quoted here at \$28 furnace base, is now obtainable at \$23.

We quote delivered at common New England points as follows, having added to furnace prices \$1.06 freight from eastern Pennsylvania, \$3.46 from Buffalo, \$6.58 from Virginia and \$10.66 from Alabama:

East Penn. sil 2.25 to 2.75	\$22.81 to \$24.56
East Penn. sil 1.75 to 2.25	22.81 to 24.06
Buffalo sil 2.25 to 2.75	23.21 to 24.46
Buffalo sil 1.75 to 2.25	23.21 to 23.96
Virginia sil 2.25 to 2.75	23.58
Virginia sil 1.75 to 2.25	23.08
Alabama sil 2.25 to 2.75	26.66
Alabama sil 1.75 to 2.25	26.16

Finished Material.—McClintic-Marshall Co. is awarded 300 tons of structural steel for a coal pocket, Cranston, R. I.; and the New England Structural Co. 100 tons for a Boston theatre addition, and 100 tons for an addition to the Fall River Gas Works Co., Fall River, Mass., plant. Stone & Webster, Boston, this week will award 430 tons for a New Bedford, Mass., lighting plant project. Bids are in on 300 tons for an Edison Co. of Boston, South Boston plant addition. The Boston Elevated Railway, Forest Hills inspection department, 60 x 500 ft. will require a round tonnage of steel, bids for which are being asked. The Lackawanna Steel Co. has closed with the Maine Central Railroad for 5000 tons of 85 lb. rails, and the Bethlehem Steel Co. for a round tonnage of frogs and switches. Mill representatives report a better demand for bars, etc., with 1.40c. Pittsburgh the usual asking price.

Jobbers now quote: Soft steel bars \$25.00 per 100 lb. base, flats, \$10.00; concrete bars, stock lengths \$2.55; structural angle and beam, \$2.65; plates, \$2.65; to \$2.83; wire steel, \$2.83; to \$1.25; open hearth spring steel \$1.50; crucible spring steel \$1.10; bands \$1.10; to \$3.33; hoop steel \$1.10; cold rolled steel \$3.40 to \$3.90; toe cink steel \$5.00; chain iron \$2.55; per 100 lb. base, but refined iron, \$1.25; Wayne iron, \$5.50; Norway iron, \$5.50; No. 10 blue annealed sheets, \$3.18 per 100 lb. base; No. 28 black sheets, \$4.50; No. 28 galvanized sheets, \$5.50.

Coke.—New England producers of by-product foundry coke announce no change in their price for March. The market is \$10.15 delivered where the local freight does not exceed \$3.40. Further expansion in releases of contract coke is noted. Such releases this week included 1200 tons by a manufacturer of electrical appliances for two plants, 1000 tons by a maker of textile machinery, and 600 tons by an Ansonia, Conn., foundry. Both the New England Coal & Coke Co. and the Providence Gas Co. are barely keeping even with shipping instructions. Coke is taken in, not so much because of increased foundry melts, as because of apprehension over the coal labor outlook.

Old Material.—Were it not for slight activity in turnings and borings, the old material market could be classified as lifeless. Turnings and borings are in light supply due to the low operating ratio of the average machine shop in this territory. It does not take much buying, therefore, to sustain values. Dealers expect higher prices on heavy melting steel within the near future. In the absence of business, quotations on machinery cast, stove plate, railroad malleable, forged scrap, bundled skeleton, axles, shafting, car wheels and rerolling rails sag under their own weight.

The following prices are for gross ton lots delivered consuming points.

No. 1 machinery	\$17.50 to \$18.00
No. 2 machinery	15.50 to 16.00
Stove plate	11.50 to 15.00
Railroad malleable	13.00 to 13.50

The following prices are offered per gross ton lots f.o.b. Boston rate shipping points.

No. 1 heavy melting steel	\$8.00 to \$8.50
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	9.50 to 10.00
Wrought pipe (1 in. in diam. over 2 ft. long)	7.00 to 7.25
Machine shop turnings	4.50 to 4.75
Cast iron borings, rolling mill	7.50 to 8.00
Cast iron borings, chemical	8.00 to 9.00
Blast furnace borings and turnings	4.50 to 4.75
Forged scrap and bundled skeleton	4.00 to 4.50
Street car axles	11.50 to 12.00
Shafting	12.00 to 13.00
Car wheels	11.00 to 11.50
Rerolling rails	8.50 to 9.00

Philadelphia

PHILADELPHIA, Feb. 28.

Accompanied by a dip of \$1 a ton in prices, the Eastern foundry iron market has had a few days of marked activity, the first real buying flurry since early December. Fully 40,000 tons of iron was sold the latter part of last week by eastern Pennsylvania furnaces to consumers in the Philadelphia and New York districts, very little going to New England. The principal buyers were makers of cast iron pipe and soil pipe. Prices dropped to \$19 for No. 2 plain, \$19.50 for No. 2X and \$20 for No. 1X, f. o. b. furnace, but, after all available tonnage had been closed, were advanced by two or three furnaces to the former basis of \$20, furnace, for No. 2 plain.

In steel products, particularly plates, shapes and bars, there have also been price recessions. A leading Pittsburgh independent is generally credited with setting the pace, with the result that sellers admit it is comparatively easy to place attractive orders for plates, shapes and bars at 1.35c., Pittsburgh, while in exceptional instances the dip has gone as low as 1.30c., Pittsburgh. Sheets and wire products appear to be firm, but in nearly all other steel products there is uncertainty as to prices, with the tendency toward concessions. Extra discounts are reported to have been granted on pipe. Bolts are firmer, but rivets and spikes are weak.

Coke and old material show the only upward price tendencies. Furnace coke is strong at \$3.40 to \$3.50, Connellsville, for prompt shipment, while foundry coke has advanced to a minimum of \$4.50, with some ovens quoting as high as \$5.50. Stimulated by a buying flurry at Pittsburgh, the Eastern scrap market has turned firmer, but without marked changes in prices.

As a whole, the situation looks somewhat brighter, despite price weaknesses, as in some lines consumers are taking more interest and orders are coming from a greater range of industries.

Pig Iron.—Fully 40,000 tons of foundry iron has been booked by eastern Pennsylvania furnaces in the past week or 10 days, the best buying movement since last December, when many of the first quarter contracts were closed. A good part of the above-mentioned tonnage went at \$19, furnace, for No. 2 plain, \$19.50 for No. 2X and \$20 for No. 1X. The first marked recession occurred a little over a week ago when a New Jersey cast-iron pipe maker bought 7500 tons of No. 2 plain at \$20, delivered, or \$19.30, furnace. Other cast iron pipe makers and a few soil pipe manufacturers came into the market late last week and keen competition for the business resulted in concessions averaging \$1 a ton from what had previously been considered the market. At least two or three of the active sellers withdrew all low quotations after having taken substantial orders and again are quoting on the basis of \$20, furnace, for No. 2 plain, but it remains to be seen whether the market is firmly established at that level. In no instance was iron sold for delivery beyond July 1. The buyers are said to have covered for anticipated requirements only, but it is probable that purchasing in this volume was at least partly due to fear of a coal strike April 1. There were several purchases of about 4000 or 5000 tons each, and a fair number of small sales. Two lots of 1000 tons of gray forge iron were sold at about \$20.50, delivered. Steel-making iron is not in demand. It is reported here that the Bethlehem Steel Co. will cast about 60 per cent of the 105,000 tons of cast iron segments for the New York-New Jersey vehicular tunnel and the Davies & Thomas Co. the remaining 40 per cent. The Bethlehem Steel Co. will also furnish the steel castings, about 9000 tons. Approximately 75,000 tons of pig iron will be required.

The following quotations are, with the exception of those on low phosphorus iron, for delivery at Philadelphia, and include freight rates varying from 84 cents to \$1.54 per gross ton:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	\$19.84 to \$21.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.84 to 21.76
Virginia No. 2 plain, 1.75 to 2.25 sil.	26.24 to 26.74
Virginia No. 2X, 2.25 to 2.75 sil.	27.24 to 27.74
Basic delivery eastern Pa.	19.84
Gray forge	20.50 to 21.00
Malleable	22.50 to 24.00
Standard low phos. (f.o.b. furnace)	24.00
Copper bearing low phos. (f.o.b. furnace)	28.00

Plates.—A further break in plate prices has resulted from the efforts of a Pittsburgh independent to obtain a larger share of Eastern business. Orders as small as 200 tons have been taken at 1.35c., Pittsburgh, while it is generally admitted by sellers that buyers would have little difficulty in placing a large tonnage at 1.30c., Pittsburgh. Whether 1.30c. actually has been done has not come to light, but there are strong intimations to that effect. There has been no marked improvement in business, orders continuing at about the rate of the previous two or three weeks. About 1500 tons of plates and 600 tons of shapes required for two boats to be built at the Pusey & Jones shipyard at Wilmington, Del., apparently have not been placed. The Baldwin Locomotive Works will require about 1800 tons of plates for the 47 locomotives it will build for the Chicago, Burlington & Quincy Railroad. We quote sheared and universal plates at 1.35c. to 1.40c., Pittsburgh.

Structural Material.—The P. H. Kelly Construction Co., Philadelphia, was low bidder on the Philadelphia public library. Bids are being taken by the contractor on the steel work, which will require about 4300 tons. Keen competition has developed and low prices are expected. Considerably more building work is being estimated upon by fabricators. Two office buildings for Baltimore are among the new projects. Fabricators having fair-sized tonnages to place are able to cover at 1.35c., Pittsburgh, while there seems little doubt that a very attractive tonnage might be placed as low as 1.30c. Small lots are quoted at 1.40c., Pittsburgh.

Bars.—The demand for steel bars is about keeping pace with that of the past few weeks. Soft steel bars are now available at 1.35c., Pittsburgh, while it is possible that a large tonnage, particularly of reinforcing bars, could be placed at 1.30c., Pittsburgh. Bar iron is unchanged at 1.40c., Pittsburgh, but concessions are reported to have been granted by some mills rolling a limited range of sizes.

Sheets and Tin Plate.—Sheet manufacturers are standing firmly for their prices of 2.25c. on blue annealed, 3c. on black and 4c. on galvanized, Pittsburgh, and in this respect the sheet situation is quite in contrast to other finished steel lines, except possibly wire products, which are also firm. Some of the tin plate manufacturers are making an effort to hold to a minimum of \$4.60 per base box, Pittsburgh, but it is possible for large buyers to obtain quotations of \$4.50. Stock plate is quoted at \$4.25.

Wire Products.—Although the recent reduction on wire products of \$2 a ton was generally supposed to apply to all forms of wire, the mills have raised their prices on plain wire to \$2.25 per 100 lb., Pittsburgh. Wire nails are quoted at \$2.40, galvanized wire at \$2.75 and barbed wire at \$3.05.

Bolts, Nuts and Rivets.—Bolts are somewhat firmer and discounts of 70, 10 and 5 per cent from list are less frequent, 70 and 10 per cent being quoted in most instances. On the other hand, rivets are weak, structural being quoted frequently at 2.10c. and boiler at 2.20c. per lb., Pittsburgh. The Philadelphia & Reading Railroad is expected to buy 300 kegs of button-head rivets this week.

Coke.—Coke prices have stiffened considerably during the week. For prompt shipment it would probably be difficult to obtain furnace coke below \$3.40 Connellsville, while \$3.50 is a more common quotation. Foundry coke is at a minimum of \$4.50, Connellsville, with some ovens asking as high as \$5.50. The coke situation has worried some of the Eastern pig iron producers and at least one stack now in blast may be put out soon if the coke price continues to advance.

Ferroalloys.—An Eastern maker of ferromanganese has taken orders for about 500 tons in the past week, which is somewhat better than has been done in previous weeks. On both British and domestic alloy the price of \$62.50, seaboard, remains firm. Spiegeleisen, 16 to 19 per cent, is quoted at \$30, furnace. The higher grade is difficult to obtain.

Rails.—Distribution of the Philadelphia & Reading rails for 1922 delivery has been completed as follows: Bethlehem Steel Co., 13,000 tons; Carnegie Steel Co., 5000 tons; Cambria Steel Co., 2000 tons. A fair demand

continues for light rails, which are obtainable at 1.40c., Pittsburgh.

Semi-Finished Steel.—A small tonnage of slabs has been sold at \$28, Pittsburgh, and this also is the ruling price on re-rolling billets. Forging billets are quoted at \$32 Pittsburgh. Wire rods are now quoted at \$36, Pittsburgh, an advance of \$1 a ton.

Old Material.—Buying of steel scrap at Pittsburgh at prices which reached a maximum of \$15.50, delivered, has created a better sentiment in this market, although business has not increased materially in the East. One or two Eastern mills, however, are now permitting shipments on old contracts. The Midvale Steel & Ordnance Co. within the past week has bought 15,000 tons of heavy melting steel, 11,000 tons for Johnstown, 3000 tons or more for Nicetown, and about 1000 tons for Coatesville. Prices paid for Johnstown delivery ranged from \$13 to \$14 and for Coatesville \$11 to \$11.50. A few hundred tons of No. 1 railroad wrought was sold at \$15.50 and pipe has been sold at \$12.50. Chemical borings have been sold at \$15. Machine-shop turnings are slightly higher. We quote for delivery at consuming points in this district as follows:

No. 1 heavy melting steel.....	10.00 to 12.50
Scrap rail.....	6.00 to 6.50
Steel rails, re-rolling.....	15.00 to 15.50
No. 1 low phos., heavy 0.01 and under.....	18.00 to 19.00
Cast iron car wheels.....	15.00 to 15.50
No. 1 railroad wrought.....	15.00 to 15.50
No. 1 yard wrought.....	12.00 to 12.50
No. 1 forge fire.....	10.00 to 10.50
Handled sheets (for steel work).....	5.50 to 6.00
No. 1 bushing.....	11.00 to 12.00
No. 2 bushing.....	9.00 to 10.00
Turnings (short shoveling grade for blast furnace use).....	9.50 to 10.00
Mixed borings and turnings (for blast furnace use).....	
Machine-shop turnings (for rolling mill and steel works use).....	10.00 to 10.50
Heavy axle turnings (or equivalent).....	10.00 to 10.50
Cast borings (for steel works and rolling mills).....	12.00 to 12.50
Cast borings (for chemical plants).....	11.00 to 11.50
No. 1 cast.....	15.50 to 17.00
Railroad grate bars.....	11.00 to 14.50
Stove plate (for steel plant use).....	11.00 to 11.50
Railroad malleable.....	12.50 to 13.50
Wrought iron and soft steel pipes and tubes (new specification).....	5.00 to 13.00
Iron car axles.....	No market
Steel car axles.....	9.00 to 13.50

CHINA MORE ACTIVE

Chinese Merchants Inquire But Some Business Goes to Europe Japanese Trade Unchanged

NEW YORK, Feb. 28.—The Japanese trade situation is unchanged. Merchant buying is continuing on a small scale and there is the usual number of Government inquiries. Chinese trade activity, however, is becoming more marked. Small quantities of second-hand structural material, bar crop ends and plate cuttings are in demand from this market. South American markets show an inclination to buy but orders from this source are small. Although prices in European centres still show an upward trend, no immediate possibilities of sales to these markets are reported yet, with the exception of spiegeleisen, for which there have been several small inquiries evidently sent out as price feelers. One exporter and importer in New York believes that he may be able to close on some small quantities of spiegeleisen for European consumption.

A Chinese purchaser, who recently closed on a fairly large tonnage of material, inquiry for which had been current for some time, placed the order in England. Included in this order was about 8000 base boxes of tin plate, reported to have been placed at \$10.50 (Hong Kong dollars) per box, c.i.f. Hong Kong, while the galvanized sheets went for about \$28 per ton. These were 5 x 7 ft., packed 50 sheets to the box. A c.i.f. Hong Kong price of \$4.60 per keg was quoted by the British seller on 2640 picule kegs of iron, checker head, countersunk wire nails. This Chinese buyer is now receiving quotations on another inquiry calling for 1790 picule kegs of wire nails and a tonnage of mild steel bars, ranging in size from 3/8-in. to 2-in., the greater part being 3/4-in. Wire ranging up to No. 25 gage to be shipped in 133-lb. bundles, is also included in this inquiry.

British Iron and Steel Market

Cautious Buying Follows Higher Fuel and Iron Prices - Tin Plate Situation Unsatisfactory
(By Cable)

LONDON, ENGLAND, Feb. 28.

Pig iron demand has slackened and consumers are adopting a more cautious attitude, owing to the uncertainty as to future prices resulting from dearer fuel, but makers are still able to dispose of the output of Cleveland foundry iron. Scotland is buying more material from Cleveland. There have been further sales to Hamburg, which are believed to be destined ultimately for Czechoslovakia. Prices are firm on advancing fuel costs. The London Metal Exchange is resuming its dealings in pig iron.

Hematite is firmer and is moderately active, with improved Continental demand. Italy is purchasing with more regularity. The home trade generally is quiet. Few makers are willing to book it below £4 17½s. (\$21.55).

Durham coke is strong, producers asking up to 30s. (\$6.63) delivered, owing to strong Continental demand.

North Spain and African ore freights are rising; consequently weak sellers of Bilbao Rubio ore are expected to diminish their prices. Meanwhile the ore is held at nominally 26½s. (\$5.86) ex-ship Tees.

Lockout notices for March 11 have been posted by the Engineering Employers' Federation, owing to a dispute with the union on overtime payments. There is a reported strike of Welsh chemical workers, but confirmation is lacking.

Steel prices are unchanged, but the tendency is firmer on dearer fuel. Cheap export quotations on steel sections are less heard of, but the works are still badly in need of orders. There is a moderate home trade business in iron bars and hoops.

Sir W. G. Armstrong, Whitworth & Co., Ltd., has closed its Elswick works, at Newcastle-on-Tyne, owing to high costs. The Clyde shipbuilding output for February was six vessels of 20,451 tons.

American wire nails have been offered at 21s. per picul keg (\$3.48 per 100-lb. keg) c.i.f. Japan. American No. 8 gauge wire is quoted at £16 (3.16c. per lb.) c.i.f. Japan.

Belgian and Luxemburg foundry pig iron stands at £5 to £5 5s. (\$22.10 to \$23.20) f.o.b. French foundry pig iron is held at £5 10s. to £5 15s. (\$24.31 to \$25.42) f.o.b.

Belgian light rails are offered at £7 5s. (\$32.05) f.o.b., including fish plates. English heavy rails are being sold at £8 (\$35.36) f.o.b., for prompt shipment.

French, Belgian and Luxemburg merchant bars are held at £8 to £8 10s. (1.59 to 1.68c. per lb.) f.o.b., for April and May delivery; and plain structural steel at £7 10s. to £7 12½s. (1.48 to 1.51c. per lb.) for March and April shipment. Belgian angles have been quoted at £7 12½s. (1.51c. per lb.) f.o.b., for April and May delivery. Belgian angles are held at £7 12½s. (1.51c. per lb.) f.o.b., for April and May shipment.

German 3/16-in. plates are offered by agents at £7 12½s. (1.51c. per lb.) f.o.b., for May and June shipment. Belgian sheet bars are quoted at £6 10s. (\$28.73) f.o.b., for March shipment. French billets are held at £7 (\$30.94) f.o.b., and Luxemburg billets at £6 17½s. (\$30.39) f.o.b., both for March shipment. Belgian plates are quoted at £10 (1.97c. per lb.) c.i.f. India.

Tin plates are dull and the market is unsatisfactory. Further mills are closing, and consumers are purchasing only from hand to mouth, but the tendency

of prices is upward, due to dearer raw materials. Germany is offering 28 x 20 in. plates at 45s. (\$9.95) f.o.b. Hamburg, for 8 to 12 weeks delivery. South America has bought tin plate at 19s. (\$4.20) f.o.b., prompt delivery. Home consumers paid 18s. (\$3.98) f.o.b., prompt.

Galvanized sheets are in fair demand, but the market is quiet and business is slow. Prices are firmer on dearer pig iron. There are few sellers below £15 15s. (3.11c. per lb.) f.o.b. Commencing March 1, galvanized sheet makers will work on the allotment basis. Producers have endeavored to stimulate demand by advancing values, but prices are now weak. Corrugated, 24 gage, is being sold at £15 15s. (3.11c. per lb.) f.o.b.

Continental black sheets, 4 x 2½'s, 2/5, have been sold to India at £11 17½s. (2.34c. per lb.) c.i.f. We quote per gross ton, except where otherwise stated, f.o.b. maker's works, with American equivalent figured at \$4.42 per £1 as follows:

Durham coke, delivered	£1 8½s. to £1 10s.	\$6.30 to \$6.63
Cleveland No. 1 foundry	4 15	21.00
Cleveland No. 2 foundry	4 10	19.89
Cleveland No. 4 foundry	4 7½	19.34
Cleveland No. 1 forge	4 10	19.89
Cleveland basic	4 10	19.89
Hematite	7 0*	30.94*
East Coast mixed	4 15 to 4 17½	21.00 to 21.55
Permanganese	15 0 & 14 10*	66.30 & 64.09*
Bails, 60 lb and up	8 0 to 9 10	35.36 to 41.99
Billets	7 0 to 7 10	30.94 to 33.15
Sheet and tin plate bars,		
Welsh	7 0 to 7 7½	30.94 to 32.60
Tin plates, base box	0 18½ to 0 19	4.09 to 4.20
		C. per Lb.
Ship plates	9 0 to 10 10	1.78 to 2.07
Boiler plates	12 10 to 14 0	2.47 to 2.76
Tees	9 10 to 11 0	1.88 to 2.17
Channels	8 15 to 10 5	1.73 to 2.02
Beams	8 5 to 10 0	1.63 to 1.97
Round bars, ¾ to 3 in.	10 10	2.07
Galvanized sheets, 24 g.	15 15 to 16 0	3.11 to 3.16
Black sheets	12 10 to 13 0	2.47 to 2.57
Steel hoops	12 0 & 12 5*	2.37 & 2.42*
Cold rolled steep strip,		
20 K.	23 10	4.64

*Export price.

Puddlers' Pay Reduced

YOUNGSTOWN, Feb. 28.—The boiling rate for March-April will be reduced to \$8.03 per ton, from \$8.22, paid in January-February, as the result of the bi-monthly examination of sales sheets Tuesday by the Western Bar Iron Association and Amalgamated Association of Iron, Steel and Tin Workers.

The average price of bar iron covering the 60-day period ending Feb. 20 was \$1.60 per 100 lb., which represents a decline of 5c. per 100 lb. from the average two months before.

Under the new rate, finishers will be paid 28½ per cent above base, as compared with a rate of 30½ per cent above base in the first two months of year. The average bar iron price compares with the current market of \$1.40, and the puddling rate will therefore be still further reduced in May-June.

Aggregate shipments by affected interests were less than one third of normal, during the period covered by the settlement.

The puddling rate reached the peak of \$18.76 per ton on July-August, 1920, shipment when bar iron averaged \$3.55. There has been a steady decline since.

It is estimated 35,000 workers will be directly and indirectly affected by the settlement. James H. Nutt acted for the manufacturers and M. F. Tighe, Pittsburgh, for the employees.

Nagle Steel Co. in Difficulties

The Alan Wood Iron & Steel Co., Rogers, Brown & Co. and the Cortright Coal Co., all of Philadelphia, have petitioned the Federal Court in Philadelphia to adjudge the Nagle Steel Co. a bankrupt. The Nagle Steel Co. owns a small steel plant at Rahway, N. J., and plate and sheet mills at Pottstown and Seyfert Station, Pa.

Prices Finished Iron and Steel, f.o.b. Pittsburgh

Freight Rates

Freight rates from Pittsburgh on finished iron and steel products, in carload lots, to points named, per 100 lb., are as follows:

Philadelphia, domestic.	\$0.36	Kansas City	\$0.815
Philadelphia, export.	0.265	Kansas City (pipe)	0.77
Baltimore, domestic.	0.35	St. Paul	0.665
Baltimore, export.	0.255	Omaha	0.815
New York, domestic.	0.38	Omaha (pipe)	0.77
New York, export.	0.285	Denver	1.35
Boston, domestic.	0.405	Denver (wire products)	1.415
Boston, export.	0.285	Pacific Coast	1.665
Buffalo	0.295	Pacific Coast, ship plates	1.335
Cleveland	0.24	Birmingham	0.765
Detroit	0.325	Jacksonville, all rail.	0.555
Cincinnati	0.325	Jacksonville, rail and water	0.46
Indianapolis	0.345	New Orleans	0.515
Chicago	0.38		
St. Louis	0.475		

The minimum carload to most of the foregoing points is 36,000 lb. To Denver the minimum loading is 40,000 lb., while to the Pacific Coast on all iron and steel products, except structural material, the minimum is 80,000 lb. On the latter item the rate applies to a minimum of 50,000 lb., and there is an extra charge of 9c. per 100 lb. on carloads of a minimum of 40,000 lb. On shipments of wrought iron and steel pipe to Kansas City, St. Paul, Omaha and Denver the minimum carload is 46,000 lb. On iron and steel items not noted above the rates vary somewhat and are given in detail in the regular railroad tariffs.

Rates from Atlantic Coast ports (i.e., New York, Philadelphia and Baltimore) to Pacific Coast ports of call on most steamship lines, via the Panama Canal, are as follows: Pig iron, 55c.; ship plates, 75c.; ingot and muck bars, structural steel, common wire products, including cut or wire nails, spikes and wire hoops, 75c.; sheets and tin plates, 60c. to 75c.; rods, wire rope, cable and strands, \$1; wire fencing, netting and stretcher, 75c.; pipe, not over 8 in. in diameter, 75c.; over 8 in. in diameter, 2 1/2c. per in. or fraction thereof additional. All prices per 100 lb. in carload lots, minimum 40,000 lb.

Structural Material

I-beams, 3 to 15 in.; channels, 3 to 15 in.; angles, 3 to 6 in., on one or both legs, 1/4 in. thick and over, and zeels, structural sizes, 1.35c. to 1.40c.

Sheared plates, 1/2 in. and heavier, tank quality, 1.35c. to 1.40c.

Wire Products

Wire nails, \$2.40 base per keg; galvanized, 1 in. and longer, including large-head barbed roofing nails, taking an advance over this price of \$1.25 and shorter than 1 in., \$1.75. Bright Bessemer and basic wire, \$2.25 per 100 lb.; annealed fence wire, Nos. 6 to 9, \$2.25; galvanized wire, \$2.75; galvanized barbed wire, \$3.05; galvanized fence staples, \$3.05; painted barbed wire, \$2.55; polished fence staples, \$2.55. Cement-coated nails, per count keg, \$1.90; these prices being subject to the usual advances for the smaller trade, all f.o.b. Pittsburgh, freight added to point of delivery, terms 60 days, net, less 2 per cent off for cash in 10 days. Discounts on woven-wire fencing are 70 1/2 per cent off list for carload lots, 69 1/2 per cent for 1000-rod lots, and 68 1/2 per cent for small lots, f.o.b. Pittsburgh.

Bolts and Nuts

Machine bolts, small, rolled threads, 70, 10 and 30 per cent off list
Machine bolts, small, cut threads, 70 and 10 per cent off list
Machine bolts, larger and longer, 70 and 10 per cent off list
Carriage bolts, 1/2 in. x 6 in.:
Smaller and shorter rolled threads, 70 and 10 per cent off list
Cut threads, 70 per cent off list
Longer and larger sizes, 70 per cent off list
Lag bolts, 70, 10 and 5 per cent off list
Flaw bolts, Nos. 1, 2 and 3 heads, 60 and 10 per cent off list
Other style heads, 20 per cent extra
Machine bolts, c.p.c. and t. nuts, 1/2 in. x 4 in.:
Smaller and shorter, 65, 10 and 5 per cent off list
Larger and longer sizes, 65 and 10 per cent off list
Hot pressed sq. or hex. blank nuts, \$5.50 off list
Hot pressed nuts, tapped, \$5.25 off list
C.p.c. and t. sq. or hex. blank nuts, \$5.25 off list
C.p.c. and t. sq. or hex. blank nuts, tapped, \$5.00 off list
Semi-finished hex. nuts:
1/2 in. to 9/16 in. inclusive, 80, 10 and 10 per cent off list
Small sizes S. & A. E., 80 and 10 per cent off list
1/2 in. to 1 in. inclusive, U. S. S. and S. A. E., 70, 10 and 10 per cent off list
Stove bolts in packages, 80 and 3 tens and 5 per cent off list
Stove bolts in bulk, 80, 3 tens and 2 1/2 per cent off list
Tire bolts, 70, 10 and 5 per cent off list
Track bolts, carloads, 3c. to 3.25c. base
Track bolts, less than carloads, 4c. to 4.25c.

Upset and Hex. Head Cap Screws

1/2 in. and under, 80 and 10 to 80, 10 and 10 per cent off list
9/16 in. to 1 in., 80 and 10 to 80, 10 and 10 per cent off list

Upset Set Screws

1/2 in. and under, 80, 10 and 5 to 85 per cent off list
9/16 in. to 1 in., 80, 10 and 5 to 85 per cent off list

Milled Square and Hex. Cap Screws

All sizes, 75 and 10 to 80 per cent off list

Milled Set Screws

All sizes, 70, 10 and 10 per cent off list

Rivets

Large structural and ship rivets, \$2.10
Large boiler rivets, 2.20
Small rivets, 75 and 10 off list

Wire Rods

No. 5 common basic or Bessemer rods to domestic consumers, \$36; chain rods, \$36; screw stock rods, \$41; rivet and bolt rods and other rods of that character, \$36; high carbon rods, \$43 to \$46, depending on carbons.

Railroad Spikes and Track Bolts

Railroad spikes, 9 16-in. and larger, \$2 to \$2.10 base per 100 lb. in lots of 200 kegs of 200 lb. each or more; spikes, 1/2-in., 3/4-in. and 7/16-in., \$2.15 to \$2.25 base; 5/16-in., \$2.15 to \$2.25 base. Road and large spikes, \$2.15 to \$2.25 base per 100 lb. in carload lots of 200 kegs or more f.o.b. Pittsburgh. Track bolts, 3c. base per 100 lb. The plates, \$2 per 100 lb. Angle bars, \$2.10 per 100 lb.

Terne Plates

Prices of terne plates are as follows: 8-lb. coating, 200 lb., \$9.30 per package, 8 lb. coating, 1 C., \$9.60; 15-lb. coating, 1 C., \$11.80; 20-lb. coating, 1 C., \$13; 25-lb. coating, 1 C., \$11.25; 30-lb. coating, 1 C., \$15.25; 35-lb. coating, 1 C., \$16.25; 40-lb. coating, 1 C., \$17.25 per package, all f.o.b. Pittsburgh, freight added to point of delivery.

Iron and Steel Bars

Steel bars, 1.35c. to 1.40c. from mill. Refined bar iron, 2c. to 2.10c.

Welded Pipe

The following discounts are to jobbers for carload lots on the Pittsburgh basing card:

Inches	Steel		Iron	
	Black	Galv.	Black	Galv.
1/4	5 1/2	28	1 1/2 to 3/4	31 1/2 + 22 1/2
3/8 to 1/2	60	23 1/2	1 1/2	36 1/2 18 1/2
1/2	65	50 1/2	3/4	42 1/2 27 1/2
3/4	69	56 1/2	1 to 1 1/2	44 1/2 29 1/2

To the large jobbing trade the above discounts are increased by one point, with supplementary discounts of 5 and 2 1/2 per cent.

Boiler Tubes

The following are the discounts for carload lots f.o.b. Pittsburgh:

Lap Welded Steel		Charcoal Iron	
1 1/2 in.	26 1/2	1 1/2 in.	5
2 to 2 1/2 in.	41	1 1/2 to 1 3/4 in.	15
2 1/2 to 3 in.	52	2 to 2 1/2 in.	25
3 1/2 to 13 in.	57	2 1/2 to 3 in.	30
		3 1/2 to 4 1/2 in.	32

To large buyers of steel tubes, a supplementary discount of 5 per cent is allowed.

Standard Commercial Seamless Boiler Tubes

New discounts have been adopted on standard commercial seamless boiler tubes, but manufacturers are not yet ready to announce them for publication, and for that reason we publish no discounts this week.

WASTE IN FOUNDRIES

Concrete Illustrations Given in Meeting of Newark Foundrymen's Association

That waste in industry is not something abstract, something for somebody else to act upon, was brought out strongly by C. E. Knoepfel, C. E. Knoepfel & Co., New York, in addressing the Feb. 25 meeting and dinner of the Newark Foundrymen's Association, at the Downtown Club, Newark, N. J. The subject of Mr. Knoepfel's address was "Some Foundry Overhead Problems under Present Conditions." In pointing out the great necessity for savings in overhead to-day, to offset in some measure lower selling prices and inroads of foreign competition, he stated that the problem of waste was entirely relative in its importance to industry. If all foundries and all manufacturers in the United States were operating at a 20 per cent waste and this 20 per cent of waste were also true of producers the world over, there would be no great necessity for considering waste as a great economic factor. But the relative performances of plants, industries and nations show something different in waste.

Business in this country does not know the facts of industry, past trends and future possibilities. Savings are possible in manufacture, and Mr. Knoepfel related the example of a manufacturer of pumps in the West, who, after performing a surgical operation on his pump, discovered that by thinning one metal part he saved \$80,000 a year in production costs. Consideration must be given to economics, budgeting and sales analysis. Mr. Knoepfel's speech was based upon twelve business axioms that he points out are essential to any line of industry. These are:

1. Greatest volume of business goes to that concern whose prices reflect the normal operating conditions.
2. Those who purchase goods should pay most for that which costs most to produce.
3. Productivity (relative amount produced) is, in the last analysis, the gauge of real economy in manufacturing.
4. The real investment in a plant, in goods produced, is the hours and minutes spent on them by machines and men (from president to office boy).
5. The best insurance against loss in producing goods is advance knowledge of likely happenings.
6. That concern is best protected against uncertainties in

commercial competition which is most closely in touch with all current conditions.

7. The only protection against unintelligent competition in industry is to insure that all factors are considered in setting prices.
8. No division of a business should be served at the expense or to the exclusion of other important divisions.
9. Averages should be ignored, as they mean that some items are less and others more.
10. Profits should be divided so that operating efficiency may be considered separately from sales and buying efficiency.
11. The concern which is best posted as to cost of idleness of men and machines and cost of rejections is in the best position to reduce industrial wastes.
12. Consumers and not producers are those benefited by uneconomic methods of costing and pricing.

All these axioms have a bearing on overhead, price and efficiency of operation, said Mr. Knoepfel, who explained each axiom by quoting actual occurrences in various plants of his experience.

Following the address H. M. Lane, H. M. Lane Co., industrial engineer, Detroit, gave a brief impromptu talk, in which he related several experiences in foundries where he eliminated some of the waste of material, time and other items, assisting in placing production upon a more efficient basis. One of the greatest wastes in foundries, said Mr. Lane, is walking too far in carrying through a process. In one foundry of his experience, after a few time studies he found that twelve men carrying trays of cores were doing the daily equivalent in mileage of one man carrying a tray of cores 14 miles into the country and returning with another tray. By rearranging some of the floor space, he reduced this walking to the equivalent of one man walking four miles into the country and back with the result that in this particular instance the foundry was able to reduce the number of men engaged in this work.

Another instance of reduction of costs by rearrangement was related by Mr. Lane, who told of a core room in which 44 girls were working. By rearranging the benches, tables and racks, which were in the center of the room, production was increased with a force reduced to 23 girls.

The meeting was presided over by J. L. Carter, Barlow Foundry Co., Newark, N. J. The Quigley Furnace Specialties Co., New York, was elected to membership in the association and a resolution opposing the Federal bonus bill, excepting as it includes all possible aid to the wounded and disabled, was passed.

HOG ISLAND SURPLUS

Steel Disposed of by United States Shipping Board in One Lot

WASHINGTON, Feb. 28.—Disposal of 93,754.5 gross tons of surplus steel at Hog Island, Pa., was made to De Neal Samuel, of Washington, as a member of the firm of M. Samuel & Sons, 1746 Woolworth Building, New York, at \$9.37 per ton, a total of \$887,479.67. M. Samuel & Sons have scrap yards at Brooklyn, Bridgeport, Conn., and Greenville, N. J.

The material was auctioned off last Tuesday through Edward P. Farley, vice-president of the United States Shipping Board Emergency Fleet Corporation. All of the material, according to the terms of the contract, must be removed from Hog Island by Dec. 31, 1922. Because of this the Shipping Board was unable to accept an alternate bid of the Bridgeport Iron & Metal Co., offering \$9.50 per gross ton, provided the board would give the company 18 months from the date of signing the contract in which to remove the material. It is the plan of the board to dispose of all of its Hog Island real estate and other property there as early as possible.

On Tuesday, March 7, at 11 A. M., the equipment and fixtures of the Pennsylvania Pressed Steel Corporation, alleged bankrupt, will be offered for sale by order of David L. Ullman, receiver, Philadelphia.

Coke Production Increases

UNIONTOWN, PA., Feb. 27.—Four hundred and fifty ovens were added Saturday to the active list of the H. C. Frick Coke Co., bringing the coke output of the company up to approximately 30 per cent. The week just passed has witnessed a slight further increase in coke production with a stiffening in price, although no increase of a considerable nature has been manifested. A shortage in foundry coke has developed.

Increased furnace activity is taken by observers as the reason for the increased production in coke. Most observers say that the threatened strike in union coal fields is not having an effect on increased coke output. Purchases during the past fortnight have been for immediate consumption. Quotations are \$3.25 to \$3.60 for furnace coke, with a sale or two reported at \$4.

Technologic paper of the Bureau of Standards, No. 206, discusses the "Effect of Heat Treatment on the Mechanical Properties of One Per Cent Carbon Steel." The effects of varying time-temperature relations in heat treatment on tensile impact properties, hardness and structure of 1 per cent carbon steel have been studied, including (a) effect of temperature variations in hardening, (b) time at hardening temperatures both above A_{cm} and between the A_{c1} and A_{cm} transformations, (c) effects of tempering steel hardened in different ways and effects of "soaking" just under the lower critical range, (d) comparison of oil and water hardening for production of definite strengths.

*Refinery quotation.

New York

NEW YORK, Feb. 28.

Conditions in the copper market are slightly better and demand is improving. The tin market is spasmodically active and prices are rising. The lead market continues active and firm. Inquiry has improved for zinc and prices are stiffening.

Copper.—While actual sales of electrolytic copper cannot be said to have expanded, inquiry is improving and some orders have been placed. There is an undercurrent of optimism and a feeling that the bottom of the market has been reached and that from now on improvement may be expected. This is not alone the opinion of sellers, but also that of some buyers. It is a fact, however, that most large consumers are still well provided for, but a buying movement will not come unexpectedly if it should appear within the next 30 days. Quotations vary with the seller and the quantity involved, and it is possible to buy small amounts of electrolytic at 12.75c., delivered, or 12.50c., refinery, but the majority of sellers who are participating in the market quote 12.87½c., delivered, or 12.62½c., refinery, which may be regarded as the general market, there being still some large producers who remain uninterested under 13c., delivered. Export demand has also improved in the last week and sales have been made at a range of 12.62½c. to 12.75c., f.a.s. New York.

Copper Averages.—The average price of Lake copper for the month of February, based on daily quotation in THE IRON AGE, was 13.19c. The average prices of electrolytic copper was 12.92c., refinery, or 13.17c., delivered.

Tin.—On each day of the last week the market was exceedingly quiet except on Feb. 21 when heavy sales were made of Straits tin, estimated to total at least 1000 tons, with both dealers and consumers participating. The heavy decline in London on the day before, referred to in this report last week, was further emphasized on Tuesday to the extent that prices appeared attractive. Sales in this market were so heavy that some sellers, particularly dealers, found it necessary to do business on the holiday, Feb. 22, to cover sales made the day before, and several hundred tons were dealt in. There has been no activity since then except a sale of two lots of 25 tons of March delivery on the New York Metal Exchange at 28.75c. and 29c. respectively. One cause of the inactivity was the disappointment of the response of the London market to the heavy buying here, referred to. Yesterday and to-day the market was dull, but prices since last week have gradually advanced, due largely to the strength in sterling, until spot Straits to-day was quoted at 29.75c., New York. The London market to-day was about £5 per ton above the low point reached Feb. 21, with spot standard quoted at £145, future standard at £146 15s. and spot Straits at £147 5s. Arrivals thus far this month have been 3270 tons, with 7450 tons reported afloat.

Lead.—The eminently healthy condition of the lead market where consumption fully balances production, continues a characteristic of this market and quotations are unchanged with the leading interest still doing business at 4.70c., New York and St. Louis, and inde-

pendents at 4.40c., St. Louis, or 4.70c. to 4.75c., New York and Eastern points.

Zinc.—A better feeling pervades the market which has remained inactive and stagnant for many weeks. Inquiry from consumers, particularly galvanizers, is not active and moderate sales have been made at prevailing quotations. The tendency of prices is to stiffen and it is doubtful whether prime Western for early delivery could be bought to-day for less than 4.55c., St. Louis, and there are those who are inclined to quote 4.60c., St. Louis. The rise in the pound sterling has also had its influence, so that there have been tentative proposals by British buyers on a 4.50c., St. Louis, basis, which might have resulted in sales had not the market here stiffened at this time. We quote prime Western for early delivery at 4.55c., St. Louis, or 4.90c., New York.

Antimony.—Quietness pervades the market and wholesale lots for early delivery are quoted at 4.35c., New York, duty paid.

Aluminum.—Wholesale lots of virgin metal, 98 to 99 per cent pure, are still quoted by the leading interest for early delivery at 19c. to 19.10c., f.o.b. plant, depending on the quantity, and the same grade is offered by importers at 17c. to 18c., New York, duty paid.

Old Metals.—Prices are a little lower and buying is only of the hand to mouth variety. Dealers' selling prices are as follows:

	Cents Per Lb.
Copper, heavy and crucible.....	12.50
Copper, heavy and wire.....	11.50
Copper, light and bottoms.....	9.00
Heavy machine composition.....	9.50
Brass, heavy.....	7.25
Brass, light.....	6.75
No. 1 red brass or composition turnings.....	8.00
No. 1 yellow red brass turnings.....	6.00
Lead, heavy.....	4.25
Lead, tea.....	3.25
Zinc.....	3.00

Chicago

FEB. 28.—The metals are quiet and prices are the same as last quoted. Tin receded one cent during the latter part of last week and some business came in on the decline, but the price has since recovered to its former level. Old metal prices also are unchanged. We quote in carload lots: Lake copper, 13.25c.; tin, 31c.; lead, 4.50c.; spelter, 4.55c. to 4.60c.; antimony, 6.50c., in less than carload lots. On old metals we quote: Copper wire, crucible shapes and copper clips, 9.50c.; copper bottoms, 7.50c.; red brass, 7.50c.; yellow brass, 6c.; lead pipe, 3.25c.; zinc, 2c.; pewter, No. 1, 22c.; tin foil, 23c.; block tin, 25c.; all buying prices for less than carload lots.

St. Louis

Feb. 28.—Both lead and zinc are notably unchanged; we quote lead at 4.40c., carlots, and slab zinc at 4.50c. On old material we quote: light brass, 3.50c.; heavy red brass, 7c.; light copper, 7c.; heavy yellow brass, 4c.; heavy copper and copper wire, 7.50c.; pewter, 15c.; tin foil, 16c.; tea lead, 2c.; aluminum, 9c.

Nitrogen in Oxyacetylene Weld Metal

Analyses for nitrogen in oxyacetylene weld metal have been completed by the Bureau of Standards on samples which are representative of two types of fracture, crystalline and fibrous. On the basis of combined nitrogen, there seems to be no distinction between the crystalline and fibrous weld metal. The limits of combined nitrogen found were approximately one-sixth the limiting values for nitrogen in electric arc deposited metal, that is, 0.015 to 0.027 per cent nitrogen in oxyacetylene welds, as compared with 0.10 to 0.15 per cent in the arc weld.

A list of 500 or more trade directories is to be published by the Special Libraries Association, 1731 H Street, N. W., Washington. It is said that this is the first time such a list has been compiled and is an answer to demands for trade directories of a specific kind for pursuing sales campaigns and the like.

PERSONAL

Henry Harnischfeger started Jan. 28 on a combined business and pleasure trip around the world. Mr. Harnischfeger is one of the founders and president of Pawling & Harnischfeger Co., Milwaukee, Wis. He expects to go to Japan, the Philippines, China, Burma, Ceylon, India, up through Suez to Naples and Europe. He will visit the various foreign branch offices of the Associated Machinery Corporation, of which Mr. Harnischfeger is also president, with a view to looking over general business conditions and possibilities in the far East and also to determine upon the opening up of new offices. Mr. Harnischfeger will transact business at Kobe, Japan; Hongkong, China; Singapore, Rangoon and Bombay. He is accompanied by Mrs. Harnischfeger.

The resignation of Charles F. Smith, chairman of the board of directors New Britain Machine Co., New Britain, Conn., automatic screw machines, etc., has been accepted. Mr. Smith has been in poor health for some time.

Charles Glover, vice-president American Hardware Corporation, New Britain, Conn., has resigned and has been succeeded by George T. Kimball. Albert N. Abbee, purchasing agent, takes Mr. Kimball's place as secretary. Mr. Glover has been in ill health for some time. He was connected with the corporation or its components for forty years. He was made vice-president in 1917.

Harry Brearley, Brown Bayley's Steel Works, Ltd., Sheffield, England, sailed for home last Saturday after spending some time in this country on business.

Prof. William G. Fearnside, Sheffield University, Sheffield, England, who has been in the United States and Alaska since last August, returned last week.

J. Harvey Williams, president J. H. Williams & Co., Brooklyn, has been elected president of the American Drop Forging Institute and re-elected president of the Brooklyn Chamber of Commerce.

Clifford Egan has been elected president of the J. A. Fay & Egan Co., Cincinnati, succeeding his father, the late Thomas P. Egan. Si P. Egan and Fred T. Egan were elected vice-presidents; W. M. Green, secretary; A. A. Faber, treasurer, and R. W. Egan, general manager.

At the annual meeting of the stockholders of the Seneca Falls Mfg. Co., Inc., held at Seneca Falls, N. Y., on Feb. 15, Ogden R. Adams was re-elected president and general manager for the coming year. An entirely new board of directors was also elected.

John McConnell, formerly superintendent of the United Steel Co., Canton, Ohio, now the United Alloy Steel Corporation, having been affiliated with that company 11 years, has returned to the Canton corporation as its vice-president in charge of operation. For some time he has been vice-president of the Interstate Iron & Steel Co., Chicago.

Robert D. Carroll, Bucyrus, Ohio, has been elected a director of the Fairbanks Steam Shovel Co., Marion, Ohio.

Ross E. Willis, formerly sales engineer of the Lake-wood Engineering Co., Cleveland, in the southern Michigan territory, has become affiliated with Wm. F. V. Newmann & Sons, Detroit, representing the Baker, R. & L. Co. line of industrial tractors, trucks and cranes in the Detroit territory.

Phillip J. McKenna, representative of the Bridgeport, Conn., works of the Crane Co., manufacturer of valves, pipe fittings, plumbing supplies and goods, recently left Bridgeport for a business trip into Mexico.

Peter F. Augenbraun, recently appointed manager of the new plant of the Yale & Towne Mfg. Co., Stamford, Conn., in Germany, left New York for Germany, Feb. 4. He was tendered a farewell dinner at the home plant in Stamford, and was presented a handsome suitcase and a brief case, J. A. Horne, vice-president of

the company, being toastmaster. Mr. Augenbraun has been with the Yale & Towne company for 30 years.

The Gilbert & Barker Mfg. Co., Springfield, Mass., recently announced the following additions to the personnel at the plant in Springfield: George W. Atkinson has been chosen superintendent of the maintenance department. Mr. Atkinson was formerly with the U. S. Government, being electrical and consulting engineer at the Springfield, Mass., Armory. Edward W. Beckman, appointed superintendent of the foundry division. Mr. Beckman came from the Kewanee, Ill., plant of the Walworth Mfg. Co., tool manufacturer, where he was foundries superintendent. He was also with the Dodge Mfg. Co., Mishawaka, Ind., for a time. William J. Smith, formerly with the McNab & Harlin Co., has been selected as assistant superintendent of the foundry department.

Joseph H. Roberts, Midvale Steel & Ordnance Co., Nicetown Works, has resigned to become assistant to the president Electric Alloy Steel Co., Youngstown, Ohio.

Edwin S. Webster, president and director Stone & Webster, Boston, and George O. Muhlfeld, vice-president, are in Japan, looking over large engineering works.

James L. Richards, president Massachusetts Gas Co., which owns the New England Coal & Coke Co., Boston, is in Belleair, Fla., recuperating from a serious operation.

Richard W. Maher, sales representative Boston office, Rogers, Brown & Co., pig iron, has been transferred to that company's Buffalo office. Mr. Maher was associated with the Boston office for approximately 10 years, and one of the best known pig iron representatives in the New England territory.

Paul B. Morgan was re-elected president of the Morgan Construction Co., Worcester, Mass., at the annual meeting held last week. The other officers and directors were re-elected also.

Ralph M. Hamilton has resigned as general sales manager of the Jefferson Gas Coal Co. to become sales manager of the coal and coke department of the Iron Trade Products Co., Pittsburgh. In earlier years, Mr. Hamilton was with the Hillman Coal & Coke Co. and the Lackawanna Steel Co.

Oswald Fowler, Rogers Brown & Co., New York, has returned from an extended trip to Norway, Sweden and England. He went abroad to investigate the aluminum business. He found conditions abroad very much depressed with little prospect of early recovery due largely to the demoralized finances of most of the European countries.

Charles M. Schwab, president of the Bethlehem Steel Co., is scheduled to address the annual banquet Friday evening, March 3, of the Chamber of Commerce of Youngstown, Ohio.

Technologic Paper of the Bureau of Standards, No. 203, entitled, "The Influence of Phosphorus Upon the Microstructure and Hardness of Low Carbon Open-Hearth Steels," states that, in this investigation, no clear relationship could be established between the phosphorus content, varying within the range of 0.008 to 0.115 per cent which marks the usual limits in plain carbon steels, and the microstructure and hardness as developed in two series of specimens, one of basic and the other of acid open-hearth steel, by a series of different heat treatments because of the marked irregularity in the distribution and grain size of the ferrite and pearlite grains found present in many of the specimens. This irregularity was traced to the non-uniform distribution of the phosphorus. A cellular-like structure formed in conjunction with the microstructure normal to these steels was studied and the relationship between this unusual structure and the distribution of phosphorus was established.

R. L. White has been appointed district manager in charge of Detroit office, 309 Kresge Building, Detroit, of the Wilson Welder & Metals Co., Inc., New York, maker of arc welding machines and welding metals.

OBITUARY

WILLIAM C. GRAVES, aged 45, president Graves Machinery Exchange, 50 Church Street, New York, died suddenly at the Richmond Hotel, Richmond, Va., Feb. 27. Mr. Graves, whose home is at Manhattan Beach, L. I., was on his way to his winter home at Miami, Fla. He was born in Louisville, Ky., where he first became interested in the machinery business through operating a small bicycle repair shop in that city. He was for several years a salesman with the Wicks Machinery Co., Jersey City, N. J., leaving that connection to establish the New York Machinery Exchange with L. Bertollette of the Bertollette Machine Tool Co., Jersey City, N. J. Later, when Mr. Bertollette withdrew from the company, Mr. Graves changed the name to the Co-operative Machinery Exchange, becoming associated with C. W. Pritchard and George Bennett. About 1916, when the latter withdrew from the company, Mr. Graves again changed the name. This time to the Graves Machinery Exchange, under which name it now operates.

MORRIS THOMAS, purchasing agent National Enameling & Stamping Co., died Feb. 16 at his home in Milwaukee, aged 51 years. He was connected with the company in various capacities for more than 33 years.

REINHARD MANNESMANN, Berlin, Germany, manufacturer of seamless steel tubing, died in Berlin Feb. 22.

Possible Youngstown Merger

YOUNGSTOWN, Feb. 27.—Possibilities of a merger of independent steel interests in the Mahoning Valley, in event current consolidation negotiations involving scattered plants fail, are being appraised. Principal independents in the Valley district are the Youngstown Sheet & Tube Co., Republic Iron & Steel Co., Brier Hill Steel Co., Trumbull Steel Co. and the Sharon Steel Hoop Co. Of these, the first three have been most prominently mentioned in connection with merger reports.

It is contended that with the Valley interests merged into one corporation, they would be in better position to bring pressure to bear on problems confronting the district. Furthermore, there appears to be a growing disposition that an amalgamation of concerns with plants in different sections may not materialize at this time.

Jeffrey Mfg. Co. Policies

The Jeffrey Mfg. Co., Columbus, Ohio, has made some changes in its sales plans. The company has established a direct action method in place of the old branch office system. The sales forces of the various departments are being condensed and consolidated under direct control of the home office at Columbus. The company also announces the expansion of its department of contract engineering to engage in more extensive and complete engineering projects than has been its policy heretofore, and the Middle States Construction Co. becomes an integral part of this department. The company also intends to still further extend its dealer-agency system, thereby assuring the widest distribution of Jeffrey standardized equipment. Important economies are expected to ensue as a result of the changes.

An exposition of plumbing apparatus and sanitary equipment for buildings is to be held in the General Motors Building, Detroit, in connection with the fortieth annual convention of the National Association of Master Plumbers. A bureau has been established for taking care of the details of the exposition under the business management of E. K. Durham at 484 Penobscot Building, Detroit.

Thermal Expansion of Nickel, Monel Metal, Stellite, Stainless Steel and Aluminum

The increasing use of nickel, Monel metal, stellite, stainless steel and aluminum for spark plugs, steam valves, automobiles and in household and surgical appliances has created a considerable demand for the accurate determination of the thermal expansion of these metals and alloys.

Scientific Paper No. 426 of the Bureau of Standards considers this subject fully. Ten samples of commercial nickel containing from 94 to 99 per cent nickel, five of which were heat rolled and five heat rolled and annealed; 10 samples of Monel metal, 60 to 69 per cent nickel, of which two samples were cast, three hot rolled, and the remaining of various compositions and treatments; five samples of stellite of different grades; two samples of stainless steel and two samples of 99.4 per cent aluminum were used in the work. The conclusions should prove of assistance to engineers using these metals in connection with varying temperatures.

Taylor Society to Meet in Philadelphia

A mid-winter meeting of the Taylor Society will be held at the City Club, Philadelphia, March 16, 17 and 18. The tentative program is as follows:

Thursday afternoon, March 16, "A Case of Sales Research," by John M. Holcombe, Jr., manager sales research division, Phoenix Mutual Life Insurance Co., Hartford, Conn. Thursday evening, "Problems of General Management," by Henry P. Kendall, manufacturer and banker, Boston.

Friday forenoon, "Super-Standards," by Dr. Frank B. and Dr. L. M. Gilbreth, Montclair, N. J. Friday afternoon, "Budget Control," by George E. Frazer, Frazer & Torbet, Chicago. Friday evening, "Mills, Minds and Men," by Arthur Pound, Flint, Mich., author of the articles, "The Iron Man," now appearing in the *Atlantic Monthly*.

Saturday forenoon, "String-Board Graphics," by Percy S. Brown, works manager, Corona Typewriter Co., Groton, N. Y. "The Work of the Balance of Materials Clerk," by Thomas W. Mitchell, Philadelphia.

New Iron Agency in Buffalo

Waldo, Egbert & McClain, Inc., Buffalo, recently chartered under State laws, will engage in a general agency and brokerage business in pig iron, steel, coke, fluorspar, etc. Offices have been opened at 744-46 Marine Trust Building. Fred J. Waldo, president, has been connected with Rogers, Brown & Co. for a number of years, recently resigning to form the new company; Justus Egbert, vice-president, was associated with the American Radiator Co. in different capacities for about 20 years, and at one time was identified with the company's plants in France and England; William J. McClain, secretary and treasurer, resigns from the position of district sales manager at Buffalo for the Republic Iron & Steel Co., to become connected with the new enterprise. He was associated with the Republic company for about 11 years, and previous to this spent four years with the United States Steel Corporation, located in the operating department at Youngstown, Ohio.

Presented a Community House

At a community celebration Thursday evening, Feb. 23, the Carnegie Steel Co. formally presented to the Village of McDonald, in Trumbull county, Ohio, a three-story pressed brick Community House building. It contains assembly rooms, reading, billiard, bowling and other recreational facilities. The building was formally accepted by James A. Freed, mayor of the village. McDonald was created by the Carnegie company for the employees at its McDonald bar mills. The company recently completed the erection of 172 dwellings of modern type, which are sold or rented to employees, as desired. Workers are offered an attractive deferred payment arrangement in case of purchase, and many have taken advantage of this plan. McDonald is located five miles west of Youngstown.

VEHICULAR TUNNEL CONTRACT

Reported That Bethlehem Steel Co. and Davies & Thomas Co. Will Be Awarded Castings

Although the contract for the construction of the New York-New Jersey vehicular tunnel has not yet been formally awarded to the low bidder, Booth & Flinn, Inc., New York and Pittsburgh, it is expected that the papers will be signed within two or three weeks. The delay has been caused by the refusal of the Erie Railroad to vacate certain streets in Jersey City, though the city government has posted notices that these streets will be closed. As yet no legal action has been taken.

Despite this delay, Booth & Flinn, Inc., is understood to have virtually completed arrangements for cast iron and steel segments, fabricated steel and bolts, nuts and washers required in the tunnel work. THE IRON AGE is reliably informed that the Bethlehem Steel Co. will cast 60 per cent of the 105,000 tons of cast iron

segments and all of the steel castings, about 2600 tons, and will also fabricate about 10,000 tons of structural steel required in the work. The remaining 40 per cent of the cast iron segments, THE IRON AGE is informed, will be cast and machined by the Davies & Thomas Co., Catasauqua, Pa., which did similar work for the Hudson tubes.

The Bethlehem Steel Co. will, of course, furnish its own pig iron, while it is expected that the pig iron supply for the work to be done by the Davies & Thomas Co. will come from the furnaces of the Empire Iron & Steel Co., Catasauqua, Pa., Leonard Peckitt being president of both companies. According to original estimates about 75,000 tons of pig iron, the remainder scrap, will be required for the castings.

It is further intimated that a large part of the bolts, nuts and washers for the tunnel will also go to the Bethlehem Steel Co., though it is reported that a Pittsburgh company is slated to receive a part of this business. The specifications provide for approximately 1,000,000 nickel steel bolts, the same number of nickel steel nuts and about 2,000,000 washers.

BROADER BUYING

Activity at Youngstown Not Great Enough to Cause Marking Up of Prices

YOUNGSTOWN, Feb. 28.—While lighter steel products are benefiting from current buying, there is a tendency to over-emphasize the movement. Without exception Valley steel makers report that incoming tonnage is on a broader basis, but it still lacks sustaining influence. In finished directions, tin plate makers are in the best operating position. The Trumbull Steel Co., for instance, which ranks as the third largest independent tin-plate interest in the country, has a backlog of unfilled orders which will engage its capacity through March at a rate close to normal.

Buying of strip steel is likewise on a larger scale and production schedules have been accelerated. The principal district interest claims to be holding to a base of 2c. on hot-rolled, though reports of concessions in this market are frequent.

Valley producers believe that in the immediate future any price changes will be in the way of firming current levels and eliminating concessions, rather than actual advances in the nominal market.

In most finished lines buyers are still booking tonnage with considerable caution, deterred by the uncertainties surrounding the whole price structure.

The Ford Motor Co. has come into the market for larger requirements against an increased production schedule in March. Sheets are likewise moving to subsidiaries in the General Motors group, the Dodge Bros., Studebaker and the Fisher Body Corporation, among others. Makers not catering to the auto trade similarly report more activity from other sources. The Republic Iron & Steel Co., for instance, now has eight of 18 sheet mills at its Niles works engaged, as compared with four during the first weeks of February.

Fair Orders for Refractories

PITTSBURGH, Feb. 27.—Business in refractories is feeling quite fully the betterment in blast furnace and steel plant operations. While there is yet no disposition on the part of the iron and steel makers to anticipate their requirements, their needs are increasing and the past few weeks have been marked by fairly numerous, if individually small, orders. The business is well distributed among the different kinds, but relatively is better in silica and magnesite than in fire clay or chrome. Quotations are unchanged, but observance of published prices is not 100 per cent. Less than \$53 Baltimore, has been done on magnesite brick, and some concessions are appearing also in fire clay and silica.

Chrome brick are not readily sold at more than \$40 per net ton works.

We quote per 1000, f.o.b. works:

Fire Clay	High Duty	Moderate Duty
Pennsylvania	\$32.00 to \$35.00	\$30.00 to \$32.00
Ohio	30.00 to 35.00	28.00 to 30.00
Kentucky	32.00 to 35.00	30.00 to 32.00
Illinois	32.00 to 35.00	30.00 to 32.00
Missouri	32.00 to 35.00	28.00 to 32.00
Silica Brick		
Pennsylvania		30.00
Chicago		35.00 to 37.00
Birmingham		40.00
Magnesite Brick		
Standard size per net ton (f.o.b. Baltimore)		53.00
Chrome Brick		
Standard size, per net ton		40.00 to 42.00

Ohio Foundry Operations

The trade report of the Ohio State Foundrymen's Association for the month of January shows that the actual melt of 78 foundries reporting was 23 per cent of normal. Figures for the month showed that foundries in operation had received 2715 tons of pig iron and 776 tons of scrap. The actual melt of pig iron and scrap during the month was 6929 tons, and the stock of pig iron reported on foundry yards, as of Feb. 1, was 23,595 tons and scrap 5704 tons. Samuel Powell, Jr., secretary of the association, in the January bulletin, urges the members to send in their complete reports.

The annual meeting of the Ohio State Foundrymen's Association will be held at the Hotel Deshler, Columbus, Ohio, on March 31. The election of five new members of the board of administration and the officers for the ensuing year will take place at this meeting. In addition to the regular business program, the subject of uniform foundry practice will be presented to the association by the committee that has this matter in hand.

Contracting all the maintenance of way and maintenance of equipment work on the Ohio Region of the Erie Railroad has been completed, it is announced from the Youngstown, Ohio, offices of the regional manager. The Meadville Machinery Co., Inc., Meadville, Pa., has been awarded a contract to operate the Meadville car yards, roundhouse and repair shop, the Cleveland roundhouse and repair shop and the Galion shops. This interest has also taken over, effective March 1, all other repair work in the region not covered in previous contracts.

The Williamson & Lawrence Sand Co., Springfield, Mass., has been incorporated with Robert E. Lawson, president, and Harley F. Williamson, treasurer. The company owns 135 acres of silica sand at Provincetown, Mass., suitable for molding and for glass manufacture, and expects to begin operations on or about March 20.

Mining and Metallurgical Engineers

Continued from page 587)

New Jersey Zinc Co., Franklin, N. J., as the chairman. This meeting was a further step in the movement started a year ago when the first assemblage on this subject came together at the February meeting of the institute. This was described in THE IRON AGE, Feb. 24, 1921.

The session this year was an assemblage of the advisory board, created in the past year by the appointment of representatives of the various technical and engineering societies and consisting of the following appointees:

American Iron and Steel Institute: no one yet appointed; American Society of Civil Engineers: T. R. Lawson, Rensselaer Polytechnic Institute, Troy, N. Y.; American Society of Mechanical Engineers: George T. Cousins, manager mining and drill department Ingersoll-Rand Co., New York; American Society for Steel Treating: H. S. Brainerd, metallurgist Ingersoll-Rand Co., Phillipsburg, N. J.; American Society for Testing Materials: Dr. J. A. Mathews, president Crucible Steel Co. of America, New York; Associated General Contractors of America: George H. Clark, chief engineer Holbrook, Cabot, Rollins Corporation, New York; American Institute of Mining and Metallurgical Engineers: B. F. Tillson, assistant superintendent New Jersey Zinc Co., Franklin, N. J.; N. B. Braley, superintendent North Butte Mining Co., Butte, Mont., and Prof. H. M. Boylston, Case School of Applied Science, Cleveland; American Welding Society, represented by the American Bureau of Welding: C. J. Holslag, chief engineer Electric Arc Cutting & Welding Co., Newark, N. J., and Walcott Remington, chief engineer Thompson Electric Welding Co., Lynn, Mass.; Engineering Foundation: Prof. H. M. Boylston, Case School of Applied Science, Cleveland; National Research Council: Bradley Stoughton, 1107 Broadway, New York; Tool Steel Society: no one yet appointed; American Petroleum Institute: Van H. Manning, director of research American Petroleum Institute, 15 West Forty-fourth Street, New York.

All the members of this board were present, with one or two exceptions.

At this meeting the following report, outlining the proposed scope of the research investigation, was submitted by the Bureau of Standards and the Bureau of Mines:

1. A survey, under the direction of the Bureau of Mines, of the present status of the work.
2. Study of drill steels that give the greatest service before failure by breakage:

(a) nature of sections; (b) microstructure; (c) composition; (d) methods of manufacture; (e) heat treatment.

We recommend that this problem be assigned to the Bureau of Mines.

3. Testing of steel for determining:

(a) service qualities; (b) development of methods for recording service.

We recommend that this problem be assigned to the committee on field tests and shop practice, of which F. W. Denton is chairman.

4. Mechanics of failure:

(a) microanalysis; (b) nature of stresses, (c) detection of incipient failure: (1) magnetic analysis, (2) other methods not destructive of bar steel; (d) is failure due to fatigue of metal?

We recommend that this problem be assigned to the Bureau of Standards.

5. Methods and machine development for accelerated tests: (a) nature of forces involved: (1) impact; (2) vibratory compressional waves; (3) combined bending, vibratory, shearing and torsional.

We recommend that this problem be assigned to the committee on machine development for accelerated tests, of which W. H. Leonard is chairman.

6. Correlation of field tests with accelerated laboratory tests. We recommend that this problem be assigned to the chairman of the committees in charge of subjects Nos. 3 and 5, co-operating with representatives of the Bureau of Mines and the Bureau of Standards.

7. Special studies relating to the importance of heat treatment and use of steels best adapted to the drilling of oil and gas wells, and the application of acquired data on rock drills to such work, with special reference to conditions met with in the drilling of oil and gas wells.

We recommend that this problem be assigned to the Bureau of Mines.

8. Reclamation of depreciated drill steels:

(a) before failure; (b) after failure; (c) methods of

heating: (1) oil-fired furnaces, (2) electric furnaces: resistance (carbon or nichrome), induction (high-frequency or low-frequency), (3) ohmic resistance methods; (d) welding of fractured steel: (1) electric, (2) forge.

We recommend that this problem be assigned to the committee on the reclamation of depreciated drill steels, of which B. F. Tillson is chairman.

This report was adopted substantially as read after some discussion.

Non-Ferrous Sessions

The various meetings of the institute of metals division were presided over by W. H. Bassett, technical superintendent American Brass Co., Waterbury, Conn., and were some of the most profitable ever held by the institute.

A feature was a lecture on "Colloid Chemistry and Metallurgy" by Prof. Wilder D. Bancroft, Cornell University, delivered at a special session, Tuesday morning, Feb. 21, an abstract of which it is hoped may be published later in these columns.

Another feature was the presentation at the last session on Tuesday afternoon by Dr. Zay Jeffries, director of research, Aluminum Castings Co., Cleveland, of an abstract of his work on the "Slip Interference Theory of Hardening of Metals"—a theory which has attracted wide attention and whose importance is generally regarded as considerable. It applies to both steel and non-ferrous metals. Dr. Paul D. Merica, research engineer International Nickel Co., Bayonne, N. J., discussed Doctor Jeffries' theory, characterizing it as of paramount importance and agreeing with most of its phases with one or two exceptions.

Some interesting light on the process of sherardizing was thrown by a paper by Leon McCulloch, East Pittsburgh, Pa., entitled "Experiments with Standardizing." The author gives the composition of such coatings and discusses their life.

Election of Officers

At the annual election of officers, the following were selected:

Arthur S. Dwight, president.

J. V. W. Reyniers, vice-president and director.

Dr. A. R. Ledoux, vice-president and director.

Charles F. Rand, treasurer and director (re-elected).

New directors: William H. Bassett, Waterbury, Conn.; Thomas E. Stearns, Denver, Col.; William Kelly, Vulcan, Mich.

The new president is well known as a mining engineer, particularly for his connection with the Dwight-Lloyd sintering process for iron ore.

Walter H. Aldridge, New York, was made chairman of the finance committee; Doctor Ledoux, New York, chairman of the executive committee and Edward DeGolyer, New York, chairman of the membership committee.

The report of the membership committee showed that in 1921 there were 1251 new members placed in the roll, bringing the total to 10,205 after deducting 402 losses from various causes. At the end of 1920 the total membership was 9323. In finances, the deficit which prevailed at the end of 1920 has been wiped out and last year ended with "a creditable balance on hand."

The Banquet

The annual banquet, held on Wednesday evening at the Hotel Pennsylvania, was next to the largest ever held, with an attendance of about 650. The toastmaster was George Otis Smith, director U. S. Geological Survey, Washington, and the other two speakers were the outgoing president, Edwin Ludlow, and the new president, Arthur S. Dwight.

The plant of the Birmingham Steel Corporation, Birmingham, Ala., a Government works during the war period, has been purchased at a bankruptcy sale by the United States Shipping Board for \$7,000 and assumption of obligations totaling \$123,000. The plant specialized in the manufacture of structural shapes for shipbuilding, and is equipped for a capacity of about 3000 tons of fabricated steel per month.

Roberts Type of By-Product Coke Oven

(Continued from page 583)

the upper pass and the lower pass of the recuperator, due to the difference in the temperature of the waste gas in the two passes, does not interfere with the tension on the vertical joints in the recuperator, because with a temperature above 500 deg. Fahr. the coefficient of expansion in silica brick up to about 1200 deg. Fahr. is very small, compared to its expansion from atmospheric temperature up to 500 deg., or its rate of expansion above 1200 deg. Fahr. In other words, the operating temperatures of the recuperator are such that that part of the brick exposed to the lowest temperature comes in the flat part of the line in the expansion curve of silica brick, and will stand a variation of about 300 deg. without sufficient movement to affect the joints.

Our experience at Granite City since we started the plant has been such that we have operated at from 12 to 24 hr. coking time. In changing from one coking time to another we do not find that the overall efficiency of the recuperators for the recovery of heat is materially affected.

It is evident from our experience that the recuperative type of oven can be designed and built to give as good efficiencies as any other method of heat recovery. It will give longer satisfactory service without being affected by the wide swings that may come in operation.

The only question that may be involved in the relative value of a recuperator of this type as against the regenerator is the difference in cost. It is true that it costs more to install the recuperator than the regenerator, if brick only is considered, but in regarding it only from the angle of operation, and offsetting the higher brick cost by the elimination of reversing machines and valves, the relative cost is about the same.

One drawing shows graphically some heat effect curves as they refer to the Roberts coke oven wall. The curve *I* represents the ideal condition, where the heat would be transferred to the coal at an absolutely uniform rate throughout the entire height of the wall. The curve *M* represents the heat effect as it actually happens in the Roberts wall, and the curves *K* and *L* and *R* represent theoretical extremes to which the gases would go if they were not influenced by the conditions existing in the oven.

Theoretically, at the point of the primary gas introduction, the heat effect upon the coal would be according to curve *L*. Due, however, to the fact that 100 per cent of the air is introduced at this point, with only 50 per cent of the gas, and that the combustion starts in the mixing chamber, which is a flue-like structure, the flame temperature is tempered down to curve *K*, and the lower rate of heat transfer from the flue-like structure brings the heat effect line back to the curve *M*.

Below this point the baffle structure starts, and the rate of heat extraction is higher than above, due to the fact that more surface is exposed to the flame, so that the heat effect upon the coal is at a higher rate than would be indicated by the curves *K* or *L*. When getting to the point where the secondary gas is introduced, the curve *K* would be the natural effect for the introduction of this new gas, but it is being introduced in an atmosphere diluted by the products of combustion from the gas above, so that the rate of flame propagation is lower, and is taking place in a baffle wall structure where the rate of heat transference is high, so that the heat effect line as indicated by *M* is at a higher rate than the extremes indicated by curve *R*.

There is a marked decline, of course, in the temperature near the sole; but, due to the fact that the heat is transferred into the coal from three sides at that point, it is desirable to have this decline in temperature.

As the relative temperature of the upper zone compared to the lower is arbitrary, dependent upon the relative quantities of gas introduced at the two points, we consider that, so far as heat effect upon the coal is concerned, we have this well worked out, and high walls are no longer a problem. From a structural standpoint the design of a high wall, if designed in this

manner, is also solved, so that, if it is found desirable to build narrow coke oven chambers, and at the same time maintain the tonnage capacity of the oven, it can be done.

We have found that it is not necessary to have narrow coke oven chambers for the production of coke from the Illinois coal, as is very commonly supposed at present. The reason for advocating the narrow coke oven chamber for the many years that we have been carrying on experimental work is not due to this at all, but rather to the idea that greater economy can be obtained by narrow chambers and shorter coking time than by wide coke ovens and longer coking time.

We have demonstrated many times that the width of the oven has nothing to do with the ability to coke these high volatile, high oxygen coals. In fact, we can shut all of the heat off from one side of these ovens and coke the coal entirely from the opposite side, which would be equivalent to approximately a 28-in. oven.

It is our idea that better control can be obtained of the heat conditions throughout a long and high wall, if small quantities of gas are handled at any given point. The gas in the Roberts coke oven is introduced at 96 different points; that is, there are 48 primary orifices and 48 secondary orifices, one-half of which are on each wall. By admitting the gas in this manner it is always easy to inspect the points of inlet. By dealing with a small quantity at an individual point, there is less tendency to have wide variations in the heat effect from combustion.

Contrary to general belief, the velocities of the gases through the wall are slow, and at no point exceed 3.18 ft. per sec. When the gas adjustments are set for some given coking time, a uniform temperature can be obtained upon the wall throughout its entire height.

As stated above, the Granite City plant was designed to use Illinois and Indiana coals, and to operate the blast furnace upon the coke resulting from these coals. This we have successfully done, and the following operating data for January, 1922, will give an idea of what has been accomplished.

Average coking time.....	14 hr. 56 min.
Average charge of coal per oven.....	14.5 tons
Total coal per oven per day.....	23.9 tons
Average coke yield.....	67.21 per cent
Average coke breeze.....	3.7 per cent
Average tar yield per ton of coal.....	7.21 gal.
Average sulphate yield per ton of coal.....	28.7 lb.
Average total gas yield.....	10,248 cu. ft.
Average B.T.U. rich gas.....	593
Average B.T.U. fuel gas.....	517
Average fuel consumption.....	60 per cent
Average surplus gas.....	40 per cent

Average analysis of coal:

Moisture.....	8.06 per cent
Volatile.....	34.51 per cent
Ash.....	9.35 per cent
Sulphur.....	1.38 per cent

Average analysis of resultant coke:

Moisture.....	4.44 per cent
Volatile.....	2.47 per cent
Ash.....	13.06 per cent
Sulphur.....	1.13 per cent

Average weight per cu. ft..... 28 lb.

Shatter test on 2 in..... 51.52

Shatter test on 1 in..... 86.44

Shatter test on 3 in..... 13.12

Shatter test on 4 in..... 2.6

Porosity wall average..... 55 per cent

It is interesting to note that the amount of breeze is only 3.7 per cent of the total coke produced, because when using such a large percentage of high volatile coal, it has always been assumed that the breeze losses would be out of proportion to the total coke produced.

From the above it is apparent that the quality of the coke is good, and some of the peculiarities of this type of coal show up. It is evident that it requires more heat to make coke from this coal than out of the coking coals. But the yield of coke is good, and its strength is best evidenced by its use in the blast furnace, the data of which will be given later.

There was nothing unusual during the month's run on the coke ovens. The most significant thing was the uniformity of the coke size and structure throughout the entire month. The coke during the month of January was made from 90 per cent Black Brier, Ill., coal and 10 per cent Pocahontas.

To determine the relative value of the coke in the blast furnace as compared to last month, starting on

Feb. 1, the plant was put on 100 per cent Illinois coal, consisting of 75 per cent Black Brier and 25 per cent Orient. The Black Brier mine is in Williamson County and the Orient property in Franklin County. So far this month, practically the same results have been obtained in furnace practice with the 100 per cent Illinois coke, the only difference being that the rich gas is running higher in heat value than last month and the tar yield is slightly higher.*

Based on this, there is great doubt in our minds as to whether the mixture of any low volatile coal with the Illinois coals will give better results in the blast furnace, and everything at the present time indicates that we will get as good furnace practice and as low coke consumption on the 100 per cent Illinois as with the mixed coals.

The following report by Chas. R. Holzworth, general superintendent St. Louis Coke & Chemical Co., on the operation of the blast furnace during the month of January, upon the coke mentioned above, gives a better idea of comparison to established practice than anything else:

Attached is a tabulation of the results, which shows capacity of furnace 19,853 cu ft., pig per 100 cu ft. capacity 246 tons; average tonnage for the month 488, on coke consumption of 1875 lb per ton of pig. The limestone used per ton of pig was 1121 lb, and ash in coke 13.06 per cent, both

*Editor's Note: The blast furnace report of Feb. 11 showed a production of 513.8 tons, with a consumption of 1756 lb. of coke per ton of iron. The analysis of the coke was as follows: Moisture, 5.00 per cent, ash, 12.26 per cent; volatile, 0.84 per cent, sulphur, 1.05 per cent. Analyses of the five casts showed silicon ranging from 0.68 to 1.36 per cent, sulphur from 0.055 to 0.047 per cent, phosphorus, 0.220 to 0.231, manganese, 0.59 to 0.69 per cent.

of which are higher than used in good practice, such as is shown for No. 3 furnace, South Works, in the Year Book of the American Iron & Steel Institute for 1920.

As a matter of interest, if January, 1920, data on No. 3 furnace are used for a basis, we can calculate what our production and coke consumption would have been on the same limestone per ton of pig, and the same ash in coke, disregarding the smelting quality of the mixtures of ores. There is no method known whereby to determine the relative amounts of coke required to smelt mixtures of Old Range and Mesabi ores, although it is generally conceded that a Mesabi mixture reduces more easily than the Old Range mixture, with consequent lower fuel consumption per ton of pig.

The most important data on No. 6 furnace are shown in parallel columns with that of our furnace; one column for our furnace showing results obtained, and another column results that can be expected on the same basis of limestone used per ton of pig and per cent of coke ash.

Comparative Data		Furnaces on Comparative Basis	
	No. 6	Furnaces	19,853
Capacity, cu ft.	19,853	19,853	19,853
Tons per 100 cu ft.	246	246	246
Capacity, tons per day	1,875	1,875	1,875
Average tons per day	488	488	488
Average coke consumption	1,875	1,875	1,875
Lb. stone per ton pig	1,121	1,121	1,121
Scrap used over produced	109	109	109
Per cent Mesabi ore	100	100	100
Ash in coke, per cent	13.06	13.06	13.06
Cu ft. per minute at 60 deg., lost time deducted	31,200	31,200	31,200
Cu ft. alt per lb. coke	54.1	54.1	54.1
Blast temperature	1,936	1,936	1,936
Top temperature	261	261	261
Actual yield	49.68	49.68	49.68
Average silicon, per cent	1.01	1.01	1.01
Average sulphur, per cent	0.039	0.039	0.039
Pig per ton of iron lb.	88	88	88

(To be concluded)

American Incomes, Farmer and Otherwise

Figures prepared by the National Bureau of Economic Research show estimates of the aggregate individual incomes in the United States for the calendar years of 1910 to 1920 inclusive. Appended to these figures are the estimated aggregate incomes of the farm communities, both in dollars as received and in equivalent dollars based on 1913 prices. Based upon the aggregate figures, average individual incomes have been computed in 1913 dollars in two groups, one covering all those gainfully employed, as expressed in census statistics, while the other includes the farmers only.

It will be noted, from the table appended, that the farmers' percentage of the aggregate incomes during the years 1910 to 1916 inclusive varied between 12 and 14. In the three years of guaranteed prices on farm products, the farmer received about 17 per cent of the total income. Collapse of farm prices in 1920 cut down the farmers' proportion of 10.9 per cent of the total. Ex-

thirds of the total average for the country in the early years of the decade, reached in 1918 and 1919 a figure greater than the average for the rest of the country. In the year 1920, however, the farmer's proportion dropped off much more heavily than that of the rest of the country, which fact is responsible for many political and other movements now engaging the attention of the public press.

Restraining Order Against Wheeling Strikers Extended

Holding that "the right to work is open to all and one cannot be accosted or interfered with unlawfully merely because he chooses to work in an open shop or mill," Judge Addleman in the circuit court at Wheeling, W. Va., on Feb. 23, extended the restraining order of last August, directed against striking employees of the Wheeling Steel & Iron Co., to include a number of other locals, including the Crescent lodge of the Amalgamated Association of Iron, Steel & Tin Workers of North America, on petition of the plaintiff in the original case. A temporary injunction was allowed restraining the defendants from molesting non-union or other workers at the Yorkville, Ohio, mills of the Wheeling Steel & Iron Co. The first injunction dealt with picketing and interference on the part of strikers at the Belmont plant of the company. This new order merely enlarges the scope of the injunction to cover operations in Yorkville and follows an injunction of similar tenor recently granted by the United States district court at Columbus, Ohio. One paragraph of the restrictions imposed on the strikers lays down the general proposition that "the union has no right under the law superior to a non-union man and there must be no interference with any of these rights by any of the defendants."

Electrical resistivities of different resistor materials are being determined under different conditions of temperature, pressure, purity, etc., at the Northwest Experiment Station of the Bureau of Mines at Seattle, Wash., by Prof. G. R. Shuck of the University of Washington. It is hoped that these data will be of value in designing furnaces which use a resistor as the heating element or which make use of carbon as a reducing agent, and also in the manufacture of electrodes.

Calendar Year	Billions of Dollars			Average Income in 1913 Dollars		
	Aggregate Individual Incomes	Aggregate Farmers' Incomes	Farmers' Incomes, 1913 Basis	Farmers' Percentage of Total	All Gainfully Employed	Farmers' Percentage
1910	30.0	3.95	4.01	13.2	946	67.1
1911	30.2	4.7	3.78	12.3	923	64.3
1912	31.5	4.6	4.04	12.7	939	66.5
1913	32.5	4.2	4.20	12.9	955	68.8
1914	32.2	4.2	4.17	13.0	932	70.0
1915	34.5	4.7	4.59	13.7	1,000	71.7
1916	41.8	5.8	5.10	13.9	1,060	75.0
1917	50.7	8.8	6.45	17.4	1,025	97.9
1918	60.2	10.45	6.50	17.4	941	107.4

1920	65.8	7.2	3.50	10.9	850	63.9
Average	43.1	6.17	4.77	13.0	955	77.8

pressed in another way, the average income of all those gainfully employed varied in 1910 to 1919 inclusive between \$920 and \$1,060, in dollars of 1913 purchasing power. During this same period, the average farmer's income in 1913 dollars varied from \$593 to \$1,011.

The average farmer's income, which was about two-

NEW WORKING RULES

Abuses of Labor Unions Abandoned as Decree Is Accepted

A consent decree, drawn and signed in Washington, Feb. 24, established new working rules for approximately 119,000 members of the Bricklayers, Masons and Plasterers' International Union of America. These new rules are directly opposed to many of the rules of the American Federation of Labor.

The decree followed a conference with Attorney General Daugherty with the leaders of the union. It will be entered in the United States Court in New York.

The work of preparing a decree that would be accepted by more than 50 representatives of the various locals throughout the United States and by the Government followed research and inquiry on the part of the Federal officials for nearly four months.

The conviction and imprisonment of several persons charged with violation of the Sherman law, the voluntary disintegration of illegal combinations and the pending trials of others operated favorably in obtaining the consent of the union to discuss the matter with the authorities.

As finally prepared the decree provides in brief:

1. There is to be no limit to the productive capacity of the individual workman within the working day or any other time.
2. There is to be no limit upon the right of the employers to purchase their material wherever and whenever and from whomever they may choose, whether these materials be union made or otherwise.
3. There is to be no favoritism shown by organized labor toward employer or trade associations and no discriminations are to be indulged in against the independent employer who may not be a member of such an organization.
4. The labor organization is not to be used, or permit itself to be used, by material men or contractors or subcontractors as an instrument for the collection of debts or enforcement of alleged claims.

Employee Representation Defeated

The employees of the General Electric Co. at Schenectady, N. Y., have defeated the Rockefeller or American shop plan by a vote almost two to one. There were 5704 votes against the plan and 3549 in favor of its adoption.

When working with a full force the plant has 22,000 employees, and the vote was approximately less than half of that number, but many men have been idle some time, owing to business depression.

Industrial representation as expressed by the proposal was the result of weeks of careful study by a committee of 11, eight selected from among the employees and six by the company. Their draft was submitted to a committee of 250 selected from all sections of the plant. This committee approved the plan.

Under the terms of the defeated plan the plant would have been divided into 12 sections and the sections, in turn, into election districts. Each election district was entitled to one representative and one alternate representative for each 150 employees, or fraction thereof, in the district, their terms of office to be one year. Day workers elected to the committees would have been paid their day rate and piece workers their average piece workers' earnings for time spent on committee work.

Labor Conditions in Pennsylvania

HARRISBURG, Pa., Feb. 28.—Slight improvement in general conditions in the iron and steel trade is shown in the semi-monthly report of the Pennsylvania Department of Labor and Industry for the period ending Feb. 15. Three offices report conditions improved, while one reports that conditions have become more slack.

The McKeesport branch office optimistically reports that the main plants of the iron and steel mills of the district are operating nearer to capacity than they did at any time during 1921. This has brought about a

great reduction in the total amount of unemployment in the district.

Johnstown and Altoona are the other offices to report improvement. "Marked improvement" in the iron and steel trade was attributed by the Johnstown office to have materially helped in the decrease of 3700 in the number of unemployed. Re-hiring of workers in the railroad shops at Altoona has brought relief there, the Altoona office reports.

Scranton, the sole office to report worse conditions, says that "the laying off of metal workers and the slump in the mines and building have resulted in an increase of about 5500 in unemployed."

Conditions generally throughout Pennsylvania were about the same at the end of the period as they were at the start, according to Commissioner Clifford B. Connelley. Sporadic increases and decreases were reported, but the total number of idle in the entire State on Feb. 15 was reported to be 313,575.

Shift Workers in American Industry

More than 500,000 shift workers are employed in American industries, according to a report of the committee on work periods in continuous industries of the American Engineering Council of the Federated American Engineering Societies made public a few days ago.

Chairman H. E. Howe of the National Research Council said that the conclusions of the committee are based on a nation-wide survey of "an unexplored field" conducted under the direction of Dr. Horace B. Drury, formerly of the faculty of Ohio State University. The survey is now complete with the exception of certain regions of the South and Far West.

Labor efficiency, it is indicated, is higher with three shifts of eight hours each than with two 12-hr. shifts. Continuous operation, according to the engineers, was found to constitute a great social and industrial problem.

"While the committee plans a further engineering study in the steel industry," says the report, "its investigations to date have been in industries other than steel. It has been found that the extent of continuous operation industry outside of steel is greater than had been supposed. There are well up to 40 or 50 industries which involve a greater or smaller amount of continuous operation in all or a portion of the country's plants.

"Very roughly, the number of shift workers in the United States is probably well over 500,000, though likely not as large as 1,000,000. And the number of men on 12-hr. shifts, in the period preceding the depression, was perhaps not far from 300,000, of which about as many were outside the steel industry as in the steel industry."

Will Study Unemployment

WASHINGTON, Feb. 28.—Consistent with the previously expressed opinion of Secretary of Commerce Hoover that the question should be studied further because it is made the object of legislation, the fundamentals of unemployment and control of the business cycle are to be the subjects of a thorough investigation by a special committee of the President's Conference on Unemployment. The committee was selected at a meeting held at the Department of Commerce on Monday of last week and will report to the Conference on Unemployment and the public in about six months. The committee consists of Owen D. Young, vice-president General Electric Co., New York, chairman; Joseph H. Defrees, president, Chamber of Commerce of the United States; Clarence Mott Woolley, vice-president American Radiator Co., New York; Matthew Woll, vice president American Federation of Labor and Miss Mary Van Kleeck, Russell Sage Foundation, New York. Edward Eyre Hunt, secretary of the President's Conference on Unemployment, was appointed secretary of the committee, and Wesley C. Mitchell, New York, was made field director of the study.

The Champion Engineering Co., Kenton, Ohio, manufacturer of electric traveling cranes, has added more than 100 men to its working force as a result of a recent increase in orders.

Machinery Markets and News of the Works

FEBRUARY SALES DROP OFF

Machine-Tool Trade in Past Month Not So Active As in January

Inquiries Are Fairly Numerous But Prospective Buyers Are Slow in Placing Orders

Inquiries for machine tools are more numerous than orders. Prospective buyers are slow in closing. Used tools are in better demand than new tools, this situation being largely due to the very low prices quoted on used machines in good condition.

Sales in nearly all selling centers dropped off in February as compared with January. In some markets there are signs of improvement, but the situation is spotty, and, on the whole, the industry sees no promising indications of early resumption of satisfactory activity.

It is believed that marked improvement in the industrial situation must come as a prelude to better buying of machine tools. In this respect, however, there are some gains. It is reported from the Cleveland district that foundries are generally operating at 30 per cent as compared with a low point of 20 per cent last year. New England metalworking plants are slowly increasing the number of operating hours.

A few fairly good-sized orders have been placed, notable among which is that of the Franklin Motor Co., Syracuse, N. Y., for about 30 machines. The General Electric Co., Lynn, Mass., has bought several large milling machines, but most of the equipment listed on its recent inquiry for 42 machines will be moved from other plants. The H. B. Smith Co., Westfield, Mass., has closed on the remainder of its recent list. A Cincinnati manufacturer bought about \$10,000 worth of tools. The P. H. Murphy Co., New Kensington, Pa., recently bought several Bliss and Toledo presses.

There is very little railroad buying, such orders as that of the Maine Central for an 80-in. driving wheel lathe and a 60-in. boring, drilling and milling machine being conspicuous. The Santa Fe has bought several tools and the Chesapeake & Ohio is reported to have selected several used tools at the Hog Island shipyard. Requirements of its subsidiary road, the Hocking Valley, numbering seven machines, may be satisfied at the same source.

The Ward Baking Co., New York, is out with an inquiry for about 30 metalworking and woodworking machines, in addition to chucks, vises, etc., for a motor truck shop. The Springfield, Mass., plant of the Westinghouse Electric & Mfg. Co., which is busy on radio apparatus, may close soon on several tools.

New York

New York, Feb. 28.

February business in machine tools in this market did not show as large a total as that of January. There are few inquiries and fewer orders. Buying of new tools is restricted considerably by the number of used tools in good condition which are offered at prices varying from 25 to 50 per cent of the prices asked for new machines.

The McCabe & Sheeran Machinery Corporation, Singer Building, New York, has sold a used 16-ft. boring mill to a Cleveland manufacturer, a 6-ft. Bullard boring mill to a Canadian company, and an 8-ft. Niles mill to a New Jersey company.

The Ward Baking Co., New York City, which is planning to equip a shop for building motor trucks for its own use, has inquired for the following metalworking and woodworking machines.

- One threading machine (bolt cutter).
- One circular metal saw.
- Two 18-in. stationary head drill presses.
- One No. 1½ milling machine with index head and centers.
- One 20-in. shaper.
- One 26-in. x 12-ft. lathe.
- One 16-in. x 10-ft. lathe.
- One 16-in. x 6-ft. lathe.
- One 11-in. x 6-ft. speed lathe.
- Three 16-in. four-jaw chucks.
- Three 10-in. three-jaw universal Westcott chucks.
- Three sets Armstrong lathe tools.
- One No. 5 emery grinder.
- One No. 3 emery grinder.
- One No. 2 emery grinder.
- One American universal saw bench.
- One American single surfacer, 30 in.
- One American 24-in. jointer.
- One two-spindle shaper.
- One No. 2 borer.
- One No. 20 hollow chisel mortiser.
- One No. 10 band saw, 36 in.
- One No. 1 rip saw.
- One motor-driven swing saw.

- One 14-in. mult. Buffalo large blower.
- One 3-ft. dirt collector.
- Eight woodworking vises.
- 18 Monarch vises.
- Two direct-connected motor-driven forges.
- One power hack saw.
- One Buffalo No. 45 combination punch and shear.

The crane market continues dull as far as actual purchasing is concerned but inquiries continue to appear from time to time. Considerable activity is manifest in chain blocks in capacities varying from 1 and 2 tons to as high as 20 tons. One hand-power hoist inquiry, for export to Brazil, comes through H. E. Braisted & Co., 32 Broadway, New York, and calls for quotations on eight 20-ton chain hoists and several boxes of chain. Among recent chain block purchases were eight 2-ton hoists to the Bethlehem Steel Co. for the Wilmington plant, placed with the Chisholm-Moore Mfg. Co. This company has also booked an order for 12 1-ton, 12 1½-ton and 12 2-ton chain blocks for export to Japan.

Revised bids have been submitted on a revival of the inquiry of P. L. Smith & Co., 50 Church Street, New York, for a 10-ton crane with 3-nd bucket for the Glens Falls Portland Cement Co., Glens Falls, N. Y.

Among recent sales were Grey Steel Products Co., 111 Broadway, New York, two 30-ton, 50-ft. boom used Browning locomotive cranes and one 20-ton used Browning locomotive crane from Philip T. Kemp, 30 Church Street, New York; Kelsey Motor Co., Newark, N. J., two crane runways and two 1000-lb. capacity electric hoists from the New Jersey Foundry & Machine Co.; David H. Smith & Sons, Brooklyn, N. Y., a 7½-ton transfer crane from the Shepard Electric Hoist Co.

The National Marble & Slate Corporation, 236 West Fifty-fifth Street, New York, is arranging for the establishment of a plant for cutting, shaping, polishing and other operations, and will purchase machinery, including traveling cranes, etc. A stock issue of \$19,000 has been arranged to finance the project. John J. Burns is president, and James D. Corra, secretary and treasurer.

The New York Central Railroad, W. C. Bower, purchasing agent, 466 Lexington Avenue, New York, is taking bids

until March 6 for one 2000-kw synchronous motor-generator set, with appurtenances, switchboard, etc.

The Fitzgerald Brothers Brewing Co. 490 River Street, Troy, N. Y. is having plans prepared for remodeling its two-story plant 120 x 140 ft. for an ice manufacturing and cold storage works. Estimated cost, about \$300,000, including machinery. Office Hill & Mott, 11 West Forty-second Street, N. Y. C.

The Van Nostrand Co., Inc., 111 E. 42d St., N. Y. is arranging for the construction of a general machine building plant at 111 E. 42d St.

Albert O. Van Nostrand, 111 E. 42d St., New York, is having plans prepared for a new machine building plant at 111 E. 42d St. Estimated cost, \$1,000,000.

The New York City Board of Education is having plans prepared for a new high school at 111 E. 42d St. Estimated cost, \$1,000,000.

The New York City Board of Education is having plans prepared for a new high school at 111 E. 42d St. Estimated cost, \$1,000,000.

The United States Shipping Line, Inc., 111 E. 42d St., New York, is having plans prepared for a new shipyard at 111 E. 42d St. Estimated cost, \$1,000,000.

The United States Shipping Line, Inc., 111 E. 42d St., New York, is having plans prepared for a new shipyard at 111 E. 42d St. Estimated cost, \$1,000,000.

The International Combustion Engineering Corporation, 43 Broad Street, New York, is having plans prepared for a new foundry at 111 E. 42d St. Estimated cost, \$1,000,000.

The Precision Thermometer Corporation, New York, is having plans prepared for a new foundry at 111 E. 42d St. Estimated cost, \$1,000,000.

The Standard Oil Co., 111 E. 42d St., New York, is having plans prepared for a new foundry at 111 E. 42d St. Estimated cost, \$1,000,000.

A vocational department will be installed in the new high school to be erected at 111 E. 42d St. Estimated cost, \$1,000,000.

The Public Service Co., 111 E. 42d St., New York, is having plans prepared for a new foundry at 111 E. 42d St. Estimated cost, \$1,000,000.

The Water Committee, 111 E. 42d St., New York, is having plans prepared for a new foundry at 111 E. 42d St. Estimated cost, \$1,000,000.

The P. W. Well, 111 E. 42d St., New York, is having plans prepared for a new foundry at 111 E. 42d St. Estimated cost, \$1,000,000.

The Atlantic Metal Products Corporation, Newark, N. J., has leased the three-story and basement factory at 91 New Jersey Railroad Avenue for a new plant to manufacture metal specialties. Improvement will be made at once and machinery installed.

The Bayonne Steel Products Co., affiliated with the Bayonne Steel Rolling Co., 2 West Nineteenth Street, New York, will soon file plans for a two-story building, 10 x 219 ft., at Clinton and Fifth Avenue, Newark. Carl E. Gold, 45 Broadway, Bayonne, N. J., architect.

New England

Boston Feb. 25

The machine tool market was quiet the past week. The most important development was in connection with the recent inquiries put out by the General Electric Co., West Lynn, Mass., for 4' tool for work requiring fine measurements, and for miscellaneous heavy duty equipment. The company purchased a few large milling machines, but abandoned the remainder of the list having substituted equipment heretofore used in other departments of the West Lynn and subsidiary plants. The H. B. Smith Co., Westfield, Mass., heating appliances, closed on the remainder of its machine shop equipment and the Maine Central has purchased one 30-in. driving wheel lathe, a 60-in. horizontal boring, drilling and milling machine, motor driven, with 4½-in. bar, and an 18-in. lathe. Other sales include a 30-in. x 12-ft. motor driven lathe to the Worcester Electric Light Co., and smaller single lathes, upright drills, etc. The Stevens-

Dursey Co., Chicopee Falls, Mass., is in the market for a squaring shear.

Several local houses report numerous new inquiries for single machines, and Providence dealers also have good prospects. Dealers in other sections of New England report business quiet. The belief is general here among the more important firms that February bookings will show a considerable falling off as compared with January. Sentiment is hopeful, however, it being pointed out the aggregate number of live prospects eliminating the General Electric Co., has not lessened the past fortnight. Industrial New England is slowly increasing its operating hours taken collectively, but the situation is still more or less spotty. The settlement of the textile labor situation will it is generally believed be a signal for better buying of machine tools.

The Hydrate Pump Co., Salem, Mass., is having plans prepared for a contemplated four story, 50 x 100-ft. unit to be used by the engineering testing and packing departments.

A large overhead crane operated in the gun room of the Field Iron Foundry, 9 Chidding Street, Providence, R. I., recently was badly damaged by fire, as was a part of the foundry.

Michael D. Lee, Port Chester, Conn., coal dealer, plans the erection of a 50 x 1.8 ft. coal bunker with 300-ton capacity. Conveyor machinery, etc., will be required.

Construction on a \$1,000,000 repair shop at South Everett, Mass., for the Boston Elevated Railway Co., Boston, will begin in May and be completed in one year. It will consist of three units, one 156 x 650 ft. and two 50 x 150 ft. Eventually it is planned to consolidate most of the company's repair shops in the new Everett plant. Machine tool requirements have not yet been prepared, but are expected within a short time.

The Fabric Machine Co., 307 Center Street, Bridgeport, Conn., filed a certificate of incorporation Feb. 20 to engage in the manufacture of cloth cutting and winding machinery. It has been organized by Joseph J. Musante, who purchased the building's machinery and business of the late A. L. Adams last December. The capital stock is \$5,000 and the incorporators include Mr. Musante, Clifford J. Lewis and Arthur J. Bromley. Arthur Sullivan will be general manager.

The city of Middletown, Conn., is planning to erect a trade school at the corner of Church and Main streets to cost about \$10,000. Frank A. Cole, 128 Main Street, is chairman of the committee.

The H. I. Judd Co., 12 Cherry Street, Wallingford, Conn., fancy hardware manufacturer, has let contract for its six-story reinforced concrete addition, 75 x 102 ft. Lockwood Greene & Co., 60 Federal Street, Boston, are the engineers and John W. Ferguson, 23 Broadway, New York, has the general contract.

A vocational department will be installed in the new high school to be erected at Palmer, Mass., for which an appropriation of \$170,000 has just been approved. E. C. and G. C. Gardner, 315 Main Street, Springfield, Mass., are architects.

Underhill Brothers, 6 Sherman Street, Charkstown, Mass., manufacturers of hardware, have filed plans for the erection of a one-story factory, 50 x 100 ft., on Winthrop Avenue, Somerville, Mass.

A vocational department will be installed in the new high school to be erected by the School Board, Belchertown, Mass., appropriation for which has just been approved.

The Lynch Brothers Carriage Co., Chelsea, Mass., has foundation work under way for a one-story addition to approximate 5000 sq. ft. of floor space.

The Tush Mag Co., Wellington Avenue, Hartford, Conn., manufacturer of automobile radiators and other metal products, has completed plans for a one-story addition, 50 x 250 ft. Buck & Sheldon Inc., 60 Prospect Street, Hartford, are architects.

The Victor Page Motor Corporation, 301 Lafayette Street, New York, has awarded a contract to the Truscon Steel Co., 110 West Fortieth Street, for a one-story plant, 50 x 105 ft., on Melrose Avenue, Stamford, Conn., to cost about \$25,000. The company is now operating a works at Farmingdale, L. I.

A one-story power house will be erected by the Velvet Textile Corporation, P. O. Box 1962, New Haven, Conn., in connection with a new factory to cost about \$180,000, at Alhambra. D. E. Smith, 152 Temple Street, New Haven, is architect.

Herbert B. Rust, Meredith, N. H., and associates are planning the construction of a hydroelectric power plant on the Pemigewasset River, vicinity of Manchester, N. H., with transmission system to furnish power at Ashland, Wolfeboro, Plymouth, Bristol and vicinity.

A vocational department will be installed in the new high school to be erected at Belfast, Me., three stories, 140 x 150 ft., estimated to cost \$150,000. Kilham, Hopkins & Greeley, 9 Park Street, Boston, are architects.

Chicago

CHICAGO, Feb. 27.

Sentiment has improved in the local machinery district because of the more active interest taken in the market by buyers, but thus far inquiries have greatly outnumbered sales. Orders for single machines predominate and used equipment continues to move faster than new tools. One dealer, however, reports the sale of a 34-in. boring mill, a 16-in. shaper, a 20-in. shaper, and a No. 3 milling machine, all new tools, within the past week. The Santa Fe continues to make a few purchases against its outstanding list from time to time. For La Junta, Colo., it has ordered a 48-in. x 48 x 12-ft. motor-driven planer, and for San Bernardino, Cal., it has bought a 15-ton overhead traveling crane. The Burlington is preparing an extensive list which is expected to be issued within a week or two.

C. R. Berglund, manufacturer of automobile bodies, 2630 Wentworth Avenue, Chicago, is taking bids on a one-story plant, 100 x 125 ft., on Sixty-seventh Street near Park Avenue, to cost \$75,000.

The Elgin Stove & Oven Co., 14 Chicago Street, Elgin, Ill., plans to construct a two-story factory to cost \$50,000.

The American Clutch & Machinery Co., recently organized, is about to start operations at 1842 East Miner Street, Des Plaines, Ill. It will manufacture steel clutches for shafting and will also do general machine shop work.

At a special election at Muscatine, Iowa, a \$350,000 bond issue was authorized for the construction for a municipal electric light and power plant.

At the recent annual meeting of the Rockford Steel Equipment Co., Rockford, Ill., it was voted to raise the capital stock to \$150,000 to finance the provision of larger quarters to take care of the company's growing business. W. H. Hendrickson is president and general manager.

The Atlas Powder Co., Wilmington, Del., contemplates the erection of a \$2,000,000 powder plant at Pinckneyville, Ill.

The City Council, Red Wing, Minn., has passed an ordinance calling for the erection of a municipal light and power plant. Three years ago the city authorized the issue of \$350,000 worth of bonds for the construction of such a plant, but this was delayed owing to arrangements made with the Wisconsin-Minnesota Light & Power Co.

The Central Illinois Public Service Co. has purchased 180 acres of land two miles north of Grand Tower, Ill., as a site for a \$2,000,000 power plant.

C. G. Budig, McCook, Neb., will start the construction of a machine shop, 32 x 75 x 100 ft. about March 1. The building will cost \$250,000 and will be used for general machine shop work and automobile truck and tractor repairs.

Abraham Mikel, 1311 Washburn Avenue, Chicago, has taken bids on a two-story garage, 72 x 107 ft., at the north east corner of West Taylor Street and Garibaldi Avenue to cost \$50,000.

The Chicago Union Station Co. will soon take bids on the construction of a power plant at Harrison and Canal streets, Chicago.

The L. W. A. Bunge Mfg. Co., recently incorporated with \$20,000 capital stock, has leased space at 2638 West Madison Street, Chicago. It will engage in general machine shop business and is fully equipped with machine tools for the time being. The officers are L. W. A. Bunge, president and treasurer; H. C. Dawson, secretary, and H. D. Bunge, vice-president.

The American Cabinet Co., 3021 North Crawford Avenue, Chicago, has let a contract for a one-story plant, 100 x 125 ft., to cost \$40,000.

Fred R. Chandler, 3817 North Pennsylvania Street, Indianapolis, has completed plans for a four-story automobile service and repair building, 60 x 200 ft., on West Vermont Avenue, estimated to cost \$125,000. Vonnegut, Hohn & Mueller, 610 Indiana Trust Building, are architects.

The Lampman Tool Co., Angola, Ind., is planning for the installation of new machine tools and other equipment. H. W. Lampman is manager.

A vocational department will be installed in the new high school to be erected at Shelburn, Ind., plans for which have been prepared.

The Evan L. Reed Mfg. Co., Sterling, Ill., manufacturer of metal display stands, racks, etc., has completed plans for a three-story and basement addition, 40 x 90 ft., estimated to cost in excess of \$125,000, with equipment. Evan L. Reed is president and general manager.

The Union Light, Heat & Power Co., Fargo, N. D., has preliminary plans under way for a new electric power plant near Broadway and Roberts Street.

The Illinois Central Railroad Co., 135 East Eleventh Place, Chicago, is arranging a preferred stock issue to total \$50,000,000, to be disposed of in allotments over a period of years, the larger part of the proceeds to be used

for the electrification of its system in the Chicago district, including about 190 miles of line, power plants, electrical equipment, etc., with new passenger terminal and other work.

The Union Utilities Co., Rutland, Iowa, is having plans prepared for a new hydroelectric generating plant near Rutland, estimated to cost about \$150,000. Toitz, King & Day, Inc., 1410 Pioneer Building, St. Paul, Minn., are architects and engineers.

A vocational department will be installed in the three-story and basement high school to be erected at Fort Madison, Iowa, 157 x 190 ft., estimated to cost about \$350,000. Owen, Payson & Carswell, American Bank Building, are architects.

The Common Council, Hillsboro, N. D., will soon take bids for the construction of a municipal electric light and power plant. The C. L. Pillsbury Co., 1200 Second Avenue, South Minneapolis, Minn., is engineer.

A vocational department will be installed in the new senior and junior high school to be erected at Ainsworth, Neb., W. A. Sawyers, secretary, bids for which are being taken until March 20. Davis & Wilson, Lincoln, Neb., are architects.

The Common Council, Centralia, Ill., will commence the immediate erection of a one-story municipal power plant, 50 x 105 ft., to cost about \$85,000.

Philadelphia

PHILADELPHIA, Feb. 27.

The Moore-White Co., Fifteenth Street and Lehigh Avenue, Philadelphia, manufacturer of machinery and parts, has commenced the construction of a two-story foundry addition, 60 x 165 ft., estimated to cost about \$35,000.

The Grissenger Machine Works, 904 Quarry Street, Philadelphia, has leased the first floor and basement of the building at 236 Quarry Street, for extensions.

The Champion Incandescent Light Co., 235 Market Street, Philadelphia, manufacturer of lighting fixtures, has purchased the building at 635 Market Street, for \$125,000. Alterations and improvements will be made, and the structure occupied as a new plant.

The Bureau of Supplies and Accounts, Navy Department, Washington, will take bids under schedule 9461 until March 7 for 1800 socket wrenches for the Philadelphia Navy Yard.

The Electrical Foundry & Equipment Co., Philadelphia, has construction under way on a new plant at Tacony and Bleigh streets, estimated to cost about \$200,000, including machinery. It will specialize in steel castings, with facilities to manufacture castings up to 200 lb. William P. Cunningham is president.

Thomas E. Miller, 3243 Germantown Avenue, Philadelphia, operating a brass manufacturing and refinishing works, has had plans prepared for an addition. Improvements will be made, also, in the present building.

The Bureau of Highways, City Hall, Philadelphia, has arranged a list of machine tools to be purchased for its new automobile service and repair works, including engine lathes, drill press, power hack saws, shaper and portable floor crane. F. H. Craven, room 216, is director.

A one-story power house will be constructed at Fifth and Annsbury streets, Philadelphia, by the Oscar Nebel Knitting Mills, 3860 Coral Street, for mill service. It will cost \$75,000.

John M. Greene, Drexel Building, Philadelphia, is making inquiries for a used compound 12 x 12-in. air compressor, from 400 to 600 cu. ft., operating at 100 lb. pressure.

The International Harvester Co., 606 South Michigan Avenue, Chicago, has taken title to property on Sixteenth Street, Philadelphia, 100 x 194 ft., for \$62,000, to be used for the erection of a local branch.

Joseph Katter Co., 1621 Ridge Street, Philadelphia, manufacturer of lighting fixtures, has leased the first floor of the building at 19 North Ninth Street, opposite its present branch works, for extensions.

A vocational department will be installed in the three-story and basement high school addition to be erected at Ford City, Pa., bids for which will be asked early in March. W. G. Eckles, Lawrence Savings & Trust Building, New Castle, Pa., is architect.

The East Penn Foundry Co., Macungie, Pa., will operate a nickel-plating department in connection with its casting room for plumbing fixtures. Heretofore this work has been handled in outside shops. The company has other extensions and improvements under way.

The Crescent Truck Co., Lebanon, Pa., recently organized, has taken over the factory of the Hunsicker Engineering Co., 167 North Tenth Street, previously used for machinery manufacture, which it will use for the manufacture of small storage battery trucks.

Fire, Feb. 18, destroyed a portion of the plant of the Wehaver Hardware Co., Danville, Pa., with loss estimated at about \$75,000, including equipment.

A one-story power house will be erected at the plant of the York Sanitary Milk Co., North George Street and Hamilton Avenue, York, Pa., 45 x 52 ft. Rinnhard Dempwolf, Cassett Building, is architect.

The Keystone Carbonic Gas Co., Conneautville, Pa., recently organized, has acquired the plant of the Highspire Distillery Co., Highspire, Pa., for the manufacture of industrial gas. T. B. Ironnelly is vice president, and E. W. Powell, secretary, both of Conneautville.

The Dudley Watch Co., Orange and Queen streets, Lancaster, Pa., has awarded a contract to Herman Wohlsein, Woolworth Building, for a two-story factory, 13 x 100 ft., on South West End Avenue. Henry Y. Shaab, Imperial Building, is architect.

Buffalo

BUFFALO, Feb. 27

The Atlas Vase Co., Inc., Lowville, N. Y., is planning for the erection of a new two-story factory to cost about \$27,000. E. W. Fulton, Lowville, is president.

The H. H. Franklin Mfg. Co., Syracuse, N. Y., manufacturers of automobiles, has arranged an appropriation of \$5,000,000 for a new plant to manufacture a light four-cylinder, air-cooled automobile. A site at Eastwood, near Syracuse, is being considered. The company is said to be negotiating for the purchase of the plant of the Willys Corporation, Elizabeth, N. J., never entirely completed. With such acquisition the proposed Eastwood plant would be deferred. H. H. Franklin is president.

The Syracuse Twist Drill Co., Syracuse, N. Y., is planning to rebuild the portion of its plant recently destroyed by fire with loss estimated at about \$20,000.

The Greene Machine Co., Watertown, N. Y., is planning for the erection of a new two-story machine shop to cost about \$25,000. C. H. Greene is head.

The Johnson City Motor Car Co., Johnson City, N. Y., has awarded contract to H. B. Van Ness, Washington Street, Endicott, N. Y., for a one-story service and repair building, 72 x 115 ft.

The United Fertilizer & Lime Co., Merchants' Bank Building, Syracuse, N. Y., is planning for the installation of new crushing and screening machinery at its plant at Gouverneur, N. Y.

The National Lamp Works, 1495 Fillmore Avenue, Buffalo, has filed plans for a machine shop to cost \$15,000.

Fire, Feb. 17, damaged the plant of the McKaig-Hatch Co., 1590 Niagara Street, Buffalo, maker of tools and drop forgings. The loss is estimated at \$30,000.

Cleveland

CLEVELAND, Feb. 27

Machine tool sales fell off the past week. Inquiries are holding up fairly well, but practically all that came out during the week were for single machines. Plant operations in the metal working industries show a slight gain and the sentiment is better than for some time. Cleveland foundries are operating on an average of about 30 per cent as compared with the low point of about 20 per cent reached last year. Some of the recent buying has been from comparatively new industrial concerns that had not provided all the equipment they expected to install when the slump came a year ago and which shut off on additional purchases at that time. Some additional machine tool business is looked for from this source shortly.

Demand for used machinery picked up with some dealers during the week. In used machinery one local dealer reports the sale of four single spindle drilling machines to a northern Ohio manufacturer and four lathes, a shaper and drilling machine for equipping a Chicago shop.

Inquiry for hydro-electric equipment shows improvement. There is also better inquiry for locomotive cranes.

The Fostoria Welding Co., Fostoria, Ohio, a new company, has established a plant at 319 North Main Street. A. W. Zenz is the principal owner.

The India Machine & Rubber Mold Co., Akron, has purchased the plant of the Vulcan Welder Co. in that city and will move into its new quarters shortly.

The Sandusky Gas & Electric Co., Sandusky, Ohio, will enlarge its plant. Additional equipment to be installed will include boilers, turbines and coal and ash handling equipment.

It is reported that the Wells Process Co., Conneaut, Ohio, will build a one-story machine shop, 66 x 130 ft.

The Standard Body Co., Angola, Ind., will establish a plant in Hicksville, Ohio, for the manufacture of motor truck bodies. It has acquired a lease of the Collier factory and is installing equipment.

The Lucius Mfg. Co., Uhrichsville, Ohio, has completed and placed in operation its plant for the manufacture of welded tanks for automobile and other uses. The officers are J. E. Smith, president; Alexander Robinson, vice-president; C. E. Lucius, secretary and manager; John L. West, treasurer.

The United States Street Sweeping Machine Co., Akron, Ohio, has been incorporated to manufacture patented street sweeping equipment. Offices have been opened at 712 Second National Bank Building, Akron.

The Interstate Aluminum Co., Canton, Ohio, which recently increased its capital stock from \$25,000 to \$60,000, plans to enlarge its works and install new equipment.

The D. Connelly Boiler Co., Cleveland, has taken an order from the San Joaquin Light & Power Co., Los Angeles, Cal., for six 850-hp. water tube boilers.

Cincinnati

CINCINNATI, Feb. 27.

At least two fair-sized orders were placed the past week in which local manufacturers participated. The Franklin Motor Co., Syracuse, N. Y., closed for approximately 30 machines, many of which were booked in this market. The General Electric Co. was also a buyer for its Lynn, Mass., plant, and local manufacturers were also well represented in this deal. The Santa Fe closed for several tools, among them a large planer. A Cincinnati manufacturer was also a purchaser, buying about \$10,000 worth of equipment. The Chesapeake & Ohio is reported to have bought a number of used tools from the Hog Island shipyards and it is said that the Hocking Valley Railroad, which recently inquired for seven machines, will likely fill its requirements from the same source.

Some manufacturers have quoted on more inquiries the past two weeks, while others state the market is much quieter than for some months past. The market can well be classed as "spotty," but the majority of manufacturers are of the opinion that the general position of the industry is much improved. Some large lists of high-grade used tools are coming out and an analysis shows that tools classed as 95 per cent new are being offered at approximately 55 per cent of to-day's list prices. On smaller tools some low prices are being made by dealers, in one instance an 18-in. x 8-ft. engine lathe, with full attachments, being offered at \$600 and an intimation made that this price could still be shaded considerably. A 14-in. x 8-ft. engine lathe with full attachments is being offered at \$400. Prices on heavier machines, however, are holding firm and local manufacturers are refusing to make any concessions on even the most attractive business.

The Midwest Engine Co., Indianapolis, Ind., is being reorganized as the Midwest Engine Corporation. Howard S. Mott, New York, is the chairman of the new corporation and Oscar F. Stevens, New York, secretary.

The Globe Register Co., Reading Road, Cincinnati, has placed contract with the Ferro-Concrete Construction Co. for a two-story addition which will increase its manufacturing facilities 50 per cent. The present plant is a three-story structure and two additional floors will be added.

The Hamilton, Ohio, plant of the Ford Motor Co., which has been engaged in tractor production, has been turned into a wheel manufacturing plant and is now turning out 300 sets a day. It is understood that the plans of the company call for an increase in the output until the entire production of 4000 sets a day are made. The plant also manufactures locks for touring cars, 4500 a day being the present capacity.

Detroit

DETROIT, Feb. 27.

The Stafford Roller Bearing Co., Lawton, Mich., has awarded contract to Benjamin Barnhart, Lawton, for a new one-story plant. L. K. Stafford is president.

The Detroit Edison Co., Detroit, is arranging an appropriation of \$3,000,000 for extensions and improvements in electric generating plants and system during the year.

A vocational department will be installed in the new high school to be erected at Rockford, Mich., for which bonds for \$100,000 have been voted.

The Big Rapids Electric Co., Big Rapids, Mich., will build an addition to its generating plant and install new equipment. W. A. Stillwell is secretary.

The Gangnier Stereotype Foundry Co., 525 Howard Avenue, Detroit, will take new bids on revised plans for its one-story factory, 30 x 200 ft., estimated to cost about \$40,000.

Business changes in the machine tool trade in the last few months are as follows:

E. C. Chaffield, Escanaba, Mich., is organizing a company to build and operate a foundry at Iron Mountain, Mich., for the manufacture of iron, brass and other metal castings. A site has been selected.

The Egyptian Portland Cement Co., Port Huron, Mich., is completing plans for remodeling the former shops of the Grand Trunk Railway Co., recently acquired, for the establishment of a new cement manufacturing plant.

The National Portland Cement Co., Mt Pleasant, Mich., is planning to break ground early in April for its new works at Coldwater Lake, to comprise a main two-story mill, with several one-story buildings, estimated to cost about \$500,000, including machinery. H. C. Shields is general manager.

The Dall Steel Products Co., Lansing, Mich., is arranging to extend its production and will soon commence the manufacture of steel toys.

Milwaukee

MILWAUKEE, Feb. 27

Machine tool trade in February is generally regarded as equal in volume to either December or January. The tone of business showed slight improvement over previous periods, although this betterment was noticeable more in the character and scope of inquiry rather than sales. Used tools continue to furnish strong competition to new equipment, especially where price is the determining factor. It is said that there still remains an enormous quantity of used tools to be worked off, although the supply is steadily being reduced. Improvement in the general position of metal-working industries continues to manifest itself with more certainty, if slowly.

The Prairie du Chien, Wis., Tool Co., manufacturer of mechanics' tools, grinders, etc., has increased its capital stock from \$50,000 to \$150,000 by a new issue of \$50,000 common and \$50,000 preferred stock. The proceeds will be used for the general development of the business, which contemplates enlargement of the facilities during the present year.

The Board of Education, West Allis, Wis., is asking bids for the construction of a west wing of the new high school building to be used exclusively for manual arts training. The cost of the addition, with shop equipment, etc., is estimated at \$100,000. The architects are Robert A. Messmer & Bros., 221 Grand Avenue, Milwaukee.

The Argo Tool & Machine Mfg. Co., Milwaukee, has been incorporated with a capital stock of \$25,000 to manufacture machinery, tools, mechanical specialties, etc. The incorporators are Charles A. Phillips, 383 Thirty-first Avenue; Charles E. Helm, 345 Twenty-fifth Avenue, and Arthur J. Huck, 309 Fortieth Street, Milwaukee, all of whom have been for many years connected with the West Milwaukee locomotive and car shops of the Chicago, Milwaukee & St. Paul Railway Co. as shop superintendent.

William Trachte, Watertown, Wis., has plans for a garage, sales and service building, 56 x 100 ft., part two stories and basement, to be erected at Third and Jefferson streets for the occupancy of the Klinger Buick Agency. It is to cost about \$25,000 and be ready May, 1.

The Board of Education, Chippewa Falls, Wis., will close bids March 27 on the construction and equipment of a junior high and vocational training school, to cost \$175,000. The architect is E. J. Hancock, Eau Claire, Wis. It will contain machine, plumbing, automotive and other manual arts shops.

The Svoboda Altar Works, Kewaunee, Wis., manufacturer of church furniture, fixtures, etc., has purchased a two-acre site for a new factory which it will build in units, the first to be undertaken immediately. It will be of brick, 60 x 125 ft., part two stories. Current will be purchased. Considerable new wood and metal-working equipment will be purchased to supplement the equipment of the present factory. Joseph Svoboda is proprietor.

The Jacobsen Auto Co., 1713 West Sixth Street, Racine, Wis., will build a new public garage with display rooms and machine shop, 85 x 102 ft., one-story and basement, to cost about \$30,000. William J. Redden, local architect, is in charge.

The Mar-Tan Motor Mfg. Co., Milwaukee, has been granted a charter to manufacture engines, motors, machinery, etc. The capital stock is \$125,000 and the incorporators are A. E. Martin, W. L. Tanhauser and H. E. Winkle, 78 Loan & Trust Building, Milwaukee. A definite statement of plans will be made later.

The Board of Education, Sheboygan, Wis., will take bids after March 15 for the construction of the second unit, or continuation school department, of the new \$1,250,000 high school designed by Childs & Smith, architects, Chicago.

J. H. Oaburn, Waukegan, Ill., has been awarded a contract by the city of Waukegan for the construction of a public bath and shower building, 58 x 100 ft., two stories and part basement. It will cost about \$37,000, including equipment.

The J. W. Bithrong Sheet Metal Co., Waukegan, has been organized by J. W. Bithrong, who has leased a building at 139-141 West Broadway and will purchase new equipment to supplement that acquired from the Perkins Hardware Co., with which concern he was connected for fifteen years.

The Board of Education, Ashland, Wis., is calling for bids for the construction of the Latimer Memorial manual arts training school, estimated to cost \$120,000. It will be two stories, 65 x 122 ft., and is to be ready for the opening next September.

The Nordberg Mfg. Co., Milwaukee, has taken a contract to build two 13,000-hp. steam engines for a rolling mill at Steubenville, Ohio, at a price said to be approximately \$500,000, for delivery in about a year. The engines will be of special design and are said to be the largest units of the kind ever built in this country.

Pittsburgh

PITTSBURGH, Feb. 27.

Inquiries for machine tools still are more numerous in this district than orders and the trade drives most of the cheerfulness shown from the somewhat better operation of steel plants. Purchases of individual tools are constant enough, but they do not run into very large values. Prospective buyers who have issued bids are moving slowly about closing. Seemingly, there is not much urgency for the tool sought or it is possibly believed that a little delay will bring more favorable quotations. The P. H. Murphy Co., New Kensington, Pa., recently closed for several processes, the business being divided by the E. W. Bliss Co., Brooklyn, and the Toledo Machine & Tool Co., Toledo, Ohio. These were double-turn presses with 8 in. shafts. This company is doing nothing at present in connection with equipment for the Pressed Steel Mfg. Co., Chicago, a subsidiary plant. The Westinghouse Electric & Mfg. Co. will probably close soon for some additional tools for its Springfield, Mass. plant, which is busy on radio apparatus.

The crane market does not show much life, although manufacturers' representatives are getting a fair number of inquiries. The Ellwood City Forge Co., Ellwood City, Pa., has closed with the Northern Engineering Works, Detroit, for a 15-ton crane with 5-ton auxiliary, with 60 ft. span. The Northern Engineering Works also has taken a 1-ton hoist for the Pennsylvania Rubber Co., Jeannette, Pa. The Sharpsburg Foundry Co., Sharpsburg, Pa., has ordered a Shaw yard crane.

The Babcock & Wilcox Co., has taken the order for three Stirling boilers and superheaters for installation at the Carrie furnaces, Homestead, Pa., works of the Carnegie Steel Co. These boilers have a combined rating of 2500 hp. The West Penn Power Co. is expected to close shortly for two 30,000-kw. turbines and several boilers for its Windsor, W. Va., plant, and the West Lechburg Steel Co. for a new 16-in. electrically driven continuous strip mill, with necessary auxiliary equipment.

The National Supply Co. of Pennsylvania, 1304 Union Bank Building, Pittsburgh, manufacturer of oil well, water well and other equipment, is revising plans for its proposed two-story and basement building, 100 x 105 ft., at Delaware and Preble streets, estimated to cost about \$50,000. J. H. Barr is president.

Julius J. Quertlbaum, Point Marion, Pa., head of the Jeannette Window Glass Co., plans to construct a sheet glass works at Fairchance, Pa., estimated to cost in excess of \$300,000, including machinery. Work will commence at an early date.

The Erie Railroad Co., 50 Church Street, New York, has arranged for the operation of its repair shops at Meadville, Pa., under the management of W. S. Schlafre, head of the mechanical department of the road, recently granted a leave of absence for this purpose. It will resume under full capacity at once, giving employment to more than 800 men.

The Granny Branch Coal Co., 70 Wall Street, New York, is planning for the installation of electrically operated mining machinery and other equipment, including motor cars, at its properties in the vicinity of Big Chimney, W. Va. Bids will be asked in the spring. Clark & Krebs, Charleston, W. Va., are engineers.

The Virginia Western Power Co., Alderson, W. Va., is disposing of a bond issue of \$850,000, and will use more than one-half of the proceeds for extensions in its power plant, including new generating machinery. The company operates

A steam-turbo plant at Ronceverte, W. Va. Headquarters are at Clifton Forge, Va.

The receivership of the Jeffery-Dewitt Insulator Co., Kenova, W. Va., has been dismissed, and the plant and property returned to the officials. The company has been reorganized with a capital of \$800,000 to manufacture high-tension insulators, etc. and is affiliated with the Champion Spark Plug Co., Detroit. R. A. Stranahan, president of the last noted organization, is head of the West Virginia company; J. F. Sinclair is general manager and will be in charge at the Kenova works.

A vocational department will be installed in the two-story and basement high school to be erected by the Wayne County Board of Education, Clarksburg, W. Va., estimated to cost about \$180,000. Herman P. Dean is secretary.

A one-story power house addition will be erected by the Libbey-Owens Sheet Glass Co., Charleston, W. Va., at its plant at Kanawha City, W. Va., in connection with other extensions estimated to cost \$200,000, including equipment.

C. E. Hines, Buckhannon, Pa., will build a one-story power house in connection with his proposed new wood working plant.

The Gulf States

BIRMINGHAM, Feb. 27

The Dallas Power & Light Co., Dallas, Tex., has made application for permission to make extensions in its power plant and system to cost about \$167,000. C. W. Davis is general manager.

Thompson & Norman, Mexia, Tex., have completed plans for a new one-story machine shop at Marshall, Tex.

The Shreveport Foundry & Machine Co., Cedar Grove, La., has acquired property at Bossier City, La., and has plans under way for a new plant. It is proposed to remove the present works to the new location.

The Common Council, Willis Point, Tex., is considering tentative plans for the establishment of a municipal electric light and power plant.

The Petrous Mfg. Co., Chuluota, Fla., recently organized with a capital of \$50,000, has plans under way for a two-story factory, 40 x 90 ft., to manufacture concrete brick and kindred products. The machinery installation will include a steam shovel for sand digging. The plant will have an initial daily capacity of about 30,000 brick. J. A. Rogers is secretary and treasurer and A. S. Nunamaker manager.

Fire, Feb. 20, destroyed a portion of the plant and machinery of the Hesse Envelope Co., Carter and Caruth streets, Dallas, Tex., with loss estimated at \$100,000. George S. Otey is president.

The Republic Power & Service Co., Breckenridge, Tex., is planning for extensions and improvements in the former plant of the Breckenridge Ice & Cold Storage Co., recently acquired, estimated to cost about \$45,000, including equipment.

Fire, Feb. 15, destroyed the mechanical plant of the Griswold Oil Co., Wichita Falls, Tex., with loss estimated at about \$25,000. It will be rebuilt.

The Texas Power & Light Co., Dallas, Tex., is considering tentative plans for its new central generating plant at Denison, Tex., which has been held in abeyance. The company is operated by the Electric Bond & Share Co., 71 Broadway, New York.

John P. King and E. P. Maddox, Fort Worth, Tex., have organized a company to build a one-story ice manufacturing plant at Arlington, near Fort Worth, to cost \$40,000. James Davis, Arlington, is also interested in the new organization.

The Frost-Johnson Lumber Co., Shreveport, La., has acquired timber properties in the vicinity of Monroe, La., for about \$60,000, and has tentative plans for the erection of a new lumber mill near Bastrop, La.

The city manager, G. H. Cairns, Gainesville, Ia., will install a new turbo-generator set, switchboard and other equipment at the municipal power plant. Bids are being asked. Robert & Co., Red Cross Building Atlanta, Ga., are engineers.

Baltimore

BALTIMORE, Feb. 27.

The Boston Iron & Metal Co., Pratt and Fremont streets, Baltimore, has acquired through its president, Morris Schapiro, the plant and property of the C. A. Gambrell Mfg. Co., Ellicott City, for \$410,500. The new owner plans to utilize the property in connection with its business.

The General Machinery & Supply Co., Baltimore, has leased the three-story building at 411 Exchange Place, for local works and headquarters.

The Eastern Shore Gas & Electric Co., Salisbury, Md.,

has arranged for a bond issue to ~~total \$250,000~~ a portion of the proceeds to be used for enlargements to the electric generating plant at Laurel, including the installation of a 2500-kw. turbo-generator and auxiliary equipment. John E. Zimmerman is secretary and treasurer.

The United States Engineer Office, Wilmington, Del., will take bids until March 20 for a complete pumping unit, consisting of centrifugal pump and engine, piping, etc., for use at Cheasapeake City, Md. The unit is to have a daily capacity of 50,000,000 gal. of water, with alternate estimates to be received covering electrically-operated equipment, oil and steam-operated.

The Norfolk & Western Railroad Co., Roanoke, Va., has preliminary plans under consideration for enlargements in its car and locomotive shops at Hagerstown, Md.

John H. Gels & Co., Brooklyn, Baltimore, will take bids in March for a one-story planing mill, 65 x 100 ft., estimated to cost about \$32,000, including machinery. William A. White, 2024 North Smallwood Street, is architect.

The American Locomotive Co., 1301 North Boulevard, Richmond, Va., is planning for the erection of a one-story brass foundry, to cost about \$16,000.

The Bureau of Supplies and Accounts, Navy Department, Washington, will take bids until March 7 for 9000 ft. of plow steel wire rope for the Norfolk Navy Yard.

The Jarvis Storage Battery Co., Winston-Salem, N. C., has filed plans for a one-story factory, 72 x 100 ft. J. C. Jarvis is president.

An ice-manufacturing plant to cost about \$60,000 will be constructed by the American Cone & Pretzel Co., Macon, Ga. Plans have been completed.

The office of the Chief of Air Service, United States Army, Washington, will take bids until March 30 for seamless annealed copper tubing.

A vocational department will be installed in the two-story and basement high school at Charlotte, N. C., estimated to cost \$100,000. C. C. Hook, Trust Building, is architect.

The Hiddenite Quarry Co., Concord, N. C., is planning for the construction of a new rock crushing plant at Hiddenite, N. C., with screening and sorting departments. It will have a capacity of about 1000 tons a day. E. V. Correll is manager.

The White Provision Co., Atlanta, Ga., has plans under way for the erection of a one-story power house, cold storage and refrigerating plant, and will call for bids soon.

The Lansing Lumber Co., Lansing, N. C., recently organized with a capital of \$100,000, will call for bids early in March for planing mill and wood-working machinery for a new plant, 60 x 80 ft. V. E. Ballou is secretary and manager.

The Pacific Coast

SAN FRANCISCO, Feb. 21.

The Los Angeles Automotive Co., Los Angeles, will break ground at once for its new one-story automobile manufacturing plant, 71 x 252 ft., at 1020 Towne Avenue, estimated to cost about \$100,000, including equipment. The Moran Co., 206 Kerckhoff Building, has the contract.

M. Elsasser, Oakland, Cal., care of S. Helman, 57 Post Street, San Francisco, architect, is completing plans for a one-story machine shop, 75 x 100 ft., at Fourth and Washington streets, Oakland, to cost about \$18,000.

Knox & Stout, 522 North Main Street, Santa Ana, Cal., have awarded contract to Ross & Ritchie, Long Beach, Cal., for a one-story automobile service and repair works, to cost \$65,000.

A vocational school will be constructed by the Board of Education, Glendale, Cal., in connection with the group of high school buildings, plans for which are being prepared, estimated to cost in excess of \$600,000. John C. Austin, 1125 Baker-Detwiler Building, is architect.

The Power Implement & Machine Works, Modesto, Cal., are having plans prepared for new works on property recently acquired on San Fernando Road, Glendale, Cal., consisting of a main one-story shop, 40 x 200 ft., and adjoining structure, 25 x 125 ft., estimated to cost about \$30,000. Henry F. Bean, Central Building, Los Angeles, is architect.

The Pacific Gas & Electric Co., 445 Sutter Street, San Francisco, is arranging for an expenditure of \$1,670,000 during the next 24 months for extensions to its hydroelectric generating plants.

Fire, Feb. 11, destroyed a portion of the plant of the Thomas Day Co., 725 Mission Street, San Francisco, manufacturer of electrical equipment and supplies, with loss estimated in excess of \$250,000, including equipment.

The San Joaquin Light & Power Co., Fresno, Cal., will commence the immediate erection of an addition to its steam-operated electric generating plant at Buttonwillow, Kern County, to cost in excess of \$1,000,000.

The City Council, Fallon, Nev., will take bids until

March 15 for a new electrically-operated pumping plant, including pumping machinery, motors, automatic control, tank, valves, piping, etc. The city engineer is in charge.

The Columbia Tire Corporation, Northwest Bank Building, Portland, Ore., will open bids early in March for its new two-story plant, 80 x 350 ft., on the Columbia Boulevard, estimated to cost about \$85,000. R. A. Wurzburg is president.

The City Council, Canby, Ore., has plans under way for a municipal electric light and power plant.

The Consolidated Railway Equipment Co., Knott Street, Portland, Ore., is making inquiries for an overhead electric traveling crane, about 50-ft. span, 35-40 tons capacity.

The Long-Bell Lumber Co., Kansas City, Mo., is considering preliminary plans for a new mill in the vicinity of Kelso, Wash., estimated to cost in excess of \$300,000 with machinery. R. A. Long is chairman of the board; F. J. Bannister is president.

The Common Council, Puyallup, Wash., has tentative plans under consideration for a municipal electric light and power plant.

The General Petroleum Corporation, 310 Sansome Street San Francisco, is planning for extensions in its terminal plant at Harbor Island, Seattle, Wash., to cost about \$100,000. The installation will include new steel tanks, pumping machinery, distributing equipment, etc.

The Central South

St. Louis, Feb. 27.

The Chicago, Rock Island & Pacific Railroad Co., Chicago, has completed plans for a new cooling station at Booneville, Ark.

Fire, Feb. 23, destroyed the grinding plant of the Charleston Mining & Mfg. Co., near Mount Pleasant, Nashville, Tenn., with loss estimated at \$150,000, including machinery.

The United Light & Power Co., Manhattan, Kan., has plans nearing completion for a one-story power house, 50 x 80 ft., at Downs, Kan.

Fire, Feb. 14, destroyed a portion of the plant of the Ardmore Nut Co., Ardmore, Okla., and adjoining works of the James Everett Machine Co., with total loss estimated at \$100,000, including buildings and equipment.

The Common Council, Foss, Okla., has commissioned H. G. Olmstead & Co., Oklahoma City, Okla., engineers, to prepare plans for a municipal electrical light and power plant.

A vocational department will be installed in the two-story and basement junior high school, 120 x 215 ft., to be erected at Peabody, Kan., estimated to cost about \$150,000. Mann & Gerow, Rorabaugh-Wiley Building, Hutchinson, Kan., are architects.

The Osage Power Development Co., P. O. Box 922, Lamar, Mo., W. R. Banks, manager, is perfecting plans for its new hydroelectric generating plant on Linn Creek, Camden County, with capacity of about 30,000 hp. A transmission system, over 100 miles long, will also be built. The entire project is estimated to cost in excess of \$3,000,000.

The Kansas City Power & Light Co., Kansas City, Mo., will build a new one-story and basement power house, 50 x 140 ft., at 1110-12 Baltimore Avenue. H. C. Blackwell is manager.

A vocational department will be installed in a one-story and basement high school to be erected at Frederick, Okla., estimated to cost about \$150,000. Tonnini & Bramblett, Terminal Arcade Building, Oklahoma City, Okla., are architects.

The Martin-Parry Corporation, York, Pa., manufacturer of automobile bodies, has leased about 20,000 sq. ft. at Kansas City, Mo., for the establishment of a branch assembling plant for commercial car bodies.

The Midland Metal Mfg. Co., 1219 Lydia Avenue, Kansas City, Mo., has filed plans for a one-story addition, 50 x 75 ft.

The Broderick & Bascom Rope Co., 4600 North Main Street, St. Louis, manufacturer of wire rope and cable, will rebuild the portion of its wire-stranding department, recently destroyed by fire with loss estimated at about \$75,000, including equipment.

The Board of Water Commissioners, St. Louis, will construct a steam-operated power house in connection with extensions to the city waterworks, to include electric generator, exciter, engine, boiler and auxiliary equipment. A machine shop will also be built. The entire project will cost in excess of \$1,000,000. Edward E. Wall is water commissioner in charge.

Fire, Feb. 19, destroyed a portion of the plant of the Commercial Car Co., Highland Park, Louisville, manufacturer of automobile bodies, etc., with loss estimated at \$100,000 including equipment and stock.

IRON AND INDUSTRIAL STOCKS

Steel Shares Attracted Much Attention During the Past Week

Steel shares attracted much attention in the investment world. Industry, in general, is looking to the steel industry for an indication of prospective business. Increased steel mill operations, as well as renewed talk dealing with combinations of steel properties, have but accentuated public interest in steel shares. The strength of United States Steel common has been the outstanding feature the past week, establishing, as it has, new high records for this movement. Against the strength of Steel common there has been some liquidation in other steel shares, prompted by published and forthcoming annual statements. Aside from the steel outlook, the continued strength of foreign exchange is perhaps the most outstanding development.

The range of prices on active iron and industrial stocks from Monday of last week to Monday of this week was as follows:

Lackawanna Steel Co. Loss

The Lackawanna Steel Co. for the year ended Dec. 31 reported a loss of \$1,082,276 from operations, after taxes and maintenance, against profits of \$10,674,345 in 1920. The net profit and loss deficit after inventory adjustment and other charges, amounted to \$3,384,876, against a surplus of \$4,294,375 in 1920. Details of the report follow:

	1921	1920
Net earnings after providing for taxes, expenses, maintenance	\$1,082,276	\$10,674,345
Interest on bonds and other obligations		
Lack Steel Co.	887,962	985,151
Subsidiary Co.	147,916	157,006
	\$1,035,879	\$1,122,211
Balance	\$2,118,155	\$9,552,111
Less Appropriations		
For extinguishment mines and invest	\$151,557	\$300,000
For deprec. and accruing renewals	1,378,176	2,127,421
	\$1,529,734	\$2,427,421
Balance of profit	\$3,647,889	\$7,124,690
Less-Adjust account of excess prov for Fed. taxes and sundry res less inventory revaluation adjust.	\$263,012	\$2,830,321
Net profit and loss for year	\$3,384,876	\$4,294,375

* Deficits.

Truscon Steel Co. Report

President Julius Kahn of the Truscon Steel Co., Youngstown, Ohio, informed stockholders at the yearly meeting in Detroit that business this year is at a rate 30 per cent above the corresponding period in 1921. The company's gross receipts last year aggregated about \$10,000,000. At the end of the year it showed a deficit of \$336,000 after all charges depreciation and dividends.

Inventory writeoff and depreciation charge in 1921 totaled \$880,000. Current assets as of Dec. 31 last were \$3,661,228.84 and current liabilities \$796,249.86, the latter item representing total obligations of the interest, other than cap

REPUBLIC'S REPORT

stock. Current assets included these items—cash, \$264,438.14; inventory, \$1,830,813.64; bills receivable, \$1,490,236.01, and investments and bonds \$185,285.

During the year the company paid dividends at the rate of 7 per cent on its preferred stock and 11½ per cent on common. President Kahn said that, unless conditions should prove worse than now anticipated he expected the company to earn its dividends this year.

Last year was the first in which the company lost money, attributed largely to depreciation in inventory valuation, occasioned by large stocks of raw materials on hand when cancellations started about a year ago.

National Enameling & Stamping Co. Elects New Directors

The management of the National Enameling & Stamping Co. at the annual meeting of its stockholders in Jersey City met with opposition in the form of a ticket against that put up by those in control. Under the leadership of Clement Studebaker, a ticket consisting of six new directors and ten old directors won over the management ticket by a vote of 130,512 to 77,719.

The six new directors elected are Clement Studebaker, J. W. Dougherty, former president of the Crucible Steel Co. of America; W. J. McGuire, J. S. Moran, Fred Orthwein, associated with the Bush interests of St. Louis, and W. B. Randolph. The following were re-elected, having received all the votes of the opposition: L. C. Bartling, G. V. Hagerty, G. W. Knapp, A. W. Niedringhaus, G. W. Niedringhaus, M. H. Schwartzburg, A. J. Knochhofer, L. I. Niedringhaus, G. H. Niedringhaus and W. Howard Matthai. The directors who were defeated for re-election were: H. W. Bartling, George W. Knapp, Jr., W. H. Matthai, Charles L. Wagandt, Solomon Richman, Robert D. Samuels.

The board re-elected G. W. Niedringhaus president and adjourned until March 2, when a reorganization meeting will be held and action taken on the common and preferred dividends.

Mr. Studebaker said after the meeting the election of his ticket did not indicate that there was any dissatisfaction with the present management. "It means that we are going to advocate a more active policy and develop to a greater degree the steel end of the business," he said. The election of Mr. Dougherty as a director is expected to be of assistance in this direction.

The report of earnings for 1921, made public at the annual meeting, showed an operating loss of \$218,510, against a net profit of \$3,183,927 in 1920. After depreciation, interest and other charges, there was a deficit of \$1,258,615, against a surplus of \$3,362,151. After payment of common and preferred dividends, the total deficit last year amounted to \$2,591,123 against a surplus of \$1,726,613 in 1920.

Railway Steel Spring Shows Deficit

The annual report of the Railway Steel Spring Co. shows net earnings from all sources of \$1,551,625, in 1921, after deducting all operating expenses, depreciation, reserve for taxes, etc., as compared with a net of \$3,435,350 in 1920. After dividends there was a deficit of \$473,365, while in 1920 there was a surplus of \$1,410,350.

The dividends on preferred stock amounted to \$915,000 and on the common stock to \$1,080,000. Surplus accounts was reduced from \$12,912,511 to \$12,168,990. The company has \$1,433,601 in cash, \$1,460,296 in accounts receivable, \$7,877,162 in securities and investments and \$2,405,781 in inventories. Accounts payable amount to \$132,927. Total assets and liabilities are \$41,233,262.

President Fitzpatrick told the stockholders that the railroads had purchased only moderate quantities of equipment and supplies in the last two years, and that these purchases should increase greatly during 1922. The regular quarterly dividend of 2 per cent was declared on common and ½ per cent on preferred stock.

The St. Louis office of the Chicago Flexible Shaft Co. is to be resumed March 1, in charge of J. J. Wittenburg, who has been with the Chicago office of the company for three years. The office, as heretofore, will be located in the Railway Exchange Building.

Owing to the continued high cost of materials entering into industrial plant construction, the Youngstown Steel Co., Youngstown, Ohio, is not likely to proceed this year with its proposed mechanical puddling plant at Warren, Ohio. Several years ago the company acquired a site at Warren and planned to proceed with its plant this year. The mechanical puddler which it will employ is the invention of E. L. Ford of Youngstown.

Large Deficit, Payment of Dividend on Preferred Stock Suspended

The quarterly dividend of 1½ per cent due to be declared on the preferred stock of the Republic Iron & Steel Co. was passed by the directors last Thursday. Dividends at the rate of 7 per cent annually have been paid regularly since 1916. In that year and in 1917 payments exceeded 7 per cent, owing to extra payments on account of accumulated dividends for previous years. Dividends on the common stock were passed last May. The company had paid at the rate of 6 per cent annually on that stock from the beginning of 1917 to last spring.

A statement issued by the company following the meeting said, in part:

"The board of directors has decided to suspend payments on the preferred stock until future earnings warrant resumption of dividend disbursements. As current operations are without profit and the future outlook for business is uncertain, it was the opinion of the board of directors that this action is to the interest of the stockholders."

The annual report for 1921 shows that the company did a gross business of \$20,756,749, against \$76,342,220 the year before. Total net income amounted to \$685,120, against \$11,171,161. After all charges, including interest and other deductions, there was a deficit of \$5,665,242, against a surplus of \$7,616,522 the year previous. The income account follows:

	1921	1920
Net earnings	\$511,528	\$13,825,522
Interest, etc.	173,482	318,642
Total income	\$685,010	\$11,174,164
Expenses, etc.	1,194,130
Loss	\$809,120	*\$14,174,164
Total deductions	1,049,148	5,819,674
Deficit	\$4,808,268	*\$8,354,489
Bond-note interest	806,974	737,967
Deficit	\$5,665,242	*\$7,616,522
Preferred dividend	1,750,000	1,750,000
Deficit	\$7,415,242	*\$5,866,522
Common dividend	450,000	1,500,000
Deficit	\$7,865,242	*\$4,066,522
Previous surplus	37,141,571	33,880,972
Surplus	29,276,329	37,947,494
Written off	605,923
Final surplus	\$29,276,329	\$37,441,571

*Net profits and surplus.

On Dec. 31, 1921, the company reported unfilled orders on hand amounting to 67,731 tons of finished and semi-finished products and 23,839 tons of pig iron, against 162,906 tons of finished and semi-finished and 35,772 tons of pig iron at the close of 1920.

The general balance sheet on Dec. 31, 1921, showed inventories valued at \$15,251,801, against \$18,751,451 at the close of the previous year. Accounts receivable amounted to \$3,656,145, against \$8,869,442 and cash \$1,292,437, against \$1,443,752. Accounts and bills payable were \$4,196,639, against \$6,653,892, while reserves for depreciation totaled \$12,675,924, against \$11,901,170.

The report says:

"The operating results for the year ending Dec. 31, 1921, were decidedly the worst in our history, notwithstanding the company's growth with respect to diversity of product and facilities for economic manufacture. The outstanding feature of the business situation affecting operations was the general collapse in demand which occurred in the early part of the year, which situation became intensified during the second and third quarters of the year. Price declines occurred throughout the year on an increasing scale, but the fall in price was out of all proportion to cost reductions.

"General conditions affecting operating results can be best summarized by the statement that the tonnage shipped during 1921 decreased about 68 per cent as compared with the tonnage shipped during 1920, whereas selling prices for the principal iron and steel products, as tabulated by trade journal authorities, declined from the high point of 1920 approximately 50 per cent. Our total tonnage for the year was adversely affected by the unprecedented depression in the agricultural implement trade, and also by subnormal demands from the railroads, railway equipment, trade and other construction enterprises, using such heavy iron and steel products as bars, plates and shapes, which products represent about one-half of our finishing capacity. In other departments of our business, such as sheets and tubular products, the demand was relatively better. As a result of this unbalanced condition of trade, our total production and

shipments for the year were only approximately 25 per cent of our normal capacity.

"The total earnings for the year ending Dec. 31, 1921, were \$685,010.21, from which amount there was deducted on account of idle plant expenses, depreciation, inventory shrinkage and other miscellaneous items the amount of \$6,350,252.35, and as a result the net loss for the year ending Dec. 31, 1921, was \$5,665,242.14.

"Earnest efforts were made during the year to effect economies in all directions: common labor rates were reduced about 40 per cent, with relative adjustments in all other labor and salaries, and substantial reductions in other items of cost were also effected, but as price reductions were necessarily made before cost reductions were possible, operating losses followed; furthermore, the limited demand for our products made an economic operation impossible.

"Freight charges, a large item of cost in iron and steel (due to the fact that it requires five tons of inbound material for the production of one ton of outbound shipment) were maintained throughout the year on a war basis, these rates being about double pre-war rates; in consequence of this abnormal condition, freight charges now represent about 50 per cent of the cost for producing crude products of iron and steel, and until this blockade against further cost reductions is lifted by freight rate reductions, neither normal costs nor normal demand for iron and steel can be expected.

"In view of the liberal charges heretofore made for provisional funds, the board of directors were of the opinion that these charges for the year ending Dec. 31, 1921, should be reduced. Ample expenditures, however, were made for proper upkeep of the plants and property, and we are therefore in position to take advantage of any improvement in demand which may occur. In addition to these expenditures, over \$3,000,000 was expended during the year, completing prior year's appropriations, for improvements and extensions to property and equipment, the most important items being increased sheet steel finishing capacity, and for additions to our Northern mineral properties.

"Dividend payments on the preferred stock of the company were continued throughout the year because the board of directors were of the opinion that accumulated surplus justified such payments. As a result of these various expenditures, working capital has been necessarily reduced, leaving, however, a balance of net quick assets as of Dec. 31, 1921, of \$15,180,064.10. Reductions were also made in the surplus account, through the absorption of losses incurred and dividends paid, leaving the net balance Dec. 31, 1921, of \$29,576,329.35."

Industrial Finances

The Ryan Car Co., Chicago, has increased its capital stock from \$2,500,000 to \$6,000,000 by the issuance of 35,000 shares of additional common stock with par value of \$100 per share. The new stock issued was distributed to the old common stock holders as a stock dividend. The company is merely capitalizing its assets. It is not contemplating any new extensions, as it has completed within the last year or so a large steel repair plant at Chicago.

The gross sales of the Transue & Williams Steel Forging Corporation for 1921 were \$3,605,444, the net profits after charges and Federal taxes \$43,138, and the deficit after \$300,000 paid out in dividends \$256,862. In 1920, the gross sales were \$7,559,871, the net profits \$670,734, dividends \$500,000, and the surplus \$170,784.

The net profits of the Wellman-Seaver-Morgan Co., Cleveland, for the year ending Dec. 31, 1921, after Federal taxes were deducted, amounted to \$61,518, according to the statement presented at the annual meeting, Feb. 21. The company's surplus at the end of the year amounted to \$770,467 as compared to \$728,956 a year ago. Reports show that the company has no bank loans and is in a strong financial position, having \$399,773 in cash on hand as against \$269,691 on Dec. 31, 1920.

Plans of New Companies

The Automotive Accessories Corporation, Redford, Mich., has let contracts covering dies and an initial order of 1000 oil pans to the Detroit Stamping Co., Detroit. The new company states that whether it will install equipment has not been definitely decided.

The Brake Appliance Co., 3609 Gratiot Avenue, Detroit, is just getting into manufacture on a production basis, its product being the Simplex brake equalizer which applies the tension to both brake drums through the medium of a steel compression spring. It is claimed that this device eliminates the wearing jerk, causes instant response to the pressure of the foot upon the brake and obtains a safe, smooth stop under all conditions.

TRADE CHANGES

Negotiations have just recently been consummated whereby R. W. Monger, Elkhart, Ind., has purchased controlling interest in the Godfrey Conveyor Co. of that city. At the last meeting of the board of directors Mr. Monger was elected president of the company. Other officers elected were B. C. Godfrey, vice-president, D. H. Heibster, treasurer, and Chas. F. Clouse, secretary. The board of directors includes all officers of the company with James H. Channon, Chicago, and Fred W. Reid. At the meeting it was announced that the Godfrey Conveyor Co. would plan to occupy a greater place in the conveyor field than before and would aim to serve a wider field in supplying additional equipment now perfected and ready for the market. This new equipment includes the Godfrey standard car puller, which is designed to economically serve all general car moving needs, and Godfrey single drum hoists, which are destined to fill a great need among contractors and manufacturing plants.

L. Norris Hall, Inc., 910 North Front Street, Philadelphia, have just been appointed sales agents for the Philadelphia territory by J. W. Hammond Steel Co., Warren, Ohio, manufacturer of patented hoops and rivets.

The George J. Hagan Co. has recently opened up offices in Detroit and Chicago. The Detroit office is located at 515 Murphy Building and is under the management of J. Sandberg, formerly of the General Electric Co. The Chicago office is at 70 East Jackson Boulevard and is under the management of V. A. Ham, formerly of the General Electric Co.

Frank E. Waddell and John Husband, for 15 years actively identified with the Consolidated Coke Co., Uniontown, Pa., and Pittsburgh, and the Pioneer Coal & Coke Co., Pittsburgh, have disposed of their holdings to George Whyel, Uniontown, Pa., and Charles F. Colhart, Jr., Pittsburgh.

The Norwalk Iron Works Co., South Norwalk, Conn., recently dissolved, was the old concern incorporated under the laws of Connecticut. The new company by the same name is incorporated under the laws of Delaware. The proceeding was simply a matter of form. The newly organized company announces the personnel of its executive staff as follows: C. L. Thompson, president and general manager; Howard E. Adt, first vice-president; Harold B. Knowles, treasurer and assistant secretary; Thomas M. Steele, secretary; A. R. Betts, vice-president in charge of sales; W. E. Mathews, vice-president in charge of manufacturing and engineering; G. W. Wardwell, chief engineer; W. M. Greene, general superintendent.

M. Samuel & Sons, scrap dealer, 1746 Woolworth Building, New York have opened a branch office at 1721 H Street, N. W., Washington, which is in charge of DeNeal Samuel, a member of the firm.

The United States Cast Iron Pipe and Foundry Co. has opened a new office at the Interstate Building, Kansas City, Mo., which will be in charge of D. W. Pratt, sales agent.

The Cummings Machine Co., Munster, Ohio, has had its name changed to the Industrial Equipment Co.

The A. Z. Boyd Co., 126 Chambers Street, New York, has taken the New York agency for the sale of the line of screw plates made by the Russell Mfg. Co., Greenfield, Mass. It has had wide experience in selling these tools, having in the past been instrumental in building up the New York sales of one of the largest makers of screw plates.

The Spad Mfg. Co., Inc., has been incorporated for the purpose of manufacturing and distributing the Spad timer, a distributor for Ford cars. The company has gone into rather large production on this item and is solely occupied with its manufacture at present. Parts of this work are done under contract, such as brass automatic screw machine parts, pressed and rolled screw parts and rubber molding. Not wishing to confine itself for the entire future of the company to the manufacture of one item, the incorporation papers allow room for the fabrication of practically any devices in the automotive industry.

The International Lubricants Co., Ltd., Evanston, Ill., established 1914, has been incorporated and capitalized for \$500,000, fully paid up, under the trade name of International Refining & Mfg. Co. W. O. Jeffery, president, has been in this line of business practically all his life, and the company can take care of domestic and foreign trade in its special lines of cutting lubricants, fibre, transmission and cup greases.

Butts & Ordway Co., Purchase Street, Boston, on March 11, will open a branch store at 68 Brookline Street, devoted exclusively to lines used in the garage and service station business, including a line of metal-working machine tools.

Current Metal Prices

On Small Lots, Delivered from Merchants' Stocks, New York City

The following quotations are made by New York City warehouses.

As there are many consumers whose requirements are not sufficiently heavy to warrant their placing orders with manufacturers for shipment in carload lots from mills, these prices are given for their convenience.

On a number of articles the base price only is given, it being impossible to name every size.

The wholesale prices at which large lots are sold by manufacturers for direct shipment from mills are given in the market reports appearing in a preceding part of THE IRON AGE under the general heading of "Iron and Steel Markets" and "Non-ferrous Metals."

Submarine Cutting Torch Under Water

Broken Siphon Pipe Burned Off by Electric Torch Under
50 Ft. of Water—Great Advance in the Art of
Submerged Metal Cutting

BY ROBERT G. SKERRETT

AS the oxy-acetylene flame is capable of fusing its way through metallic masses of all sorts and divers thicknesses, whenever it can be brought into play in capable hands, it is not surprising that much experimenting has been done in the last decade to adapt the torch to the needs of the marine worker. This flame has been utilized extensively in cutting out the rivets of steel hulls, so as to hasten repair jobs and replacements; but as a rule this procedure has been confined to ships in dry dock or to parts of vessels that could be approached in the open air. It has long been realized that much could be gained if a torch capable of working under water could be devised, for service in cutting metal bodies of one kind or another. To this end, the Germans brought out some years back a submarine oxy-acetylene torch.

Broadly stated, the gases were discharged through a cup-shaped nozzle, and the flame was generated at the inner center of this vessel. The pressure of the expanding gases was relied upon to prevent the enveloping water from flooding the nozzle. Further, the force of the gas blast also served to wipe away or to scatter the metal made fluid by the heat of the flame. If the position of the nozzle opening or the impulse of the stream of gas was such that the water could inundate the cup, then the flame was extinguished and it was necessary to carry the torch to the surface to relight it.

In using this torch, care had to be exercised to hold the nozzle downward—at least not to raise its mouth above the horizontal. And the flame could not be kept alive unless the pressure of the repelling gases considerably overbalanced the hydrostatic pressure at the operating depth. In short, this submarine-cutting apparatus was found effective only at comparatively shallow depths. Nevertheless, the Germans pointed the way and proved that a bare flame could be kept burn-

ing when submerged. This much was clear gain.

The question is often asked: "Why try to cut metals with a flame under water when there are already available pneumatically-driven tools that can be utilized for such work?" And the query is a logical one, as compressed air must be used for the divers. Air-actuated tools have been built for service of this sort, but they are not commonly employed, for one reason or

another. Mechanisms of this character are apt to clog with ice, owing to the refrigerating action of the rapidly expanding exhaust air, and this chilling is speeded up when the temperature of the water is already low. Therefore, the idea of a submarine torch has appealed to the inventive mind.

During 1918 and 1919 the French naval authorities became much interested in efforts made at Lorient to improve upon the earlier German torch, and to devise comparatively simple attachments by which the ordinary oxy-acetylene torch might be operated under water in dealing with marine salvage problems, of which there were then many. After months of experimenting a measure of success was attained, and steelwork—parts of wrecked vessels—was so dealt with. That is to say, angles, T-bars, deck beams, etc., were thus cut through in a fairly rapid manner at depths ranging from 10 to 30 ft.

The nozzle finally evolved for the work was a double-walled affair, the inner tube constituting the flame chamber. From between this tube and the outer sleeve was discharged a stream of compressed air at sufficient pressure to form an atmospheric envelope for the flame. The force of this air held the water at bay while the torch reached the metal so bared.

While theoretically simple, the French torch was, in fact, complex, because it had to be supplied with acetylene, comparatively pure oxygen and air, each at a different pressure. At a depth of 30 ft., the pressure of

Hoisting from the Water the Broken Section of
Pipe with at Top the Bell Cut from the Next
Section

the acetylene was about 23 lb. per sq. in., while that of the oxygen and the air was much higher. The purpose in keeping the pressure of the acetylene as low as possible was to check its tendency to explode rather than to burn as a flame. Indeed, this characteristic of acetylene has limited its subaqueous use; and, inasmuch as the pressure of the gas must be augmented as the depth increases, the operation of such a torch has been confined to submergences of less than 40 ft.

While the French found that their torch was apt to

Diagram of the American Torch

Diagram of the French Torch

Diagram of the German Torch

be extinguished if the nozzle touched the metal surface, yet the tip of the apparatus had to be held from it a distance of but a few millimeters. It has latterly been reported that they have improved upon the apparatus, so that it can be ignited under water by chemical action; this obviates necessity for the diver to return to the surface to relight the gases. But there is nothing to indicate that this torch has yet gone beyond the experimental stage.

American Progress in Submerged Cutting

The foregoing résumé of the art will help to a better understanding of what has been achieved here during the last few years. These steps forward have placed our engineers in a position to attack successfully certain difficult tasks under water; and the recent repair of the ruptured water main beneath the Narrows in New York harbor represents a climacteric performance. Staten Island, by reason of the break, was cut off from the Catskill water supply system for several weeks, and this period of isolation would, undoubtedly, have been a good deal longer but for the aid rendered by submarine cutting torches in facilitating the removal of the damaged piping.

These torches are the outcome of experiments begun in 1918, during the refloating of the transatlantic liner *St. Paul*, which sank at her slip. For the purpose of draining that craft the divers blasted passages through various bulkheads. These holes allowed the water within the ship to move freely from one compartment to another so as to reach the suction of wrecking pumps. But the salvors realized that this time-honored method of breaching steel partitions always did a good deal of damage and entailed correspondingly heavy outlays in making repairs.

Therefore Ralph E. Chapman, one of the engineering force of the wreckers, and J. W. Kirk, an associate, set about adapting the oxy-acetylene torch and the electric arc for subaqueous service. The improvements evolved by them did much to insure a more nearly continuous working of the cutting flame; and by means of this apparatus 12 holes, each about 14 in. in diameter, were made through as many steel barriers. It took several hours to cut the average opening; some of the passages were located in decidedly awkward places; and the deepest of them were 50 ft. under water. The torch was lighted below the surface electrically, both at the outset and whenever the flame was extinguished accidentally. However, experience revealed that the acetylene was troublesome at the lower depths, and for the reason already explained.

This introduction of the electrical feature marked an advance in the art; and between 1918 and 1921 the **Merritt & Chapman Derrick & Wrecking Co.**, recognizing the desirability of such a tool for dealing with wrought iron and steel under water, gave Ralph E. Chapman a free hand in the further development of the torch. Last December, in its new form, the torch was put to a convincing test during the raising of the United States submarine *S-48*, which sank off Bridgeport, Conn.

To refloat that boat, it was necessary to drain the flooded afterbody; and the primary problem was to get divers into the vessel to make a pipe connection so that wrecking pumps could be brought into action. The logical way to do this was through a hatch immediately over the inundated motor-room, but that hatch—at a depth of 70 ft.—was sealed tight by a cast-steel cover locked in position from within the submarine. A hole

How the Old Pipe Section Was Cut Out and Lifted; How the New Section Was Inserted and Made Tight

was cut through the center of the heavy steel hatch cover by the new torch; and when this was large enough a diver reached in and released the locking gear.

The torch used on the submarine was simple in its get-up. Its operative parts, at the working end, consisted of a carbon electrode, a few inches long, traversed longitudinally by two small gas conduits—brass tubing about $\frac{1}{8}$ in. in external diameter. The pressure and the quantity of gas conform with the operating depth. All the diver has to do is to bring his tool close enough to the metal to be cut to cause arcing; and the best effect is obtained when the electrode is something like $\frac{1}{4}$ in. away from the "ground." The electrode is connected to one pole of a generator, the other pole being grounded through the water to the work. Acetylene is not employed. The "cutting gas," of a nature not disclosed, is supplied from the surface through a suitable hose, within which is carried also the electrical conductor.

The temperature of the oxy-acetylene flame is in the neighborhood of 3600 deg. Fahr., while that of the electric arc is more than 6000 deg. The function of the gas used is to create a gaseous envelope for the arc, by converting the surrounding water into steam, and to oxidize and blow away the metal that is fused by the arc. Without this action of the gas, the fused metal would be apt to "freeze" quickly with the shifting of the electrode, and thus slow up the speed of cutting. The new torch is not hampered by hydrostatic pressure so long as the "cutting gas" has sufficient heat to vaporize the water, and force enough to blow the melted

Illustrating the Method of Cutting from Outside the Pipe; the Lower Third of the Bell, at Left, Had to Be Cut from Inside the Pipe, the Diver Lying on This Side to Operate the Torch

metal aside. A carbon electrode will last for 30 minutes of cutting.

The torch lately used on the Narrows siphon was much like that employed in cutting through the hatch of the S-48, save that it had to be modified slightly so that it could deal with thick cast iron. The remelting temperature of cast iron is around 2800 deg. Fahr.; and the higher the fusing point the faster a metal freezes, especially when acted upon by cold water. The problem, therefore, was to utilize as much of the heat of the electric arc as practicable in melting the cast iron, and then to scour out the molten crater by a suitably strong blast of "cutting gas." At the time the work was undertaken in February there was ice in the harbor, and the temperature of the water was close to 32 deg. Fahr.

Cutting of metal walls ranging in thickness from 1½ in. to 3½ in. was involved, the thinner body being severed at a linear speed of from 4 to 6 in. an hour, depending upon the ease with which the divers could get at their points of attack. All told, the divers made cuts aggregating nearly 30 ft. in length; and they were engaged on this phase of the task for the better part of ten days. One portion of the work involved cleaving circumferentially a section of the cast-iron pipe having an external diameter of 39 in.; this cut was made on a slant to facilitate lifting out the detached portion. The lower third of this cutting had to be done from within the conduit.

What Made the Job Necessary

Where the siphon nears the bulkhead line of the Staten Island piers, it rests 53 ft. below the surface of the water and is buried under 26 ft. of mud. By chance a dredge, engaged in deepening the overlying slip, hit one of the 12-ft. pipe lengths a shattering blow; the impact opened up a wide and long fracture. This necessitated shutting the gate valves at the Brooklyn and the Staten Island ends of the main. The ques-

tion was, how to withdraw the damaged unit and to insert a new one in the shortest possible time, and with the least disturbance of the neighboring links? The Merritt & Chapman Derrick & Wrecking Co., which had laid the siphon, tackled the job.

First, a wide excavation was made in the harbor bed for the purpose of baring the injured pipe, and to give the divers a chance to work without fear of the mud sliding in on them. The blow that had fractured one pipe unit also forced the two contiguous ones downward out of line; and before any cutting was done the divers blocked these up. Next, the fracture was enlarged near the spigot end (right end, in our drawing) to form a hatchway through which a diver could get inside to cut the lower part of the adjoining pipe just back of the bell. Most of the upper section of the bell of the ruptured pipe length was then detached by cutting, including an enveloping wrought iron band 4 in. wide and 1½ in. thick. This work produced an elbow-like hollow which allowed sufficient play, when the opposite end was lifted, as shown in dotted lines, to break that lead-packed joint and to let the remaining part of the bell swing outward and free.

A new section was promptly lowered and installed in place of the fractured one, the joint at the bell being sealed with a packing of lead wool hammered home. The gap between the spigot end of the new unit and the pipe from which the bell had to be severed was bridged by a cast steel sleeve of ample length (5 ft.) to provide a strong union. The manner of making this connection is shown in the sketch. The bolts shown were used merely to equalize the space to be used for lead wool packing.

Before the repaired siphon was permitted to send water onward to Silver Lake reservoir, Staten Island, it was scoured out and sterilized. This was done by turning Catskill water into the siphon at Brooklyn and discharging it into a sewer at the Staten Island side by way of a 12-in. blow-off. When all of the mud and foul water were thus purged from the conduit, chloride of lime was added to the water entering at Brooklyn.

This Portion of the Bell of the Broken Pipe Section Was Cut Off to Permit Easy Separation of the Broken Unit from the Next Intact Section

This protective measure continued until tests showed the siphon to be absolutely clean. These steps were essential, for normally this siphon supplies some 125,000 people daily with the bulk of their potable water.

The Commonwealth Steel Company, St. Louis, is paying its molders 76c. an hour and not 90c., as recently stated in these columns.

Novel Applications for Thin Steel Bands

Special Advantages Follow Their Use for Power Transmitting and Conveying Purposes—Question of Tension Important

BY BERNARD KRUGER*

WHILE the entering of metal bands into competition with ropes, leather and textile belts for the transmitting of power and the mechanical handling of material, has made great headway during the past few years in Europe, very little concerning this development has appeared in the literature of this country. At present there is almost 1,000,000 hp. being transmitted by steel bands, covering every class of drive, and over 1000 steel band conveyors are at work, handling not only ordinary materials, but including some hitherto impossible for any kind of belt conveyor.

Successful use of steel bands for power and conveying has been gradually evolved from experiments made during a period of nearly fifteen years in most countries where mechanical power is used. The early experimental attempts were directed to the use of steel bands for power transmitting, but after a short period of use they invariably broke when subjected to any considerable increase in load. Persistent failure also attached itself to the various connections used in joining the ends of the bands together.

Subsequent experiments showed that these unsatisfactory results were attributable mainly to mistaken conceptions as to the conditions under which steel bands should be used. In calculating and constructing metal band gearing, on the occasion of previous experiments, it was found that consideration was not given to the fact that the metal band employed is subjected to a flexure constantly varying from zero to a maximum, and that to insure durability with such a demand it was not sufficient for the bands to be calculated in the usual manner, that is, so that the greatest bending stress which occurred was below the limit of fracture of the material. The error consisted in not regarding the result of philosophical researches first undertaken by Wohler, according to which a tension constantly varying from zero value to a maximum, and frequently applied to a body, causes self-destruction, if the maximum tension is not confined to half the breaking stress of the material.

Avoiding Fractured Bands

The present system is, therefore, based on the knowledge that a fracture of the belt band, even with a constantly varying demand on its flexibility, can be avoided with certainty if the maximum demand likely to occur is kept so low that it does not attain the value of the limit of fracture. According to the present method the breaking of the bands is avoided, and the durability made unlimited by the thickness; that is, the sectional dimension which, when wrapping the pulley, is perpendicular to the pulley surface, is arranged to be not more than a definite maximum.

The bands are made from carefully hardened and tempered carbon steel, prepared by special process, rough rolled at red heat and then brought down to standard thickness and width by cold working. The tensile strength of the finished material is about 95 tons to the sq. in. The edges are rounded and so finely finished that the bands can be safely handled, even when running at high velocity.

The dead weight of the steel band is very small, as compared with its great tensile strength, consequently, power for power, it is far lighter than any leather or woven-belt, than the equivalent power chains or cotton ropes. In the following table are shown the approximate leading dimensions, namely, effective driving

width and weight of leather belt, cotton ropes, power chain and steel band for transmitting 200 hp. at about 3000 ft. per min.

System	Weight Per Ft.	Driving Width
Double leather belt.....	6 lb.	24 in.
Five 2-in. cotton ropes.....	7 lb.	15 in.
Three-inch pitch chain.....	43 lb.	7 in.
Steel band	15 lb.	8 in.

It will be gathered from the preceding figures that the steel band is so light in weight that it would be impracticable to depend upon its sag to give any serious proportion of the driving tension or adhesion to the pulleys.

Owing to the high modulus of elasticity of steel it is necessary to determine the length of a driving band with considerable accuracy; a short extension, compelled by cutting the band too short in the first instance, sets up very serious stresses. To accomplish this determination, an ingenious device has been invented for determining the necessary length for the purpose, obtaining a truly correct working tension. For this purpose it is requisite to make allowance for the sagging of the band, which is effected in this manner:

A measuring band of small breadth and of definite section is mounted on the pulleys on which the operating band will subsequently be required to run, and the ends fitted into a tension frame. By means of a helical spring and calibrated nut, by the compression of which the arms of the tension frame approach one another, the total tension equaling the desired initial unit stress in the driving band is read off on a scale. One of the pulleys around which the band is placed (or also both pulleys, in opposite directions) is now slowly rotated so that the friction of the pulley causes a rise in tension in that branch in which the tensioning apparatus is placed, without, however, the band being driven by the pulley. The tension indicated by the apparatus is noted, the pulley or pulleys are then rotated in the reverse direction, so that the branch under test is now slackened to a certain extent; the tension then indicated by the apparatus is again read, and it is ascertained whether the arithmetical mean of the two tensions which has been read corresponds to the desired fundamental tension. The overlap of the ends of the measuring band is now cut off and, the tension being released, the remaining length is the correct measurement to which the driving band unstrained must be cut.

The Joint

Attention was next devoted to evolving a suitable method of connecting the ends of the bands together. It was discovered essential, for insuring durability, that the joint be provided at its ends with extension surfaces of suitable curvature, from which the steel band would be able to ride off, on transition to the circular path around the pulley from the straight path. This led to the invention of the present joint in which, the clamping plates being shaped to the pulley profile, stresses at the joint are distributed evenly over the whole width, and one of the most prolific causes of fracture in the early installations is thus avoided.

Friction Covering on Pulleys

So that metal does not run to metal, and to prevent any possible slip, a friction coating consisting of a layer of canvas, to which are glued fine sheets of cork, is placed over the pulley rim, and to avoid stripping under variable load, the pulley rim is first serrated by a rough file or chisel nuts. A special cement is available for use in very damp situations.

In a prolonged series of tests, made to show the

*J. G. Wray & Co., engineers, Chicago; late manager and director Steel Belts Limited, and Steel Conveyors, Limited. The paper was presented before the Western Society of Engineers.

values of the coefficient between a steel band and a covered pulley, it was found that for a useful tension, such as is now considered good practice in steel band driving, the frictional coefficient between steel bands and covered pulleys has practically an equivalent value to that between leather belts and iron pulleys.

Stresses

The permissible bending and tensile stresses for the normal use of steel bands depend on the total amount of the stresses, on the ratio of speed reduction, and on the ratio of the driving distance to the velocity of the bands. The bending stresses caused by running the belt over the pulley depend on the ratio of the band thickness to the pulley diameter. The tensile stresses thus determine the maximum bending stresses and the permissible thickness for the required pulley diameter. Where it is found impossible to obtain a width for a necessary tensile area by means of one band, several individual bands are run alongside each other. So as to allow the maximum power to be transmitted over a pulley of small diameter, it has been found necessary that the breadth of the band should be as large, and the thickness as thin, as possible.

Necessary Conditions

The requirements necessary to the successful employment of steel band transmission are simple, but nevertheless important. The lack of even one of the essentials would lead to unsatisfactory results. On the other hand, given suitable conditions, the results are definite and certain. The shafts, bearings and fixings must be of solid construction, strong enough to transmit the maximum load demanded. The shafts must also be parallel, and the pulleys running true.

Pulley Construction

In steel band transmission it is necessary that the pulley face should be flat. This is due to the fact that if the pulley was crowned, the centers of gravity of the joint clip would be raised slightly from the pulley every time the clip would run on the latter, thus causing a blow to be struck which is greater, the smaller the pulley diameter and the higher the belt speed. The stress caused by this blow would be thrown mainly onto the middle of the band, and this would cause at this point gradual deterioration of the material and ultimate fracture. As the steel band is only one-third the width of an equivalent leather belt, the use of specially narrow and correspondingly stronger pulleys enables considerable saving in weight to be made, particularly in large diameters, at the same time considerably reducing the cost.

Assuming, from a millwright's point of view, that the shafts and bearings are properly proportioned and fixed, and the amount of power to be transmitted being already determined, the necessary calculations are then made for the size and length of the belt to be used. These are based upon carefully worked out formulae, and as the material is practically static (the maximum and minimum contraction and expansion being only $\frac{1}{2}$ in. to the yard) the tension necessary for any particular power or width is exactly determined. Thus it will be readily understood that, when once the belt has been mounted in the manner previously described, it requires no further adjustment.

Advantages

Assuming that the necessary conditions can be fulfilled, steel band transmission is guaranteed to give the following important advantages:

1. An efficiency in power delivery of 99.995 per cent.
2. Great steadiness: a necessity for electrical machinery, textile purposes, paper mills, etc.
3. Favorable use of space: the distances of pulleys are optional to a great extent, depending on the speed; a perpendicular drive is no disadvantage for steel band driving.
4. Absence of stretching: a steel band does not stretch by use, as has been seen by eight years' experience.
5. Even running: free from slip; as there is no actual measurable slip, it follows that transmission by steel bands is uniform and invariable.
6. Narrower width: a steel band is only about one-third as broad as a corresponding leather belt.
7. Cool bearings, owing to the exact calculations of the necessary tension for each particular drive, together with the great reduction in the weight of steel bands, there is a

minimum of strain on the bearings, which consequently run cooler.

8. Cleanliness: no dressings are required.
9. Unwearability: steel driving bands have now been in operation for eight years, and tests made of the belts first fitted show no signs of deterioration.

Steel Bands for Conveying Materials*

In using the steel band in conveying, the same general basic principles are adhered to as for transmission, but other factors developed have also to be taken care of. The steel band conveyor is designed in two ways: With the upper strand supported by rollers, i.e. rolling conveyor; with the upper strand sliding on timber runners, i.e. sliding conveyor. In both cases the lower strand is supported by rollers at intervals of 15 to 30 ft.

With the rolling conveyor, the upper strand of the band is supported by rollers at intervals of 6 to 13 ft., according to the nature of the material conveyed. For materials such as charcoal and coal, a box troughing arrangement can be employed, but in this case the distance between rollers is reduced considerably below that employed for the open belt.

With the sliding conveyor, in many cases, particularly for short conveyors, and for certain classes of material, the upper strand of the steel band can slide on a timber support instead of being carried by rollers. With this type of construction the belt can run:

1. Free without trough.
2. In the bottom of the trough.
3. So that it forms the bottom of a trough narrower than the steel band and lined with steel plates.

Relative applicability of the rolling and sliding conveyor types depends on the nature of the material conveyed, and on local circumstances. A combination of the two methods can also be employed. The framework is made either of wood or metal. As a general practice, the terminal pulleys are of cast iron of 40 in. diameter. The bearings of the terminal pulleys are designed so as to permit easy adjustment.

The only variations in length of the band to be taken into consideration are those due to changes in temperature. For short conveyors the tension of the band is adjusted by means of movable bearings of the driven terminal pulley. For long conveyors, 130 ft. or more, as well as for conveyors handling warm material, the driven terminal pulley is fitted on a tension frame, supplied with counterweight or steel springs to obtain the necessary stretching force.

The joint of the steel band is made by means of single row riveting, with the rivets countersunk and short overlap. The rivet holes are punched with a special punching tool through both ends of the band at the same time. Due to the rivets being countersunk, they remain firm after the heads have been worn away. The bearings for the supporting rollers are carried on pillow blocks easily movable horizontally, so as to facilitate erection and adjustment.

Running of the Band

True running of the steel band depends mainly upon the accurate location of the end pulleys and supporting rollers. These should be exactly in line with each other, the shafts being at right angles to the direction of motion of the band. As an additional precaution, long conveyors are supplied with flanged idlers at intervals of about 65 ft. on the upper strand, and 100 ft. on the lower strand. With terminal pulleys of 40-in. diameter, the distance between the upper and lower strands at the guide roller is about 2 ft. 6 in.

The material conveyed is fed onto the belt by the usual hopper or chute arrangement, and need not be fed in a longitudinal direction, though this, of course, is always advantageous, in order to get material to rest quickly and quietly on the band. The material is delivered from the band either over the end pulley or by means of delivery scrapers. These are constructed of laminated steel plates, and designed so that they can easily be removed from one point to another. The drive of the steel band generally consists of spur gears. The driving gear can be placed either at the charging or discharging end.

The characteristics of the steel band permit the fol-

*See also page 321. THE IRON AGE, Feb. 2.

lowing advantageous applications of the conveyor, not hitherto possible:

1. If the material conveyed is to be discharged at a point other than the end pulley, the expensive and power-consuming throw-off carriages are replaced by a simple delivery scraper or plow.
2. By means of delivery scrapers of special construction, medium sized material can be discharged at several points at the same time.
3. The material to be conveyed need not, as previously mentioned, necessarily be delivered onto the band in a direction parallel to that in which it is running.
4. Sticky materials such as sugar clay, etc., can be discharged easily and perfectly and the band kept clean without any difficulty whatever.
5. Sharp-edged and cutting materials, such as broken glass, can be handled satisfactorily.
6. In special cases supporting rollers may be dispensed with and the loaded strand drawn directly over a timber runner, without unduly wearing the steel band. Under the action of the steel the timber runner becomes highly polished, and the power consumption due to friction is then relatively small.
7. Owing to its rigidity in a transverse direction, the steel band has a larger conveying capacity than textile bands. The edges of the band do not bend down even with considerable load obliquely discharged.
8. The supporting rollers can be made narrower than the band, thus permitting, at reasonable cost, the use of large diameters for the idlers, with correspondingly low power consumption.
9. Low elongation permits considerable distances between the idlers, for the loaded as well as for the empty strand of the band, without excessive local sagging.
10. Insensibility to moisture and variation of temperature permit the use of the steel band conveyor in the open air, though in certain cases it is advisable to give the band a coating of tar or oil.
11. Hot material up to a temperature of 212 deg. Fahr. can be handled safely by the steel band.

Steel Mill Wage Cuts in England

Reports show that in the iron and steel trades of England wages have been cut more heavily than in any one of half a dozen other important fields, with the exception of mining and quarrying, and that the iron and steel workers have made a contribution to general liquidation twice as heavy as the average of all the others. Returns for October, 1921, show the average weekly wages, in 103 steel companies having 90,395 employees, to be £3 8s. 2d., compared with £4 18s. 8d. in October, 1920, and £5 8s. in September, 1920. Returns from 126 companies which employed 171,948 persons in June, 1920, show that at the end of November, 1921, employment was only 82,328, or less than 48 per cent of the previous figure.

A survey made by a labor bureau, covering the first eleven months of 1921, showed that the net reduction in weekly wages of 239,500 iron and steel employees amounted to £431,690, or an average per employee per week of £1 16s. 1d. The survey covered more than 5,300,000 other employees in the engineering and shipbuilding, mining and quarrying, textile, transport, public utility and binding and allied trades, with net reductions amounting to a total of more than £4,500,000, or an average of about 17s. per person per week, this being approximately one-half the reduction of the steel workers.

Engineering Foundation has on the press a report of its seventh year of activities in research connected with various branches of engineering. The book will contain also an abridged report of the extensive investigation of the fatigue phenomena of metals, made possible by a large contribution from the foundation. This investigation was conducted at the Engineering Experiment Station of the University of Illinois. Persons desiring to obtain a copy of this report, when issued, should write to the office of Engineering Foundation, Engineering Societies Building, 29 West Thirty-ninth Street, New York.

A summary is being prepared of the data obtained by the Bureau of Standards on the various carbon and alloy steels which have been tested in the metallurgical laboratories of the bureau, including the effects of normalizing rolled-low carbon steel, the effects of 1.25 per cent of manganese, the presence of 5 per cent cobalt, the addition of 0.4 per cent of molybdenum to carbon chromium steel, and the effect of various heat treatments on their properties. Progress has also been made in determining the effect of time-annealing at blue heat on the properties of cold-rolled boiler plate.

EXTENDING FOREIGN TRADE

Operations Under the Webb-Pomerene Act Are Explained

WASHINGTON, March 6.—Pointing out that approximately 50 "associations" operating under the export trade act (Webb-Pomerene law) have recently filed annual reports with the Federal Trade Commission, and a number of new associations are in the process of organization, Dr. William Notz, chief of the export trade division of the commission, in an article in *Commerce Reports* of Feb. 27, explains how the law operates, its advantages and obstacles exporters face. The act is referred to as being among the first of Federal laws looking toward the stabilization of American trade in the after-war period. Its primary purpose, it is stated, was to facilitate the movement of American goods to foreign markets, to serve as an encouragement to exporters and to enable them to compete successfully in foreign markets with buying and selling combinations of other countries. Under the act "associations" may be formed for the sole purpose of engaging in export trade, these associations to be exempt from the Sherman anti-trust law of the United States, and from a certain portion of the Clayton act, with the proviso that there shall be through the association no restraint of trade within the United States, no restraint of the export trade of any domestic competitor, no enhancing or depressing of prices, or substantial lessening of competition within the United States. Further provision is made for the filing of documents and reports with the Federal Trade Commission, to which office is intrusted the administration of the act.

In explaining the different plans of organizations under the act and their operation, Dr. Notz mentions an association of manufacturers whose subscribing firms contract to do all export business through the association. The association makes all contracts with foreign representatives, and export agents receive all orders and apportion them to members. Members deliver and invoice merchandise to the association, which becomes immediately liable for the sale price. The association assumes all responsibility and risk of shipping, insurance, export documents, credit, etc., and as the organization is purely mutual, these expenses and loss (if any) are prorated among members upon the basis of business done with and through the association.

The advantages of co-operation under the act grow more and more apparent, Dr. Notz says, as the details of operation are perfected. Substantial reduction of overhead has been accomplished through joint advertising and selling and the pooling of administrative expense. Exclusive representation abroad is declared to be an important asset formerly not so readily attainable by the smaller export houses. Distribution of orders among several members of an association makes it possible to complete shipments in less time and with more satisfactory results than formerly. Although figures have not been received for the volume of exportation under the act during 1921, the total volume exported by associations in 1920 was estimated at \$221,000,000; and, it is said, it is undoubtedly true that without such combination only a small percentage of that amount could have been shipped by the member concerns represented. Members of these combinations number about 1000 and are scattered throughout 41 States. Many lines are represented, among them iron and steel, foundry, locomotives, lumber, furniture, general merchandise, etc.

"The export business during the past two years has been beset by many obstacles," says Dr. Notz. "Well-established export houses have found operation difficult, and newly organized associations report that it is 'hard to get started.' But there is on every hand a confidence that when the wheels begin to move they will be able to establish and hold foreign markets for American goods. The best indication of this confidence is found in the fact that new companies are in the process of organization, and export problems are being actively met by definite, constructive development of foreign markets."

laboratory for Malleable Iron Foundry

Equipment for Running Carbon, Sulphur and Manganese
Determinations Facilitates Control of Product—
Getting Rid of Heavy Gases

TO facilitate operation and obtain close control of of the product without necessity for long waits, such as were occasioned when the laboratory work was done in a commercial establishment, the Arcade Malleable Iron Co., Worcester, Mass., has installed in a new building laboratory equipment, which is to be expanded when conditions warrant. Except for a microscope, the present equipment is entirely chemical. It is planned, however, later on, to place physical testing equipment in the basement of the present building, space having been allotted there for the future installation of tensile and (probably) torsion machines. It is the plan to use the tension machine also for transverse tests.

The product of the company consists entirely of malleable castings, which go into a large number of industries. Prominent among the industries served are

those making textile machinery, lawn mowers, revolvers and shotguns, wringers, motorcycles and motor trucks, etc. Large numbers of pipe unions are made, while a considerable business has been built up in the line of radiator nipples and in gears. The product has a tensile strength varying under different conditions from 40,000 to 50,000 lb. per sq. in., accompanied by a ductility represented by an elongation of 12 per cent in 2 in. This compares with the malleable specifications of the American Foundrymen's Association of 45,000 lb. tensile strength and 7½ per cent elongation.

Analyses are made from drillings taken from hard iron bars, cast from the air furnace at time of tapping each heat. The samples are sand-blasted before being drilled, to get rid of extraneous material. Drillings are regarded as far better for this purpose than the usual shot dropped into water, for the latter have to be

(Below)

pounded up or crushed, before they can be used, and there is much opportunity for the inclusion of foreign material.

Determination of carbon is made in a Fleming combustion train, which includes a Hoskins electric furnace. This determination can be made in 7 min. The furnace heats the material up to about 2000 deg. Fahr.; while the carbon dioxide separated from the iron at this temperature is caught in the usual manner and determined by weighing, on a Volland & Sons balance.

The sulphur rack, for volumetric determination of sulphur—sulphur by the evolution method—is located in the main laboratory room, while the combustion train is in the office. This sulphur rack is so arranged that it may also be used for igniting precipitates. It includes six Bunsen burners connected on one manifold.

Control of manganese in connection with sulphur is accomplished in the following manner:

The coal pile is staked off in sections and numbered, and each section is analyzed the day before it is used. This plan permits regulating the manganese in the heats according to the sulphur content in the coal. Any section of the pile which shows up fairly high in sulphur is used in the first part of the heat, before the iron has reached the molten state, and when it will not absorb much of the sulphur from the coal. The manganese should be approximately $2\frac{1}{2}$ times the sulphur, in order to absorb from the coal all the sulphur, to form sulphide of manganese, MnS , according to the atomic weights—manganese, 55; sulphur, 32; which produces 87 parts by weight of manganese sulphide for each 32 parts of sulphur.

Thus it can be seen that, if the manganese is much under this ratio, some of the sulphur will not be removed from the iron, and this would cause a composition rim which would make the castings somewhat harder to machine. It would also increase the tensile strength, and slightly decrease the percentage of elongation. Only in extreme cases, however, are these castings so hard and brittle as to be unsuitable for use. Silicon and carbon must also be closely watched, as these two elements have much to do with the physical properties of the iron.

For special work in the study of materials, a small Hoskins electric furnace of rectangular shape has been installed, capable, like the combustion train, of reaching a temperature of 2000 deg. Fahr. This has inside dimensions of $3 \times 4\frac{1}{4} \times 10$ in. Temperature determinations are made by a Hoskins thermo-electric pyrometer,

with a chromel thermo-couple. This may be attached so that it may be used in either room, there being a small sliding window in the wall, as shown in two of our photographs.

An innovation in the bench tops throughout the laboratory lies in the fact that they are made of $\frac{3}{4}$ -in. asbestos boarding, painted with Sherwin Williams acid resisting black paint, instead of the usual slate slabs. The joints are cemented and the cracks filled with a mixture of marble dust and water glass. The combustion hood is lined with the same material. The advantage of this material, aside from its relative cheapness, lies in the fact that it will not stain under any of the acids in use, while slate is not immune from stains.

The hood has not only the customary upper draft into the stack, but also a lower draft. The draft is sufficient to pull out heavy fumes which otherwise would get into the room—such as sulphur and bromine compounds. The hood is arranged so that access may be had from both sides, thus facilitating its use for two or more simultaneous operations.

While the sides of the room are made up of match boarding, as shown, the ceiling is of wall board finished with a non-lead white paint, to avoid discoloration from fumes of hydrogen sulphide. The laboratory has windows on all four sides, each room being thus lighted on three sides. The ceiling lamps are of the nitrogen filled type.

Among the items of equipment is a gas-heated Barnstead still for distilled water, with capacity of one gallon per hour. The sink, together with trap and pipes to the sewer, are of petrified Akron ware, this having great resistance to acids. To accelerate filtering, a suction on the injector principle has a suction pump, with a plunger so arranged that the pump may be cleaned out by the plunger, without dismantling. The Bausch & Lomb microscope is used for examining fractures. It is expected to install later a photo-micrographic instrument in a part of the basement.

Laboratory work consists in examination of raw materials, coals and the product in process of finishing in the air furnaces. There are also a number of special investigations carried on from time to time, and some work is done for outside local concerns, particularly for one plant which is affiliated with the foundry. In connection with the air furnaces, a Leeds & Northrup optical pyrometer is used for temporary determinations.

The building measures 18×32 ft., the office being 11×18 ft. and the main laboratory room 18×21 ft.

MAGNETIC TESTING OF CHAIN*

Apparatus for Determining Depth of Case and Durability of Skid-Chains for Auto Tires

The problem of determining the depth of case in carbonized and case hardened work is one in which the customary non-destructive methods of test are difficult or impossible to apply. In some cases, the surface hardness may be estimated with a scleroscope or a file, or under favorable conditions a Brinell test can be made, but in general, none of these tests is satisfactory on this class of material. A magnetic method which has been applied successfully to a particular product therefore may be of some interest.

The product under discussion is small steel chain in various diameters of wire from 0.192 up to $\frac{3}{4}$ -in., and in short lengths of from 5 to 15 in. It is used as the cross member in automobile tire chains, where it is exposed to the wear of hard roads, and to the shock of pounding over car rails and cobble stones. The result is that if the case is too thin it wears out too fast, and if too thick, it breaks even before the soft chain has worn out. Fortunately, there is an intermediate condition from which reasonable service may be expected.

In order to determine this condition for maximum

service, a test is needed in which any variable which increases the brittleness of the chain will show itself in the direction of increased depth of case. In the present instance, the magnetic property under observation varies with the quenching temperature and the structure of the chain in the desired manner.

The Variables Involved

Resistance to wear and the resistance to shock are in general inversely proportional to each other, and the point of maximum usefulness is highly indeterminate. The final test, the mileage run on the road, is so full of accidental variations, that the average of a large number of records must be considered. This has so far prevented a close study of the effect of small changes in structure. If we consider the depth of case as the only variable, and make the chain from the same wire, carbonize at the same temperature in the same compound for different times, and quench all our chains from the same temperature, we obtain magnetic readings proportional to the depth of case. If then a set of these chains, ranging from thin case to thick are taken off after the first to break has worn through it will be found that the wear is very closely proportional to the magnetic reading. This holds true regardless of the weight of car used or the speed and nature of the road.

When the chains are run until all are broken and the mileage of each is considered, it is found that in general the low reading and the high reading have given about the same result; and somewhere between the two is the longest lived chain. The softer the road,

*A paper presented at the New York Sectional Meeting of the American Society for Steel Treating, March 3. The author, A. V. de Forest, is research engineer American Chain Co., Bridgeport, Conn.

and the lighter the car, and the slower it is driven, the closer will the best chain come to the high reading, or deep case end of the scale. However, this hard end is the more dangerous, for a chain overhard for the use to which it is put may break in a few miles, while the too soft chain will wear out only after a fair length of travel.

The magnetic test, therefore, is used to determine when the chain is unnecessarily soft or dangerously hard. This latter figure is derived entirely from experience, and is only an estimate to meet the worst conditions. It is not yet practical to make chain to suit the temperament of the driver of each car and the paving of the streets he uses, but some day chains may come like tooth brushes, hard, soft and medium, in properly labeled packages.

Major variables involved are the size of chain; the depth of case; the carbon content of the case and its distribution; the composition of the core; the structure of case and core, as determined by the carbonizing temperature and the heat treatment. The effects of each of these factors on the magnetic result have not as yet been too accurately determined. The following points, however, may be of interest. In the carbonized chain, slowly cooled or normalized, the magnetic reading is closely proportional to the depth of case. Here the core is pretty regular in composition and the carbonizing material the same in each instance. When reheated and quenched the magnetic result is higher, the higher the quenching temperature. Furthermore, the magnetic result is higher for a coarse structure as quenched from the pot, than for a finer structure quenched from the same temperature, as is obtained by reheating and re-quenching. So far the magnetic result has given a pretty close idea of the "brittleness" of the chain, whatever that may mean.

If now another variable is brought in, the drawing temperature results are not as good. A draw at 450 deg. Fahr. lowers the magnetic reading more than it affects the life of the chain. At 550 deg. Fahr., the same thing is true. However, in practice, drawing has not so far proved generally advisable so this effect is not a factor in this case.

The Apparatus Described

The magnetic apparatus itself is a simple form of inductance bridge, operating on 60 cycle commercial current. A rather peculiar type of separately excited galvanometer is used as an indicator. A small rheostat and ammeter control the current to operate. In this case about 0.2 amperes at 110 volts are used. Resistance coils control the sensitivity of the instrument, and the deflections can be adjusted to any desired limits. An adjustable resistance is used to balance the galvanometer and is altered to compensate for different sizes of specimen or to change the scale of the instrument. Either deflection or null method can be used. The deflection method is ordinarily sufficiently accurate. The magnetizing coil may be of almost any size. The one in question will operate on 1/16-in. wire, chain formed of 3/4-in. wire, or bar stock up to 1 1/4 in. in diameter. The whole outfit is easily portable and needs no setting up beyond connection to an alternating current lighting circuit.

It has been found that the introduction of a rapid and non-destructive test enabled the testing of a vastly greater number of samples, and a much closer control over the factors affecting the problem. It enables experiments to be conducted intelligently on time of heat, temperature, shape and material of pots or retorts, method of packing, arrangement of furnace, carbonizing mediums, and all the troubles giving rise to the far-famed irregularities of case hardened work. Also, by giving quantitative results, it allows a better interpretation of service tests on the finished product.

Last but perhaps most important of all, it affords justice to the heat treating force, for careful and intelligent operation can be accurately appreciated and carelessness properly censured. The result is that much greater interest is taken in the quality and uniformity obtainable under routine conditions, and all concerned with this frequently abused department can share the satisfaction of a good job well done.

New Drill and Tap Chuck

A friction drive, quick-change positive safety drill and tap chuck, having a capacity of 1/8 to 3/8 in. straight shank drills and 1/8 to 3/8 in. taps has been placed on the market by the Save All Tool Co., Waltham, Mass. The new chuck is known as the No. 12 Save All and is shown in the accompanying illustration. It is built along lines suggested in the company's quick-change drill chuck for drills with taper shanks.

The safety device consists of a pin held in place by a pointed screw which positions in a groove in the pin. When the work exceeds the capacity of the tool, the pin shears off and can be removed by loosening the screw and inserting a new pin, a feature intended to eliminate

Friction-Drive Quick-Change Positive Safety Drill and Tap Chuck

breaking and burning of drills, taps, reamers, or other tools used in a chuck of this type. The drill or tap is held in a collet which slips into the chuck when the sleeve of the latter is raised.

Will Discuss Trade Associations

WASHINGTON, March 7.—Correspondence between Secretary of Commerce Hoover and Attorney General Daugherty regarding the legal status of trade association has brought so pointedly to the front the necessity of complete understanding of the functions, methods, and accomplishments of national trade organizations that this subject is to be made an important feature of the convention of the National Association of Manufacturers to be held in New York, May 8, 9 and 10. This will afford an opportunity for the compilation of a volume of authentic information regarding the work of national trade organizations and the association has sent out a questionnaire to its members in order to develop an elaborate study of the work of trade associations. The questionnaire, among other things, asks as to the type and percentage of industries represented, the character of the membership of associations, whether composed of individuals, firms or corporations, etc., purposes and scope and authority of the departments of the trade organizations.

The Chamber of Commerce of Bridgeport, Conn., recently appointed a merchants' committee to make a survey of all available manufacturing floor space in the city, now vacant, with a view to bringing additional industrial concerns to the city. There are several factories and plants, now idle, which were erected during the war and used by wartime factories, and it is the desire of the committee to fill as many of these as possible.

Universal Shaping Saw

Because of added features of design the universal shaping saw shown in the illustration, a recent development of the Peerless Machine Co., Racine, Wis., is adaptable to a much wider range of work than covered by the usual hacksaw machine. Specimens of the work are shown in a separate illustration.

Machine-tool standards of construction are followed in order that the machine may accomplish with a hacksaw blade the various classes of work illustrated. Bearings are liberally proportioned and placed far apart, causing variations to be decreased instead of increased. The saw blade is carried by a four-sided frame, permitting the blade to be placed under proper tension without danger of distorting the bearings. The saw frame is reciprocated by a crank and connecting-rod mechanism, and during the draw or cutting stroke the

Group View Above Shows Various Classes of Work Done on the Universal Shaping Saw, Shown Below. An angle fixture is used for blocking out and a cross-feed fixture for finishing the work

connecting rod is approximately parallel with the line of travel of the blade. This is intended to give a direct pull and permit cutting with the crank angle such that the cutting speed is reduced to a minimum for the cycle of motions, although maximum for the work being handled. During the return stroke the change in angularity of the crank causes the blade to be returned to the starting point at high speed. Three changes of cutting speed are provided.

A feature is the power-feed mechanism provided. At the end of the draw or cutting stroke a cam on the crankshaft actuates a lever which raises the frame on which the saw frame reciprocates. This lifts the blade clear of the work on the non-cutting stroke. After the saw is returned the same cam and lever serves to lower it to the cutting position. At the same time, a second cam on the crank shaft becomes operative and through

a link and lever mechanism, and a ratchet and pawl, a feed worm which meshes with a rack connected to the bearing frame by which the saw frame is carried, is turned in such a way that the worm pulls the rack and the saw frame down.

The repetition of this cycle of movements at the beginning of each cutting stroke of the saw blade provides for feeding the saw into the work at a predetermined rate of speed. Adjustment of this speed is by means of a small hand wheel near the floor at the front of the machine. When the cut has been completed the feed worm is tripped automatically out of engagement with the rack. A spring then lifts the saw frame to the up position and stops the machine. This arrangement makes it unnecessary for operator to watch the progress of the work because he is notified when the cut has been completed by the stopping of the machine.

For angle cutting operations a fixture is furnished on which the work to be cut may be easily clamped to either the horizontal or vertical face. Another fixture adding to the range of the machine is a crossfeed mechanism which is secured to the table of the saw. A piece of work can be secured to this fixture and fed transversely under the reciprocating saw which acts very much the same as a shaper tool and provides for producing a smooth finish on any rough surface that requires the performance of a second operation of this character.

The equipment includes pump, piping and reservoir, which provides cooling solution to the blades. The machine has a capacity for work 6½ in. square and takes blades from 10 to 14 in. The speed variations are 132, 85, and 50 strokes per min. The floor space occupied is 24 by 43 in., and the weight, with standard vise, 750 lb.

Complaint of Mitsui & Co. Not Sustained

WASHINGTON, March 7.—Passing upon the complaint of Mitsui & Co., Ltd., exporters of Seattle, Wash., against the Director General, C. B. & Q. Railroad, et al., the Interstate Commerce Commission has handed down a decision holding that the rate of 85c. per 100-lb. charged on 18 carloads of bar iron and steel shipped from Terre Haute, Ind., to Seattle, for export between July 1, and Dec. 31, 1918, was not unreasonable. It also was held that the complainant was not damaged as a result of any undue prejudice that may have existed and the complaint was dismissed. It was maintained by the complainant that the rate was unreasonable to the extent that it exceeded the export rate of 75c. maintained from Chicago.

The commission was asked to require the establishment of the same rate from Terre Haute as from Chicago and grouped points. The decision points out that the Pittsburgh group rate applied from Terre Haute when the shipments moved. The complainant's principal contentions were that the maintenance of the Pittsburgh rate from Terre Haute, more than 400 miles nearer Seattle, resulted in undue prejudice to Terre Haute, and that by reason of its location the latter town was entitled to the Chicago group rate. To support this argument, the complainant relied upon the decision of the commission in the Inland Steel Co. case in which the commission found that the application of the same rate on iron and steel articles in carloads from Chicago, Terre Haute, Vincennes, Ind., and Pittsburgh to the Pacific Coast ports for export was unduly prejudicial to Chicago, Terre Haute, and Vincennes to the extent that the rate from those points exceeded a rate of 6.5c. lower than the rate maintained from Pittsburgh. The Director General of Railroads was the only defendant and as Federal control had terminated no order was issued.

The American Railway Engineering Association will hold its annual convention at the Congress Hotel, Chicago, March 14 to 16, inclusive. At the same time the National Railway Appliances Association will hold an exhibition of railroad supplies and devices at the Coliseum in the same city.

Sectional Meeting of Steel Treaters

Eastern Chapters Hold First Technical Session in New York

—First Public Presentation of Two Important Developments

THE first attempt of the American Society for Steel Treating to hold a sectional meeting was an unqualified success. On March 3 at the McAlpin Hotel, New York, about 200 members from 14 chapters, embraced in the Eastern territory of the society, registered and attended two enthusiastic technical and social meetings in the afternoon and evening. The membership of these chapters approximates 1000.

The object of the directors in planning such meetings was to bring together, four times each year, members of various chapters in localities where a national convention is less likely to be held, as well as to promote the aims of the organization professionally and socially. The meeting held last week fully met these expectations in the presentation of a group of interesting papers, fairly liberally discussed, and in the realization of social and other features, which were impressive. There is the added advantage that at such meetings the national officers and directors can get into more intimate contact with each chapter.

At the afternoon session, which was called to order by George L. Norris, chairman New York chapter, and later turned over to Irving L. Cowdrey, chairman Boston chapter, five papers were presented, all by the authors.

Magnetic Testing of Chain

One of the most interesting of these and one which presented for the first time a new development in magnetic testing was entitled, "The Magnetic Testing of Small Case-Hardened Chain," by A. V. De Forest, metallurgist American Chain Co., Bridgeport, Conn. This is published practically in full elsewhere in this issue. It marks a new application of non-destructive testing and enables a distinction to be made between chain that is properly hardened to insure the best results, as automobile wheels on the average roadway and those that are either too deeply case-hardened and hence brittle, or too little hardened and hence soft.

The author in response to a question as to whether chrome-vanadium alloy steels had been tried for such chain, in view of the fact that the hardening treatment would be simpler, stated that such material had not proved enough better to compensate for the extra cost. Mr. De Forest also stated, in response to questions, that regular 18 per cent manganese alloy steel had not been tried out by his company nor the 1.25 per cent manganese alloy steel. It was the author's opinion, as to the future possibilities of magnetic testing in general, that it would probably be possible to correlate results and perfect apparatus so that at least two properties of steel might be determined by magnetic apparatus. The actual apparatus was exhibited and the testing of chain was demonstrated.

Mass in Heat Treatment

E. J. Janitzky, metallurgist Illinois Steel Co., South Chicago, presented his paper, "New Developments on the Influence of Mass in Heat Treatment," which supplements a paper on the same subject presented at the annual convention in Indianapolis last September. It is abstracted elsewhere in this issue and covers an application of his formula, previously applied to carbon steels, to certain alloy steels. Mr. Janitzky commented on Sir Robert Hadfield's criticism of his first paper, showing to his own satisfaction that the criticisms were unfounded.

New Heat-Resisting Alloy

A new heat-resisting alloy was expounded in a paper by G. R. Brophy, metallurgist research laboratory General Electric Co., Schenectady, N. Y., entitled "Calite—A New Heat-Resisting Alloy." This new

material is an alloy of nickel, chromium, iron and aluminum and is offered as castings for heat-treating equipment. The contained aluminum oxidizes under service, forming a protection coating which is a factor in bestowing certain properties. According to the author:

Calite resists oxidation up to 1300 deg. C. (2372 deg. Fahr.), but 1200 deg. C. (2200 deg. Fahr.) is recommended for indefinite service. The protective oxide formed is tight and does not snap off even on quenching from high temperatures. Quenching after 100 hr. at 1200 deg. C., calite lost but 0.03 gram per sq. cm. exposed, while the best heat resisting base metal alloy other than calite lost 0.56 gram under the same conditions. The same samples were run at 1300 deg. C. for an additional 25 hr. Calite lost 0.0003 gram, the other 0.09 gram per sq. cm. exposed. From these figures it appears that calite is 20 times as resistant at 1200 deg. C. and the only base metal alloy to stand at temperatures higher. At 900 deg. C. or ordinary operating temperatures, the loss per square centimeter was measured in 1/10 mg., or for all practical purposes, no loss.

Calite is practically noncorrosive. Samples have been polished and run in a spray of saturated sea salt solution at 100 deg. Fahr. for 200 hr. and at the end of this time still retained a perfect polish. So-called stainless steel will last but a few hours in this test. For fittings exposed to salt atmosphere calite should be excellent.

Twenty-five per cent sulphuric acid dissolves calite rapidly; hydrochloric acid slowly and nitric hardly at all. Forty-eight hours in 25 per cent nitric acid, the metal lost 0.0004 gram per sq. cm. exposed. Acetic acid has no effect. In general, the physical properties are as follows:

Melting point, deg. Fahr.	2,777
Softening temperature, deg. Fahr.	2,500
Working temperature, deg. Fahr.	2,200–2,370
Specific gravity	7.03
Weight per cu. in., lb.	0.25
Brinell hardness, annealed	286
Scleroscope hardness, annealed	40
Thermal conductivity, per cent of pure iron	25
Transverse stress, 1 in. square bar, lb. per sq. in.	4,250
Tensile stress, lb. per sq. in.	36,800

Calite cannot be machined in the cast condition, nor cut with oxy-acetylene. Any change of dimension or finish must be done by grinding. It is more resistant to oxidation at high temperatures and will stand higher temperatures than any base metal alloy tested. Its first cost is low and operating cost lower than other non oxidizing alloys. Boxes have been run for 1500 heat hours and at the end of that time were still in the best condition. Measurements of these boxes show no warpage or growth. The oxide coating is no heavier now than after the first heat.

Many questions were put to Mr. Brophy during the course of which it developed that this alloy is particularly adapted to the glass industry in that its use does not destroy glass, that it can be poured to a thinness of 3/16 in. and that in oil-fired annealing furnaces boxes made of this alloy act as a baffle, even high sulphur oil having no effect. The author acknowledged that there was much yet to be learned about the new alloy in order to overcome some of its apparent defects and to develop some of its manifest properties.

Cutlery of Stainless Steel

"Stainless Steel in Cutlery Use" was the subject of a paper by R. G. Hall, research engineer R. Wallace & Sons Mfg. Co., Wallingford, Conn. An abstract of this paper will be published in a later issue of THE IRON AGE. The author, however, states that, in studying data on this subject from many sources, "there seems to be a great divergence of opinion as to practically all essential points, including the exact chemical specifications and a very wide range of opinion as to the subsequent handling and heat treatment." As to the analysis Mr. Hall recommends "the carbon content to be between 0.30 and 0.45 per cent and the chromium between 13 and 15 per cent. Doctor Hadfield recom-

mends 13 per cent and the Brearley patents call for chromium between 9 and 16 per cent, while Elwood Haynes has covered in his patents up to 16 per cent." It is the opinion of the author and others that nothing is gained in stainless characteristics or corrosion by exceeding 15 per cent chromium. Phosphorus and sulphur should be below 0.03 per cent, with silicon and manganese about 0.30 and 0.50 per cent respectively.

This paper was read by the author and not pre-printed. It deals with the main features involved in the forging, heat treatment and finishing of this alloy to form knife blades in particular; the tests for stainless qualities are also discussed. In all there are about 40 operations through which these blades pass during their manufacture.

In response to some questions Mr. Hall said that he had no data as to ratio of stainless qualities before and after heat treatment but believed these were better after hardening; that the Crocus finish can be applied to chromium steels despite statements to the contrary; that there is not much difference as to which polishes better, carbon or chromium steels, and that for the stain test, copper sulphate is used and if the steel will stand this test for 2 min., it will stand anything.

Cold Headed Bolts

"Cold Headed Bolts—Their Metallography and Heat Treatment" was the subject of a paper by V. E. Hillman, metallurgist Crompton & Knowles Loom Works, Worcester, Mass., which the author presented in abstract. He said in part:

The term, cold work, implies that energy is expended on the metal when its temperature is below the critical range. The microstructure of the metal prior to the application of cold work consists of an aggregate of crystalline grains or cells, each grain being a structural unit. It may suffer rupture or deformation; it may be enlarged, elongated, stressed or restored to its normal size and shape. When the metal is subjected to mechanical pressure, the crystals are crushed and intimately mixed. Cold work has an embrittling effect upon the metal and the grains, which were originally equiaxed, are elongated, assuming a rope appearance resembling fibre. In brief the grains lose their original identity.

Conclusions: Various degrees of distortion may be found in the same bolt. Certain regions undergo slight deformation, whereas other sections undergo extreme distortion.

Annealing at 1150 deg. Fahr. will remove the weakening effects of cold work.

Irrespective of the degree of cold work, crystallization will not take place below 1280 or above 1380 deg. Fahr.

If the temperature of the furnace reaches the hazardous zone, 1280 to 1380 deg. Fahr., however, crystallization will take place only in those areas which have been slightly strained.

Annealing above the critical range, 1650 deg. Fahr., is preferable.

In this range of temperature 1625 to 1675 deg. Fahr., and regardless of the degree of strain, crystallization will not result.

In the discussion which followed emphasis was placed on the importance of grain growth as a factor and exceptions were taken to some of the author's statements.

Doctor Mathews Made an Honorary Member

The evening session was one that will be remembered for some time by those present. Besides the delivery of an illustrated paper on "Perfecting a Drop Forging" by J. H. G. Williams, assistant works manager Billings & Spencer Co., Hartford, which outlined some difficulties in making a certain product, and an illustrated lecture by B. H. De Long, metallurgist Carpenter Steel Co., Reading, Pa., descriptive of the company's various equipment for making high grade tool steels by the open-hearth, electric and crucible processes, there were two features of marked interest.

Early in the session the meeting was temporarily turned over by the chairman, A. W. F. Green, chairman Philadelphia chapter, to the national president, F. P. Gilligan, secretary-treasurer, Henry Souther Engineering Co., Hartford, who presented to Dr. John A. Mathews, president Crucible Steel Co. of America, and a member of the New York chapter, an engraved certificate of honorary membership, in which was ex-

pressed a brief appreciation of Doctor Mathews' work in the manufacture and heat treatment of alloy steels as well as of his pioneer work in electric steel. The certificate was graciously accepted by Doctor Mathews in a brief speech.

Colonel White Honored

The surprise of the evening was introduced by W. H. Eisenman, national secretary, Cleveland, who was given temporary charge of the meeting after the presentation of the paper by J. H. G. Williams. Mr. Eisenman reviewed briefly the developments which led up to the amalgamation of the two heat-treating societies in 1920 into the present organization, of the untiring efforts of Col. A. E. White, the first president of the amalgamated society, to whom should be given the major credit for the carrying on of the difficult negotiations. Calling Colonel White to his side, Mr. Eisenman presented a large mahogany chest of sterling silverware to Mr. White as a token of the entire organization's appreciation of the services he had rendered, indicating that the ware was sterling because of the sterling character and sterling zeal in work of the recipient.

Colonel White, completely taken by surprise, said in accepting it that he felt there were many others engaged in that work more deserving than he and then recounted that, while in the service at Washington, he had advocated 100 per cent heat treatment of shells but had been unsuccessful because of the conviction of others in power that there were not enough men, skilled in heat treatment, to carry such a program through. Colonel White said he knew the situation to be such in Cleveland, Detroit and Chicago, that there were enough such men there, but he did not know how it was in the East, though he believed this to be true also. After leaving the service and knowing that there were two heat-treating technical organizations, he became convinced there should be but one and so worked to that end, ably seconded by the untiring aid of the secretary and others.

The Dinner and Next Meeting

A social feature of the day was the informal dinner at the Yates Hotel where over 100 gathered. The menus were unique in that each course was expressed in language embodying heat treatment adjectives such as water-quenched celery, oil-tempered olives, case-hardened tenderloin beef, sorbitic peas, over-heated potatoes, etc.

The next sectional meeting will be held in Pittsburgh, May 25 and 26, under the auspices of the Pittsburgh chapter. All papers are to be presented by Pittsburgh men and the extra day will be largely taken up with visits to steel plants. If other chapters are as successful as the New York chapter in handling the first meeting of this character, then subsequent sectional meetings will be a regular feature.

The Interstate Commerce Commission has set April 6, as the date for a hearing in connection with an investigation regarding power brakes and appliances for operating power brake systems on railroads. It is the purpose to determine whether and to what extent power brakes and appliances now generally in use upon the locomotives and cars are adequate. It also is intended to determine what improved appliances are available for use and what improvements may or should be made.

It has been pointed out that a busy blooming screw-down motor, which raises and lowers the top roll of a blooming mill, is sometimes called upon to reverse as many as 22,000 times in 24 hr. This works out at more than 15 times per minute throughout the entire period, and makes it clear that the necessity for starting and stopping very quickly is a paramount consideration in its design and operation.

Lewis R. Sackett, Samuel A. Stape and John B. Hall, all of Columbia, Pa., have formed the S. and S. Mfg. Co. capitalized at \$10,000, to manufacture steel castings.

Roberts Oven Coke in Blast Furnace Use

Analysis of Results Obtained in Practice—Low Fuel Consumption Despite High Ash Content of Coal

BY M. W. DITTO

SUPPLEMENTING the illustrated description, on page 580, THE IRON AGE, March 2, of the Roberts coke ovens in use at the Granite City (Ill.) plant of the St. Louis Coke & Chemical Co., the following, from a report by Charles R. Holzworth, general superintendent of the company, has many points of interest:

The preceding calculations were made as follows, assuming that the solution losses in all cases are relative:

Case No. 1—No. 6 Furnace (South Works)

1890 lb. coke per ton of pig, containing 4 per cent carbon.

Analysis of Coke		Slag	
Ash	11.0 per cent	Ratio, ———	= 1.25
Moisture	2.5 per cent	Stone	
Vol. matter	1.0 per cent	Carbon required to melt slag	
Fixed carbon	85.5 per cent	at 4 lb. slag per 1 lb. car	
Carbon in coke, 1616 lb.		814	
Stone, 611 lb.		bon, ———	= 204 lb.
Slag, 814 lb.		4	
		Carbon in pig, 90 lb.	

The remaining carbon used to smelt pig iron is 1616 lb. — (204 + 90) = 1322 lb. One lb. carbon was used 2240 to smelt — = 1.69 lb. pig. 1322

Case No. 2—Frances Furnace (Using Roberts Oven Coke)

1875 lb. coke per ton of pig, containing 4 per cent carbon.

Analysis of Coke		Slag	
Ash	13.0 per cent	Ratio, ———	= 1.25
Moisture	2.5 per cent	Stone	
Vol. matter	1.0 per cent	Carbon required to melt slag	
Fixed carbon	83.5 per cent	at 4 lb. slag per 1 lb. car	
Carbon in coke, 1567 lb.		1401	
Stone, 1121 lb.		bon, ———	= 350 lb.
Slag, 1401 lb.		4	
		Carbon in pig, 90 lb.	

The remaining carbon used to smelt pig iron is 1567 — (350 + 90) = 1127 lb. One pound carbon was 2240 used to smelt — = 1.95 lb. pig. 1127

Case No. 3—Frances Furnace

(Assuming 11 per cent ash in coke and 611 lb. stone.)

Analysis of Coke		814 lb. slag will require	
Ash	11.0 per cent	= 204 lb. carbon.	4
Moisture	2.5 per cent	4 per cent carbon in iron will	
Vol. matter	1.0 per cent	require 90 lb. carbon.	
Fixed carbon	85.5 per cent	2240 lb. pig will require car-	
611 lb. stone.		bon equivalent to Case No.	
Slag		2240	
Ratio, ———	= 1.25 = 814	2 or ———	= 1149 lb.
Stone		1.95	
lb. slag.			

Therefore, carbon required is 1149 lb. plus 204 lb. plus 90 lb. equals 1443 lb. per ton pig. Coke required 1443 0.855 = 1688 lb. per ton pig.

Production

The amount of carbon burned at the tuyeres under like conditions, and for the same wind, is constant. The production will then increase in an inverse ratio 1875 to the coke per ton of pig, thus — × 488 tons (Case No. 2) = 542 tons.

However, as we have increased the fixed carbon in our coke by 2 per cent, we will slow up the furnace correspondingly, if same wind is blown, by 2 per cent

— = 2¼ per cent. 542 tons pig 83.5 per cent fixed carbon × (100 per cent — 2¼ per cent) = 530 tons.

Our low fuel consumption on a high ash coke and excessive amount of stone per ton of pig is greatly due to the quality of our coke, which burns almost in-

stantaneously to CO at the tuyeres, with the result that a large amount of hearth heat is developed where it belongs, and can be used most economically. With a slower burning coke, the zone of combustion extends higher into the bosh of the furnace, and oftentimes above the mantle. This is noticeable in many furnaces, by the rapid erosion of the lining at this point. With the higher zone of combustion, much of the heat that should be used in the hearth enters the shaft (where already there is plenty, due to the reaction of CO on ore) and is dissipated in the waste gas from the furnace.

With our quality of coke developing a large amount of hearth heat, we carried a 2.30 burden, consisting of 10,000 lb. of coke, 22,000 lb. of ore, 1000 lb. of scrap and 6000 lb. of stone. The ore mixture consisted of 25 per cent Mesabi, 15 per cent Menominee, 40 per cent Marquette and 20 per cent Iron Mountain. The last two—the Marquette and local Iron Mountain—amounting to 60 per cent of the burden, are very refractory, the Iron Mountain especially containing some magnetite, yet our top temperature averaged only 264 deg. Fahr. without water. This is contrary to the general belief that a refractory mixture is always accompanied by high top temperature. As explained above, this is due to the concentrated heat of combustion in the hearth of the furnace, permitting a heavy burden to be carried.

Our flue dust loss was 88 lb. per ton of pig, which, at first thought, might be considered due to the low percentage of Mesabi used, and the comparatively low wind blown, which averaged 34,200 cu. ft. at 60 deg. Fahr. after all time lost on stops and checks was deducted. While this is partly responsible, yet in a larger way the concentrated zone of fusion confined entirely in a well-designed low bosh is more responsible.

Hanging, slipping and other irregularities of operation, that produce most of the flue dust made, are almost unknown to us, because our zone of fusion is in the bosh of the furnace, rather than extending into the shaft, as in many cases, causing the above irregularities.

In connection with this, it is evident, from the attached sheet, that increased wind did not increase the flue dust loss materially, as one would expect when the wind was increased gradually from 31,025 cu. ft. on the first of the month, to 37,850 cu. ft. by the last of the month, in bringing the furnace up to capacity.

Further evidence of good economy of fuel consumption is conclusive in the analysis of the top or waste gas, which showed:

CO ₂	14.1 per cent
CO	24.3 per cent
H ₂	3.2 per cent
CH ₄	.2 per cent
N ₂	58.0 per cent
CO	
Ratio, ———	1.72 per cent
CO ₂	
B.t.u. value, 92.	

In conclusion, it is well to summarize the important characteristics of our coke, which are conducive to the lowest fuel consumption, even approaching that of charcoal used in the early days of furnacing:

1. Absence of cross fracture, combined with uniformity of size.
2. Uniformity of cell structure.
3. Tough cell structure, permitting a heavy burden.
4. High speed of combustion—approaching that of charcoal.
5. Concentration of heat of combustion in hearth, where it can be used most economically.
6. Low transfer of hearth heat to shaft.

7. Low top temperature—longer contact of ore with reducing gas, which means maximum stack efficiency.
8. Low waste gas analyses, low thermal loss.
9. Low flue dust loss—more regular settling and lower gas velocity.
10. High pig production with low fuel consumption.

From this report it will be seen that the practice on this type of coke is comparable with blast furnace practice throughout the United States, and it is felt that with more experience a considerably better showing than the above will be made.

The only reason for using the present coals is the fact that, with coal from practically every section of Illinois, it was found that the two coals mentioned run more uniformly in ash and sulphur.

It is difficult as yet to make a comparison of the gas yields from these coals, and the amount possible to recover, as compared to the coking coals, as there has never been an opportunity of running over a long period on a coking coal to find out the relative amount of heat required compared to the Illinois coals. However, in short tests it is found that the coking coals can be pushed at least 2 hr. earlier with the same heat in the coke oven chamber than the Illinois coals, and, based upon present practice, everything indicates that the Illinois coal does not submit to the coking process on as economical a use of fuel gas as the coking coals.

Machine for Filing Edges of Strip Steel

A strip metal filing machine for use in cold rolling mills in filing the edge of strip steel after it has been slit into narrow strips has been brought out by the D & C Engineering Co., Cleveland. It is said to be the first machine of the kind to be placed on the market, although some strip mills are using machines of their own design for use in their own plants.

Cold-rolled strip steel after being slit has rough square edges. When used for springs, hacksaw blades and some other purposes, edges that are half round, oval or of some other shape are required.

After being slit and coiled the steel is placed on a spool and mounted on the spindle shown at the left of the machine, the end of the strip being passed through a clamp at either end of the machine and is gripped by a coiler at the other end. The coiler draws the strip steel through the machine, past a series of 15 files. The machine has semi-circular cast iron heads mounted in pairs on two rods, the two heads forming a circle. On one side the heads are secured to a rod by set screws. On the other side they are affixed to a movable shaft operated by a lever so that the heads may be opened. A sliding fit of two heads under spring tension is provided.

A file holder mounted on each head carries a file $1\frac{1}{4}$ in. wide, $2\frac{1}{4}$ in. long and $\frac{1}{4}$ in. thick, which will cut on both faces. These files are adjustable in any position within 180 deg., and by setting the files in the proper position the desired shaped edge is obtained. The metal passes through the machine in a straight line instead of over and under the files, as in other designs. When a new coil is to be inserted the operator pulls on the lever which opens the 15 heads, and reverses the lever to close the heads. The coiler is arranged for drawing the strip steel through the machine at a speed of 100 to 125 ft. per min., which is the speed at which the steel can be filed. The machine weighs 1000 lb. and is simple in construction and easy to adjust. Its capacity is any gage steel up to 3 in. wide.

The machine was designed by E. W. Duston, formerly chief engineer of the Blake & Johnson Co., Waterbury,

No cause for this difference has yet been determined, but it is believed that it is due to the difference in the physical and chemical structures of the two coals. However, it is known that as large surplus gas yields can be obtained from the use of Illinois coal as can be secured from the coking coals.

The plant of the St. Louis Coke & Chemical Co. was designed to discharge its waste gases at 750 deg. Fahr., and the question of heat recovery from the waste gases is a question of areas and weight of brick exposed to waste gas and air. From the practice established it is felt that the recuperator is as efficient as the regenerator, and gives much better operating conditions in the ovens, due to the fact that there is no reversal of the flow of air or gases through them. While there is no prejudice in their favor, it is evident from the operating results obtained in this plant that they will give entire satisfaction.

It is interesting to note that the results obtained with coke made from 100 per cent Illinois coal, so far during the month of February, show that better practice can be obtained than was obtained upon the mixed coal for the month of January, the largest day being 544 tons of iron on 1755 lb. of coke. Another significant thing is that the rich gas from 100 per cent Illinois coal is running 600 B.t.u. and over.

Conn., but now associated with the D. & C. Engineering Co.

Reducing Iron Ores with Carbon Monoxide

A laboratory study of the time rate of reduction of iron oxides by carbon monoxide is under way at the Minneapolis station of the Bureau of Mines. The reducing gas employed will be 35 per cent CO and 65 per cent N₂. The iron oxide will be obtained from the higher grade Lake Superior shipping ores and the reducing gas will be driven through the ore bed at such rates of speed as obtained in blast furnace operation—

Machine for Filing ti
is coiled, placed on a

Edges of Cold-Rolled Strip Steel After Slitting. The steel
spool and mounted on spindle shown at left. The strip passes
through the machine in a straight line

i. e., about 25 ft. per sec. The rate of the reaction is known to depend primarily upon the gas velocity and the size of the ore particles. To a lesser extent the reaction will depend upon the temperature and the composition of the reducing gas. It is only when conditions of the experiment approximate blast furnace conditions that the laboratory results will have a technical application. Previous workers in this field have invariably used extremely low gas velocities and have used carbon monoxide without dilution in nitrogen. The greater number of them have also sought to obtain equilibrium conditions and no reaction rates. This investigation is undertaken by the Bureau of Mines to supply the need of data which may be of practical use.

Machine for Staybolt Threading

The Warner & Swasey Co., Cleveland, has brought out a staybolt threading machine, made up of its No. 4 turret lathe with a special attachment instead of the regular turret slide and saddle. When not used for staybolt threading the regular turret slide and saddle may be replaced and the machine used for the production of the many miscellaneous studs and bolts necessary in railroad shops.

The machine handles stays of the crown, button-head, or swivel type up to 40 in. in length and for any size of thread, larger or smaller self-opening die heads being used as the situation demands. Present-day practice seems to lead principally toward the use of upset forgings and an increasing number of taper-head staybolts. It is claimed that in a test the button head shown in the illustration was taper formed under

Special Attachment Used for Staybolt Threading, Instead of Regular Turret Slide and Saddle

the head and the thread cut on the end and under the head at the rate of one per min.

In operating the machine, the rough forging is passed through the back of the forward die head to insert in the square collet in the automatic chuck. The die has an enlarged hole in the shank and the chasers an especially large opening movement. After being chucked the staybolt carriage is fed forward until the end of the bolt is supported in the steady rest between the two heads. The head is then formed by the forming cutter on the cross slide, while the other end is supported in the steady rest. Then the staybolt carriage is fed forward, the die heads, operated by the cams on the rear bar, close automatically and cut the threads.

As soon as the die heads reach the end of the cams both heads open. The cams may be made to cut any type thread desired, as the action of the head is dependent upon the contour of the cam. The carriage is then brought back and is ready for the next staybolt. The die heads are placed so that they cut the thread on the end and under the head in continuous lead. The thread on the end is cut without any previous machining.

Phosphor-Copper from Phosphate Rock

General contact is maintained by the Ithaca, N. Y., field office of the Bureau of Mines with the metallurgy of non-ferrous alloys in general and copper alloys in particular. Plans have been made for experimental study of two problems as soon as the other work in progress will allow.

(a) Study of the preparation of phosphor copper by electric smelting direct from phosphate rock. Phosphor copper is an essential material in the production of many high grade bronzes, and is made from elemental phosphorus by different methods, in which there may be loss of phosphorus, danger of fire and of phosphorus poisoning. Besides the possibility of a cheaper method of producing phosphor copper, a study of its preparation by electric smelting should throw light on some problems in the theory of the reduction of phosphatic ores.

(b) The Bureau of Mines is continually in receipt of requests for information in regard to the preparation of such alloys as that of 50 per cent copper and 50 per cent lead. On account of the apparent need for information on melting and casting technique and because it is quite possible that present methods might be improved, a study of the problem is planned.

Chicago Foundrymen's Club

The Chicago Foundrymen's Club will convene on March 11 at the City Club, Chicago. A dinner will be held at 7 p. m. and the meeting will start at 8 o'clock. E. W. Smith, the Crane Co., Chicago, a veteran foundryman, will read a paper on molding sand, its characteristics, the sources of supply and his experiences with it. The discussion will be participated in by R. E. Kennedy, assistant secretary American Foundrymen's Association and secretary of the joint committee on molding sand research of the National Research Council and the American Foundrymen's Association; R. A. Bull, chairman of this joint committee; C. S. McNeal of the Garden City Sand Co., Chicago, and H. S. Vrooman, another veteran sand man.

Metal-Cutting Band Saw

The band saw shown in the accompanying illustration is a recent addition to the line of the Clark Tool Works, Inc., Belmont, N. Y., and is intended for general machine-shop use. In general design it is very much the same as the company's brass-cutting machine.

Bearings are designed to require little attention, the lower bearings being lubricated from the gear box and the upper-wheel bearings packed in grease. The machine is equipped with a moveable carriage and a gravity feed. The vise for holding the work is mounted on the carriage in such a way that by loosening a cap screw it can be turned to permit holding the work at any angle to the saw. This adjustment is for cutting different angles. By removing the cap screw the vise can be lifted off, leaving a smooth table 20 by 24 in. for use when cutting plates or irregular shapes.

The table is pivoted in the center and can be swung to allow long bars to clear the saw on the opposite side, and the saw guides are mounted on the table and swing with it, thus holding the saw at right angles at all times. With this construction, it is claimed, the saw is never twisted except when cutting of long pieces and then only enough to clear the opposite side.

The machine has two speeds, which are controlled by a handle on the gear box. The capacity is given as 6 by 12 in. An adjustable ball-bearing stock stand is included in the equipment.

The Two Speeds Are Controlled by Handle on Gear Box

The Summermill Tubing Co., Bridgeport, Pa., manufacturer of steel and non-ferrous metal tubing, reports increasing business. Orders received in the first two months of 1922 are in excess of those received in the last four months of 1921. The company finds that prices of its products are becoming more stabilized and customers are satisfied to book orders ahead.

The Receiving Bay, Which Is Under Cover, Is Commanded by a Travelling Crane, and the Platforms at the Wall on the Left Open into the Ends of the Parallel Factories

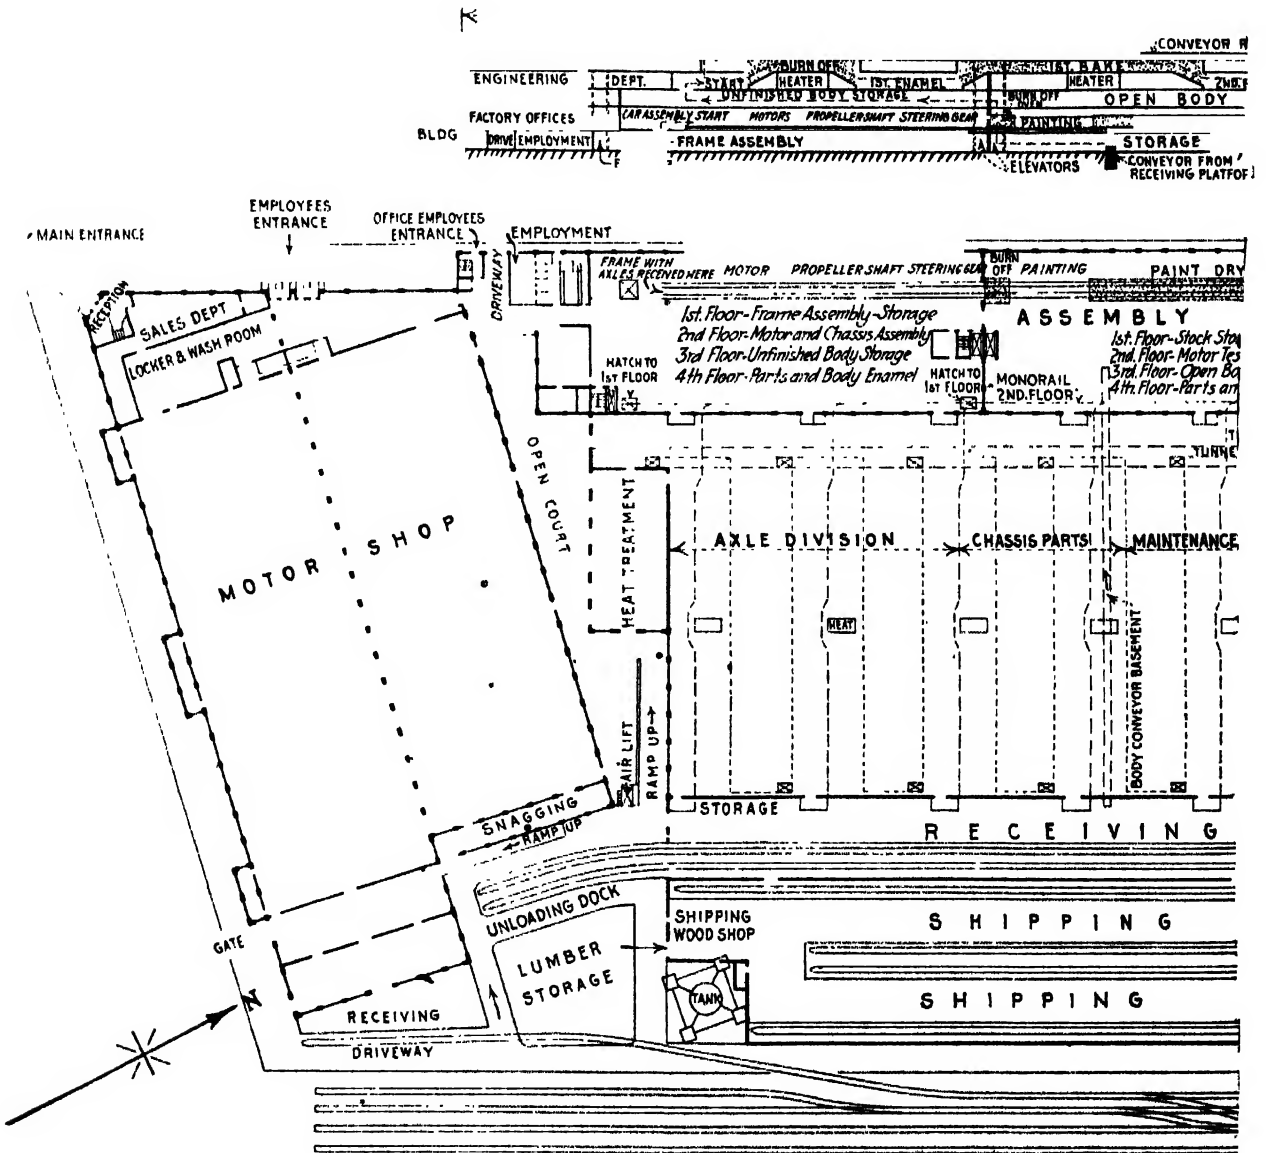

Designing a Modern

What Is Involved in Relations
Many Services Now
Future in Indust

BY PAUL L. BATTEY*

LATE in the summer of 1919 the Willys Corporation undertook the enlargement of the plant of the Duesenberg Motors Corporation at Elizabeth, N. J., having acquired that property together with additional adjacent land, for the manufacture of a new six-cylinder motor car, in the usual four body types. It was the intention to make the complete car in this plant with the exception of rough castings and forg-

*Consulting engineer, 123 West Madison Street, Chicago. Becoming associated in 1901 with the Arnold Co., he has devoted himself since then to the design and construction of industrial plants. The present paper is based on an address he made before the New York section of the American Society of Mechanical Engineers.

rial Developments

ings and the bodies for the closed types, together with a few miscellaneous specialized items. The car is in the medium price class, but of superior quality and durability.

The writer was retained to design the plant and supervise its construction and the instructions were substantially to provide the most modern and efficient plant possible for the manufacture of 250 cars per day of 8 hr., or 500 cars per day in two 8-hr. shifts. Preliminary layout plans were prepared just previous to Sept. 1 and upon that date the final detail plans were begun. In the latter part of October proposals from

Factory Floor Space

contractors were received and the first week in November construction was started with the force organized for maximum expedition. The plant was 90 per cent complete eleven months later, when the business depression of 1920 and the resulting financial difficulties caused a delay extending to the present time. During the past year, however, the work progressed upon an extremely limited scale—the plant now being practically complete with the exception of a portion of the manufacturing equipment.

The dominant factor in the design of such plants is simplicity and the degree to which it is carried is the true measure of successful accomplishment. The sim-

tion. In other words install as little as possible and work it as much as possible. This is always the realization of maximum economy.

There are many secondary factors logically grouped under these two of primary importance the detail consideration of which forms the analysis of any industrial problem their "relativity" being generally as elusive as Einstein's. In this particular instance it is proposed to discuss the relation of these factors in their practical application. Such analyses are like problems in calculus with many variables some frequently refusing to "stay put" even long enough to complete the analysis as we are all familiar with the ever impending factor

The Manufacturing Bays Terminate in a Transfer Aisle Served by a Crane Which May Take Material Through Hatchways from the Basement-Tunnels and Which Deliver to the Platforms Opening into the Assembly Building at the Left

ple way is always the most efficient because it is the more direct and requires the least effort; of least cost in operation and investment and of compelling psychology with both management and men.

The teammate of simplicity is usefulness or the use factor which introduces the time element and represents a two-fold economy in that a high use factor not only spreads annual fixed charges but reduces them through the lower depreciation rate on long-lived equipment. Therefore the designer should mentally measure the number of hours each day an item may be used in operation, the maximum hourly output and its character as to length of life and chance of obsolescence.

The writer has become accustomed to thinking of simplicity and usefulness as complementary factors represented by parallel scales; the maximum of simplicity at zero; the maximum of usefulness at 100 per cent. An analysis leading to points of widest divergence on these scales roughly represents the best solu-

tion of the client's change of mind upon important predictions.

General Product Routing

A glance at the general routing plan shows it to be roughly a simple right-hand turn of a spiral. Everything is under cover from receipt of the raw materials to the shipping of the finished product and, as will be noted, the entire plant is contained in one building.

This, to provide for the required capacity, is of unusual magnitude, approximately one-third of a mile long by one-eighth of a mile wide, facing the Lincoln Highway between New York and Philadelphia, and in the rear abutting the main line tracks of the Pennsylvania Railroad entering New York.

The building covers a ground area of 18 acres upon a property site of 25 acres. The total floor space is a little over 2,100,000 sq. ft., or nearly 49 acres. Sixty-five per cent of this area is of fireproof, reinforced con-

The Scheme of Flow of Materials Through the Works and to the Shipping Platforms Is Indicated by This Diagram

General Construction of the Parallel Manufacturing Bays Extending Between the Receiving Bay and the Four-Story Assembly Building. There are 19 such bays, alternately 40 and 60 ft. wide. The 10-ft. bays have balcony floor and a basement space on the level of the receiving bay containing conveyors

crete flat slab construction. The remainder of the new construction is of non-inflammable material throughout, with steel superstructure and concrete tile roof decks. The original Duesenberg building on the south approximately 280 x 500 ft. is of slow-burning mill construction with a saw-tooth roof over the manufacturing area.

The raw materials enter the plant by a track leading directly from the Pennsylvania Railroad drill track and the finished product leaves over a separate track, thus eliminating any interference in the shipping facilities as far as switching is concerned. There is covered track space on the plant property for 80 cars of incoming material spotted ready for unloading and for 60 cars of finished product at the shipping docks. Estimating that one-third of the finished cars will be driven away, the railroad facilities provide for the entire requirements with a single switch on the part of the rail-

Parallel with and immediately next to this, and lying along Newark Avenue, is the assembly building, and continuing northward is the test building. Then to the east along the north end of the property is a large building designated as the stock building, which serves several purposes. The assembly, test and stock building sections are of reinforced concrete construction. The 120 x 1200 ft. assembly building is of four stories and the 120 x 240-ft. test building on the north of two stories and basement, with provision for three more stories. The stock building, 320 x 400 ft., contains four stories and a basement open on three sides, the second floor connecting with the shipping docks by means of a ramp passing over the incoming and outgoing railroad tracks with full 22 ft. clearance.

There was naturally a considerable slope in the property from the front on Newark Avenue to the rail-

The Typical 60-Ft. Bay in the Manufacturing Shop, Showing the Fan Heater Units on the Balconies of the 40-Ft. Bays

road company every day, thus simplifying the transportation factor as much as possible.

The Pennsylvania Railroad has provided immediately adjacent to the plant a storage yard for about 125 cars so arranged with cross-overs as to facilitate switching operations, and about one-half mile to the north of the plant site lies the big Waverly yard of the Pennsylvania, greatly amplifying the available railroad facilities. With the exception of the always desirable switch connection to a second railroad, which was impossible at this site, the transportation facilities are quite as satisfactory as it is possible to provide.

Departmental Arrangement

The factory is divided by fire walls and departmental arrangement into (1) three parallel 60 ft. bays on the east for receiving and shipping. (2) Nineteen 60-ft. and 40-ft. manufacturing bays lying at right angles to the receiving bay, which together with the old Duesenberg building on the south, constitutes the parts manufacturing department. There is a 40 ft. bay, parallel with the receiving bay, serving as a transfer aisle between departments and for intermediate storage of finished parts.

road at the rear—this amounting to a little over 10 ft.—and in order to utilize this to the best advantage and to avoid an expensive grading proposition, the receiving and shipping level was made 10 ft. below the street level. There is also provided on the same level as the receiving floor a considerable area of basement space lying under the alternate 40-ft. bays of the manufacturing section, these basement sections leading from the receiving bay to a connecting tunnel 15 ft. wide lying under the finished parts transfer aisle, this also connecting directly with the basement of the stock building, which is on the same level. This arrangement provides for a complete system of sub-grade internal transportation with contiguous and well distributed storage areas for the several departments.

Detailed Departmental Routing

It will be noted in the detailed plant layout and sections that practically all of the facilities for enameling, painting and varnishing are located on the top floor of the building, to get as far away from dust and dirt of the street level as possible and to minimize fire hazard from these operations. As this could thus be accomplished without seriously increasing the length of travel

Spn

the Balconies Serves to Give an Idea of the Universal Clamping System Employed for Hanging Shafting

of the parts, it was possible to arrange the baking ovens on the roof with inclined approaches from the flow-coat rooms on the fourth floor, thus heat trapping the ovens.

For the motor parts shop, castings and forgings are received in the south end of the receiving bay and on the extension of these tracks which are protected from the weather by overhead shelter.

When taken direct to the motor assembly department on the second floor, they are handled in standard containers by the monorail system, by platform elevator, or by transfer aisle crane and landing decks. A careful study was made of all the various parts entering into the construction of the car and a size and shape of container was chosen which is as universally applicable to all required purposes as possible—it being considered vitally important that all material in process of manufacture should be maintained in mobile units and never piled or binned directly, except where absolutely necessary in a few isolated cases. Standard steel tote boxes of a size which makes up in multiple units to fill the standard container unit, certain combinations being worked out for the various classes of material giving suitable loads for truck, hoist or crane and to simplify as far as possible the checking of stock material for inventory purposes.

These manufacturing bays consist of alternate high bays 60 ft. wide by 40 ft. double deck or balcony bays, the balcony extending on each side into the 60 ft. bay, which contains the crane, thus providing crane transportation for both ground and balcony levels throughout. These departmental bay cranes move at right

angles to the receiving bay, at the dividing wall of which the runway starts, extending to the transfer aisle for finished material. They may move any machine weighing up to 10 or 12 tons direct to the maintenance department and back, thus to shorten the time it is out of service.

In the north end of the receiving bay immediately adjacent to the press shop is located the scrap department. The basements under the 40-ft. manufacturing bays make it possible to deliver much of the scrap from machining operations to the basement floor by means of chutes into scrap trucks. Track space for two cars is provided immediately adjacent to the scrap department with platform for box car loading and overhead gravity chutes from an elevated deck inside the building served with the crane for such scrap material as can be loaded in this manner in open or closed cars.

For such finished materials as may come to the receiving bay to be moved directly to the assembly building, two continuous apron conveyors are provided passing through the basements under the manufacturing bays and via inclined tunnel up to the ground floor of the assembly building.

The plant is not at all dependent upon the monorail system and overhead traveling cranes for handling finished parts from manufacturing departments as ample provision is made for moving materials in containers by trucks, and therefore certain thoroughfares are provided, but careful attention has been given to placing these in locations of least interference with the manufacturing and stocking of parts.

(To be concluded)

There Are Two Chain Conveyor Assembly Units in the Assembly Building, Each Approximately 1050 Ft. Long. They are designed to move about 4 ft. per min., thus completing a car assembly in a little over 4 hr.

BETWEEN MILLSTONES

Midvale Steel & Ordnance Co. Tells What Is the Trouble with Business

The sixth annual report of the Midvale Steel & Ordnance Co. shows the very great change that has taken place since the preceding report was made. In the report for 1920 the opinion was expressed that at least the first half of 1921 would be required for the adjustment to normal of the excessively high freight rates. "Events have shown," says the report for 1921, "that we were unduly optimistic, as the entire year has elapsed and the steel business is still being ground between the upper and the nether millstones of high freight rates and low selling prices for steel products." Continuing, the report says:

"Steel prices have been liquidated to the pre-war level. This is shown by the following statement of base prices, f.o.b. Pittsburgh, of our standard products:

C. per Lb.	Plates	Shapes	Bars
1909.....	1.42	1.42	1.33
1910.....	1.47	1.45	1.44
1911.....	1.31	1.32	1.26
1912.....	1.33	1.32	1.29
1913.....	1.50	1.50	1.55
Five-year average..	1.406	1.402	1.374

"The present selling price of these three standard products is about 1.40c. Steel products have been liquidated to a lower point than most other standard commodities.

"The effect of abnormal freight rates on the consumer of steel products has been to increase both the cost of manufacture (which, manifestly, must be reflected in the selling price eventually), and the prices at point of consumption. While the cumulative amount of freight charges in a ton of steel is always an important item, the rise in the last few years has been alarming. To New York, for example, in 1913, transportation amounted to \$10, or 30 per cent of the delivered price of a ton of plates; to-day it is \$19.07, or 53½ per cent of the price paid by the consumer. This has localized his sources of supply and thus materially limited his opportunity to purchase in competitive markets.

"Wage rates at the mills and furnaces during the

war period and later were advanced approximately 180 per cent. This rate has since been substantially reduced, but is still 47 per cent higher than the pre-war rate.

"As compared with the complete liquidation in selling prices and partial liquidation in labor, freight rates on the materials which must be assembled for the production of steel are still substantially at war levels.

"Railroad prosperity and national prosperity are one and inseparable. We are certain that high freight rates are the principal factor in preventing a return to normal conditions, not only in the steel business, but also in the general business of the country. The railroads claim that they cannot reduce rates unless they are relieved from the oppressive restrictions imposed by the Federal Government and the States. We will not now venture to predict when this situation will be remedied. It is certain, however, that until adjustments are made to conform to peace conditions, no industry in which transportation is a large factor can prosper. This is particularly true of industries which handle large quantities of raw materials.

"Every individual interested in the prosperity of the country at large should urge his representatives in the State Legislature and in Congress to throw their influence into the scale against all artificial restrictions imposed by these agencies which hamper the free operation of economic laws."

The table giving the average number of employees and the expenditures for labor from ore to finished product shows that the pay roll for 1920 was \$58,828,739 compared with \$31,521,531 in 1916 and \$21,860,985 in 1921. The average number of employees ranged from 38,375 in 1917 to 14,432 in 1921, while the average wages per employee per year ranged from \$2,161 in 1920 to \$1,015 in 1916, while for 1921 the amount was \$1,515. Of the six years covered by the table, the shipments were heaviest in 1917 when they reached 1,614,373 tons, and lowest in 1921, when they amounted to 509,849. The inventory at the close of 1921 was \$36,319,212, compared with \$45,393,834 at the end of 1920. The net loss for the year 1921 was \$5,313,173, compared with the net income of \$12,424,919 for 1920. The surplus at the close of 1921 was \$53,551,936, compared with \$59,865,449 at the end of 1920. Cash in banks and on hand at the end of 1921 was \$4,336,125, compared with \$27,684,921 at the end of the year 1920.

TARIFF PLANS

Manufacturers' Association Would Assess Duties in a New Way

WASHINGTON, March 7.—Sponsored by the Manufacturers' Association of New Jersey, Senator Frelinghuysen, of New Jersey, has introduced a bill in the Senate which would assess specific duties on all imports, according to the difference in "conversion costs" here and abroad. The authority for determining these "conversion costs" would devolve on the Tariff Commission to operate under the direction of the Secretary of Commerce, assisted by a body of advisers comprised of bankers, manufacturers, agriculturists, economists, and labor leaders.

The association has announced that it had determined on a nation-wide campaign "to remove the tariff from politics and to urge the enactment of a non-partisan measure based on scientifically appraised specific duties." The bill has created some interest and is being given study by members of Congress, but it is not believed it will be given any serious consideration with a view to urging its adoption in the near future. To do so would require a sweeping change in the plan of the Administration with respect to the Fordney tariff bill, which has been for a number of months, and still is, before the Senate Committee on Finance after passing the House last fall. As is known, delay in reporting this bill is due to differences of opinion as to the basis of valuation for fixing import duties.

The bill introduced by Senator Frelinghuysen is explained in an elaborate statement of the Manufac-

turers' Association of New Jersey and the program laid before members of the House Committee on Ways and Means and the Senate Committee on Finance by J. Philip Bird, president of the association, and Julius Forstmann, of Forstmann & Huffmann Co., Passaic, N. J., members of the association's tariff committee. They have emphasized the necessity for immediate passage by Congress of some temporary tariff bill that will afford protection to American manufacturers while a scientific measure is being prepared.

It is known that Secretary of Commerce Hoover does not favor the idea of having the Tariff Commission operate under his direction. Apparently Mr. Hoover feels that he already has enough duties to perform without having thrust upon him the responsibility of the work of a tariff commission.

The Aluminum Goods Mfg. Co., Manitowoc, Wis., with branch factories in Two Rivers, Wis., Newark, N. J., and St. Louis, has informed its employees that it has arranged for an increase in the amounts of the policies they hold under the corporation's group insurance plan. The new plan will be effective as of Jan. 1, although just announced. Under the plan an increase of \$100 is made in the amount in all classes, with a new class added giving employees under 45 years who have been in the company's service five years or longer \$1,500 of insurance; between 45 and 54, \$1,000, and between 55 and 59, \$700. Female employees are insured regardless of age. Since the institution of the group insurance plan, the company has paid more than \$30,000 in claims on 47 deaths among employees of its five plants.

Mass in the Heat Treatment of Steel

A Suggested Formula for Calculating the Brinell Hardness from Given Data—Applicable to Alloy and Carbon Steels

IN the paper dealing with the influence of mass in heat treatment, read at the Indianapolis convention of the American Society for Steel Treating, and published in the October, 1921, issue of the society's *Transactions*, the author confined himself to data taken on a 0.45 per cent carbon steel, as published by the British Engineering Standards Association in its report No. 75, dated October, 1920. In the paper it was shown that the hardness-mass formula is:

$$B = \frac{nC}{(D-d)} + b$$

which B is the Brinell hardness of any section, n is a factor which is constant for each steel of a particular analysis.

C represents the product of the diameter and surface per pound of steel of any round section.

D is the diameter of the section, the hardness of which is desired.

b is the vertical asymptote of the curve.

normalized Brinell hardness of the steel.

The object of the present paper is to show that the same general formula that was used for plain carbon

Fig. 1—Standard Test Specimen for Determining the Influence of Mass in Heat Treatment. In the upper left-hand corner are shown cross sections of the four diameters, indicating the points at which Brinell measurements were taken.

steel is applicable to structural alloy steels; also that this formula holds good for the "midway" Brinells, that is, Brinell hardnesses taken half way between the centers and outsides of rounds on their cross sections.

In his previous paper, the author pointed out that n is a factor which is constant for each steel of a particular analysis, and which appears to be, for plain carbon steel, the square of the hardening capacity of the steel in question. As the variable d is a function of the factor n , it is obvious that n is the salient point of the formula.

From experiments soon to be described on two nickel steels, one chrome-nickel steel and from data given by the British Engineering Standards Association on a 5 per cent nickel case-hardening steel, it became apparent that the factor n for structural alloy steel is twice the square of the hardening capacity, or more generally expressed, a multiple of the square of the hardening capacity, thus:

$$n = 2 \left(\frac{B_m}{b} \right)^2 \text{ in which}$$

B_m is the maximum Brinell hardness which can be developed in the steel.

b is the normalized Brinell hardness of that steel.

Thus, for a 0.32 per cent carbon, 3.25 per cent nickel steel,

$$n = 2 \left(\frac{532}{196} \right)^2 = 14.73$$

*A paper presented at the New York Sectional Meeting of the American Society for Steel Treating, March 3. The author, E. J. Janitsky, is metallurgical engineer, Illinois Steel Co., South Chicago, Ill. In this paper the author has answered the criticisms of Sir Robert Hadfield on his previous paper, which appear on page 396 of the February issue of *Transactions*.

For an 0.42 per cent carbon, 3.15 per cent nickel steel,

$$n = 2 \left(\frac{600}{217} \right)^2 = 15.27$$

For an 0.34 per cent carbon, 1.20 per cent nickel, 0.56 per cent chromium steel,

$$n = 2 \left(\frac{555}{217} \right)^2 = 13.08$$

For an 0.17 per cent carbon, 5 per cent nickel case hardening steel,

$$n = 2 \left(\frac{388}{187} \right)^2 = 8.6$$

The specimen used to make these experiments is shown in Fig. 1. It is composed of four sections, each nicked circumferentially as indicated, so that, at the nicks, the diameters of each of the sections respectively is approximately 0.5, 1.0, 2.0 and 3.0 in. It is best to cut the specimen into two parts before quenching, as this facilitates handling; cutting should be done at the junction of the 2 and 3-in. sections as shown in Fig. 1. After quenching the test pieces should be broken at the nicks and the fractured surfaces ground. Brinell hardness numbers should then be obtained on three places of the ground cross sections, thus, close to the surface (circumferential), midway and in the center. In a 0.5-in. round there will be little or no variation in hardness between the center and the outside, but it is obvious that as the section grows larger this difference becomes greater. Ordinarily after quenching the 3-in. round can be cut with a saw in which case, of course, it is not necessary to fracture it.

It will be noted in all of the following tables that the hardness of the 0.5-in. section is not calculated. The 0.5-in. section is used only to obtain the maximum hardness which can be developed in the steel. A section of this diameter has been chosen to determine the maximum Brinell hardness because it is the smallest one which can be treated practically and brinelled on the cross section. A smaller section is liable to crack

Fig. 2—Water Quench Curve Showing Relation of Brinell Hardness to Diameter of Section. After determining the Brinell hardness of a 1-in. section, for example, locate this point on the curve and, using the same horizontal scale, read off the Brinell hardness of other sections.

in drastic quenching and does not allow the Brinell hardness of it to be obtained.

When a section of steel is quenched, a section so small that it has on quenching a perfect martensitic structure, the quenching of a smaller section will not give a higher Brinell hardness than that obtained in the section just mentioned. Thus, in alloy steels of the structural type, this largest section at which the maximum Brinell hardness can be obtained is on a section having a diameter somewhere between 0.5 and 1.0 in. Therefore it is not to be expected that the theoretical curve will pass through the point corresponding to the actual Brinell hardness obtained for 0.5 in.

The following tables give actual and calculated data of the center and midway Brinell hardness of sections whose diameters are shown:

(1) *Nickel steel, 3.50 per cent, quenched in water at 1450 deg. Fahr.*—The composition of the steel was carbon, 0.32; manganese, 0.56, and nickel, 3.25 per cent.

$B_m = 532$, $b = 196$, thus

$$n = 2 \left(\frac{B_m}{b} \right)^2 = 14.73$$

Center Data

$$\text{for 1 in., } d = 1 - \frac{(14.125)(14.73)}{430 - 196} = 0.111$$

$$B = \frac{(14.125)(14.73)}{D - 0.111} + 196$$

The following results were obtained:

Diameter of section, inches	Actual Brinell hardness	Calculated Brinell hardness
0.50	532	532
0.73	430	430
1.00	302	306
2.00	348	268

Midway Data

$$n = 14.73$$

$$\text{for 1 in., } d = \frac{(14.125)(14.73)}{430 - 196} = 0.260$$

$$B = \frac{(14.125)(14.73)}{D - 0.260} + 196$$

The following results were obtained:

Diameter of section, inches	Actual Brinell hardness	Calculated Brinell hardness
0.50	532	532
0.879	477	477
1.00	477	477
2.00	302	315
3.00	255	272

(2) *Nickel steel, 3.50 per cent, quenched in water at 1450 deg. Fahr.*—The composition of the steel was carbon, 0.42; manganese, 0.61, and nickel, 3.15 per cent.

$B_m = 600$, $b = 217$, thus

$$n = 2 \left(\frac{B_m}{b} \right)^2 = 15.27$$

Center Data

$$\text{for 1 in., } d = 1 - \frac{(14.125)(15.27)}{540 - 217} = 0.332$$

$$B = \frac{(14.125)(15.27)}{D - 0.332} + 217$$

The following results were obtained:

Diameter of section, inches	Actual Brinell hardness	Calculated Brinell hardness
0.50	600	600
0.826	540	540
1.00	540	540
2.00	321	346
3.00	286	298

Midway Data

$$n = 15.27$$

$$\text{for 1 in., } d = 1 - \frac{(14.125)(15.27)}{555 - 217} = 0.362$$

$$B = \frac{(14.125)(15.27)}{D - 0.362} + 217$$

The following results were obtained:

Diameter of section, inches	Actual Brinell hardness	Calculated Brinell hardness
0.5	600	600
0.925	555	555
1.0	555	555
2.0	340	349
3.0	302	300

(3) *Chrome-nickel steel quenched in water at 1535 deg. Fahr.*—The composition of the steel was carbon, 0.34; manganese, 0.50; nickel, 1.20, and chromium, 0.56 per cent.

$B_m = 555$ and $b = 217$; thus

$$n = 2 \left(\frac{B_m}{b} \right)^2 = 13.08$$

Center Data

$$\text{for 1 inch, } d = 1 - \frac{(14.125)(13.08)}{477 - 217} = 0.289$$

$$B = \frac{(14.125)(13.08)}{D - 0.289} + 217$$

The following results were obtained:

Diameter of section, inches	Actual Brinell hardness	Calculated Brinell hardness
0.50	555	555
0.826	555	555
1.00	477	477
2.00	340	325
3.00	286	285

Midway Data

$$n = 13.08$$

$$\text{for 1 inch, } d = 1 - \frac{(14.125)(13.08)}{495 - 217} = 0.336$$

$$B = \frac{(14.125)(13.08)}{D - 0.336} + 217$$

Diameter of section, inches

(4) *Nickel case hardening steel, 5 per cent, quenched in water at 1580 deg. Fahr. and retempered in water at 1400 deg. Fahr.* (From British Report).

The composition of the steel was carbon, 0.17; manganese, 0.34, and nickel, 6.0 per cent.

$B_m = 388$, $b = 187$, thus

$$n = 2 \left(\frac{B_m}{b} \right)^2 = 8.6$$

$$\text{for } 1\frac{1}{4} \text{ in., } d = 1.125 - \frac{(14.125)(8.6)}{363 - 187} = 0.435$$

$$B = \frac{(14.125)(8.6)}{D - 0.435} + 187$$

The following results were obtained:

Diameter of section, inches	Actual Brinell hardness	Calculated Brinell hardness
0.6875	388	388
1.04	363	363
1.125	321	300
2.125	277	259

In regard to the formula, it would appear that the Brinell hardness of the steels in the annealed state should be taken for b ; however, as we do not deal with sections of indefinite diameter, the value used for b is that of the steel in the normalized condition. It seems to answer the purpose of the formula better for engineering purposes.

It is also obvious that in the case of specimens drawn or quenched in different media, the same procedure should be followed as that in this paper. It is not necessary to calculate the Brinell hardness for sections drawn or quenched in different media, if the water quench curve for that particular steel is at hand. It is only necessary to obtain the Brinell hardness of say, a 1-in. section, fix this point on the water quench curve and using the same scale, read off the Brinell hardnesses of other sections, as shown in Fig. 2.

Attention is called to the fact that the results given in this paper are not averages of a number of tests. They represent a single result of one investigator. If this experiment would be carried out by a number of investigators and the results averaged, still closer checks between the actual and calculated values would be expected.

In concluding the author wishes to state that whereas the first paper was a demonstration of the hyperbolic tendency of the curve of the physical properties of steel sections of the same analysis, this paper endeavors to cover the practical application when one is confronted with the mass problem.

Experiments on Sponge Iron

At Minneapolis, the Bureau of Mines is making a study of the properties of steel made in an electric furnace from sponge iron. The steel has been furnished by the California Electric Steel Co., Los Angeles. Chemical and microscopic analyses are being made. The effect of heat treatment on the physical properties of this steel will then be determined by the usual tests for tensile strength, elasticity, hardness, etc.

At the Northwest station of the Bureau of Mines, Seattle, Wash., a study is being made of the melting of sponge iron. In work recently performed foundry iron has been made by melting sponge iron. The maximum amount of carbon introduced was 3.00 per cent. Further work is being undertaken in which the attempt is made to introduce more carbon. Other tests are to be made with the idea of producing low-carbon and high-carbon steels. All of these tests will necessitate the control of the introduction of carbon and silicon and of removing sulphur and phosphorus.

At Seattle the preparation of sponge iron is being undertaken by the Bureau of Mines with two objects in view: First, to supply sponge iron for copper precipitation, and, second, for melting and conversion into the most suitable iron or steel product.

Progress of Steel Making in Australia

Member of Queensland Parliament Tells What Has Been
Accomplished and Speaks of Prospects—
Iron Ore Is of High Grade

BY RANDOLPH BEDFORD*

I AM glad to accept the invitation of the editor of THE IRON AGE to write, while in New York, a short statement concerning the iron and steel trade of Australia and its projected extensions.

The history of iron smelting and steel production in Australia is the history of a few men putting up a long and gallant fight against ignorant opposition, and against the stupid and slipshod methods that belong to free trade.

To the end of 1886 the greater quantity of the pig iron produced in New South Wales from local ores was the output of Sandford's iron works at Lithgow, stated by the proprietor at 21,880 tons. The Fitzroy furnace's only record is 3242 tons; but it was in blast intermittently for years prior to that record, and must have produced more than the record. This much is certain: that up to 1901 the total iron product from New South Wales ores was under 30,000 tons.

True to the free trade of the time, even if Australia could make iron, it was still too thick-headed to manufacture iron into articles, and a lot of the New South Wales pig was sold to San Francisco. Mac-Condray & Co., of San Francisco, wrote in 1868:—"The parcels of your pig iron received here have given great satisfaction. We can dispose of 300 tons a month, and it would command from \$2 to \$4 a ton more than any other iron imported into California."

Broken Hill Development

The development of Broken Hill has had tremendous effect on general Australian developments of industries and men. Its general operation has trained Australian engineers, as its zinc problem has educated Australian chemists. It developed the local industry of making coke—which used to come from Germany; and its educative influence can be found on every notable mining field in Australia to-day. At Newcastle it is the key industry to most industries of the land; it has attracted to itself satellite industries working up its by-products such as that of tar from the coke ovens; and it has grouped around it wire and wire netting factories with galvanized iron and nail factories, and tin plate factories to come.

In the extension of its coke ovens and the ability to supply customers with surplus waste gases for power, a tremendous extension of its business has come; grouping around it industries in no way allied to it, and rapidly erecting Newcastle into the position of the Pittsburgh of the Commonwealth.

The great rich iron deposits of Australia are many, but there are none better than the Broken Hill Proprietary Co.'s iron mines of the Iron Knob and Iron Monarch at Spencer's Gulf (S. A.). The Iron Knob ore bulks 68 per cent, metallic iron and has 10,000,000 tons in sight. That is to be read with the fact that the hematite deposits of Lake Superior average 50 to 55 per cent and bear a railage of 1000 miles to the coal of Pittsburgh. To make a ton of pig iron requires these varying quantities of ore in the countries named:

United States (nearly).....	2 tons ore to 1 ton pig
Sweden and Russia.....	2 tons ore to 1 ton pig
Britain and Germany.....	2.4 tons ore to 1 ton pig
France and Belgium.....	2.7 tons ore to 1 ton pig
All native British ores.....	3 tons ore to 1 ton pig
Iron Knob (Australia).....	1.5 tons ore to 1 ton pig

The 1921 output of the Broken Hill Company's works at Newcastle (New South Wales) included 251,417 tons pig, 219,973 tons steel ingots and 8723

tons billets, and 176,000 tons rails, bar, rod, plate and structural steel.

Australia's Importations

Yet Australia, suffering under an inadequate tariff, imported in 1919-20 manufactures of steel to the value of \$29,000,000. Some of this was Belgian—and some of that was suspected of German origin. Until we can overhaul that value by local production, Australia would prefer to do that business with the United States of America which has money to buy our products in return. The preference to Britain should be extended to preference to the English-speaking countries. At the moment we are importing from Japan general merchandise in such volume that it is disquieting; for rightly or wrongly most Australians believe that every dollar sent to Japan gives Japan another cartridge or two for the white man.

In the State of whose Legislature I am a member (Queensland) the steel shortage of the war impelled us to move for the establishment of State steel works because private enterprise had neglected it largely because of low duties. Besides the Newcastle steel works of the Broken Hill Proprietary Company, the State of New South Wales houses the important Hoskin's works at Lithgow. Combined these ironmasters could not then meet the demand and small steel founders were during the war buying scrap iron up to \$30 per ton.

Great Iron Deposits

Yet every State has great iron deposits. Beginning in the South, Tasmania has great iron reserves at Blythe River and Penguin, by the sea; Victoria at Nowa Nowa (at present inaccessible for production in quantity); New South Wales at Carcoar, Cadia and other places connected by railroad with the sea; South Australia at Iron Knob, which supplies Newcastle; Queensland at Biggenden, Cloncurry, Iron Island and other places, and West Australia at Yampi Sound. The Queensland Government has a vast coal-field now being connected by railroad with the deep water port of Bowen (about 17 days distant from San Francisco) and our Parliament has passed a bill providing for the establishment of State steel and iron works at Bowen. Contemporaneously the State Government secured by private purchase and by concession from the West Australian Government the iron deposits of Yampi Sound, situated in latitude 16° 8' South and longitude 123° 45' East. The largest ships afloat can enter or leave Yampi at any time of the tide.

The deposits are in the form of huge beds of dense solid steel-gray crystalline hematite, and there are roughly 15,000,000 tons on Cockatoo Island above high water mark. On Coolan Island there are 70,000,000 tons above high water mark; recoverable without any removal of over-burden. Other ore bodies represent 15,000,000 tons—a total of 100,000,000 tons above high water in sight—which probably represent a hundredfold of the quantity to be developed by mining.

The ore is very even in quality and very free from deleterious qualities. Phosphorus is below the limit of 0.05 per cent allowable for acid open-hearth treatment, or 0.10 per cent allowable for acid Bessemer ores.

The method of working will be by heavy charges of explosives breaking thousands of tons at a shot, blowing out the width of the ore body clean from the footwall, and throwing the ore down to near sea-level, whence it can be loaded to the ships. The proposition is that ships shall load ore at Yampi, transport it to

*Member of the Parliament of Queensland, Australia.

the State coal fields at Bowen, and take back loading of coal to Java en route to Yampi for further cargo. The value of the ore is best shown by these comparisons.

In San Francisco I was told that steel manufacture on the Pacific Coast would be established if a new supply of cheap coke should offer. In the making of coke at Bowen as one of the activities of steel production in Australia, there will probably be found the means to bring our two countries in close association in trade as already they are allied by a strong and continuously increasing sentiment.

Steel Mill Employment Increases

WASHINGTON, March 7.—The iron and steel industry, with an increase of 7256 employees, or 2.2 per cent, showed a larger gain in employment in February over January than any other of the 14 industries reporting to the United States Employment Service, except the vehicles for land transportation. In this case the gain was 11,149 employees, or 6.5 per cent. All but two industries, textiles and their products and paper and printing, showed gains. The total net gain, however, was only 8894 employees, or 0.57 per cent, the total gain of 28,131 being offset by a decrease of 19,237 in the two industries showing losses. Of this decrease, 19,152 was in the textile industry and is attributed to the strike.

An increase of 2471 was made in metal and metal products, and of 2452 in railroad repair shops. Iron and steel towns showing gains in February over January were Johnstown, Pa., 1960, or 22.5 per cent; Cleveland, 3806, or 5.5 per cent; Birmingham, Ala., 1130, or 5 per cent; New York, 2744, or 1.9 per cent; Pittsburgh, 1215, or 1.7 per cent. Decreases were shown by Youngstown, Ohio, 679, or 2.4 per cent; Philadelphia, 953, or 0.96 per cent; Chicago, 842, or 0.5 per cent.

IRON AND STEEL MOVEMENTS

More Than One-Quarter of All Water Traffic Consists of Ferrous Materials

In a volume of commercial statistics for 1920, the statistical division of the Board of Engineers for Rivers and Harbors has published a volume of more than 1400 pages, showing the movements of export and import tonnage and of river and canal tonnage for a vast quantity of materials. The table showing the movements of iron and steel gives both the imports and exports in foreign commerce, and the receipts and shipments in domestic commerce, for the year 1920, with comparative figures for 1919. The table gives the movement by ports on the Atlantic, Gulf and Pacific coasts and on the Great Lakes, the latter being domestic shipments, mainly of iron ore. The table gives also the movements on canals, on the Mississippi River and on rivers of the Atlantic, Gulf and Pacific coasts.

It may be pointed out that the total iron and steel movement shown, amounting in 1920 to 189,617,864 net tons, is 36½ per cent of the entire movement for the year of the twelve principal products, aggregating 523,267,141 net tons. It is also 27 per cent of the 703,675,131 tons of all products moved by water. The principal information regarding movements of iron and steel for the two years will be found in the appended table.

Movement of Iron and Steel by Water (Net Tons)

	1919	1920	Increase, Per Cent
Imports: Atlantic coast.....	471,030	637,548	35.3
Gulf coast		32,046	...
Pacific coast	2,905	47,469	...
Great Lakes		124,340	...
Total	473,935	841,403	77.5
Exports: Atlantic coast.....	135,656	(c) 903,634	566.2
Gulf coast	(a) 210,664	300,225	42.5
Pacific coast	403,156	238,401	-40.9
Great Lakes		1,281,795	...
Total	749,476	2,724,055	263.5
Total foreign commerce.....	1,223,411	3,565,458	191.5
Domestic receipts: Great Lakes	51,584,356	63,993,374	24.0
Seacoasts	1,122,645	334,660	-70.2
Rivers and canals.....	10,111	337,295	...
Total	52,717,112	64,665,329	22.7
Domestic shipments: Great Lakes	52,019,248	63,801,034	21.7
Lakes		160,686	85.7
Seacoasts		160	...
Rivers and canals.....		439,647	...
Total	52,180,094	64,039,077	22.7
(b) Total domestic commerce..	105,612,629	186,052,406	76.2
Total movement recorded...	106,836,040	189,617,864	77.5
Adjusted movement*	54,029,725	96,591,661	78.8

*Eliminating all known duplications; consists of total foreign commerce added to one-half the domestic figures.

(a) Includes 75,870 tons of river movement.

(b) Includes local traffic not segregated.

(c) Includes 51,274 tons of river movement.

Newport Company Will Not Move

Officials of the Newport Rolling Mill Co., Newport, Ky., state that it is not the intention of the company to move from Newport. During the height of the strike troubles the desirability of moving the plant was considered, but with the re-establishment of order in the strike zone and the assurance that the operations of the company will not be interfered with, the consideration of moving the plant to some other city was dropped. Communications from approximately 35 cities from all sections of the United States, offering the company various inducements to locate their plant in these cities, were received.

The sixth annual meeting of the American Gear Manufacturers' Association will be held at the Hotel Lafayette, Buffalo, April 20 to 22, inclusive.

FEBRUARY PIG IRON OUTPUT

A Gain of 5,151 Tons Per Day Over January

Seventeen Furnaces Blown In, Five Blown Out

The steady increase in the pig iron production of the country which characterized the last few months of 1921, but which came to a standstill in January, was resumed in February with decided impetus. The production in February was 5151 tons per day larger than that in January which contrasts with a decline in January from December of 133 tons per day and a gain in December over November of 6013 tons per day. As in January the feature of the February production was the relatively high output of steel-making pig iron which showed an increase of 4697 tons per day over January.

The production of coke and anthracite furnaces for the 28 days in February amounted to 1,629,991 gross tons, or 58,214 tons per day, as compared with 1,644,951 tons, or 53,063 tons per day in January, a 31-day month. Owing to an error in the returns of one furnace, the January figures have been revised upward from those published Feb. 9. The output last month was larger than the March output last year and was only 307,266 tons less than in February, 1921.

The total number of furnaces in blast on March 1 was 138 as compared with 126 on Feb. 1. This number is just twice the number of furnaces in blast on Aug. 1, 1921, at the low point in the depression, when only 69 were operating. The capacity of the 138 furnaces in blast March 1 is estimated at 59,080 tons per day, as contrasted with a capacity of 53,305 tons per day for the 126 furnaces in blast Feb. 1. In February 17 furnaces were blown in and 5 were blown out.

Of the manganese-iron alloy output in February of 8540 tons, spiegeleisen constituted 4930 tons and ferro-manganese 3610 tons, the latter being a decided decline from the January output of 5644 tons.

Daily Rate of Production

The daily rate of production of coke and anthracite pig iron by months, from February, 1921, is as follows:

Daily Rate of Pig Iron Production by Months—Gross Tons			
	Steel Works	Merchant	Total
February 1921	58,060	11,127	69,187
March	42,691	8,777	51,468
April	33,854	5,914	39,768
May	33,054	6,340	39,394
June	29,414	6,050	35,464
July	23,086	4,803	27,889
August	26,037	4,743	30,780
September	27,189	5,661	32,850
October	33,365	6,850	40,215
November	37,960	9,223	47,183
December	41,173	12,023	53,196
January, 1922	42,130	10,933	53,063
February	46,827	11,387	58,214

The figures for daily average production, beginning with January, 1916, are as follows:

Daily Average Production of Coke and Anthracite Pig Iron in the United States by Months Since Jan. 1, 1916—Gross Tons							
	1916	1917	1918	1919	1920	1921	1922
Jan.	102,746	101,643	77,799	106,525	97,264	77,945	53,063
Feb.	106,456	94,473	82,835	105,006	102,720	69,187	58,214
Mar.	107,667	104,882	103,648	99,685	108,900	51,468	
Apr.	107,592	111,165	109,607	82,607	91,327	39,768	
May	108,422	110,238	111,175	68,002	96,312	39,394	
June	107,053	109,002	110,793	70,495	101,451	35,464	
July	104,017	107,820	110,354	78,340	98,931	27,889	
Aug.	103,346	104,772	109,341	88,496	101,529	30,780	
Sept.	106,745	104,465	113,942	82,932	104,310	32,850	
Oct.	113,189	106,550	112,482	60,115	106,212	40,215	
Nov.	110,394	106,859	111,802	79,745	97,830	47,183	
Dec.	102,537	92,997	110,762	84,944	87,222	53,196	

Among the furnaces blown in during February were the following: One Donner furnace in the Buffalo district; No. 2 Swede furnace in the Schuylkill Valley; No. 1 Clairton, No. 3 Duquesne furnaces and No. 2 Lucy furnace of the Carnegie Steel Co. and one Monessen furnace of the Pittsburgh Steel Co. in the Pittsburgh district; one Johnstown furnace of the Cambria Steel Co. and the Perry furnace in Western Pennsylvania; No. 1 furnace of the National Tube Co. and the Dover furnace in Central Ohio; No. 4 Joliet furnace of the Illinois Steel Co., No. 11 Gary furnace and No. 1 Madeline furnace in the Chicago district; Detroit furnace B in Michi-

gan; No. 4 Ensley furnace of the Tennessee Iron & Railroad Co. and the Alabama City furnace of the Gulf States Steel Co. in Alabama. The Adrian furnace, reported blown out in January, was in blast and is included in the February totals.

Among the furnaces blown out during February were the following: The Northern furnace of the Witherbee Sherman Co. in New York; the Saucon furnace of the Thomas Iron Co. in the Lehigh Valley; Newcastle No. 1 of the Carnegie Steel Co. in the Shenango Valley; Mary furnace in the Mahoning Valley and one Madeline furnace in the Chicago district.

Output by Districts

The accompanying table gives the production of all coke and anthracite furnaces for February and the three months preceding:

Pig Iron Production by Districts, Gross Tons

	February (28 days)	January (31 days)	December (31 days)	November (30 days)
New York	105,708	110,867	126,734	91,535

Diagram of Pig Iron Production and Prices

The fluctuations in pig iron production from 1913 to the present time are shown in the accompanying chart. The figures represented by the heavy line are those of daily average production by months of coke and anthracite iron. The dotted curve on the chart represents monthly average prices of Southern No. 2 foundry pig iron at Cincinnati, local No. 2 foundry iron at furnaces in Chicago, and No. 2X at Philadelphia. They are based on the weekly quotations of THE IRON AGE.

The Full Line Represents the Daily Production of Pig Iron and the Dotted Line Is the Average of the Price Per Ton of No. 2 Southern Pig Iron at Cincinnati, Local No. 2 Iron at Chicago and No. 2X Iron at Philadelphia

Production of Coke and Anthracite Pig Iron in the United States by Months, Beginning Jan. 1, 1918—Gross Tons

	1918	1919	1920	1921	1922

companies, as well as from merchant furnaces producing ferromanganese and spiegeleisen, show the follow-

ing totals of steel making iron, month by month, together with ferromanganese and spiegeleisen. These last, while stated separately, are also included in the columns of "total production."

Large Furnace Output

The blast furnace of the Weirton Steel Co., Weirton, W. Va., on Feb. 25 produced 823 gross tons of pig iron, thus coming within a couple of tons of the record mark established a few years ago by No. 1 furnace of the Pittsburgh Steel Co., which made 825 gross tons of pig iron in one day. In both instances these yields were possible by the charging of a good deal of scrap. On the straight ore charge, the best record recently was made in the new furnace of the Trumbull-Cliffs Furnace Co., Warren, Ohio, which tapped 715 tons in one day. For the two weeks ended March 5, the 600-ton furnace of the Weirton Steel Co. averaged 723 tons.

The Hardinge Co., 120 Broadway, New York, has acquired the business of the Coal Washing Equipment Co., Pittsburgh. The Coal Washing Equipment Co. did not have its own factory, its equipment being made in other shops on a contract basis, but the Hardinge Co. will now manufacture this equipment in its own plant at York, Pa.

At the regular monthly meeting of the Detroit Chapter of the American Society for Steel Treating on Feb. 27, F. H. Helrigel, Motor Products Co., discussed heat treating as applied to sheet steel.

PITTSBURGH BASE HEARING

It Is Resumed at Minneapolis—Testimony Remembers That at Milwaukee

MINNEAPOLIS, MINN., March 6.—The second of a series of hearings on the Pittsburgh basing point practice was opened before Examiner J. W. Bennett of the Federal Trade Commission on March 1. The testimony taken thus far is similar to that brought out in the Milwaukee hearing. In each case the witness explained the effect of "Pittsburgh plus" on his particular business and the alleged handicap it placed upon him in competing with Eastern companies. Melvin Ovesrud, mechanical engineer of the Twin City Forge & Foundry Co., Stillwater, Minn., was the first to offer testimony. He asserted that despite the fact that his company is closely related to the Minneapolis Steel & Machinery Co., it lost contracts with that company because it could not meet the competition of Eastern drop forge shops. In supplementing Mr. Ovesrud's testimony, H. E. White, traffic counsel for the Western Association of Rolled Steel Consumers, presented evidence to show how the Western forge shop is handicapped at various points of delivery. He stated that the advantage of the Pittsburgh shop over the Stillwater plant on forgings delivered at destination was \$11.30 per ton at Duluth, Minn.; \$12.20 at Waterloo, Iowa; \$16.30 at Peoria, Ill.; \$16.60 at Racine, Wis.; \$14.80 at Janesville, Wis.; \$21.60 at Muskegon, Mich., and \$18.90 at Cadillac, Mich.

E. J. Ellertson, assistant secretary of the Russell Grader Mfg. Co., Minneapolis, testified that his company, which did \$2,000,000 worth of business in 1921, was under a severe disadvantage because of "Pittsburgh plus." The graders manufactured are 75 per cent steel, some graders containing as much as 5200 lb. of steel each. He stated that some of the steel bought came from Steelton, Minn., but until recently the company paid the freight on it as though it came from Pittsburgh. He asserted that this additional freight charge blocked the company's efforts to obtain Eastern business and handicapped it throughout the country. Mr. White testified that because of the Pittsburgh basing point practice the company was at a disadvantage of 47c. on each 100 lb. in bidding against a Cleveland manufacturer at Chicago, 43c. at Milwaukee, 20½c. at Des Moines, Iowa; 17½c. at Omaha, and 12½c. at Duluth.

H. C. Baldry, vice-president of the Flour City Ornamental Iron Co., Minneapolis, declared in his testimony that the company's fence plant had been closed in 1912 because of the handicap of "Pittsburgh plus." He asserted that at one time as many as 300 men were employed in this department of his company, but that Cleveland and Cincinnati competitors had such an advantage because of a "fictitious and excessive" freight charge that the company had to discontinue the manufacture of the product.

G. A. Stockland, secretary of the Stockland Road Machinery Co., Minneapolis, declared that the increased manufacturing cost in the "Giant" type of Stockland grader attributable to "Pittsburgh plus" was \$24.73. He asserted that Eastern competitors were able to maintain warehouses in Minneapolis and compete on even terms notwithstanding the great distance they had to ship their finished products. On shipments to Canada, Mr. Stockland said, Minneapolis manufacturers paid a double duty. This point was brought out in greater detail in testimony by Mr. Ellertson, who used a Galion, Ohio, manufacturer of road machinery, and the Russell Grader Mfg. Co. as examples. The rate from Pittsburgh to Galion, he said, is 28c. per 100 lb., and the rate from Galion to Regina, Sask., is \$1.63½c., making a total freight charge to the Galion manufacturer of \$1.91½c. The freight from Pittsburgh to Minneapolis is 66c. and from Minneapolis to Regina \$1.01½c., making a total of \$1.67½c. It seems apparent, he asserted, that Minneapolis enjoys a differential of 24c. per 100 lb. over its Galion competitor, but such is not the case. The Canadian duty is based on the price of the machine f.o.b. fac-

tory, and in the case of Minneapolis the price necessarily includes "Pittsburgh plus," with the result that the duty on the competing Galion machine is 30c. less, and the net advantage of the Galion manufacturer in Regina is therefore 6c. Mr. Ellertson also testified that the Galion competitor can ship within a few miles of Minneapolis and compete with his company on even terms. If prices on steel were definitely on a Chicago or Duluth base instead of a Pittsburgh base, he declared, Minneapolis manufacturers would be able to ship half way to Galion and compete on even terms.

The hearing at Minneapolis will probably continue throughout this week, after which the commission will take testimony in Chicago, Duluth and Birmingham.

Sligo Iron & Steel Co. Sold

Max Solomon, iron and steel scrap, Oliver Building, Pittsburgh, was the successful bidder for the plant and property of the Sligo Iron & Steel Co., Connellsville, Pa., which was sold at a trustees' sale, Feb. 8. Beside the plant, which has an annual capacity of about 70,000 tons of iron and steel bars, plates and sheets, there are about 15 acres of land. The plant contains 19 single puddling furnaces, six 4-door heating furnaces, one open annealing furnace; a 20-in. 3-high, 2-stand muck bar mills, a 16-in. 3-high 1-stand roughing, a 16-in., 3-high, 1-stand and a 16-in., 2-high, 1-stand finishing mills, a 16-in., 2-high, 1-stand bullhead, 12-in., 3-high, 1-stand roughing mill, a 9-in., 3-high, 3-stand and a 9-in., 2-high, 1-stand guide mills, a 24-in. x 66-in., 2-high roughing and a 24-in. x 60-in. 3-high finishing plate mills, one drop hammer, one shingling hammer and two forge fires. Rated annual capacity of the plant is 7000 tons of muck bar, 40,000 tons of iron and steel bars and 24,000 tons of plates and sheets. Mr. Solomon has not yet announced his intentions with regard to his purchase.

New Steel Warehouse in Philadelphia

A new steel warehouse will be opened at Third and Venango streets, Philadelphia, about April 1 under the name of R. B. Fritch & Co. R. B. Fritch is president, W. F. Hays, treasurer, and A. T. Green, secretary. Mr. Fritch was purchasing agent for 16 years with R. D. Wood & Co., and treasurer of Southwark Foundry & Machine Co., Philadelphia, until he formed the Provident Engineering Co., the interest which he is relinquishing to form the new company. The company will stock merchant bars and shapes, sheets, wire and in addition carry foundry supplies. The new warehouse will be well equipped as to shipping facilities, having a railroad siding. It is the intention to maintain trucks for local delivery.

An excellent opportunity for American manufacturers of agricultural machinery to introduce their equipment in Ireland will be afforded by the annual Agricultural Spring Show of the Royal Dublin Society, to be held at Ballsbridge, Dublin, on May 16-18, according to a letter received by the Agricultural Implement Division of the Department of Commerce from Joseph Connolly, Irish trade commissioner to the United States. This show is attended by practically all those who are interested in agriculture in Ireland, and it is believed that substantial sales of American implements and machinery will follow if these products are on display. Allocation of sites for exhibits will be made soon. Interested American manufacturers should apply promptly to the secretaries of the Royal Dublin Society, Dame Street, Dublin, Ireland.

Work of rebuilding the plant of the Standard Slag Co., Youngstown, Ohio, at the blast furnace in Sharpsville, Pa., of the Shenango Furnace Co., was started last week. It will replace the old plant destroyed several months ago by fire, and will be larger in capacity, having two bins instead of one. The main building will be of steel construction. Additional equipment and slag crushing machinery will be installed, furnished by the Allis-Chalmers Mfg. Co.

of March 3, 1879.

A Good Tin Plate Year

It is well established now that 1922 will be a good tin plate year, possibly even a record year. It is not sufficient explanation of the conditions to say that tin plate is an article of common everyday consumption by the great mass of the people and is therefore not subject to ups and downs. There is more in the matter than that. Thirty years ago, when the production of tin plate in the United States really began, the material was also an article of everyday consumption. There were heavy imports from Wales and the average price over a period of years had not been unreasonably high. Our annual consumption then was about ten pounds per capita, while lately it has been running over twenty-five pounds. The production in a good year is from four to five times the imports of thirty years and more ago, for in addition to the increase in per capita consumption the population has grown and we now export tin plate. We exported as much tin plate in 1918 as we imported in 1886, when we were drawing all our supplies from abroad.

There are several reasons for the growth in tin plate consumption. Of course it is an advantage to have the sources of production within our own borders, instead of depending on imports, but it is a fact that the country was well served, in the matter of deliveries, when it was depending upon South Wales. Prices were fairly steady and the "Big Four" New York importing houses (Phelps, Dodge & Co.; Bruce & Cook; Dickerson, Van Dusen & Co., and Robert Crooks & Co.) maintained stocks that could readily be drawn upon.

The next argument commonly adduced is that methods of sterilizing food products have been so improved that there is a much wider demand. The improvements are not denied, but the foods prepared in tin plate containers a quarter century and more ago were pretty good, nevertheless. Another argument is that machinery for making containers has been greatly improved, whereby the cost is lessened. That also is true, but tin cans were rather cheap even thirty years ago.

The greatest influence in increasing the consumption of tin plate is the large development in its use in packing articles other than the fa-

miliar food products of twenty and thirty and more years ago. The time was when the chief employment of tin plate was in "the canning crops," but that is no longer the case. Tin plate is one of the modern conveniences. People buy articles in tin plate containers that do not have to be so packed, but which are much more attractive when so prepared.

Tin plate production first exceeded a half million gross tons in 1906, while it was in 1915 that the million-ton level was reached. Since then the output has not fallen as low as a million tons, with the probable exception of last year, the official report for which will perhaps show about 900,000 tons. That was a year of liquidation of stocks of goods prepared in tin plate containers and of restricted consumption on account of the persistence of high prices at retail for the prepared articles. The record year was 1917, with an output of 1,512,146 gross tons.

In the first two months of this year production of tin plate was between 225,000 and 250,000 tons, or almost one-sixth of the record annual production. Since it is not usual for the mills to run at their full rate at that time of year, the augury for a heavy year's production is excellent, and there is also the factor that the relation of mill shipments to production was high in the two months. The chief hindrance to a record production this year is the relative lightness of exports of tin plate and of oil in tin plate containers. This handicap may disappear, while heavy domestic consumption is certain.

In the ups and downs of the foreign trade of Great Britain, the rôle of pig iron is conspicuous. An analysis of the official data for 1913, 1920 and 1921 shows that whereas British exports of pig iron were approximately 22 per cent of the total iron and steel exports in 1913, by 1920 they had fallen to 18 per cent and by 1921 to only 8 per cent. As to imports the comparison is still more striking: In 1913 imports of pig iron into Great Britain were only 10 per cent, in 1920 they were 21 per cent, but in 1921 the percentage was no less than 41. Before the war Great Britain was the chief exporter of pig iron. The coal strike early in

1921 was largely responsible for the reversal in pig iron movements. Meanwhile no one may venture to suggest how readily or rapidly the 1913 ratios may again be reached.

Steel and Commodity Prices

With the additional declines that have occurred in finished steel prices in the past fortnight the average price, according to THE IRON AGE composite, stands at 120, using the average in 1913 as 100, according to the practice of the Bureau of Labor with its index number representing commodities in general. The bureau's index, which is of prices at wholesale, was 148 for January and has shown scarcely any change for more than six months.

It is admitted that steel manufacturers are not making money, but they are presumably getting a new dollar for an old, and perhaps are earning something against their overhead. No doubt, on the average, the mills are not getting their full cost in their present selling prices, i.e., they are losing part or all of their overhead expense.

If steel were not being made very economically, conditions would be still worse. There are the handicaps of a low operating rate, which unavoidably greatly increases unit cost, together with wages, freight rates and taxes at much higher levels than before the war. Any guess at steel mill costs and selling prices based upon the known conditions would be at a higher level than is actually shown. The necessary inference is that the steel industry is making efficient use of its facilities, apart from the known handicaps.

The industry has made great progress in recovering from the conditions imposed by the war and the soft labor times of 1920. This, however, is no new showing for the steel industry. Since the outset the industry has been increasing in efficiency, whereby it has balanced many handicaps that have arisen, such, for instance, as the decreasing iron content of the ores available, as compared with the Lake Superior ores used in the eighteen-nineties.

It may be of interest to recall that on Aug. 24, 1911, THE IRON AGE published an editorial making a comparison somewhat similar to the one made above. The index numbers of the Bureau of Labor and Bradstreet were quoted, showing that at that time steel prices were lower, relative to commodity prices, than in 1906-7 or the period of very low prices in 1897. The comparison between prices in 1897 and prices in 1911 showed an increase of 30 per cent for steel, and increases for commodities in general of 40 per cent according to Bradstreet and 46 per cent according to the Bureau of Labor.

The steel industry cannot control all its costs. It cannot make fuel costs, freight rates or tax rates; but the things it cannot control are things that producers of other commodities cannot control either. Apparently the industry will still be able to make a good showing, in economy and efficiency, by comparison with industries in general. There is no danger that the use of steel

will be restricted at any point on account of the price comparing unfavorably with prices of other commodities. Rather, steel is likely to forge ahead and develop new uses. To-day a given quantity of commodities will buy more steel than in 1911 and in 1911 it would buy more than in 1897. That is an achievement. We do not make progress in everything. Who will assert that mail service, for instance, is notably better than ten years or twenty-five years ago? There are industries that are not rendering nearly so good service as they used to render, while steel is doing much better.

An Advance in Magnetic Testing

Magnetic testing has now been applied for determining the efficacy of case hardening. More than that, it has been applied in a practical way that suggests broad possibilities. Announcement of the development was made at the meeting last week to discuss steel treating problems and covered the perfection of an apparatus used for testing the case hardness of small chain. Briefly, by empirically determining the maximum and minimum depths of case in chain corresponding to poor results, an approximate standard is established by which it is possible to determine magnetically the depth of case which will give the longest life for definite conditions. This has already afforded a test basis which is being applied commercially.

This principle may, in the not distant future, be applied to other properties of steel. The designers of the apparatus are making just such predictions and assert that it will be possible to correlate the tensile strength or ductility as easily by magnetic tests as the case hardness of steel. All that appears necessary is the determination of maximum and minimum limits within which the material will be satisfactory and use these for the fixing of a standard. There are those who do not appreciate that this is really the principle on which most specifications are now based. New apparatus will not be needed, it is claimed. The application of the magnetic testing idea to case-hardened chain is after all merely a step in the development of non-destructive testing for which there has long been a demand.

What of the Size of Factories

Consolidations of several small plants into one large one and of large ones into still larger have been reflected from time to time in the census returns of manufactures. This tendency toward larger manufacturing units has been brought out afresh by the census figures for 1919, some of which have now become available. The total number of manufacturing establishments is given as 290,105, with 9,096,372 wage earners. The average number of wage earners per establishment works out at 31.4, as compared with 25.5 in 1914 and 24.6 in 1909.

As might be expected, the great bulk of employees are to be found in the larger plants. It happens, however, that the number of these larger

plants has also proportionately increased. Thus, those plants employing more than 50 wage earners, which numbered only 8.9 per cent of the total in 1909 and 1914, have now gone up to 9.95 per cent. And the number of wage earners employed in such plants has increased from 74 per cent of the total in 1909 to 76.3 per cent in 1914 and 80.5 per cent in 1919.

This fact is brought out more strikingly when we consider that, in 1919, the number of employees in plants employing more than 50 was 2.85 times the number in smaller plants; in 1914 the number in the larger plants was 3.22 times those in the smaller plants; in 1919 the number in the larger plants was 4.13 times the number in the smaller plants. This general tendency seems to be especially concentrated in the still larger plants, for it is found that the number of employees in plants having more than 500 wage earners has practically doubled between 1909 and 1919, while the number in plants having less than 500 employees has gained only 15 per cent and the number in plants having no more than 50 employees has gained only 3.3 per cent in the ten years.

It may be pointed out, as a matter of particular interest to the steel industry, that there are more of the largest plants—those having over 1000 wage earners each—in Pennsylvania than in any other State. The number of such plants is 142 in Pennsylvania, with 368,002 employees; Massachusetts stands second with 118 plants and 244,045 employees; New York is third with 106 plants and 226,236 employees. Both Michigan and Ohio have more than 200,000 employees in such plants, while New Jersey and Illinois, with about 171,000 men each, occupy sixth and seventh places respectively. This seventh position for Illinois appears surprising, in view of the number of large plants in and about Chicago, and particularly in view of the importance of Chicago from the iron and steel standpoint, based upon the location there of such big units as the Illinois Steel Co., the International Harvester Corporation, the Inland Steel Co. and the Steel & Tube Co. of America.

That the tendency is still toward large concentration of manufacturing capacity does not follow. A belief is growing that more account must be taken hereafter in industrial undertakings of the human element. The modern factory has done well to make conditions pleasant for the employee, but it has not done as much for his open-air living in the hours out of the factory. It is saying nothing new to emphasize that the more diversified the industries in a given community, the less likelihood of labor disturbances through such causes as idleness in any one industry. The flattening of the curve of unemployment is a result, and there is a better feeling the year 'round in the community as a whole.

If there is much in the contention of industrial students that the pendulum is now swinging in the direction of decentralization, it seems reasonable to believe that new enterprises and the amalgamations which are forming out of the present stress will consider locating in the small rather than the large cities. There seems to be a size of town below which the feeling prevails that opportunities do not exist in such number as to

encourage the ambitious to remain. The larger the city the wider is the natural belief in chances for benefit, but a realization of the congestion growing out of the massing of large plants in overcrowded centers may put the smaller center in a new light. The gradual building of large power stations, as proposed by the super-power project for the East, the tying of these and water power developments together, and the improvement of our highways with the realignment of transportation are among the factors which are calculated to influence the decentralization movement, but most of all it will probably come as the result of a definite program of industrial engineers and promoters and from the appreciation on the part of the wage earner that self-advancement may actually be attained, without sustaining the high cost and unsatisfactory conditions of living in the largest cities. Owing to the costs involved, decentralization of existing plants would naturally proceed slowly, but so far as the workers are concerned, any movement away from largest centers will come largely as the result of appreciation of what life means in its broadest terms.

CORRESPONDENCE

Verses Relating to Sciences

To the Editor: I am making a collection of verses, whose subject matter relates to the sciences, or to their co-related branches of engineering, with the intention of publishing at some future date an anthology of such verse. It has occurred to me that there may be among your readers many who have verses of this character in their possession, and who would be willing to contribute them to this collection. Will you kindly grant me space for this appeal to your readers to send to me copies of such verses, together with the necessary details of authorship, place of publication (if previously published) at my address Box 130, Massachusetts Institute of Technology, Cambridge, Mass.? Such verses sent to me will be greatly appreciated and duly acknowledged.

CHARLES E. RUBY.

Steel Electrical Engineers to Meet

Approaching meetings of the Association of Iron and Steel Electrical Engineers include the following:

March 13, Cleveland: "Protective Relays for Generators and Transmission Lines."

March 15, Chicago: "Plant of Acme Steel Goods Co."

March 18, Pittsburgh: "Synchronous Motors in Mines and Steel Mills."

March 25, Birmingham: "Lubrication of Mill Motors" and "Electric Power Distribution in Steel Industry." At Youngstown: "Bent Tube vs. Straight Tube Boilers."

Sale of Winnisimmet Ship Yard, Inc.

The plant of the Winnisimmet Ship Yard, Inc., Chelsea, Mass., has been sold. The real estate and the marine railway and the marine railway equipment were purchased by H. F. Winslow of 30 State Street, Boston, for \$200,000—plus \$52,452 of unpaid taxes; and 1692 lots of personal property realized \$55,684, hence the total sale amounted to \$308,136. The attendance at the sale was an unusually representative business one and of size. It came from all parts of the country and Canada.

FEBRUARY INGOT OUTPUT

Increase Over January 9.33 Per Cent — Yearly
Rate Nearly 27,000,000 Tons

The steel ingot statistics of the American Iron and Steel Institute show that 30 companies which in 1920 produced 84.20 per cent of the total, had an output in February of 1,742,345 gross tons as compared with 1,593,482 tons in January. The increase in February over January was 148,863 tons or 9.33 per cent. This contrasts with an increase in January over December of 166,389 tons, or 11.6 per cent. Estimating the production of other companies on the basis of the 30 companies (though it is probable the small companies did not equal the rate of the larger ones), the total output of ingots in February was 2,069,292 tons or 86,220 tons per day, counting 24 working days for February. The January output on the same basis was 75,700 tons per day, which makes the February output a gain of 10,520 tons per day.

In the table below, the output of Bessemer and open-hearth works is separated and the figures for 1920 by months are included:

Monthly Production of Steel Ingots by 30 Companies Which Produced About 84.20 Per Cent of Total in 1920—Gross Tons

	Open Hearth	Bessemer	All Other	Total

Total, 1921	13,125,578	3,679,682	21,686	16,826,946
January, 1922 ..	1,260,809	331,851	822	1,593,482
February	1,393,158	348,571	616	1,742,345

The February ingot production was at yearly rate of 26,814,420 tons, counting 311 operating days to the year. This compares with a rate in January of 23,542,500 tons and with 11,857,186 tons in July, the low point for 1921.

The increase of 10,520 tons per day in the ingot output of all companies reporting in February over January contrasts with an increase of 5151 tons per day in the February pig iron output over January.

March Meetings of Mechanical Engineers

Among meetings scheduled for March by various sections of the American Society of Mechanical Engineers may be mentioned the following:

March 10—Newark, N. J., "Die Castings." Joint meeting with Society of Automotive Engineers. Providence, R. I., Society rooms, Leo Loeb, Day & Zimmerman, Philadelphia, "Heat Balance in Power Plants." Richmond, Va., Murphy's Hotel, E. J. Willis, "History of Steam Power"; H. G. Johnson, "Gas Manufacture and Distribution"; H. D. Savage, "Pulverized Fuel"; W. A. Ludwick, "Coal Tar By-Products" and "Lubrication."

March 13—Boston; joint meeting with students of technical schools. Major W. E. Hoke, "Precision in Machine Tool Work."

March 14—Hartford, Conn., Hartford Electric Light Co., "Conveyors," by a representative the Lamson Co.; "Furnace Combustion," by a representative of the Sanford Riley Stoker Co.; both illustrated.

March 16—Meriden, Conn., "Leather—Its Uses in Industrial Plants."

March 17—Chicago, Charles Piez, "The Landis Award." Philadelphia, Towne Scientific School, W. L. Saunders, "Forty-Six Years Out of College." Afternoon inspection Delaware plant Philadelphia Electric Co. Film from Sanford Riley Stoker Co., showing combustion in a boiler furnace.

March 20—New Haven, Conn., Taft Hotel, "Human Element in Industry," President Dexter S. Kimball in the chair. J. J. Callahan, "Heart Power"; J. E. Bennett, "How Poor."

March 21—Detroit; joint meeting with Affiliated Technical Societies of Detroit. Philadelphia, Engineers' Club, joint meeting with A. I. E. E. and A. S. C. E. Hydro-electric symposium with special reference to Chippewa-Queenston (Ontario) development. Atlanta, Carnegie Library, R. V. Wright, speaker.

COMING MEETINGS

March

National Association of Waste Material Dealers. March 14 and 15. Annual meeting, Hotel Astor, New York. Secretary, Charles M. Haskins, Times Building, New York.

Refractories Manufacturers' Association. March 15, 16 and 17. Annual meeting, Chicago. Secretary, F. W. Donahoe.

Taylor Society. March 16 to 18. Midwinter meeting. City Club, Philadelphia. Managing director, Dr. H. S. Person, 29 West Thirty-ninth Street, New York.

April

National Federation of Construction Industries. April 3, 4 and 5. National conference, Drake Hotel, Chicago. Association headquarters, Drexel Building, Philadelphia.

National Metal Trades Association. April 19 and 20. Annual meeting, Hotel Astor, New York. Secretary, Louis W. Fischer, Peoples Gas Building, Chicago.

American Gear Manufacturers' Association. April 20, 21 and 22. Annual meeting, Hotel Lafayette, Buffalo. Secretary, P. D. Hamlin, Earle Gear & Machine Co., Philadelphia.

American Supply and Machinery Manufacturers' Association and Southern Supply & Machinery Dealers' Association. Joint Meeting. April 24 to 26, Birmingham. P. D. Mitchell, 233 Broadway, New York, is secretary of the American association and A. M. Smith, Smith-Courtney Co., Richmond, Va., is secretary of the Southern association.

Society of Industrial Engineers. April 26 to 28. Spring meeting, Hotel Statler, Detroit. George C. Dent, business manager, 327 S. La Salle Street, Chicago.

American Electrochemical Society. April 27 to 29. Spring meeting, Baltimore. Acting secretary, Dr. Colin G. Fink, 110 Park Avenue, New York.

May

Iron and Steel Institute. May 4 and 5. Annual Meeting. Quarters of Institution of Civil Engineers, London, England. Secretary, George C. Lloyd, 28 Victoria Street, S. W., London.

The National Supply and Machinery Dealers' Association. May 8, 9 and 10. Seventeenth annual convention, Marlborough-Hillem Hotel, Atlantic City. Secretary, T. James Fernley, 505 Arch Street, Philadelphia.

American Society of Mechanical Engineers. May 8 to 10. Spring meeting, Atlanta, Ga. Secretary, Calvin W. Rice, 29 West Thirty-ninth Street, New York.

National Association of Manufacturers. May 8, 9, and 10. Annual Convention, Waldorf-Astoria Hotel, New York. General Offices, 50 Church Street, New York.

National Foreign Trade Council. May 10 to 12. Convention, Philadelphia. Secretary, O. K. Davis, 1 Hanover Square, New York.

National Sheet Metal Contractors' Association. May 15 to 19. Convention and exposition, Cadle Tabernacle, Indianapolis.

National Association of Purchasing Agents. May 15 to 20. Annual convention and exposition, Exposition Park, Rochester, N. Y. Secretary, H. R. Haydon, 19 Park Place, New York.

American Iron, Steel & Heavy Hardware Association. May 23 to 25. Annual meeting, Hotel Washington, Washington. Secretary, A. H. Chamberlain, Marbridge Building, New York.

American Society for Steel Treating. May 25 and 26. Sectional meeting, Pittsburgh. Secretary, W. H. Elsenman, 4600 Prospect Avenue, Cleveland.

Iron and Steel Markets

FOCUSING ON PRICES

Attempts to Stabilize on Higher Levels

Operations Steady—February Iron and Steel Production at 35 Per Cent Above 1921 Rates

Definite efforts are now being made to stiffen steel prices. In a market still strongly in buyers' hands and not many mills with more than a month's business ahead, the leading Pittsburgh independent, which in recent weeks made a drive for current business, announced late on Monday a return to a basis of 1.50c., Pittsburgh, for plates, shapes and bars. The immediate effect has been to make buying at 1.35c. difficult and to focus on 1.40c. as a minimum for the heavy tonnage products.

The action, so far as it may now be gaged, has accentuated the disinclination of mills to consider forward buying at to-day's prices. It follows the refusal of several steel bar makers to take less than 1.40c., and on May 7 the leading Chicago independent put its heavy tonnage items up \$2 a ton.

Attempts to break through wire and sheet prices have proved unsuccessful. Some sheet makers are now selling the heavier blue annealed sheets on the straight sheet basis instead of the plate basis, as was the case in meeting competition with plate makers.

The first week of March has shown no general increase in operations. The Carnegie Steel Co. is to blow in another blast furnace next week, and one each will go in for the Republic and the Cambria companies for their Bessemer plants. Chicago remains a notably active center. The Illinois Steel Co. increased ingot production in the week from 55 to 63½ per cent.

No concern is shown over the impending coal strike. A substantial gain in bookings of wire products is credited to the recent stabilization of prices. In fuel, buying has been of an ordinary character, and prices are not much more than 25c. or 30c. above the low bases of January.

February pig iron production was 1,629,991 tons, or 58,214 tons per day. January's total for the 31 days was 1,644,951 tons, or 53,063 tons daily. Of the total daily increase of output of February over January, namely, 5151 tons, 4697 tons or over 90 per cent represented the gain of steel making furnaces.

On March 1 there were 138 furnaces in blast, operating at a rate of 59,080 tons per day, against 126 furnaces active on Feb. 1, at a daily capacity of 53,305 tons. A total of 17 furnaces was blown in, five of these merchant furnaces, and five went out of blast in the month, of which two were merchant furnaces.

The production of steel ingots for February, on a basis of the compilations of the American Iron and Steel Institute, indicates a total of 86,220 tons per day against 75,700 tons per day in January. The February rate was 26,800,000 tons per year, which is 35 per cent above the actual production of 1921 and the February rate of pig iron making, 22,250,000 tons, is likewise 35 per cent above the output of last year.

Buying of pig iron in the East has continued. In the New York district orders for about 20,000 tons of various grades were placed. Eastern Pennsylvania furnaces pretty generally have advanced prices and the market is firmer, but concessions are still made. At Chicago the withdrawal from the market of the steel works furnace which had been an active seller has had a steadying influence. In the South, the general selling price has receded 50c. to a basis of \$15, Birmingham. Stocks of Alabama pig iron declined from 157,000 tons Feb. 1 to 134,000 tons March 1.

THE IRON AGE composite pig iron price is now \$18.25 per gross ton against \$18.10 a week ago.

Competition in fabricated steel lines remains keen. On the 23,000 tons for the New York Central's bridge across the Hudson River, the notably low bid of \$68.60 per ton, fabricated and erected, was received. Upward of 15,000 tons of steel structures was put under contract, including tanks involving chiefly plates. New work totals about 16,000 tons, including a 6000-ton bridge for the Northern Pacific.

Little fresh railroad equipment work appeared. The Chicago & Northwestern is inquiring for 2750 cars, the Norfolk & Western for 2000 to 4000 70-ton steel cars and the Monon for 20 locomotives. In rails, 5000 tons for the Buffalo, Rochester & Pittsburgh was placed with a Buffalo mill.

Automobile makers of Detroit are operating at 55 to 75 per cent of capacity. An inquiry has come from that center for 2000 tons of sheets.

The agricultural implement makers have been heard from chiefly for orders to round out stocks in preparation for production.

Pittsburgh

PITTSBURGH, March 7.

The most interesting development of the week is the announcement of the Jones & Laughlin Steel Co., issued late yesterday afternoon, restoring the quotation of the early part of the year of 1.50c. on bars, plates and shapes. Officials of the company state that practically all lower quotations which have been out against these products have been withdrawn, and that 1.50c. now is the price either on old inquiries or new ones. The Carnegie Steel Co. has made no announcement yet of a change either in its prices or its sales policy and while it is possible that this company as well as the other independent companies may follow the advance, no definite developments yet have taken place other than that a Buffalo steel maker is reported to have withdrawn all outstanding quotations on hot rolled steel. Plates, shapes and bars at recent selling prices not only were considerably below producing costs but also well below the 10 year pre-war average. The move to put prices up, therefore, may be looked upon as an effort to reduce losses, and to bring these products more nearly in alignment with the prices of other lines of finished steel. The price has not been in effect long enough nor are a sufficient number of makers quoting this figure to give it standing as a quotation. Such business as has been done lately in plates, shapes and bars has in but few instances been at above 1.35c., Pittsburgh.

Betterment in steel business is well sustained and while there still is considerable doubt that the present upswing in the demand will prove long lived, it is a fact

Composite Price, March 7, 1922, Finished Steel, 1.998c. Per Lb.

Based on prices of steel bars, beams, tank plates, plain wire, open-hearth rails, black pipe and black sheets	Feb. 28, 1922, 1.998c. Feb. 7, 1922, 2.019c. Mar. 8, 1921, 2.771c. 10 year pre-war average, 1.689c.
These products constitute 88 per cent of the United States output of finished steel.	

Composite Price, March 7, 1922, Pig Iron, \$18.25 Per Gross Ton

Based on average of basic and foundry irons, the basic being Valley quotation, the foundry an average of Chicago, Philadelphia and Birmingham	Feb. 28, 1922, \$18.10 Feb. 7, 1922, 18.10 Mar. 8, 1921, 25.64 10-year pre-war average, 15.72
---	--

that in a number of products the mills have at least a month's business in sight. This is true of sheets and tin plate and the bookings of the wire manufacturers have gained substantially as a result of the stabilization in prices. There is an impression that the Jones & Laughlin Steel Co. accumulated a fair-sized backlog in the hot-rolled products before taking its recent action with regard to prices.

The railroads are evincing more interest in track material as the spring approaches, although making a strong effort to get prices down. Structural activities are showing more life and taking the general situation as it applies to the Pittsburgh district, it must be said that conditions are fairly satisfactory.

Activity still is lacking in the pig iron market outside of foundry grades and there is an utter absence of concern over the impending coal strike. Instead of an exerted demand for fuel in anticipation of a shortage, buying is of a most ordinary character and prices do not average much more than 25c. to 30c. a ton above the low point of January. Consumers generally are well

stocked, most of them having at least a month's supply in reserve, while a good deal of coal lately has been mined and current supply is more than sufficient for the present demand.

The scrap market still shows a strong tone due to purchases by dealers against recent sales in this and nearby districts, amounting to between 30,000 and 40,000 tons.

Plant activities have not changed greatly in the past week. The Carnegie Steel Co. is warming up one of its Isabella furnaces, at which it will be making iron by next week, while the Republic Iron & Steel Co. and the Cambria Steel Co. each are about ready to start up a furnace on Bessemer iron in connection with heavier operations of Bessemer converters. It is reported that a Valley furnace which is nearing the end of its supply of ore will go out of blast early in April.

Pig Iron.—There is a fairly good market in foundry iron, due to demands from radiator and sanitary ware interests, in addition to which producers report that shipping instructions against standing orders are more

insistent. One sanitary ware company has just closed for about 1000 tons of foundry iron, paying \$19, Valley furnace, for No. 2 grade. Furnaces outside the Valley also have obtained \$19 for the base grade, and there is considerable doubt that less than that price now can be done. Interest in the steel making grades is almost nil. The general asking price on basic is \$18, Valley furnace, but there has been no business here recently at above \$17.75. Valley furnace interests continue to quote Bessemer at \$19.50, but there is doubt that this price can be done since small lots have been sold for less, while the Cambria Steel Co. a short time ago took business at \$19, Johnstown, or \$20.96, delivered Pittsburgh, common rate points.

Iron and Steel Bars.—The advance to 1.50c., base, just announced by the Jones & Laughlin Steel Co., has not yet found any response among other makers. We note a sale of 800 tons of bars running 0.40 to 0.50 carbon, but reports about the price paid are conflicting. One is that the business was done at 1.30c., and the extra for carbon waived, and another that the price was 1.35c., plus the extra \$1 per ton for the carbon. Meanwhile several makers who have refused to go below 1.40c. still are holding to that figure. Reinforcing bar inquiries generally are for small tonnages. The R. R. Kitchen Co., Wheeling, W. Va., has the contract for a 10-story reinforced concrete office building to be erected in Wheeling, but has not yet put out the inquiry for the bars required. Inquiry for iron bars is reported to be somewhat better than it was recently.

We quote Valley furnace, the freight rate for delivery to the Cleveland or Pittsburgh district being \$1.96 per gross ton:

Basic	\$17.75 to \$18.00
Bessemer	19.00 to 19.50
Gray forge	18.75
No. 2 foundry	19.00
No. 3 foundry	18.75
Malleable	19.00

Ferroalloys. The market does not change much. While small tonnages of 80 per cent ferromanganese are being moved at \$62.50 Atlantic seaboard, for domestic material, large tonnage consumers are hesitating about placing orders at that figure, and apparently are finding accommodation at less money. The American Steel Foundries has an inquiry out for from 200 to 300 tons of this material. No German ferromanganese is being offered at present because most German makers have been out of production in the past few weeks on account of labor troubles. The latest advice is that there has been a resumption, but until an exportable surplus has been built up, German makers probably will remain out of the market. Interest in spiegeleisen has dwindled following the recent purchases by Youngstown and Canton, Ohio, consumers. The New Jersey Zinc Co. will blow in a furnace on spiegeleisen at Hazard, Pa., March 15. Spot supplies of spiegeleisen are very limited and no official announcement has been made with regard to forward deliveries. The market for 50 per cent ferrosilicon is dull and nominal.

We quote 78 to 82 per cent ferromanganese, \$62.50 c.i.f. Atlantic seaboard for domestic and English. Average 20 per cent spiegeleisen, nominal; 16 to 18 per cent, \$30 to \$35, delivered Pittsburgh or Valleys; 50 per cent ferrosilicon, domestic, \$56 to \$60 furnace, freight allowed. Bessemer ferrosilicon is quoted f.o.b. Jackson and New Straitsville, Ohio, furnaces as follows: 10 per cent, \$36.50; 11 per cent, \$39.80; 12 per cent, \$43.10; 13 per cent, \$47.10; 14 per cent, \$52.10; silvery iron, 6 per cent, \$25; 7 per cent, \$26; 8 per cent, \$27.50; 9 per cent, \$29.50; 10 per cent, \$31.50; 11 per cent, \$34; 12 per cent, \$36.50. The present freight rate from Jackson and New Straitsville, Ohio, into the Pittsburgh district is \$1.06 per gross ton.

Steel Skelp.—The going quotation on steel pipe skelp is 1.40c., but inquiries generally are for small tonnages and it is probable that sizable tonnages could be placed for less.

Wire Rods.—The recently established price of \$36 for the base size of soft rods has found some basis in sales, and as a result of a steadier market in the finished products, orders and specifications again are on the increase. Prices are given on page 685.

Wire Products.—A firm stand by makers at \$2.40 base per keg for nails and \$2.25 base per 100-lb. for bright and annealed wire has given buyers some con-

fidence in the stability of the market and this finds reflection in larger orders and specifications. The demand is well distributed among the different products and the manufacturers are looking forward hopefully to a fairly good spring business. Concessions from established minimum quotations are practically unheard of because of advices to branch offices that no consideration would be given to orders carrying lower prices. Mills in this district are operating at about 60 per cent of capacity.

We quote wire nails at \$2.40 base per keg, Pittsburgh, and bright basic and Bessemer wire at \$2.25 base per 100 lb., Pittsburgh.

Billets, Sheet Bars and Slabs.—Open market activities are limited. Such demands as are coming out for the various forms of steel usually are for one or two carloads and early delivery is specified in all instances. There is no change in prices. Re-rolling billets still are available at \$28 Pittsburgh, or Youngstown, for 4-in. and larger, while the common quotation on small billets is \$29, Pittsburgh or Youngstown. The market on sheet bars still is commonly regarded as \$29, Pittsburgh or Youngstown, with freight rates equalized to point of consumption. A few small sales of forging billets have been made at \$32 Pittsburgh.

We quote 4 x 4-in. soft Bessemer and open-hearth billets at \$28; 2 x 2-in. billets, \$29; Bessemer and open-hearth sheet bars, \$29; slabs, \$28; forging billets, ordinary carbons, \$32, all f.o.b. Youngstown or Pittsburgh mills.

Steel Rails.—The market on light sections rolled from billets hardly is quotable on sales at more than 1.40c., base, although the Carnegie Steel Co. still is quoting 1.45c. Demand is lighter than it has been, but there is a fairly large aggregate tonnage in the small orders coming from coal mine operators for prompt shipment. Light rails rolled from old standard sections still are readily available at 1.35c. base mill. The local standard rail unit of the Steel Corporation has enough business in sight to keep it steadily engaged until about July 1. This year's bookings were about 100,000 tons while unspecified tonnages, carried over from last year, amounted to about 50,000 tons. The Baltimore & Ohio Railroad is reported to have withdrawn a recent inquiry for 17,000 tons.

We quote 25 to 45-lb. sections, rolled from new steel, 1.40c. base; rolled from old rails, 1.35c. base; standard rails, \$40 per gross ton mill for Bessemer and open-hearth sections.

Iron and Steel Pipe.—Orders for merchant steel pipe show a well sustained betterment, but it is commented upon that jobbers still are placing only such tonnages as they see a probable need for. The fact that considerable uncertainty as to the course of prices still exists tends to make jobbers cautious about anticipating their needs. As the spring approaches, more interest is being shown in oil country goods and inquiries for line pipe are more numerous. Among the latter are three lines out of the Wyoming field calling for a total of about 125 miles of 6-in. and 8-in. pipe. These are expected to be closed before long, as is also the order for 98 miles of 12-in. gas pipe line to be laid by the Southern Carbon Co. from the Munroe, La., field to Alexandria, La. Some low prices are coming out against line pipe inquiries. Card discounts are given on page 685.

We quote steel bars rolled from billets at 1.30c. to 1.40c.; reinforcing bars, rolled from billets, 1.30c. to 1.40c. base; reinforcing bars, rolled from old rails, 1.25c. to 1.30c.; refined iron bars, 2c. to 2.10c. in carloads, f.o.b. mill, Pittsburgh.

Structural Material.—Steel for the new Mellon National Bank Building, Pittsburgh, which will be a three-story, instead of a four-story structure, and for which 1650 tons will be required, will be furnished by the American Bridge Co., which also has taken 1000 tons of eye-bars and buckle plates for the Fort Pitt Bridge Co., for the Sixteenth Street bridge, Pittsburgh; 350 tons of beams for reinforcing work in a building of the Armstrong Cork Co., Pittsburgh, and 800 tons for a new building for the Commercial Savings Bank & Trust Co., Toledo, Ohio. The Ritter-Conley Co. has taken a contract for 10 steel barges for the Island Creek Coal Co., Huntington, W. Va., requiring 1600 tons of steel, mostly plates. The P. H. Kelly Co., Philadelphia, has a contract for the erection of a junior high school, Monessen, Pa., for which about 100 tons of steel will be required. Inquiry still is brisk and

fabricating interests are looking forward to a good spring business. Few companies, however, have very full order books, and competition for work is so sharp that very low prices still prevail. Plain material demands are larger than they were earlier in the year, but there is still considerable room for improvement. The quotable market still is 1.35c. to 1.40c. Prices are given on page 685.

Plates.—Such business as has lately been done has been at about 1.35c., Pittsburgh. There was one sale of 2000 tons at that figure to a local tank and boiler company, which has the contract for a riveted pipe line for Bay City, Mich. About 2500 tons of plates will be required for 10 55,000-barrel tanks recently awarded the Riter-Conley Co. by the South Penn Oil Co. The advance to 1.50c. for plates by one company has not yet been followed by other makers, and on the basis of business done the market remains quotable at the recent range.

We quote sheared plates, $\frac{3}{4}$ in. and heavier, tank quality, at 1.35c. to 1.40c., f.o.b. Pittsburgh.

Sheets.—Last week was one of the best in the history of the American Sheet & Tin Plate Co. in the matter of orders and specifications and the experience of independent manufacturers has been only slightly less favorable. There is no marked tendency on the part of buyers to anticipate their requirements, the bulk of the orders being for early shipment, but consumers' stocks have been allowed to run so low that actual needs are becoming more pressing. Deviations from regular market quotations are few and unimportant. The leading interest has about 70 per cent of its sheet capacity in operation while independent schedules call for about 60 per cent operations. Prices are given on page 685.

Tin Plate.—Consumers still are specifying with considerable freedom against contracts, and these demands rather than new ones, are keeping mills here and in nearby districts running at a high rate. The Weirton Steel Co., the Trumbull Steel Co., the Jones & Laughlin Steel Co., the Standard Tin Plate Co., Washington Tin Plate Co. and the American Steel Co. all have all of their tin mills in full operation this week, while the Wheeling Steel Corporation now has five mills on at Yorkville, Ohio, where an effort is being made to operate on an open shop basis. The tin plate making subsidiary of the Steel Corporation is running about 60 per cent of capacity, but this is a natural result of the fact that many of its large customers anticipated their requirements and during that period the operation of this company ran well ahead of the independent mill activities. The "official" quotation on standard cokes remains at \$4.75 per base box, Pittsburgh, but the common basis on most mills to regular customers is \$4.60 and in some markets, notably in the East, even less than that price has been done. In a general way, however, there is fairly close observance of \$4.60 as a minimum.

We quote standard production coke tin plate, \$4.60 per base box f.o.b. Pittsburgh for carload lots.

Cold-Finished Steel Bars and Shafting.—There is a better demand from the automotive industry, but other consuming industries are providing little or no business and the aggregate of orders still is unsatisfactory. Agricultural implement manufacturers are carrying rather big stocks of both bars and completed machines and are not expected to be buyers of bars until this year's crops have been garnered and farmers are buying more tools. Machine tool makers also are negligible factors because they have so many machines made up and which are moving out slowly. The general quotation is 1.90c. base, Pittsburgh, but this price is being shaded \$1 to \$2 a ton on attractive orders. Ground shafting holds at 2.25c. base, mill, for carloads.

Hoops and Bands.—The market shows little life and prices are irregular and unsettled. On hoops most makers are trying to hold the market at 1.90c. base, Pittsburgh, but on inquiries of sufficient size to cause competition, that price is being shaded \$1 to \$2 a ton. Bands range from 1.75c. to 1.90c., but only retail lots command the higher figure.

Hot-Rolled and Cold-Rolled Strips.—Business is looking up and most makers now have fair-sized order

books. Mill operations average about 50 per cent, this being the highest rate in several months. Enlarged automobile plant operations and schedules are one reason, but other consuming industries also are busier. Some second quarter specifications are coming out, but as a rule buying is for early delivery. Prices do not change much. Cold-rolled strips are fairly steady at 3.50c. base, Pittsburgh, and hot-rolled from 1.75c. to 1.85c. for large lots and 1.90c. to 2c. for small quantities.

Spikes and Track Bolts.—The approach of spring is bringing increase in inquiries from the railroads for track material, but they are buying cautiously and trying hard to get prices down. On very large lots of standard spikes, \$2 base per 100 lb. is possible, but on smaller lots such as are being bought the going price is \$2.10. Track bolts are rated at \$3 base per 100 lb. for carloads. An effort is being made to get 1c. per lb. more for less than carloads, but is not especially successful. Tie plate inquiries are numerous, but sales are moderate. The market is quotable from \$33 to \$38 per net ton, depending on specifications and tonnages involved. Prices are given on page 685.

Coke and Coal.—The coke market is considerably quieter than it was recently, and while it still is possible for producers to obtain recent maximum quotations of \$3.50 per net ton oven for furnace grade, and about \$1 per ton more for foundry coke, there is rather more resistance to these prices on the part of buyers than there was recently. Small tonnages have sold 25c. per ton below these figures and there is a possibility of \$3.25 becoming a common quotation on furnace coke soon, through the release of tonnages now moving on short term contracts. A Buffalo steel making interest making its own by-product plant on union coal is seeking 15,000 tons of beehive oven coke a month for second quarter delivery, rather than take the chance of not being able to get coal from its own properties in the event of a strike. Quotations of \$3.50 against this inquiry have been rejected as too high. Stocking of foundry coke still is going on and is the sustaining influence on prices. Steam coal still is available at \$1.50 to \$1.85 for mine run grade, by-product from \$1.75 to \$2 and non-union gas coal from \$2.15 to \$2.40.

Old Material.—Apparently some of those who recently took business from the steel makers here and in nearby districts sold short against a considerable portion of the tonnages and covering of these sales now is the sustaining influence on prices. Offerings at the moment are moderate because production is seasonably light and prices are not high enough to permit the shipment of material from dealers' yards. Offerings of steel scrap by the New York Central and Erie Railroads brought \$15.35 to \$15.40 Youngstown, and as high as \$15.75, Pittsburgh, was paid on the steel offered by the Pennsylvania Railroad, Central Region. The latter is being applied on contracts carrying a maximum price of \$15. The market is rather soft on cast iron scrap for foundry use, but steel makers want heavy breakable cast and are paying relatively high prices.

We quote for delivery to consumers' mills in the Pittsburgh and other districts taking the Pittsburgh freight rate, as follows:

Heavy melting steel, Steubenville, Follansbee, Brackenridge, Monessen, Midland and Pittsburgh.....	\$15.00 to \$15.50
No. 1 cast, cupola size.....	15.75 to 16.25
Re-rolling rails, Newark and Cambridge, Ohio; Cumberland, Md.; Huntington, W. Va., and Franklin, Pa.....	15.00 to 15.50
Compressed sheet steel.....	13.00 to 13.50
Bundled sheets, sides and ends.....	12.00 to 12.50
Railroad knuckles and couplers.....	15.50 to 16.00
Railroad coil and leaf springs.....	15.50 to 16.00
Low phosphorus standard bloom and billet ends.....	17.00 to 17.50
Low phosphorus plates and other grades.....	16.50 to 17.00
Railroad malleable.....	13.00 to 13.50
Iron car axles.....	23.00 to 24.00
Locomotive axles, steel.....	21.00 to 22.00
Steel car axles.....	15.50 to 16.00
Cast iron wheels.....	15.50 to 16.00
Hot-rolled steel wheels.....	15.50 to 16.00
Machine shop turnings.....	10.00 to 10.50
Sheet bar crop ends.....	15.00 to 16.00
Heavy steel axle turnings.....	12.00 to 12.50
Short shoveling turnings.....	11.50 to 12.00
Heavy breakable cast.....	14.75 to 15.25
Stove plate.....	12.50 to 13.00
Cast iron borings.....	11.50 to 12.00
No. 1 railroad wrought.....	12.50 to 13.00

Chicago

CHICAGO, March 7.

February records of local steel mills show marked gains over January in shipments, orders booked and production. For one important Chicago producer shipments increased 33 per cent, orders booked increased 32 per cent and ingot production 52 per cent. That this general betterment is continuing is indicated by current operating reports. The Illinois Steel Co. has blown in its thirteenth furnace, giving it seven active stacks at Gary, four at South Works and two at Joliet, and has increased its ingot production during the week from 55 per cent to 63½ per cent. Of the company's individual plants, the Gary works is leading, having reached an operating basis of 77 per cent last week. The Inland Steel Co. continues to run at 60 per cent with every prospect of bettering that record next week.

Undoubtedly the large tonnages bought by railroads and car builders account in considerable measure for the improvement in mill operations, but miscellaneous demand also continues to expand steadily, although consisting mainly of small individual orders. In fact, the mills are not encouraging forward buying, being unwilling to book plates, shapes and bars at current prices for delivery beyond March. The trend toward greater firmness in these three commodities is indicated by an announcement made by the Inland Steel Co. to-day that no further business will be taken at less than 1.60c., Indian Harbor.

The threatened coal strike has had little perceptible effect on either the steel or pig iron markets up to date. The only precautionary measures taken so far have had to do with fuel requirements, orders for foundry and furnace coke being more numerous. Connellsville foundry has advanced to a minimum of \$4.50 ovens, while local by-product foundry coke remains unchanged at \$10.75, delivered Chicago switching district.

Another labor controversy was reopened to-day in Chicago when the United States Railroad Labor Board started hearings on an application of the railroads for a general reduction in wages back to the basis existing before the advance of 1920.

Ferroalloys.—An inquiry for 200 tons of ferromanganese is before the trade and several carlot inquiries for spiegeleisen are pending. Prices on these alloys are firm and it is notable that available furnace stocks of spiegeleisen are very low.

We quote 78 to 82 per cent ferromanganese, \$70.90, delivered; 50 per cent ferrosilicon, \$56 to \$57.50, delivered; spiegeleisen 16 to 18 per cent, \$40.10, delivered.

Pig Iron.—Notwithstanding occasional signs of weakness such as were noted a week ago, the local iron market is growing firmer as the steel works which has been long a source of active competition becomes less of a factor in the market. This interest has all the merchant iron bookings it can handle for a considerable period ahead, and at the same time must use an increasingly large proportion of its blast furnace output as the operations of its mills expand. So far as Chicago and immediate surrounding territory are concerned, a minimum price of \$20 local furnace is well established. Concessions are being made only in competitive territory where the delivered prices of outside furnaces figure lower than that of Chicago producers. On the whole, the market is quieter than before the advance, and it is probable that melters are delaying action on large inquiries until they are thoroughly convinced that the present market will hold. New inquiries of any size are few. The National Sewing Machine Co., Belvidere, Ill., wants 200 tons of foundry for April shipment. The Chicago Hardware Foundry Co. is in the market for 500 tons of Southern foundry for delivery at North Chicago. Sales of Southern foundry in this territory are increasing, one broker reporting total bookings of 2000 tons within the past week. The Kewanee Boiler Co., Kewanee, Ill., has bought 500 tons of Southern foundry for delivery by the water and rail route. Iron moved north in this manner is quoted at \$20.77, delivered Chicago, while the lowest competing Southern price is \$15 base, Birmingham, or \$21.67, Chicago. Practically all charcoal iron producers are

now quoting \$22.50, base furnace. A local melter has bought 300 tons of copper bearing low phosphorus at approximately the market, which is \$2 below copper free material.

Quotations on Northern foundry, high phosphorus malleable and basic irons are f.o.b. local furnace and do not include a switching charge averaging 70c. per ton. Other prices are for iron delivered at consumers' yards, or when so indicated, f.o.b. furnace other than local.

Lake Superior charcoal, averaging sil. 1.50, delivered at Chicago.....	\$26.00
Northern coke, No. 1, sil. 2.25 to 2.75.....	20.50
Northern coke, foundry, No. 2, sil. 1.75 to 2.25.....	20.00
Northern high phos.....	20.00
Southern foundry, sil. 1.75 to 2.25....	\$20.77 to 21.67
Malleable, not over 2.25 sil.....	20.00
Basic.....	20.00
Low phos., Valley furnace, sil. 1 to 2 per cent copper free.....	30.00
Silvery, sil. 8 per cent.....	32.82

Railroad Equipment.—The Chicago & Northwestern has put out an inquiry for 2750 freight cars, including 1250 box, 500 stock, 250 gondola, 500 flat and 250 refrigerator cars. The Monon is inquiring for 20 locomotives.

Steel Castings.—Orders for the miscellaneous castings for the Burlington cars have been distributed under protections granted by the foundries 90 days ago. The Standard Steel Car Co. has let the castings for 2600 refrigerator cars for the Pacific Fruit Express to the Ohio Steel Foundry Co.

Bars.—Demand from jobbers and miscellaneous manufacturers is increasing in volume and there continues to be a fair amount of reinforcing business. Automobile manufacturers in the Detroit district are now operating at from 65 to 75 per cent of capacity and the implement makers are placing more orders to round out their stocks in preparation for a resumption of production. In the reinforcing field, bids were taken yesterday on 300 tons for the Children's Hospital and Nurses' Home, Milwaukee. An inquiry from the Great Northern for 800 tons for Lake Superior docks is pending. Prices on mild steel bars are unchanged. Bar iron mills continue to operate intermittently. As bar iron is selling at a higher figure than steel bars, the latter product is being substituted for purposes for which bar iron was customarily used.

Mill prices are: Mild steel bars, 1.50c. to 1.60c., Chicago; common bar iron, 1.55c. to 1.60c., Chicago; rail carbon, 1.50c., mill or Chicago.

Jobbers quote 2.53c. for steel bars out of warehouse. The warehouse quotation on cold-rolled steel bars and shafting is 3.40c. for rounds and 3.90c. for flats, squares and hexagons. Jobbers quote hard and medium deformed steel bars at 1.90c. base. Hoops and bands, 3.13c.

Sheets.—Jobbers and manufacturing consumers alike are taking an active interest in the market and prices are increasingly firm. Some mills are now selling Nos. 10 and 12 gage blue annealed on a straight sheet basis, whereas until recently they took some business on a plate basis to meet plate mill competition.

Mill quotations are 3c. for No. 28 black, 2.25c. for No. 10 blue annealed and 4c. for No. 28 galvanized, all being Pittsburgh prices, subject to a freight rate to Chicago of 38c. per 100 lb.

Jobbers quote: Chicago delivery out of stock, No. 10 blue annealed, 3.38c.; No. 28 black, 4.15c.; No. 28 galvanized, 5.15c.

Wire Products.—Demand shows some improvement and prices are on a firmer footing, but buying is not yet on the scale to be expected at this season of the year. With the improvement in the grain and live stock markets, however, jobbers serving the agricultural districts look forward to increased trade. For mill prices, see finished iron and steel, f.o.b. Pittsburgh, page 685.

We quote warehouse prices f.o.b. Chicago: No. 9 and heavier black annealed wire, \$2.85 per 100 lb.; No. 9 and heavier bright basic wire, \$3 per 100 lb.; common wire nails, \$3 per 100 lb.; cement coated nails, \$2.50 per keg.

Warehouse Prices.—Local jobbers have reduced wire and nails to the prices appended under the wire products paragraph.

Rails and Track Supplies.—The Missouri Pacific has placed 18,000 tons of rails, of which 12,000 went to the Colorado mill, 2000 to Tennessee, 3000 to Gary and 1000 to Inland. The Illinois Central has bought 2000

kegs of track spikes at less than 2.40c., delivered. There is still considerable business in track supplies pending and it is notable that rail specifications received at the Gary mill are increasingly liberal.

Standard Bessemer and open-hearth rails, \$40; light rails rolled from new steel, 1.50c. to 1.60c., f.o.b. makers' mills.

Standard railroad spikes, 2.05c. to 2.10c., Pittsburgh; track bolts with square nuts, 3.05c. to 3.10c., Pittsburgh; tie plates, steel and iron, 1.65c. to 1.75c., f.o.b. mill; angle bars, 2.40c., f.o.b. mill.

Plates.—The steady expansion in demand from miscellaneous sources is regarded as of far greater significance than the business recently placed by carbuilders which, although involving large individual tonnages, is believed to be of a temporary character. It is the smaller orders, from jobbers, boiler plants, fabricators, and numerous small manufacturers upon which the mills must depend for anything approaching steady operations and the fact that this class of business is slowly increasing is considered an indication of general industrial revival. In this connection it is notable that jobbers are now laying in stocks not only of plates, but also structural shapes, bars and sheets. At the same time, mills are showing less inclination to accept orders at current prices for forward delivery beyond March. The Sinclair Oil Co. has let 10 oil tanks, involving 3000 tons of plates, to the Chicago Bridge & Iron Co. and still has 10 tanks to place. The tanks are to be erected in Kansas and Oklahoma.

The ruling mill quotations range from 1.50c. to 1.60c., Chicago. Jobbers quote 2.63c. for plates out of stock.

Bolts and Nuts.—Demand is slowly expanding with business coming in from jobbers, railroads, automobile makers and miscellaneous manufacturers. While the market is still weak, bolt and nut makers in this district are in many cases selling at the discounts published on page 685, f.o.b. their plants.

Jobbers quote structural rivets, 3.43c.; boiler rivets, 3.53c.; machine bolts up to $\frac{3}{8}$ x 4 in., 60, 10 and 10 per cent off; larger sizes, 60 to 10 off; carriage bolts up to $\frac{3}{8}$ x 6 in., 60 and 10 off; larger sizes, 55 and 5 off; hot pressed nuts, square and hexagon tapped, \$3.75 off; blank nuts, \$4 off; conch or lag screws, gimlet points, square heads, 65 and 5 per cent off. Quantity extras are unchanged.

Structural Material.—Fabricating shops in this district are not operating nearly so well as the mills, but they are looking forward to better business as the season progresses. The past week, however, has been rather disappointing both from the standpoint of lettings and new inquiries. Awards include:

Elks' Building, Bakersfield, Cal., 408 tons, to Golden Gate Iron Works.

Mt. Vernon Car Mfg. Co., truck shop, Mt. Vernon, Ill., 450 tons, to McClintic-Marshall Co.

Kansas City Cold Storage & Warehouse Co., plant, Kansas City, Mo., 218 tons, to Kansas City Structural Steel Co.

Palmolive Co., plant, Milwaukee, 120 tons, to Milwaukee Structural Steel Co.

School, Whiting, Ind., 125 tons, to Duffin Iron Works.

Interstate toll bridge, Prescott, Wis., for Prescott Bridge Co., 360 tons, to Milwaukee Bridge Co.

Pending business includes:

Milwaukee Sewerage Commission, power and boiler house for Jones Island disposal plant, 530 tons, bids to be in March 10.

Indianapolis Athletic Club, 1425 tons.

Wild Bank Building, Indianapolis, 515 tons.

Masonic Temple, Aurora, Ill., 300 tons, W. Q. Bendus, Chicago, architect.

The mill quotation on plain material ranges from 1.50c. to 1.60c., Chicago. Jobbers quote 2.63c. for plain material out of warehouse.

Cast-Iron Pipe.—The Milwaukee Department of Public Works takes bids March 14 on 1430 tons of 6- to 16-in. water pipe and specials. The United States Cast Iron Pipe & Foundry Co. will furnish 1350 tons for Chicago, and the Lynchburg Foundry Co. has the contract for 110 tons for Muskegon, Mich. The market has a firmer tone with 6-in. and over at a minimum of \$33, Birmingham.

We quote per net ton, f.o.b. Chicago, as follows: Water pipe, 4-in., \$46.10 to \$47.10; 6-in. and above, \$42.10 to \$43.10; class A and gas pipe, \$3 extra.

Old Material.—The market shows greater strength and numerous grades have advanced 25c. to 50c. a ton, but it is notable that conservative buying is conservative with a tendency towards contraction as prices go

up. In fact, some buyers are of the opinion that the current rise in the market is due in large measure to trading between dealers as well as to speculative buying of railroad material. On the other hand, there are those who feel that a sustained swing upward has started which will accompany an increase in industrial activity which has already made itself apparent in more widely distributed sales of scrap. Railroad offerings include the Santa Fe, 2500 tons; the Union Pacific 2000 tons; and the Soo Line, and the Chicago and Eastern Illinois, 500 tons.

We quote delivery in consumers' yards, Chicago and vicinity, all freight and transfer charges paid, as follows:

Per Gross Ton	
Iron rails	\$16.00 to \$16.50
Relaying rails	20.00 to 25.00
Cast iron car wheels	15.50 to 16.00
Rolled or forged steel car wheels ..	13.50 to 14.00
Steel rails, rerolling	12.50 to 13.00
Steel rails, less than 3 ft.	13.25 to 13.75
Heavy melting steel	11.75 to 12.25
Progs, switches and guards cut apart	11.75 to 12.25
Shoveling steel	11.25 to 12.75
Low phos., heavy melting steel	13.50 to 14.00
Drop forge flashings	7.75 to 8.25
Hydraulic compressed sheet	8.50 to 9.00
Axle turnings	8.50 to 9.00
Per Net Ton	
Iron angles and splice bars	14.25 to 14.75
Steel angle bars	11.50 to 12.00
Iron arch bars and transoms	16.00 to 16.50
Iron car axles	19.50 to 20.00
Steel car axles	13.00 to 13.50
No. 1 busheling	9.00 to 9.50
No. 2 busheling	6.00 to 6.50
Cut forge	10.25 to 10.75
Pipes and flues	7.25 to 7.75
No. 1 railroad wrought	11.25 to 11.75
No. 2 railroad wrought	10.75 to 11.25
Steel knuckles and couplers	12.00 to 12.50
Coil springs	12.75 to 13.25
No. 1 machinery cast	13.75 to 14.25
No. 1 railroad cast	13.25 to 13.75
Low phos. punchings	11.00 to 11.50
Locomotive tires, smooth	10.00 to 10.50
Machine shop turnings	5.50 to 6.00
Cast borings	7.00 to 7.50
Stove plate	12.50 to 13.00
Grate bars	10.50 to 11.00
Brake shoes	10.50 to 11.00
Railroad malleable	12.00 to 12.50
Agricultural malleable	12.00 to 12.50

Buffalo

BUFFALO, March 6.

Pig Iron.—Probably at no time in the history of the Buffalo market has such a peculiar condition existed; with improved demand for every grade of iron, prices are perhaps weaker than at any stage since the inception of the depression. Some sales of Buffalo iron at \$18 have been made at New England points and for delivery in Buffalo and the immediate territory \$18.25 and \$18.50 for silicon 1.75 to 2.25 is a common consideration. About 14,000 tons have been sold and inquiry is much brighter. More foundries are operating in a limited way. A furnace quoting \$19, and not particularly keen to take business at that figure, has sold nothing. A firmer market is expected if the coal strike becomes a certainty. Out of a total volume of sales by one furnace amounting to 8000 tons, one was for 1000 tons and several for 400 and 500 ton lots.

We quote f.o.b. per gross ton Buffalo as follows:

No. 1 foundry, 2.75 to 3.25 sil.	\$19.00 to \$19.50
No. 2X foundry, 2.25 to 2.75 sil.	18.50 to 19.00
No. 2 plain, 1.75 to 2.25 sil.	18.00 to 18.50
Basic	18.00 to 18.25
Malleable	18.50 to 19.00
Lake Superior charcoal	27.75

Finished Iron and Steel.—Very definite improvement has appeared and in some materials sales have exceeded the present rate of production. Bars have been in good demand and in cold finished and wire products orders have come in since the beginning of March at a brisker rate than in any like period in a year. Buyers are apparently confident they will not see a lower market this year with particular reference to sheets. The price of \$2.25 for No. 10 gage blue annealed and \$3 for black has not been disturbed in the face of keen competition. In Buffalo a number of sales of tonnages varying from 25 to 100 tons at the above prices f.o.b. Pittsburgh have created confidence in the strength of the sheet market. Immediate delivery is the first requirement of most of

this business from buyers who have been out of the market for some time.

We quote warehouse prices f.o.b. Buffalo as follows: Structural shapes, 2.65c.; plates, 2.65c.; plates, No. 8 gage, 3.35c.; soft steel bars and shapes, 2.55c.; hoops and bands, 3.15c.; blue annealed sheets, No. 10, 3.40c.; galvanized steel sheets, No. 28, 5.25c.; black sheets, No. 28, 4.25c.; cold-rolled strip steel, 5.90c.; cold-rolled round shafting, 3.40c.

Warehouse Business.—Plate demand has been especially good and signs of better business in structural shapes are appearing with the progress of the spring season. March business to date has been generally more satisfactory than in January or February. Repairs to equipment of plants at Niagara Falls have developed some satisfactory business and a general overhauling of machinery in the chemical industries of that city seems to be going on.

Coke.—Efforts to anticipate future needs by stocking up far ahead have brought about price advances and best grades are quoted at \$4.50 to \$5.50 ovens for foundry coke.

Old Material.—While trade in all lines of old material is lively and demand better than in months, prices remain the same. The one mill which has been in the market for heavy melting steel for some time is still able to buy at \$13.50. Outside Buffalo it is understood that steel is quoted higher, and in railroad lists which closed March 2 quotations of \$15.50 Youngstown ruled. Demand for borings and turnings continues to increase and in all materials the week was the best this year.

We quote dealers' asking prices per gross ton f.o.b. Buffalo as follows:

Heavy melting steel	\$13.00 to \$14.00
Low phos., 0.04 and under	17.00 to 18.00
No. 1 railroad wrought	15.00 to 16.00
Car wheels	16.50 to 17.50
Machine shop turnings	7.50 to 8.00
Cast iron borings	7.00 to 8.00
Heavy axle turnings	10.50 to 11.50
Grate bars	12.00 to 13.00
No. 1 bushing	10.00 to 11.00
Stove plate	15.00 to 16.00
Bundled sheet stampings	8.00 to 9.00
No. 1 machinery cast	17.00 to 18.00
Hydraulic compressed	10.50 to 11.50
Railroad malleable	13.00 to 14.00

Cleveland

CLEVELAND, March 7.

Iron Ore.—It is reported that the railroads in the central territory will make a 15 per cent reduction in carrying rates on ore from lower lake ports to interior furnaces about April 1. Ore shippers have been advised that the matter is under consideration and the report of a 15 per cent cut has reached them from sources that lead them to give it considerable credence. It has been reported that the railroads in the Eastern territory may make a 28 per cent reduction on ore rates April 1. Information received by local ore shippers indicates that the proposed Eastern reduction will apply to Southern and New York ore as well as to imported ore. The final hearing in the ore rate case before the Interstate Commerce Commission which was to have started in Chicago yesterday has been postponed until March 21 at the request of the railroads. The improvement in the iron and steel industry will be reflected somewhat in the ore mining industry. Because of the better outlook for iron and steel, Oglebey, Norton & Co. will resume operations in their Eureka mine in the Gogebic range within a few days. Ore shipments from dock continue very light. During February, dock shipments amounted to only 166,507 gross tons as compared with 211,533 tons in January and with 523,098 tons during February, 1921. The balance on Lake Erie docks March 1 was 8,057,958 tons as compared with 8,699,284 tons on the same day last year.

We quote delivered lower lake ports: Old range Bessemer, 55 per cent iron, \$6.45; Old range non-Bessemer, 51½ per cent iron, \$5.70; Mesabi Bessemer, 55 per cent iron, \$6.30; Mesabi non-Bessemer, 51½ per cent iron, \$5.55.

Pig Iron.—The market continued fairly active during the week with a large number of small-lot sales. Some producers report a further improvement in shipments. One lake furnace booked 7,000 tons during the week, this being made up of over 50 orders which with two or three exceptions, were for small lots. While

most orders are for delivery over a period of 60 days or less, some consumers are showing a disposition to contract for longer periods. The largest order reported was for 1,000 tons of malleable iron for delivery until July 1, this coming from a Michigan foundry that specializes in automobile castings. An Indianapolis melter purchased 300 tons of malleable iron. Recent price levels are being maintained. Lake furnace quotations on foundry iron range from \$19 to \$20, but the lower price generally prevails except for nearby shipment and one or two lake furnaces will still go to \$18.50 for foundry iron for shipment to some competitive points. For Cleveland delivery, local furnaces quote No. 2 foundry iron at \$19 to \$19.50 at furnace. One Cleveland pig iron interest which expects to put a furnace in blast shortly unless a coal strike interferes has withdrawn from the market as it has only sufficient stock to fill existing orders. We note the sale of 200 tons of Ohio silvery iron to an Indiana melter at the regular price.

Quotations below are f.o.b. local furnace for Northern foundry iron, not including a 56c. switching charge. Other quotations are delivered Cleveland, being based on a \$1.96 freight rate from Valley points, a \$3.36 rate from Jackson and a \$6.67 rate from Birmingham:

Basic	\$19.71
Northern No. 2 fdy., sil. 1.75 to 2.25	\$19.00 to 19.50
Southern fdy., sil. 1.75 to 2.25	22.17
Ohio silvery, sil. 8 per cent	30.86
Standard low phos., Valley furnace	32.00

Semi-Finished Steel.—The demand for sheet bars has improved, but mills are still buying in small lots, purchasing one week for the following week's requirements. Prices are apparently well established at \$29, Youngstown, for sheet bars and \$28 for slabs.

Finished Material.—The demand has further improved. While business is still mostly in car lots, larger orders have become more plentiful. These include 500 tons of bars placed by a spark plug manufacturer, 350 tons from a rivet manufacturer, and 500 tons of plates and structural material placed by a jobber. The most important development in the price situation was the announcement to-day of a price advance to 1.50c. on steel bars, plates and structural material by the Jones & Laughlin Steel Co. While it is too early to judge the effect of the price advance by the Pittsburgh company on other producers, it is believed that with the existing sentiment among sellers it will result in a little stiffening of prices all around. However, the market is still quotable at 1.40c. for steel bars, plates and structural material for desirable orders. A local mill continues to take a fair amount of business in plates in the lighter gages at 1.50c. to 1.60c. The Otis Steel Co. has its Lakeside plate mill in operation this week for the first time since December. Hard steel reinforcement bars are very irregular. Some rerolling mills are apparently using their location as basing points and are naming prices equivalent to below 1.35c., Pittsburgh. The contractor for the Baldwin Reservoir, Cleveland, is about to place 2000 tons of twisted square or deformed bars for that work. The strike in the building trades in Cleveland has put a stop to all the larger building work and little new inquiry for fabricating material has come out. The American Bridge Co. has taken the Commercial Trust and Savings Bank Building, Toledo, requiring 250 tons, and an inquiry is out for 200 tons for a school building at Painesville, Ohio. Fabricators are figuring on Northern Pacific bridge work requiring 6000 tons of steel.

Jobbers quote steel bars, 2.36c.; plates and structural shapes, 2.46c.; No. 9 galvanized wire, 3c.; No. 9, annealed wire, 2.50c.; No. 28 black sheets, 3.75c.; No. 28 galvanized sheets, 4.75c.; No. 10 blue annealed sheets, 3.10c.; hoops and bands, 2.96c.; cold-rolled rounds, 3.25c.; flats, squares and hexagons, 3.75c.

Sheets.—The demand for black, blue annealed and automobile body sheets continues to improve. A leading Detroit automobile manufacturer is in the market for 2000 tons of frame stock and is also expected to close next week for a round tonnage of full finished sheets. A Cleveland mill during the week took 500 tons of black sheets for Japan and has quotations out on several other Japanese inquiries. Regular prices are being firmly held.

Warehouse Business.—Warehouse sales show a slight gain from week to week. Prices are firm and unchanged.

Wire Products.—All the leading mills are holding firmly to 2.40c. for nails and 2.25c. for wire. A buyer attempted to break the market with a large inquiry during the week, but was unsuccessful and did not place the order.

Bolts, Nuts and Rivets.—The demand for bolts and nuts continues to show an improvement and makers are now operating their plants at 50 per cent or more of capacity. Prices are about as irregular as they have been, most of the weakness apparently being in the Chicago territory. The demand for rivets has improved slightly. The leading local maker is adhering to the regular prices of 2.10c. for structural rivets and 2.20c. for boiler rivets.

Coke.—Some producers have advanced the price on foundry coke 25c. a ton and others have withdrawn from the market until they get caught up with existing orders. We quote Standard Connellsville foundry coke at \$4.25 to \$4.75 per net ton at oven. The demand is not active.

Old Material.—The local scrap market is again rather quiet after the activity noted last week, and the upward movement of prices has apparently been checked, the only change in quotations being an advance of 25c. a ton on heavy melting steel. A Canton mill has purchased some heavy railroad scrap at around \$15.25. For Youngstown delivery heavy melting is quoted at \$15 and dealers are offering \$13 for this grade delivered to a Cleveland mill. A Cleveland consumer has purchased the March output of machine shop turnings of a Detroit automobile plant at a reported price of \$7 Detroit or \$10.36 delivered.

We quote per gross ton, f.o.b. Cleveland, as follows:

Heavy melting steel.....	\$12.25 to \$12.75
Steel rails, under 3 ft.....	12.75 to 13.25
Steel rails, rerolling.....	14.50 to 15.00
Iron rails.....	12.00 to 12.50
Iron car axles.....	18.00 to 19.00
Low phosphorus melting.....	13.50 to 14.00
Cast borings.....	9.00 to 9.25
Machine shop turnings.....	8.75 to 9.00
Mixed borings and short turnings.....	8.75 to 9.00
Compressed steel.....	9.25 to 9.75
Railroad wrought.....	12.00 to 12.50
Railroad malleable.....	12.50 to 13.00
Light bundled sheet stampings.....	7.00 to 8.00
Steel axle turnings.....	9.50 to 10.00
No. 1 cast.....	15.00 to 16.00
No. 1 busheling.....	9.00 to 9.25
Drop forge flashings, over 10 in.....	9.00 to 9.25
Drop forge flashings, under 10 in.....	9.25 to 9.75
Railroad grate bars.....	12.75 to 13.00
Stove plate.....	13.00 to 13.25
Pipes and flues.....	8.50 to 9.00

Birmingham

BIRMINGHAM, ALA., March 6.

Very good bookings were made last week and the week before by Birmingham furnaces on a base of \$15.50 with few departures in either direction. The market gathered strength strategically, but prices showed no tendency to advance. One maker did the best business of many months the week ending Feb. 25, booking over 4,000 tons, including a lot of 2,000 tons, the remainder being smaller lots. A Southern stove foundry paid \$15.50 for 500 tons. Bookings of Sloss-Sheffield Steel & Iron Co. of its Sheffield iron going into middle and far west via Ohio river gateways through barge service on the Tennessee river are understood to have aggregated a very considerable volume with deliveries being promptly made. Birmingham district furnaces are also getting into St. Louis, Indiana, Ohio and Illinois markets with numerous lots for many kinds of consumers. The pronounced feature of the larger tonnage recently booked is that very little has come from the pipe interests, the bulk being from the general foundry trade with radiator works and stove plants large takers. One maker remains out of the market on account of sold-up condition. Another maker entered the month with 10,000 tons for March delivery on a one-furnace make. It is known that one or two makers feel so confident of the future that they are having extra furnaces kept in readiness for operations on a day's notice. Recent additional furnace capacity has been for steel mill purposes. One maker booked 1,200 tons in lots from car loads to 300 tons in a day. Consumers are clamoring for prompt delivery

and tracers are sent on slightest delay. There are six active merchant furnaces in Alabama now, seven on basic and two on charcoal. There have been several sales of charcoal iron.

We quote per gross ton f.o.b. Birmingham district furnaces as follows:

Foundry, silicon 1.75 to 2.25.....	\$15.50
Basic.....	14.50
Charcoal, warm blast.....	32.00

Finishing Mills.—The Tennessee company is continuing full turn at the Ensley ingot mill this week and, following the blowing in of Ensley No. 4, it has just blown in Alice furnace in Birmingham. This gives it six stacks producing basic iron. All finishing mills are going this week with the exception of the plate mill at Fairfield, but the plate mill at Bessemer is in operation. The rail mill is again on a schedule of 10,000 tons. Wire drawing mills of the American Steel & Wire Co. and Gulf States Steel Co. are at about the capacity of last November, which ranged around 60 per cent. New wire drawing business is coming in well with wire fencing again in demand. Structural steel has become active. The Ingalls Iron Works made unusually large bookings in January for Florida, Louisiana, Georgia and Alabama. Export structural steel is picking up and orders are being figured on.

Cast Iron Pipe.—High pressure pipe makers are receiving a steady inflow of new business with prices firm at \$33. The National Cast Iron Pipe Co. and American Cast Iron Pipe Co. booked additional orders for the West. Sanitary pipe makers report jobbers as still reluctant to place business, but expect an early change of front. Base remains at \$37 for standard.

Coal and Coke.—Coal production has risen from an average of 225,000 to 260,000 tons a week following furnace resumption and increased railroad traffic. Some consumers are laying in extra stocks as protection against labor troubles and advances in price for spot coal. Steam coal averages \$1.90 per ton, but as low as \$1.50 is heard of. Coke is in acute demand and operations are increasing. The price is held firmly at \$5.

Old Material.—Yards are about out of cast scrap owing to recent active demand. Three thousand tons of No. 1 steel are reported to have sold at as low as \$9.50, but usual yard man will not sell under quoted price. Scrap is making a turn for the better with cast strong.

We quote per gross ton f.o.b. Birmingham district yards as follows:

Steel rails.....	\$11.00 to \$12.00
No. 1 steel.....	10.00 to 11.00
No. 1 cast.....	14.00 to 15.00
Car wheels.....	13.00 to 14.00
Tramcar wheels.....	12.00 to 13.00
No. 1 wrought.....	12.00 to 13.00
Stove plate.....	11.00 to 12.00
Cast iron borings.....	6.00 to 7.00
Machine shop turnings.....	6.00 to 7.00

Boston

BOSTON, March 7.

Pig Iron.—One Buffalo furnace took practically all of the business offered in this territory last week, including three round tonnage lots. The Portland Stove Co., Portland, Me., inquiry for 50 to 150 tons of No. 2X is the only one made general last week that remains uncovered. That company has enough iron on hand to last through the summer and is in no hurry to buy. The Draper Co., Hopedale, Mass., bought 1000 tons No. 1X and a small tonnage of charcoal iron; the General Fire Extinguisher Co., Providence, R. I., 600 tons No. 1X and 300 tons No. 2X; the Gurney Heater Co., Framingham, Mass., 1000 tons No. 2X; the Old Colony Foundry, Bridgewater, Mass., 200 tons No. 1X, and several other Massachusetts foundries smaller amounts. No. 2 plain Buffalo iron sold on a basis of \$18 furnace, No. 2X at \$18 and \$18.25 furnace, and No. 1X at \$18 and \$18.25. The same furnace expects to close on 500 tons of No. 2X to-day with a Massachusetts foundry. The cleaning up of available business last week has left the market in a firmer position. The Buffalo market is now generally established on a \$18.50 furnace basis. Eastern Pennsylvania furnace interests heretofore offering iron in competition with \$18 Buffalo have withdrawn competitive quotations, and with other furnaces

in its district are quoting on a basis of \$20, \$20.50 and \$21 furnace, respectively, for No. 2 plain, No. 2X and No. 1X. Other sales for the week include two one-car and one 100-ton lot of Low charcoal to Massachusetts foundries at \$22.50 furnace, and 45 tons of malleable at \$18 furnace to a Massachusetts melter. The only large prospective customer is the H. B. Smith Co., Westfield, Mass., heating appliances. That company possibly will not buy, however, until it has made a new wage scale with its molders.

We quote delivered at common New England points as follows, having added to furnace prices \$4.06 freight from eastern Pennsylvania, \$5.46 from Buffalo, \$6.58 from Virginia and \$10.66 from Alabama:

East Penn., sil. 2.25 to 2.75.....	\$24.56 to \$25.16
East Penn., sil. 1.75 to 2.25.....	24.06 to 24.56
Buffalo, sil. 2.25 to 2.75.....	23.90 to 24.40
Buffalo, sil. 1.75 to 2.25.....	23.90
Virginia, sil. 2.25 to 2.75.....	29.58
Virginia, sil. 1.75 to 2.25.....	29.08
Alabama, sil. 2.25 to 2.75.....	26.66
Alabama, sil. 1.75 to 2.25.....	26.16

Ferromanganese.—Numerous small lots of ferromanganese, manganese 76 to 80, were sold in this territory the past week on a basis of \$70 furnace, the market showing more life than it has before in months. A small yet unusual consignment was received in Boston this week. It consisted of 25 tons of British ferromanganese, delivered direct by steamer to local pig iron interests, which sold the material two months ago.

Old Material.—Although not very active, the old material market is more so than it has been before in some time. Sales of heavy melting steel were made this week to Johnstown, Pittsburgh and other Pennsylvania mill interests at \$14 to \$15 and in some cases \$15.50 a ton delivered, or \$8.50 to \$9 New England shipping point, which represents an advance of 50c. Sales of turnings were made to a West Virginia steel mill and to a Pennsylvania rolling mill on a basis of \$4.50 to \$5 New England shipping point, and a round tonnage of skeleton was sold to New York State interests at \$10 delivered. There also has been good buying of chemical borings, shippers in a few instances paying as high as \$10 shipping point. Most lots, however, sold at \$9 to \$9.50. New England foundries continue to show indifference toward the machinery cast market. One Taunton, Mass., stove maker this week bought 200 tons No. 1 textile cast, and still another 100 tons at about 75c. per 100 lb., or \$16.80 delivered, which is considerably below the heretofore recognized range of delivered quotations.

The following prices are for gross ton lots delivered consuming points:

No. 1 machinery.....	\$17.00 to \$17.50
No. 2 machinery.....	15.00 to 15.50
Stove plate.....	14.50 to 15.00
Railroad malleable.....	13.00 to 13.50

The following prices are offered per gross ton lots f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.....	\$8.50 to \$9.00
No. 1 railroad wrought.....	10.50 to 11.00
No. 1 yard wrought.....	9.50 to 10.00
Wrought pipe (1 in. in diam., over 2 ft. long).....	7.00 to 7.25
Machine shop turnings.....	4.50 to 5.00
Cast iron borings, rolling mill.....	8.50 to 9.00
Cast iron borings, chemical.....	9.00 to 9.50
Blast furnace borings and turnings.....	4.50 to 4.75
Forged scrap and bundled skeleton.....	4.00 to 4.50
Street car axles.....	11.50 to 12.00
Shafting.....	12.00 to 13.00
Car wheels.....	11.00 to 11.50
Rerolling rails.....	8.50 to 9.00

A preliminary injunction in accordance with the restraining order issued recently was granted by Judge Cochran in the Federal Court at Maysville, Ky., against the strikers at the plant of the Andrews Steel Co. in Newport, Ky. The injunction prohibits any of the defendants from assembling or congregating in the proximity of the plant and until further orders of the court members of the union are enjoined from maintaining any pickets at or near the plant.

Realizing that most libraries do not index pamphlets, the Bureau of Standards has adopted the plan of constituting its technologic papers into volumes, with pages consecutively numbered. To cover the first 202, which have already been issued, 15 volumes have been allotted. Beginning with No. 203 the sixteenth volume will be started. This will prevent the utter loss of reference value which otherwise accompanies unindexed pamphlets in libraries.

New York

New York, March 7.

Pig Iron.—Buying of pig iron has continued in a very active way during the past week, and sales made by New York agencies amounted to about 20,000 tons of various grades, of which 15,000 tons was by one firm. One transaction of a considerable tonnage about which details are not available was involved, but most of the buying was of moderate tonnages. In the past two or three days, no large inquiries have developed. A number of buyers are in the market for from 100 to 1000 tons, including a fair tonnage of malleable. The usual quotation on No. 2 plain, eastern Pennsylvania, is \$20 and 50c. higher on No. 2 X and \$1 higher for No. 1, but these prices have been shaded as much as \$1, and at Buffalo \$18 can still be done. Strike has been declared in a number of foundries in Brooklyn and Long Island City on account of a reduction of wages of molders from \$6.50 for an 8-hr. day to \$6 and melt has been greatly reduced. Despite reports that the contracts have been awarded for the segments for the vehicular tunnel by the general contractors, Booth & Flinn, Inc., this action has not been taken. The situation is still complicated by New Jersey politicians and the effort of the legislature to legislate the New Jersey Tunnel Commission out of existence. There are also some complications in regard to the occupation of certain streets needed by the commission for entrances and exits.

We quote delivered in the New York district as follows, having added to furnace prices \$2.52 freight from eastern Pennsylvania, \$5.46 from Buffalo and \$6.16 from Virginia:

East. Pa. No. 1 fdy., sil. 2.75 to 3.25.....	\$22.52 to \$23.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75.....	22.02 to 22.52
East. Pa. No. 2 fdy., sil. 1.75 to 2.25.....	21.52 to 22.02
Buffalo, sil. 1.75 to 2.25.....	23.46 to 23.71
No. 2 Virginia, sil. 1.75 to 2.25.....	28.16

Coke.—Coke continues active, and marked scarcity has developed through the extraordinary demand attributed to the fear of the strike in the coal regions. Prompt furnace coke is now quoted at \$3.75, furnace, and foundry grades at \$4.50 to \$4.75. Deliveries are not as prompt as they were a short time ago. By-product coke is quoted at \$8.59 delivered to points on the Pennsylvania, Erie and Lackawanna railroads, and \$9.15 on the Central of New Jersey.

Ferroalloys.—The ferromanganese market is quiet with sales confined to carload lots. There is an inquiry for 1000 tons for delivery over the rest of the year and also one for 500 tons. There has been no change in prices, which continue firm. Spiegeleisen continues scarce and sales and inquiries are moderately active. In February more spiegeleisen was made than in any month since July, blast furnace returns on another page showing 4930 tons having been the output. Only 3610 tons of ferromanganese was made last month, one of the smallest outputs in several months. There is no interest in manganese ore and quotations are nominal. The 50 per cent ferrosilicon market is moderately active with prices unchanged. Quotations are as follows:

Ferroalloys

Ferromanganese, domestic, seaboard, per ton..	\$62.50
Ferromanganese, British, seaboard, per ton..	\$62.50
Spiegeleisen, 16 to 19 per cent, furnace, per ton..	\$30.00
Ferrosilicon, 50 per cent, delivered, per ton..	\$55.00 to \$60.00
Ferrotungsten, per lb. of contained metal.....	40c. to 50c.
Ferrochromium, 6 to 8 per cent carbon, 60 to 70 per cent Cr., per lb. Cr., delivered.....	12c. to 14c.
Ferrovanadium, per lb. of contained vanadium.....	\$4.00

Ores

Manganese ore, foreign, per unit, seaboard.....	25c. to 26c.
Tungsten ore, per unit, in 50 per cent concentrates.....	\$2.00 up
Chrome ore, 40 to 45 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard.....	\$20.00 to \$25.00
Chrome ore, 45 to 50 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard.....	\$25.00 to \$27.00
Molybdenum ore, 85 per cent concentrates, per lb. of MoS ₂ , New York.....	50c. to 60c.

Finished Iron and Steel.—The leading Pittsburgh independent, which has conducted a country-wide drive for business in the past two or three weeks, has booked sufficient orders to operate its plants at about 60 per cent during March and April and has advanced its prices on heavy tonnage products to 150c., Pittsburgh.

The only exception will be on quotations on which protection had been given for a definite period, such as export tonnages, and the ordinary everyday wants of its regular trade. Steel companies which have met the 1.30c. prices obtaining in certain instances rather than lose the business of regular customers, welcome the firmer appearance of prices, but it is too early to determine whether the chaotic price situation will be immediately remedied. Whether it is still possible to buy plates, shapes and bars at the low prices which were in effect last week, about 1.25c. for export and 1.30c. for domestic trade, is not entirely clear. Another factor which may tend to stiffen prices is the expectation of a coal miners' strike on April 1. As no prospective settlement of the differences between the operators and the workmen has yet appeared, the steel trade grows more apprehensive that the strike may actually be called. The New York Central opened bids last week on 23,000 tons of fabricated steel for the proposed bridge across the Hudson River at Castleton, N. Y. The Bethlehem Steel Bridge Corporation was the low bidder, its price being \$68.60, fabricated and erected. Inquiry for structural steel continues to show some gain. Among the new projects are the following: Addition for National Bank of Commerce, Norfolk, Va., 500 tons; department store, Richmond, Va., 3000 tons; addition to car inspection sheds of Boston Elevated, Boston, 300 tons. Jobs awarded include the following: New York Cotton Exchange Building, 3200 tons, to American Bridge Co.; addition to Thalheimer department store, Richmond, Va., 300 tons, to Richmond Structural Steel Co.; work for American Sugar Refining Co., Baltimore, Md., 170 tons, to McClintic-Marshall Co. Business has improved slightly in the past week. This not only applies to domestic but also to export trade. Bar iron is now quoted at 1.35c., Pittsburgh, by some Eastern mills, a further concession of \$1 a ton. Sheets continue firm. Tin plate can still be bought at \$4.60, with occasional large lots going at \$4.50. Wire products are unchanged.

We quote for mill shipments, New York, as follows: Soft steel bars, 1.73c. to 1.78c.; plates, 1.73c. to 1.78c.; structural shapes, 1.73c. to 1.78c.; bar iron, 1.73c. to 1.88c. On export shipments the freight rate is 28.5c. per 100 lb. and the domestic rate 38c.

Warehouse Business.—Prices in the New York district are slightly weaker on most items, although official asking prices are unchanged. Undoubtedly warehouse prices here have been affected by the lower mill quotations now current and the recent weakness that prevailed for a brief period in the Philadelphia market. One Brooklyn warehouse, while maintaining current quotations, offers quantity reductions as follows: For 20,000 lb. or more, 13c. per 100 lb. off list price; 10,000 lb. or more, 10c. off list; and 5000 lb. or more, 5c. off list. On lots of 1000 to 2000 lb. an extra charge of 5c. per 100 lb. is made; on lots of 500 to 1000 lb., 10c. is made and on less than 500 lb. lots the charge per 100 lb. is 25c. Quotations on wrought iron and steel pipe are unchanged, but the market is weak and little new business is noted. Among brass and copper warehouses, business is generally active in materials involved in spring building operations, such as roofing, screening, etc. Recently there has been considerable business transacted with manufacturers of radio telephones. We quote prices on page 706.

High Speed Steel.—The market continues quiet and prices weak. A fair estimate of the present market is from 75c. to 85c. per lb. for 18 per cent tungsten high speed steel with prices on special brands of some companies ranging up to as high as \$1.05 per lb.

Cast Iron Pipe.—This market is extremely strong and increased operations are quite generally reported. There is noteworthy activity on the part of private purchases and the average number of municipal purchases. Bids will be opened March 9, by the Department of Water Supply, Gas and Electricity in New York, on 900 tons of 12-in. to 30-in. cast iron pipe. These bids are by contractors and call for the pipe installed. The 1200 tons of 12-in. to 24-in. cast-iron pipe for the Newburgh Water Department, Newburgh, N. Y., was awarded to the Warren Foundry & Machine Co. We quote per net ton, f.o.b. New York, carload lots, as fol-

lows: 6-in. and larger, \$47.30; 4-in. and 5-in., \$52.30; 3-in., \$62.30, with \$4 additional for Class A and gas pipe.

Old Material.—The general improvement in prices and feeling, manifest for the past fortnight or more, continues and is, if anything, stronger. Practically all steel mills show a greater interest in buying and are less inclined to hold to low prices in their offers. In many instances of late, sales prices have not kept pace with the increase in buying prices. It is reported that some sales have been consummated on delivered prices, which left no room for profit. No. 1 heavy melting steel shows another increase of about 50c. per ton, \$8.50 to \$9 now being a fair estimate of the market. The average buying price to-day is probably about \$8.85 per ton, with some dealers going as high as \$9. Iron and steel pipe, 1 in. in diameter, not under 2 ft. long, seems fairly stationary at \$8.30 per ton, but a fair average of current buying is \$8 to \$8.25 per ton. The Midvale Steel & Ordnance Co., which was in the market about 10 days ago for forge fire, specifying light drop forge trimmings and bundled cotton ties and offering up to \$10.50, is believed to have purchased a small tonnage, but at a lower price.

Buying prices per gross ton, New York, follow:		
Heavy melting steel, yard.....	\$8.50 to	\$9.00
Steel rails, short lengths, or equivalent.....	8.50 to	9.00
Re-rolling rails.....	9.25 to	9.75
Relaying rails, nominal.....	27.00 to	29.00
Steel car axles.....	10.00 to	10.50
Iron car axles.....	17.50 to	18.50
No. 1 railroad wrought.....	9.50 to	10.00
Wrought iron track.....	8.50 to	9.00
Forge fire.....	4.75 to	5.25
No. 1 yard wrought, long.....	9.00 to	9.50
Cast borings (clean).....	7.00 to	7.50
Machine-shop turnings.....	5.25 to	5.75
Mixed borings and turnings.....	5.00 to	5.50
Iron and steel pipe (1 in. diam., not under 2 ft. long).....	7.75 to	8.25
Stove plate.....	10.50 to	11.00
Locomotive grate bars.....	9.50 to	10.00
Malleable cast (railroad).....	8.00 to	8.50
Cast-iron car wheels.....	10.50 to	11.00
Prices which dealers in New York and Brooklyn are quoting to local foundries, per gross ton, follow:		
No. 1 machinery cast.....	\$16.50 to	\$17.00
No. 1 heavy cast (columns, building materials, etc.), cupola size.....	15.50 to	16.00
No. 1 heavy cast, not cupola size.....	15.00 to	15.50
No. 2 cast (radiators, cast boilers, etc.).....	10.00 to	10.50

Cincinnati

CINCINNATI, March 7.

Pig Iron.—Several fair-sized tonnages were sold during the week, the largest being for 4000 tons taken by a West Virginia melter on the basis of \$19, southern Ohio furnace. A southern Ohio melter bought a round tonnage of Southern iron on the basis of \$15, Birmingham. Two sales of Northern iron, of 500 tons each, were made to central Ohio melters at \$18.50, Iron-ton, and an Indiana melter bought 100 tons from a lake furnace at a similar figure. A southern Ohio stove manufacturer purchased 150 tons of southern Ohio iron at \$19, base, and a number of carload orders were also booked at the same figure. There is very little inquiry, the largest being from a Tennessee melter for 1000 tons. Another Tennessee melter is inquiring for 100 tons, and a Cincinnati foundry wants a similar amount. Several inquiries mentioned in last report are still outstanding. Prices are on an average 50c. lower than last week. Southern Ohio iron is now quoted at \$18.50 to \$19, Iron-ton, and Southern iron at \$15 to \$15.50, Birmingham. The higher price on Northern iron is quoted where the furnace has a freight advantage, but in competitive territory the lower price prevails. On Southern iron \$15 can be done on round tonnages, though several furnaces are holding to \$15.50. Sarah furnace in southern Ohio will blow out shortly, and it is expected that Belfont will be blown in towards the latter part of the month.

Based on freight rates of \$4.50 from Birmingham and \$2.52 from Iron-ton, we quote f.o.b. Cincinnati:

Southern coke, sil. 1.75 to 2.25 (base).....	\$19.50 to	\$20.00
Southern coke, sil. 2.25 to 2.75 (No. 2 soft).....	20.00 to	20.50
Ohio silvery, 8 per cent sil.....	30.00 to	30.02
Southern Ohio coke, sil. 1.75 to 2.25 (No. 2).....	21.02 to	21.52
Basic, Northern.....	21.02 to	21.02
Malleable.....	21.52 to	22.02

Finished Material.—A steady improvement is reported in the demand for finished materials, sheets probably being the leader. Practically all of the orders booked are for immediate shipment and while some mills have opened their books for second quarter, very few orders are being placed for that delivery. Prices show very little change, 1.40c. being the ruling price on bars, shapes and plates, although it is said that an attractive tonnage could be placed at 1.35c. There appears to be a stiffening of prices in the wire market and while some weeks ago wire nails were available at less than \$2.40, Pittsburgh, this price now appears to be the minimum. A nearby jobber has an inquiry out for 3000 kegs of wire nails, and it is said that he was unable to develop a lower price than \$2.40 Pittsburgh. Barbed wire and woven wire fencing are in fair demand and some few carload orders were booked during the week. Reinforcing bars are also fairly active, as some building projects involving small tonnages are up for bids. In the structural field the only award of consequence was 100 tons for the Federal Reserve Bank building at Nashville, Tenn., the contract going to the Nashville Bridge Co. The Willing Co., Bellevue, Ohio, has been awarded the contract for the construction of a high school at Middletown, Ohio, involving about 200 tons of structural steel and 400 tons of bars. The only new inquiry of consequence is for a highway bridge in Mississippi, taking 400 tons. Bids closed March 1 for the Business Men's Club, Cincinnati, the Wilde Bank building at Indianapolis, and the Indianapolis Athletic Club building, but no information has been given out as to the result of the bidding. The Big Four on Feb. 27 closed bids for 81,200 tie plates, but, so far as reported, no award has yet been made. On this inquiry the Lundie Engineering Co. quoted \$37 per ton f.o.b. Indiana Harbor for open-hearth tie plates and \$40 per ton for 25 per cent copper. The Wheeling Steel Products Co. quoted \$35.40 per ton, f.o.b. Cincinnati, with \$3 additional for copper. The Illinois Steel Co. quoted \$35.10, f.o.b. Kankakee; the Cambria Steel Co., \$35.20, f.o.b. Cleveland; the Inland Steel Co., \$35, f.o.b. Blue Island; the Railroad Supply Co., \$34, f.o.b. Chicago; the Dilworth-Porter Co., \$37.80, f.o.b. Cleveland; the Inter-State Iron & Steel Co., \$38, f.o.b. East Chicago. Several fairly large inquiries for tin plate are now being figured on and it is expected that these will be closed within the next week or so.

Plant Operations.—Plant operations will show a slight gain during the week. The American Rolling Mill Co. is operating both plants at Middletown at capacity. The Newport Rolling Mill Co. will put on three additional mills, making a total of seven. The Andrews Steel Co. is preparing to resume operations and it is likely it will be running approximately 50 per cent of capacity within the next two weeks. Three open hearths and 10 sheet mills are in operation at the Whitaker-Glessner plant at Portsmouth, Ohio, and the Ashland division of the American Rolling Mill Co. will have two open hearths and its blooming mill in operation.

Old Material.—Scrap dealers report an increased inquiry from foundries, many of which have not bought for a year. More inquiry for steel scrap is also reported from Valley points, but the local market continues quiet. Prices are stronger, and dealers have advanced bundled sheets, heavy melting steel, steel rails for melting, railroad wrought, borings and turnings, machinery cast and iron axles fifty cents a ton.

We quote dealers' buying prices, f.o.b. cars:

Per Gross Ton	
Bundled sheets	\$4.00 to \$4.50
Iron rails	11.50 to 12.00
Relaying rails, 50 lb. and up	24.50 to 25.00
Re-rolling steel rails	10.00 to 10.50
Heavy melting steel	9.00 to 9.50
Steel rails for melting	9.00 to 9.50
Car wheels	11.50 to 12.50

Per Net Ton	
No. 1 railroad wrought	8.50 to 9.00
Cast borings	3.50 to 4.00
Steel turnings	2.30 to 3.00
Railroad cast	11.50 to 12.00
No. 1 machinery	13.50 to 14.00
Burnt scrap	7.00 to 7.50
Iron axles	15.50 to 16.00
Locomotive tires (smooth inside)	9.00 to 9.50
Pipes and flues	3.50 to 4.00

Warehouse Business.—Local jobbers report a very

fair week both as to the number of orders and the tonnage. Reinforcing bars continue as a leader, although there is also a fair demand for shapes and wire products. Cold-rolled steel is unusually quiet. No price changes have been made and jobbers continue to quote:

Iron and steel bars, 2.75c. base; hoops and bands, 3.35c. base; shapes and plates, 2.85c. base; reinforcing bars, 2.82½c. base; cold rolled rounds, 1½ in. and larger, 3.50c. base; under 1½ in. and flats, squares and hexagons, 4c.; No. 10 blue annealed sheets, 3.60c.; No. 28 black sheets, 4.25c.; No. 28 galvanized sheets, 5.25c.; wire nails, \$2.75 per keg base; No. 9 annealed wire, \$2.60 per 100 lb.

Coke.—The coke market is not so active though prices are inclined to stiffen. Connellsville furnace coke is now quoted at \$3.50, ovens, and foundry at \$4.25 to \$4.75. Wise County coke is also up 25c. a ton, furnace, being quoted at \$4.25 to \$4.50 and foundry at \$5.25 to \$5.50. New River is firm at \$7.50.

St. Louis

ST. LOUIS, March 7.

Pig Iron.—The pig iron market has shown more activity the last week than at any time this year. There has been more buying and inquiries have been more plentiful. Carloads and up to 100 tons have formed the bulk of the business, but some good sized orders have been placed and are pending. The market for Northern iron is firm at \$20, Chicago, that price being well established. Southern iron is being sold at \$15 to \$16 Birmingham, the latter price being made by a producer who has been selling on a basis of \$16 Sheffield, which has a freight rate of 80c. a ton less than Birmingham. This concern has thus virtually withdrawn its water and rail quotation temporarily. A few more sales were made the last week on the basis of \$19.44 St. Louis for water and rail shipment from Sheffield, and while it produced about all the business to be had here, that all was rather disappointing to the Sheffield interests that made the combination rate, being about 2000 tons. In Northern iron local interests bought 500 tons of basic and 1060 tons of foundry. Another sale of 150 tons of malleable was made locally, and several western Missouri and eastern Kansas melters bought carloads up to 150 tons of foundry iron. A Pacific Coast melter bought 100 tons here. There is an inquiry pending for 1000 to 2000 tons of malleable for a Mississippi River melter. A Pacific Coast melter wants 1000 tons and a Missouri interest is in the market for 2000 tons of foundry iron. A central Illinois melter is in the market for 500 tons, a Kansas melter wants 400 tons and a local melter wants 300 tons, and there are two inquiries for 500 to 1000 tons each from two Indiana foundries. An Atchison, Kan., melter is in the market for 500 tons of foundry iron. Two cars of 80 per cent ferromanganese were sold this week on the basis of \$62.50 New Orleans, and the Commonwealth Steel Co. wants a car of 12 to 13 per cent ferrosilicon.

We quote delivered consumers' yards, St. Louis, as follows, having added to furnace prices \$2.80 freight from Chicago and \$5.74 from Birmingham:

Northern foundry, sil. 1.75 to 2.25..	\$22.80
Northern malleable, sil. 1.75 to 2.25..	22.80
Basic	22.80
Southern foundry, all rail, sil. 1.75 to 2.25	20.74 to 21.74

Finished Iron and Steel.—The demand for finished iron and steel products is improving, one concern reporting the best week for many months. Several carloads of reinforcing bars were sold to jobbers, and local fabricators bought some structural steel on the basis of \$1.40 Pittsburgh. There still is very little being done locally in the structural field because of the failure of labor and the master builders to get together on a wage adjustment. Interest is being shown here in the Indianapolis Athletic Club, involving 1500 to 1600 tons of structural steel, of which Roberts, Frost & Daggett of that city are the architects. Bids will be opened April 15 for the Fort Madison, Iowa, school to cost \$265,000. The railroads are entering the market again. The Missouri Pacific Railroad, which last week bought 20,000 tons of rails, made a purchase this week of 1250 kegs of track bolts and 2200 kegs of track spikes. Owing to an error of the telegraph operator, the rail tonnage was reported as 200,000 in THE IRON AGE of March 2. The Wabash Railroad is

in the market for 160,000 tie plates for 70, 80 and 90 lb. rails, and the Missouri, Kansas & Texas Railroad wants 350,000 tie plates for from 56 to 80-lb. rails.

For stock out of warehouse we quote: Soft steel bars, 2.62½c. per lb.; iron bars, 2.62½c.; structural shapes, 2.72½c.; tank plates, 2.72½c.; No. 10 blue annealed sheets, 2.47½c.; No. 28 black sheets, cold rolled, one pass, 4.15c.; cold drawn rounds, shafting and screw stock, 3.65c.; structural rivets, \$3.52½ per 100 lb.; boiler rivets, \$3.62½; tank rivets, 7/16-in. and smaller, 65 and 5 per cent off list; machine bolts, large, 60-10 per cent; small, 60, 10 and 10 per cent; carriage bolts, large, 55-5 per cent; small, 60 and 10 per cent; lag screws, 65-15 per cent; hot pressed nuts, square or hexagon blank, \$4; and tapped, \$3.75 off list.

Coke.—The market for coke is showing more activity, although most of the buying is for from a carload up to 125 tons. The most favorable feature is the increase in shipping specifications against contracts, especially among manufacturers of water gas. Foundries, too, are buying more freely, although the fear of a coal strike has not produced any very heavy buying.

Old Material.—The market for old material looks brighter, and there is a somewhat more bullish feeling among the dealers, a condition due to one of the large consumers having sent a representative on a tour of inspection to all the yards in the district looking for special grades of heavy melting steel; consequently the dealers are absorbing all railroad offerings at advancing prices. While the consensus of opinion is that better prices are just ahead, still, due to lack of actual buying by consumers, most of the grades remain at present quotations, the only exceptions being a few special items. The only railroad offering before the market is a list issued by the Pennsylvania—Southwestern region—calling for about 4000 tons.

We quote dealers' prices f.o.b. consumers' works, St. Louis industrial district and dealers' yards, as follows:

Per Gross Ton

Old iron rails.....	\$14.00 to \$14.50
Steel rails, rerolling.....	11.00 to 11.50
Steel rails, less than 3 ft.....	12.50 to 13.00
Relaying rails, standard section.....	23.00 to 28.00
Cast iron car wheels.....	13.50 to 14.00
No. 1 heavy railroad melting steel.....	10.00 to 10.50
No. 1 heavy shoveling steel.....	9.75 to 10.00
Ordinary shoveling steel.....	9.50 to 10.00
Frogs, switches and guards, cut apart.....	10.00 to 10.50
Ordinary bundle sheet.....	4.00 to 4.50
Cast steel bolsters.....	10.50 to 11.00

Per Net Ton

Heavy axles and tire turnings.....	6.00 to 6.50
Iron angle bars.....	13.00 to 13.50
Steel angle bars.....	9.00 to 9.50
Iron car axles.....	18.00 to 18.50
Steel car axles.....	12.50 to 13.00
Wrought iron arch bars and transoms.....	15.00 to 15.50
No. 1 railroad wrought.....	9.50 to 10.00
No. 2 railroad wrought.....	8.50 to 9.00
Railroad springs.....	11.00 to 11.50
Steel couplers and knuckles.....	11.00 to 11.50
Locomotive tires, 42 in. and over, smooth inside.....	8.00 to 8.50
No. 1 dealers' forge.....	8.00 to 8.50
Cast iron borings.....	3.50 to 6.00
No. 1 busheling.....	8.50 to 9.00
No. 1 boilers cut in sheets and rings.....	6.00 to 6.50
No. 1 railroad cast.....	13.50 to 14.00
Stove plate and light cast.....	11.50 to 12.00
Railroad malleable.....	9.50 to 10.00
Agricultural malleable.....	9.50 to 10.00
Pipes and flues.....	7.50 to 8.00
Heavy railroad sheet and tank.....	5.50 to 6.00
Light railroad sheet.....	3.50 to 4.00
Railroad grate bars.....	10.00 to 10.50
Machine shop turnings.....	3.00 to 3.50
Country mixed iron.....	6.00 to 6.50
Uncut railroad mixed.....	7.00 to 7.50
Horseshoes.....	9.50 to 10.00
Railroad brake shoes.....	9.50 to 10.00

The "Boost Bridgeport" committee of the Chamber of Commerce of Bridgeport, Conn., is contemplating the erection of a large loft building in the very near future for use of the small manufacturing industries which do not need, or cannot afford, buildings and plants of their own.

United States Civil Service examinations are to be held for information assistants under the Federal Board for Vocational Education. Salaries offered range from \$2,400 to \$3,600. Applications must be filed with the Commission at Washington on or before March 28.

Philadelphia

PHILADELPHIA, March 7.

The Jones & Laughlin Steel Co. to-day notified its customers in this district of an advance in prices on plates, shapes and bars to 1.50c., Pittsburgh, effective immediately. This action comes as an aftermath to two or three weeks of extremely low prices, during which time orders were taken at 1.30c., Pittsburgh, and in one or two instances at even lower figures. It is understood that all low quotations have been withdrawn except where protection was given for a specified period. The Jones & Laughlin Steel Co. is reported to have booked sufficient tonnage for two months' operation at 60 per cent of capacity and fear of a coal strike on April 1 brought about a cessation of its aggressive selling policy of the past few weeks. The local sales office of the Carnegie Steel Co. has also notified some of its customers of a prospective advance to 1.50c., Pittsburgh, on plates, shapes and bars, but it is not understood that this announcement has yet been officially made at the Pittsburgh headquarters of the company.

As a result of these advances, other steel companies are adopting a little firmer attitude on prices and before the week ends steel prices generally, it is predicted, may stiffen considerably. To-day, however, it appeared that orders for plates, shapes and bars could still be placed with some makers at 1.35c., Pittsburgh, though indications were that buyers would not find it easy to do 1.30c. even on very attractive business.

Pig iron prices have also stiffened. Three Eastern furnace interests which made a drive for business week before last at \$19 for No. 2 plain and \$19.50 for No. 2X, furnace, have advanced quotations to \$20 and \$20.50, but it is still possible to buy No. 2 plain at \$19.50, furnace, and No. 2X at \$20.

Steel plant operations show a slight increase. The Cambria works of the Midvale Steel & Ordnance Co. will put on two blast furnaces within 10 days, making five out of 11 in operation. The Bessemer steel works will also be started at the same time.

There has been a general advance in prices on old material, due mostly to higher prices and more active buying at Pittsburgh.

Pig Iron.—Three eastern Pennsylvania blast furnace interests, which lowered their prices \$1 a ton on foundry grades week before last in a drive for business which netted a total of 50,000 to 60,000 tons, have advanced their quotations \$1 and are now quoting \$20, furnace, for No. 2 plain and \$20.50 for No. 2X. It is still possible, however, to buy No. 2 plain at \$19.50 and No. 2X at \$20, furnace. Considerable business was closed during the past week at the low prices, principally in the New York district, but to-day the three leading sellers were firmly quoting the higher prices. Most all of the available business seems to have been closed and current inquiries are mostly for small lots for immediate shipment. The tonnage which has been put on furnace books within the past two weeks was not all for early shipment, some of it running throughout second quarter. However, the furnaces are fairly well off for this month and their attitude at present is to await developments in the threatened coal strike set for April 1. A small tonnage of malleable iron has been sold by an eastern Pennsylvania furnace at \$22, furnace. Low phosphorus iron is inactive and prices are unchanged. There is no demand for basic.

The following quotations are, with the exception of those on low phosphorus iron, for delivery at Philadelphia, and include freight rates varying from 84 cents to \$1.54 per gross ton.

East. Pa. No. 2 plain, 1.75 to 2.25 sil.....	\$20.76 to \$21.26
East. Pa. No. 2X, 2.25 to 2.75 sil.....	21.26 to 21.76
Virginia No. 2 plain, 1.75 to 2.25 sil.....	26.24 to 26.74
Virginia No. 2X, 2.25 to 2.75 sil.....	27.24 to 27.74
Basic delivery eastern P'a.....	19.84
Gray forge.....	20.50 to 21.00
Malleable.....	22.50 to 24.00
Standard low phos. (f.o.b. furnace)...	30.00
Copper bearing low phos. (f.o.b. furnace).....	28.00

Ferroalloys.—Very little ferromanganese has been sold in the past week. There is practically no business in the British alloy, as sales are subject to increase in the duty. Prices remain at \$62.50, seaboard, for both

domestic and imported. Spiegeleisen is nominally held at \$30, furnace, for the 16 to 19 per cent.

Semi-Finished Steel.—Only occasional sales of billets are being made, prevailing prices being \$28, Pittsburgh, for rerolling and \$32 for forging quality, with \$1 a ton higher for small lots. Sheet bars are quoted at \$29, Pittsburgh, but \$28 could undoubtedly be done on an attractive tonnage.

Plates.—The price situation on plates to-day appeared somewhat firmer due to the advance to 1.50c., Pittsburgh, by the Jones & Laughlin Steel Co. and the indication that the Carnegie Steel Co. would also announce the same quotation. While it appeared more difficult to place plate orders at 1.30c., Pittsburgh, at which business has been done in the past two or three weeks, it was possible to-day to obtain quotations of 1.35c. Just to what extent other mills will follow the advance to 1.50c. remains to be seen, but it is predicted that quotations below 1.35c. and possibly below 1.40c., Pittsburgh, may entirely disappear before the end of the week. All sellers are not sanguine, however, that a marked improvement in the price situation will immediately result. Eastern plate mills are operating at a slightly better rate. The Standard Oil Co. is reported to have placed 1000 tons for its Bayway, N. J., plant. The Norfolk & Western Railroad has issued an inquiry for 2000 to 4000 70-ton steel freight cars. The Delaware, Lackawanna & Western Railroad has divided 985 cars for repair between the American Car & Foundry Co. and the Magor Car Corporation. The Baltimore & Ohio has withdrawn its inquiry for 50 passenger, mail and baggage coaches because of inability to obtain deliveries in time for the summer excursion traffic. We quote sheared and universal plates at 1.35c. to 1.40c., Pittsburgh.

Structural Material.—Steel for the new Philadelphia public library, amounting to 4300 tons, is reported to have been placed with the American Bridge Co. Considerable new work is being talked of, but most of it is still in the estimating stage. Structural shapes are possibly a trifle firmer in price, but the market can still be quoted at not over 1.35c. to 1.40c., Pittsburgh.

Bars.—Orders for steel bars continue in fair volume, with most of the business being taken at not more than 1.35c., Pittsburgh. Bar iron is now available at the same figure, but business is extremely limited.

Old Material.—Although scrap business in the East has not materially increased, greater activity and higher prices in the Pittsburgh district have given this market a much firmer tone. Such sales as have been made in eastern Pennsylvania are at advancing prices and the market this week is about 50c. a ton higher on nearly all grades. The Bethlehem Steel Co. has paid \$13.50, delivered Steelton, Pa., but at steel plants nearer to Philadelphia steel scrap has been offered as low as \$12, delivered. The steel scrap on the recent list of the Pennsylvania Railroad is reported to have been sold at \$14.60, delivered at western Pennsylvania steel plants. We quote for delivery at consumers' works in this district as follows:

No. 1 heavy melting steel.....	\$12.00 to \$13.00
Scrap rail.....	12.00 to 13.00
Steel rails, rerolling.....	15.00 to 15.50 *
No. 1 low phos., heavy 0.04 and under.....	18.00 to 19.00
Cast iron car wheels.....	16.00 to 16.50
No. 1 railroad wrought.....	15.00 to 15.50
No. 1 yard wrought.....	12.50 to 13.00
No. 1 forge fire.....	10.00 to 10.50
Bundled sheets (for steel works).....	10.00 to 10.50
No. 1 bushelling.....	11.50 to 12.50
No. 2 bushelling.....	9.00 to 10.00
Turnings (short shoveling grade for blast furnace use).....	10.00 to 10.50
Mixed borings and turnings (for blast furnace use).....	10.00 to 10.50
Machine-shop turnings (for rolling mill and steel works use).....	10.50 to 11.00
Heavy axle turnings (or equivalent).....	11.00 to 11.50
Cast borings (for steel works and rolling mills).....	12.00 to 12.50
Cast borings (for chemical plants).....	14.50 to 15.00
No. 1 cast.....	17.00 to 17.50
Railroad grate bars.....	14.00 to 14.50
Stove plate (for steel plant use).....	14.00 to 14.50
Railroad malleable.....	13.00 to 13.50
Wrought iron and soft steel pipes and tubes (new specifications).....	13.00 to 13.25
Iron car axles.....	No market
Steel car axles.....	17.00 to 18.50

Track Supplies.—The Pennsylvania Railroad will probably place orders this week for 100,000 to 200,000

tie plates (1000 to 2000 tons), 500,000 lb. of railroad spikes and 100,000 heat-treated track bolts.

Warehouse Business.—Local jobbers have reduced prices on steel bars and small shapes, round edge iron and steel, tank steel plates, deformed steel bars, hoops and bands. We now quote for local delivery as follows:

Soft steel bars and small shapes, 2.40c.; iron bars (except bands), 2.50c.; round edge iron, 2.60c.; round edge steel, iron finish, 1½ x ¼ in., 2.60c.; round edge steel planished, 3.35c.; tank steel plates, ¼-in. and heavier, 2.40c.; tank steel plates, 3/16-in., 2.55c.; blue annealed steel sheets, No. 10 gage, 3.50c.; light black sheets, No. 28 gage, 4c.; galvanized sheets, No. 28 gage, 5c.; square twisted and deformed steel bars, 2.40c.; structural shapes, 2.50c.; diamond pattern plates, ¼-in., 4.60c.; 3/16-in., 4.785c.; ½-in., 4.90c.; spring steel, 4.10c.; round cold-rolled steel, 3.25c.; squares and hexagons, cold-rolled steel, 3.75c.; steel hoops, No. 13 gage and lighter, 3.15c.; steel bands, No. 12 gage to 3/16-in., inclusive, 3c.; iron bands, 3.90c.; rails, 2.75c.; tool steel, 8c.; Norway iron, 5c.; toe steel, 4.50c.

Sheets.—Prices are firm, 2.25c. for blue annealed, 3c. for black and 4c. for galvanized, Pittsburgh, being quoted by all makers. Tin plate is usually quoted at \$4.60, Pittsburgh, but on large lots \$4.50 can be done.

LOWER EXTRAS ON WIDE PLATES

Lukens Steel Co., Makes Reductions Up to \$40 a Ton on Its Product

The Lukens Steel Co., Coatesville, Pa., which has the only mill in the country rolling extra wide plates, has issued a new card of extras on wide plates, putting into effect reductions which amount to as much as \$40 a ton on plates 190 to 195 in. wide. Cutting extras are entirely eliminated in the new card. The extra on widths over 190 in. to 195 in. is reduced from 4c. to 2c. per lb.; on widths from 170 to 185 in., the former extras ranged from 3c. to 3.75c. per lb., while the new extra on these widths is 1.50c. per lb.; from 155 to 170 in., the former extra ranged from 2.25c. to 2.75c., while the new extra for all of these widths is 1.25c. per lb.; widths from 140 to 155 in., which formerly took extra of from 1.50c. to 2c. per lb., now take an extra of 1c. per lb.; on 130 to 135 in., the former extra was 1c. and on 135 to 140 in., 1.25c., while the new card gives 0.75c. as the extra on widths from 130 to 140 in.

Alabama Pig Iron Stocks Decline

BIRMINGHAM, ALA., March 7.—Alabama iron yard stocks show a decrease of 23,000 tons. Stocks on yards Feb. 1 and March 1 were as follows: Feb. 1, 82,000 and 73,000 tons; basic 27,000 and 21,000; warrants, 800 and 700; machine cast, 46,000 and 38,000; total stocks, 157,000 and 134,000.

The Stanley Iron Works, Bridgewater, Mass., signifies its intention of resuming operations this week. The plant has been closed a week or so. A reduction in wages of molders, amounting to 20 per cent, was followed by a strike.

The number of employees at the General Electric Co., Pittsfield, Mass., has been increased 12 per cent during the past three months and the plant is running 46 per cent of normal. While domestic business continues to increase, foreign orders have been the salvation of the company.

Within the next few months, the New London Ship & Engine Co., New London, Conn., will install new engines and shafts in six submarines and later will do similar work on 12 others.

The wage scale of some 650 employees of the Hendee Mfg. Co., Springfield, Mass., motorcycles, has been reduced 15 per cent.

Several departments of the Stevens-Duryea Co., Chicopee, Mass., automobiles, have been placed on a half-time basis.

The Royal Typewriter Co., Hartford, Conn., has increased its operating schedule 15 per cent. Many of its employees are now on full time.

British Iron and Steel Market

Labor Deadlock Hampering Home Trade—Shipments to Continent Expanding—Beams and Ship Plates Higher

(By Cable)

LONDON, ENGLAND, March 7.

DUE to the deadlock in the engineering and ship-building trades, because of the dispute with regard to overtime payments and the withdrawal of the war bonus, a decrease has resulted in the home business in pig iron. The export demand is improving and there have been further sales to Continental destinations. Makers are well booked over March and prices are firm.

Hematite sales have decreased. Buyers are disinclined to pay the increased prices. Makers' order books are well filled. East Coast mixed numbers have been sold at £4 19½s. (\$21.89). Sellers are now asking £5 (\$22).

Best Bilbao Rubio ore is now held at 26½s. (\$5.83) ex-ship Tees, nominal. Coke is easier.

Finished steel trades are threatened by an industrial upheaval. The works are badly in want of orders, but prices are still held, owing to the uncertainty of future costs. Home and export demand is still slow.

Belgian merchant bars are being sold at £8 to £8 10s. (1.57 to 1.67c. per lb.) f.o.b., May and June delivery. French merchant bars are held at the same quotation. Luxembourg merchant bars are quoted at £8 2½s. to £8 7½s. (1.60 to 1.65c. per lb.) f.o.b., April and May shipment.

Belgian angles are held at £7 10s. to £7 12½s. (1.47 to 1.50c. per lb.) f.o.b. Luxemburg steel beams are quoted at £7 10s. to £7 15s. (1.47 to 1.52c. per lb.) f.o.b., for June delivery. Belgian 3/16-in. plates are held at £9 (1.77c. per lb.) c.i.f. India. Belgian sheet bars may be had at £6 10s. to £6 12½s. (\$28.60 to \$29.15) f.o.b., for March shipment. Luxemburg billets are obtainable at £7 (\$30.80) f.o.b., March and April.

Tin plates are steady, but there is little business passing. Welsh manufacturers are not yet disturbed over the acid workers' strike. Cheap offerings of Continental tin plate bars have been made, but buyers are chary of placing orders.

We quote per gross ton, except where otherwise stated, f.o.b. maker's works, with American equivalent figured at \$4.40 per £1 as follows:

Durham coke, delivered	£1 9s	\$6.38
Cleveland No. 1 foundry	4 15	20.90
Cleveland No. 3 foundry	4 10	19.80
Cleveland No. 4 foundry	4 7½	19.25
Cleveland No. 4 forge	4 10	19.80
Cleveland basic	4 10	19.80
Hematite	7 0*	30.80*
East Coast mixed	5 0 to 5 2½	22.00 to \$22.55
Ferromanganese	15 0 to 14 10*	66.00 & 63.80*
Rails, 60 lb. and up	8 0 to 9 10	35.20 to 41.80
Billets	7 0 to 7 10	30.80 to 33.00
Sheet and tin plate bars		
Welsh	7 0 to 7 7½	30.80 to 32.55
Tin plates, base box	0 18½ to 0 19	4.07 to 4.18
		C. per Lb.
Ship plates	9 5 to 10 10	1.82 to 2.06
Boiler plates	12 10 to 14 0	2.46 to 2.75
Tees	9 10 to 11 0	1.87 to 2.15
Channels	8 15 to 10 5	1.72 to 2.01
Beams	8 10 to 10 0	1.67 to 1.96
Round bars, ¾ to 3 in.	10 10	2.06
Galvanized sheets, 24 g.	15 15 to 16 0	3.09 to 3.14
Black sheets	12 10 to 13 0	2.46 to 2.55
Steel hoops	12 0 & 12 5*	2.36 & 2.41*
Cold rolled steel strip, 20 g.	23 10	4.62

*Export price.

any confidence that the corner has been turned. Certainly, there has been considerable improvement in pig iron during the past week or so, but this is only a minute proportion of the normal trade. The whole trouble, of course, is high prices, which consumers all over the world are not disposed to pay, and though the process of deflation has continued steadily for many months, prices have not yet got down to an economic level. Various wage reductions have been made recently which, of course, help to cheapen production, but there is still the question of fuel and railroad transport, and consumers of steel in this country assert that it is not so much the high price they have to pay which is a hindrance to substantial business as it is the cost involved in the handling of material afterward and in working it up for their own purposes. A certain amount of export business is, of course, moving, and in one or two instances low prices have been taken, but the works involved now appear to have sufficient orders to cope with their present limited output and are consequently slightly stiffer. On the other hand, continental quotations are advancing, and deliveries becoming more and more in arrears, so that buyers hesitate from committing themselves into such contracts.

Home consumers of pig iron are simply purchasing from hand to mouth, while export sales are small but include a few lots to Germany. No alterations have been made in Cleveland quotations, No. 3 G. M. B. being obtainable at 90s. for either home or export, but buyers are confident that before long they will be able to obtain all they want for less money, and are therefore holding off as long as possible.

Hematite continues in fair demand, South Wales and Sheffield being the prominent purchasers for the home trade, although by no means in any substantial degree, while for export Germany has bought a little. Prices, however, are weak, as makers want the orders and East Coast Mixed Nos. can be obtained for about 90s. There are in the Cleveland district 27 furnaces now working, and of these seven are on foundry and 12 on hematite pig iron, and the remainder on basic and special.

In finished iron and steel, North Eastern and Scotch makers have decided no longer to compete against each other for ship plates and shapes, and have re-established the fixing of minimum quotations for the home trade. Ship plates are accordingly offered 'at £10 10s., delivered, and shapes at £10, delivered. Apart from this, the market generally is dull and uninteresting.

On top of the recent throwing on the market of a large quantity of high-speed tool steel by the government, comes a discovery of further quantities at Constantinople, thus causing additional uneasiness to Sheffield producers. The quantity involved is in the neighborhood of 100 tons and consists in the main of 18 and 14 per cent tungsten material, which was shipped for munition making in Russia and is offered exactly as it left the works here several years ago.

Youngstown View of Advance

YOUNGSTOWN, March 7.—Independents believe the advance on bars, shapes and plates to 1.50c. by the Jones & Laughlin Steel Co., Pittsburgh, will help stabilize the market. The new minimum will be recognized by Valley interests, which have heretofore been accepting bar and plate tonnage at 1.40c. The general effect will be to strengthen prices, producers believe.

Receivers for the Pittsburgh Railways Co., have asked authority in the Federal Court to spend \$400,000 for 40 new all steel cars, money for which is available or will be available before the completion of the order, which is expected to go to the Pressed Steel Car Co. Motors are to be furnished by the Westinghouse Electric & Mfg. Co.

The Timken Roller Bearing Co., Canton, Ohio, has added 200 men to its force and is now operating its plant at from 60 to 70 per cent capacity.

Revival Slow — Pig Iron Demand Light — Further High-Speed Steel Stocks

LONDON, ENGLAND, Feb. 8.—The long-looked for revival has not yet made its appearance, to the disappointment of all concerned. It cannot be said with

FAR EAST INQUIRIES FOR BARS

Pipe for China—Quotations Asked on 10,000 Tons of Second Hand Plates

NEW YORK, March 7.—The Chinese market is beginning to show considerable improvement, evidently in sympathy with the increased activity of Japanese buying. Purchases by merchants in Japan continue on an upward trend and Chinese merchants also are beginning to inquire, with the evident intention of buying. Among recent Chinese purchases in the United States has been 2000 kegs of checker-head, counter sunk wire nails, which were reported to have gone at 3.65c. per keg, c.i.f. Chinese port. Some business has also been transacted in wire, black and galvanized sheets and bars. An inquiry is current from Chinese interests for about 10,000 tons of Matheson joint, 16-in. steel pipe and another inquiry, being handled by A. G. De Sherbinin & Co., 60 Broadway, New York, calls for 10,000 tons of second-hand steel plates, for April, May and June delivery. The offering price of the exporter is reported to be \$25 per ton.

Inquiry for bars by both Chinese and Japanese merchants continues to increase. Orders up to 500 tons are reported to have been placed and several inquiries are current. Sizes are generally confined to $\frac{1}{2}$ in. and smaller. German competition in Far Eastern markets on bars and structural material is reported to be confined to only the smallest sizes, the larger bars being quoted lower by American mills.

An inquiry for fabricated pipe for Calcutta, India, received by way of London, asks for quotations on 5/16 and 7/16-in. steel plates for 33-in. and 60-in. pipe, totaling about 4000 tons for a 6-mile line. It is understood that the fabrication is to be done in England, and as American mill prices are still rather high to compete

in England, it is doubted that the order could be closed here.

The recent activity in wire rod exports to Japan has evidently come to a temporary end with the slight stiffening of the American market, and the decline of that market in Japan. Recent sales of wire rods were made at \$47 per ton, c.i.f. (about \$38 mill) Japan, but at present sales are being consummated there at less than the American market price. Steel bar orders by Japanese merchants are reported by numerous exporters. One exporter is stated to have booked 1000 tons, another 500 tons and quotations were recently made by certain exporters on 3400 tons and on 2500 tons. Practically all were for small sizes. Although it has been reported that the Imperial Japanese Railways inquiry for 4730 tons of 20-lb. rails, with which was included 191 tons of 20-lb. rail splice bars and 6 tons of 16-lb. rail splice bars, was placed with the Asano Bussan Co., 165 Broadway, New York, no confirmation has as yet been received. The reported quotation on this order, c.i.f. Japanese port, was \$42.75 per ton.

The heavy black sheet buying of Japan, during the latter part of last year, evidently led to some speculation in the United States. Lower mill prices here and the recent light buying by Japan has brought a number of lots of both black and galvanized sheets upon the market. It is also reported that shipyards in Pennsylvania have been offering resale lots of black sheets in good condition at \$15 to \$16 per ton. Some mills are reported to be shading prices considerably on their standard brands of sheets, when quoting for export.

The leading independent steel export company reports a considerable gain for February, though tonnage figures are still very far from what may be considered a normal volume. Japan is buying consistently and South American countries have also come into the market to a greater extent.

Blast Furnace Investigations of Bureau of Mines

The blast furnace research section of the Bureau of Mines, located at Minneapolis, has carried out plant investigations for six years; these are being continued. The conviction has been forced on it, however, that little progress toward the solution of the many important problems involved in furnace operation will, or can, be solved by any method of study of commercial operations on account of the large amount of materials to be handled and the numerous causes of irregularities. The need of a furnace capable of operating on a small scale and under controllable conditions has been obvious for years. In the last year an experimental stack has been erected and twelve combinations of furnace lines and operating conditions tried out. This work is being continued.

One investigation covers the effect of furnace lines on blast furnace operations. The blast furnace works on the countercurrent principle; the ascending gas stream encountering the descending raw materials, with a regenerative transfer of heat. Maximum contact between gas stream and raw materials produces most rapid heat transfer and reduction of the ore. The degree of contact between gas stream and solid charge depends to a very large extent upon the size and shape of the furnace. About 200 furnaces are relined each year, most of the new lines being copies of previous unsatisfactory ones. The furnace designer, lacking practical rules governing the best shape of furnace, prefers to stick to known troubles rather than accept the risk of a new design. An investigation in the laboratory and in the experimental furnace is being carried on by the bureau with the hope to discover some fundamental principles which may be of use to the furnace designer.

Another investigation being conducted relates to the effect of physical characteristics of the charge on blast furnace operation. Probably the greatest cause of the fundamental inefficiency of the blast furnace, considered thermally as a furnace, is due to the enormous

disparity between the sizes of the particles of the solids charged. The average lump of coke has a volume of 400 to 800 c.c. and a surface exposed to the gas stream of 0.5 to 1 sq. cm. per gm. The average ore particle, on the contrary, has a volume approximately 0.000005 and would expose a surface of about 300 sq. cm. per gm. to the gas stream if its surface were exposed to the gas stream. A study is being made of the effect on furnace operation of a mixture of solid particles one-third of which is one hundred million times the size of the other two thirds. In a number of cases furnace operators have improved furnace efficiency by sizing the coke charge. There are prospects of being able to continue such work on the sizing, not only of the coke but of the ore.

The bureau is also conducting performance tests on various cokes in the blast furnace. Opportunities for obtaining rather complete data on coking conditions and coordinate information concerning the performance of this coke in the blast furnace are particularly good at this plant. Variations in the quality of the coke in commercial practice are sufficiently great to promise valuable data without instituting special coking conditions. Furnace irregularities from other causes probably will be difficult to eliminate. Chances of a successful study of data at this plant are better than at the majority of plants due to the simple and direct means there employed for the transfer of coke from the ovens to the furnace. In most plants the identity of individual coke heats is lost in transfer and storage of the coke.

The Worcester, Mass., Chamber of Commerce estimates the unemployed in that city as 8000, or 2000 less than was the case six months ago. At the peak of the business depression, more than 15,000 were out of employment in that city. The unemployment in the metal working and machine tool industries has grown considerably less during the past six months, largely because of the activity of steel company subsidiaries and of textile machinery accessories makers.

Prices Finished Iron and Steel, f.o.b. Pittsburgh

Freight Rates

Freight rates from Pittsburgh on finished iron and steel products, in carload lots, to points named, per 100 lb., are as follows:

Philadelphia, domestic.	\$0.38	Kansas City	\$0.815
Philadelphia, export.	0.285	Kansas City (pipe)	0.77
Baltimore, domestic.	0.35	St. Paul	0.665
Baltimore, export	0.255	Omaha	0.815
New York, domestic.	0.38	Omaha (pipe)	0.77
New York, export.	0.285	Denver	1.35
Boston, domestic	0.405	Denver (wire products)	1.415
Boston, export	0.285	Pacific Coast	1.665
Buffalo	0.295	Pacific Coast, ship plates	1.335
Cleveland	0.24	Birmingham	0.765
Detroit	0.325	Jacksonville, all rail.	0.555
Cincinnati	0.325	Jacksonville, rail and water	0.46
Indianapolis	0.345	New Orleans	0.515
Chicago	0.38		
St. Louis	0.475		

The minimum carload to most of the foregoing points is 36,000 lb. To Denver the minimum loading is 40,000 lb., while to the Pacific Coast on all iron and steel products, except structural material, the minimum is 80,000 lb. On the latter item the rate applies to a minimum of 50,000 lb., and there is an extra charge of 9c per 100 lb. on carloads of a minimum of 40,000 lb. On shipments of wrought iron and steel pipe to Kansas City, St. Paul, Omaha and Denver the minimum carload is 46,000 lb. On iron and steel items not noted above the rates vary somewhat and are given in detail in the regular railroad tariffs.

Rates from Atlantic Coast ports (i.e. New York, Philadelphia and Baltimore) to Pacific Coast ports of call on most steamship lines, via the Panama Canal, are as follows: Pig iron, 55c.; ship plates, 75c.; ingot and muck bars, structural steel, common wire products, including cut or wire nails, spikes and wire hoops, 75c.; sheets and tin plates, 60c. to 75c.; rods, wire rope, cable and strands, \$1; wire fencing, netting and stretcher, 75c.; pipe, not over 8 in. in diameter, 75c.; over 8 in. in diameter, 2 1/2c. per in. or fraction thereof additional. All prices per 100 lb. in carload lots, minimum 40,000 lb.

Structural Material

I-beams, 3 to 15 in.; channels, 3 to 15 in.; angles, 3 to 6 in., on one or both legs, 1/4 in. thick and over, and zeels, structural sizes, 1.35c. to 1.40c.

Sheared plates, 1/4 in. and heavier, tank quality, 1.35c. to 1.40c.

Wire Products

Wire nails, \$2.40 base per keg; galvanized, 1 in. and longer, including large-head barbed roofing nails, taking an advance over this price of \$1.25 and shorter than 1 in., \$1.75; bright Bessemer and basic wire, \$2.25 per 100 lb.; annealed fence wire, Nos. 6 to 9, \$2.25; galvanized wire, \$2.75; galvanized barbed wire, \$3.05; galvanized fence staples, \$3.05; painted barbed wire, \$2.55; polished fence staples, \$2.55; cement-coated nails, per count keg, \$1.90; these prices being subject to the usual advances for the smaller trade, all f.o.b. Pittsburgh, freight added to point of delivery, terms 60 days, net, less 2 per cent off for cash in 10 days. Discounts on woven-wire fencing are 70 1/2 per cent off list for carload lots; 69 1/2 per cent for 1000-rod lots, and 68 1/2 per cent for small lots, f.o.b. Pittsburgh.

Bolts and Nuts

Machine bolts, small, rolled threads, 70, 10 and 10 per cent off list
Machine bolts, small, cut threads, 70 and 10 per cent off list
Machine bolts, larger and longer, 70 and 10 per cent off list
Carriage bolts, 1/2 in. x 6 in.:
Smaller and shorter rolled threads, 70 and 10 per cent off list
Cut threads, 70 per cent off list
Longer and larger sizes, 70 per cent off list
Lag bolts, 70, 10 and 5 per cent off list
Pilot bolts, Nos. 1, 2 and 3 heads, 60 and 10 per cent off list
Other style heads, 20 per cent extra
Machine bolts, c.p.c. and t. nuts, 1/2 in. x 4 in.:
Smaller and shorter, 65, 10 and 5 per cent off list
Larger and longer sizes, 65 and 10 per cent off list
Hot pressed sq. or hex. blank nuts, \$5.50 off list
Hot pressed nuts, tapped, \$5.25 off list
C.p.c. and t. sq. or hex. blank nuts, \$5.25 off list
C.p.c. and t. sq. or hex. blank nuts, tapped, \$5.00 off list
Semi-finished hex. nuts:
1/2 in. to 9/16 in. inclusive, 80, 10, 10 and 10 per cent off list
Small sizes S. A. E., 80 and 10 per cent off list
1/2 in. to 1 in. inclusive, U. S. S. and S. A. E., 70, 10, 10 and 10 per cent off list
Stove bolts in packages, 80 and 3 tens and 5 per cent off list
Stove bolts in bulk, 80, 3 tens and 2 1/2 per cent off list
Tire bolts, 70, 10 and 5 per cent off list
Track bolts, carloads, 3c. base
Track bolts, less than carloads, 4c.

Upset and Hex. Head Cap Screws

1/2 in. and under, 80 and 10 to 80, 10 and 10 per cent off list
9/16 in. to 1 in., 80 and 10 to 80, 10 and 10 per cent off list

Upset Set Screws

1/2 in. and under, 80, 10 and 5 to 85 per cent off list
9/16 in. to 1 in., 80, 10 and 5 to 85 per cent off list

Milled Square and Hex. Cap Screws

All sizes, 75 and 10 to 80 per cent off list

Milled Set Screws

All sizes, 70, 10 and 10 per cent off list

Rivets

Large structural and ship rivets, \$2.00 to \$2.10
Large boiler rivets, 2.10 to 2.20
Small rivets, 75 and 10 off list

Wire Rods

No 5 common basic or Bessemer rods to domestic consumers, \$36; chain rods, \$36; screw stock rods, \$41; rivet and bolt rods and other rods of that character, \$36, high carbon rods, \$43 to \$46, depending on carbons.

Railroad Spikes and Track Bolts

Railroad spikes, 9/16-in. and larger, \$2 to \$2.10 base per 100 lb. in lots of 200 kegs of 200 lb. each or more; spikes, 1/2-in., 3/8-in. and 7/16-in., \$2.15 to \$2.25 base; 5/16-in., \$2.15 to \$2.25 base. Boat and barge spikes, \$2.15 to \$2.25 base per 100 lb. in carload lots of 200 kegs or more, f.o.b. Pittsburgh. Track bolts, 3c. base per 100 lb. Tie plates, \$1.75 per 100 lb. Angle bars, \$2.40 per 100 lb.

Terne Plates

Prices of terne plates are as follows: 8-lb. coating, 200 lb., \$9.30 per package, 8-lb. coating, 1 C., \$9.60; 15-lb. coating, 1 C., \$11.80; 20-lb. coating, 1 C., \$13; 25-lb. coating, 1 C., \$14.25; 30-lb. coating, 1 C., \$15.25; 35-lb. coating, 1 C., \$16.25; 40-lb. coating, 1 C., \$17.25 per package, all f.o.b. Pittsburgh, freight added to point of delivery.

Iron and Steel Bars

Steel bars, 1.35c. to 1.40c. from mill. Refined bar iron, 2c. to 2.10c.

Welded Pipe

The following discounts are to jobbers for carload lots on the Pittsburgh basing card:

Steel			Iron		
Inches	Black	Galv.	Inches	Black	Galv.

To the large jobbing trade the above discounts are increased by one point, with supplementary discounts of 5 and 2 1/2 per cent.

Boiler Tubes

The following are the discounts for carload lots f.o.b. Pittsburgh.

Lap Welded Steel		Charcoal Iron	
Inches	Discount	Inches	Discount
1 1/2 in.	26 1/2	1 1/2 in.	5
2 to 2 1/2	41	1 3/4 to 1 7/8 in.	15
2 1/2 to 3 in.	52	2 to 2 1/4 in.	25
3 1/4 to 13 in.	57	2 1/4 to 3 in.	30
		3 1/4 to 4 1/2 in.	32

To large buyers of steel tubes, a supplementary discount of 5 per cent is allowed.

Standard Commercial Seamless Boiler Tubes

New discounts have been adopted on standard commercial seamless boiler tubes, but manufacturers are not yet ready to announce them for publication, and for that reason we publish no discounts this week.

LABOR COMMENDED

Message to Employees of United Engineering & Foundry Co.—Conditions Reviewed

"Labor, generally speaking, is deserving of a large amount of credit for the commendable spirit manifested in accepting ungrudgingly the unavoidable wage reductions and for the better co-operation and higher standard of efficiency which, in the majority of cases, is clearly noticeable in the amount and quality of work turned out." This statement is contained in a message to employees at its various plants by the United Engineering & Foundry Co., Pittsburgh.

"Labor is coming to realize that the only way to relieve the unemployment situation is to put forth its best efforts toward elimination of waste, and toward increased efficiency, in order that the employer, by reason of the resultant lower production costs, may secure his share of business, which in turn means more employment. It is regrettable that all labor cannot see the vital need of co-operation between employer and employee.

"We cannot expect any considerable improvement in industry until fuel, as well as transportation, is cheaper. Many railroads are now farming out repair work which should and would be done by railroad labor, if their rates were not so far above those outside of the railroad service."

"There has been a slight upturn in general business," continues the statement, "and from present indications the improvement will continue slowly. A rapid recovery of business might result from unnatural or artificial means, but this would be dangerous and might

eventually lead to another crash similar to that experienced in 1920.

"Considering the fact that the noticeable, but slight, industrial improvement since the middle of last year represents, to a large extent, purchases for replacement or repair of worn-out equipment and buildings rather than new construction, we may safely look for a much larger volume of business this year, for the reason that in addition to a greater volume of purchases for replacement there will be a large demand for needed construction which has been pending for several years.

"Announcement has already been made that contemplated construction projects of a public utility nature as well as extensive improvements by large steel corporations and other businesses are to be prosecuted or started in the near future.

"Liquidation has progressed rapidly as is indicated by the large number of commercial failures in 1921. It is well to remember that too few failures during a business depression is a bad sign. Considering the fact that so many ill-conceived and inefficiently managed concerns entered the field of business during the period of the war, when the unlimited demand and crying need everywhere for materials made it possible for almost anyone to produce and market goods at a profit, the period of depression so far has been characterized by too low a percentage of failures to make for a healthy condition.

"There still exists a great deal of uncertainty as to whether the bottom has been reached in all lines of business. It is gratifying to note, however, that several indications now point to a slow but steady and substantial business improvement during the ensuing year and many business men are showing keen foresight by making preparations accordingly."

Iron Ore Rate Controversy Resumed

WASHINGTON, March 7.—Tariffs filed with the Interstate Commerce Commission on March 1 proposing a reduction of 28 per cent as of April 1 on iron ore from Eastern mines are to be followed at once, according to reports, by an effort to obtain a reduction of 14 per cent on April 1 on ex-lake rates. Provided the latter went into effect on the date mentioned, it would have to be through special permission of the commission. The 28 per cent reduction proposed on rates from Eastern mines, including those in Pennsylvania, New York and New Jersey, would mean the elimination of the 40 per cent increase effective on Aug. 26, 1920, while the proposed 14 per cent cut in rates from lower lake docks on Lake Superior ore would amount to the cutting off of one-half of the general 40 per cent advance.

These moves by the carriers again brings to the fore the contest between the lake front and interior iron and steel interests. Buffalo iron and steel producers have consistently opposed a reduction in rates on iron ore from lower lake ports to interior furnaces in the absence of reductions in rates on coal to the Buffalo district and in a complaint now before the commission have asked it to establish a minimum on rates on iron from lower lake ports and, going further, argue that present rates on such shipments are too low when compared with coal rates to Buffalo from Pennsylvania mines. It is therefore expected that the Buffalo producers will contest the proposed 28 per cent cut in ore rates from Eastern mines on the ground that it is an entering wedge to a move toward a cut in rates on ore from lower lake ports.

Conferences have been held during the past week between the railroads interested and the commission regarding the proposed 28 per cent reduction and it remains to be seen whether the commission will permit the lower rates to go into operation on April 1 or will suspend them. It also is expected that if the 14 per cent rate on ex-lake ore rates is proposed, as it is said will be done, conferences will be held with the commission, requiring action on this matter also. As is known, the temporary reduction of 28 per cent on ore rates from lower lake ports was eliminated on Jan. 1 of the present year and the lower rates, which applied last fall, suspended until April 1 and succeeded by the old

rates which became effective as the result of the general 40 per cent advance.

Cincinnati Section, National Metal Trades Association

The annual meeting of the Cincinnati section of the National Metal Trades Association was held at the Business Men's Club in that city on March 2. The principal speakers were W. W. Coleman of Milwaukee, George W. Cartwright, Philadelphia, and the Rev. John B. Ascham of Cincinnati. President J. B. Doan presided, and in his annual address stated that this country needed an organized force to successfully resist the oppression of misguided labor and the spirit of communism and that the National Association and all of its constituent organizations must not dilute their militant forces in the fight for the open shop. Mr. Coleman's remarks dealt with the labor situation in England, and he declared that organized labor in that country had brought it to the verge of industrial ruin. One of the most serious mistakes the United States could make would be to enact an unemployment insurance law. He declared that American industries of their own volition had accomplished far more for American labor than the British unions had accomplished for English labor.

Mr. Cartwright in his address advocated an educational reform to give the workman the proper perspective toward his work. He said there should be less of boards and co-operative legislation and that we in this country must avoid the troubles brought about through the gospels preached by the English unions. In Mr. Cartwright's opinion the present industrial depression was scheduled to arrive in 1914, but the war postponed it. Those who were first to retrench by stopping speculative credit extensions and curtailed production will be the first to recover without suffering too severe losses. The speaker asserted that it was the Federal Reserve Act more than any other thing that saved the United States from an unprecedented financial panic. The election of officers resulted as follows: President, J. Wallace Carrel; vice-president, E. A. Muller; secretary, N. C. Lamont; the executive committee will be comprised of the officers and P. O. Geier, A. B. Breeze and J. B. Doan.

*Refinery quotation.

New York

NEW YORK, March 7.

An optimistic tone pervades all the markets and prices are advancing. The tin market has been quiet and prices are steady. Conditions in the lead market are unchanged. Sentiment and prices in the zinc market have improved.

Copper.—Not only have practically all of the cheaper offerings of copper been eliminated or withdrawn, but consumers are gradually becoming convinced that the bottom of the market on this movement has been reached. As a result buying in the last week or two has improved decidedly and the lower levels have disappeared. Electrolytic copper for early or 30-day delivery is quoted to-day at a minimum of 13c., delivered, or 12.75c., refinery, and it is doubtful if this could be shaded. Some sellers, however, will quote on this basis through May, while others confine themselves to more conservative limits as to delivery. Sales in February are estimated to have been about 100,000,000 lb., as contrasted with a little over one-half of this in January. The buying late in February and so far this month has been fairly heavy, both for domestic and foreign account, the latter being much better than a few weeks ago.

Tin.—The past week has been one of the quietest in some time. Only enough business in Straits tin has been done to establish a market and it is safe to say that the week's turnover has ranged from 500 to 600 tons and that on no one day was more than 150 tons dealt in. The chief cause of the inactivity has been an uncertainty on the part of buyers and sellers as to the meaning of the fluctuations in the London market and this has resulted in extreme caution on their part. Spot Straits tin was quoted to-day at 29c., New York, and in London spot standard was quoted at £142, future standard at £144 and spot Straits at £144 10s., all about £3 per ton less than a week ago, with the market reported weak. Deliveries of tin into consumption in February are reported to have been 3215 tons, with 506 tons in stock and 900 tons landing on Feb. 28. Imports for the first two months of this year have been 7200 tons, against 3830 tons for the same two months in 1921. Arrivals thus far this month have been 1205 tons, with 7935 tons reported afloat.

Lead.—The healthy conditions in this market continue, with demand maintained at the steady rate which has characterized it for so many weeks. The only change in price is that at St. Louis of the leading interest which now stands at 4.50c., instead of 4.70c., the New York quotation being unchanged at 4.70c. In the outside market the quotation of the independents is 4.70c., St. Louis, or 4.70c. to 4.75c., New York and Eastern points.

Zinc.—Prices of prime Western have advanced from 4.55c., St. Louis, a week ago, to 4.62½c. to-day for early or 30-day delivery, and the market is regarded as firm. This is due not so much to a large increase in demand as to the fact that producers have taken advantage of the slight increase in consumption to maintain a firm attitude as to offerings which they are willing to make. Quotations for future delivery are not freely obtained except at considerable increase.

Antimony.—Due to pressure to sell a few lots, the

market is lower, at 4.20c., New York, duty paid, for wholesale lots for early delivery.

Aluminum.—The leading interest continues to quote wholesale lots of virgin metal 98 to 99 per cent pure, for early delivery at 19c. to 19.10c., f.o.b. plant, depending on the quantity, and the same grade is offered by importers at 17c. to 18c., New York, duty paid.

Old Metals.—Prices are generally unchanged with business dull, though holders seem to be less inclined to sacrifice as has been the case during the past few weeks. Dealers selling prices are as follows:

	Cents Per Lb.
Copper, heavy and crucible.....	12.25
Copper, heavy and wire.....	11.50
Copper, light and bottoms.....	9.00
Heavy machine composition.....	9.50
Brass, heavy.....	7.25
Brass, light.....	5.75
No. 1 red brass or composition turnings.....	8.00
No. 1 yellow rod brass turnings.....	6.00
Lead, heavy.....	4.25
Lead, test.....	3.25
Zinc.....	3.00

Chicago

MARCH 7.—Demand is light and prices show little change. A slight advance in tin reflects greater strength in the London market. It is to be noted that the London market last week was the lowest in 18 years. In this country lower than current prices were quoted last summer. But this was due to the exchange situation. Zinc has advanced principally because producers are holding back their metal in an effort to stiffen the market. Copper alone has shown evidences of real activity, buying in this market having been the best for several weeks. Old metal prices remain unchanged. We quote in carload lots: Lake copper, 13.25c.; tin, 32c.; lead, 4.50c.; spelter, 4.70c.; antimony, 6.50c., in less than carload lots. On old metals we quote: Copper wire, crucible shapes and copper clips, 9.50c.; copper bottoms, 7.50c.; red brass, 7.50c.; yellow brass, 6c.; lead pipe, 3.25c.; zinc, 2c.; pewter, No. 1, 22c. tin foil, 23c.; block tin, 25c.; all buying prices for less than carload lots.

St. Louis

MARCH 7.—Both lead and zinc are dull. We quote lead at 4.37½c., car lots, and slab zinc at 4.50c. On old material we quote: light brass, 3.50c.; heavy red brass, 7c.; light copper, 7c.; heavy yellow brass, 4c.; heavy copper and copper wire, 7.50c.; pewter, 15c.; tinfoil, 16c.; tea lead, 2c.; aluminum, 9c.

Investigation of the Alabama Iron Ore District

At the Southern Experiment Station of the Bureau of Mines, Birmingham-Tuscaloosa, Ala., the problem of the treatment of the iron ores of the Birmingham district has been divided into three parts as follows: (a) A detailed economic study will be made of the whole iron and steel industry in the Birmingham district, from the ore in the ground to the finished product. (b) What proportion of the gangue material associated with the iron ore of the district should be removed in ore dressing plants. (c) What proportion of the gangue of the iron ore of the district should be removed in the blast furnace for the most efficient practice.

A detailed study will be made of the methods of mining, handling and concentration of the ores, which will in turn be correlated with the studies on furnace practice and the use of coke best adapted to the treatment of the ores. The intention is to prepare a report covering the economic features of the iron ore industry of the Birmingham district, particularly with respect to the utilization of the siliceous ores that are not extensively used at the present time; also to ascertain whether it may not be possible to apply the information obtained as a result of this investigation to the mining, beneficiation and utilization of siliceous ores in other states, for example, in Tennessee and Missouri.

PERSONAL

Thomas C. Ham, who has been looking after the export business in the New York office of the Jones & Laughlin Steel Co., effective March 1, was made

THOMAS C. HAM

assistant manager of exports under A. H. Holliday, manager of exports. Mr. Ham will remain in the New York office. Mr. Ham was born in New Hampshire and is a graduate of Dartmouth College. He has been with the company since 1910, serving as assistant manager of sales in the wire department until 1919, when he was transferred to the New York office. Previously he was affiliated with the American Steel & Wire Co., first as manager of the Oklahoma City office of the company, and later as assistant manager, merchant trade

department, in the Chicago office.

Henry J. Kranz, who for the last 15 years has represented Carnegie Steel Co., Illinois Steel Co., and Tennessee Coal, Iron & Railroad Co. in Kansas and Oklahoma, has become associated with the Laclede Steel Co., St. Louis.

J. V. Emmons, Cleveland Twist Drill Co., gave an illustrated talk on the effect of structure upon the machining of tool steel, before the Boston Chapter American Society for Steel Treating, at the City Club, Boston, Wednesday, March 1.

Edward L. Pond, president Andrew Terry Co., Terryville, Conn., foundry, on March 4 observed the fiftieth anniversary of his connection with that company.

Frank S. Bradley, formerly secretary and general manager of the West Haven Mfg. Co., since its inception in 1896, has accepted the management of The Roberts Mfg. Co., New Haven, Conn., as its president.

The Pittsburgh Steel Co. announces the appointment of John F. Hazen as assistant general manager of sales. Mr. Hazen has been for several years connected with the sales end of the Pittsburgh Steel Co. in various capacities.

F. W. Pennock has resigned as vice-president and general manager of Cleaton Co. (of Canada), Ltd., and will hereafter be solely connected with Gelinas & Pennock, registered engineers, 207 St. James Street, Montreal.

Several changes in personnel were announced recently by the Westinghouse Electric & Mfg. Co. R. L. Rathbone, who has been manager of the Cleveland office, will take up special duties in connection with merchandising matters, with headquarters in Cleveland, and is succeeded by J. Andrews, Jr., who has been manager, industrial division, Pittsburgh office. C. D. Taylor succeeds Mr. Andrews in the Pittsburgh office. R. Seybold has been appointed manager of price statistics and will act as secretary of the domestic sales committee. W. R. Keagy has been appointed manager of the Cincinnati office and J. R. Deering manager of the Los Angeles office. H. S. Walker succeeds H. E. Lanning as promotion man in the Denver office and I. G. Cline takes the promotion work vacated by R. A. O'Reilly in the Chicago office. K. L. Graham succeeds to the post vacated by H. C. Hopkins as promotion man in the San Francisco office.

J. C. Miller, formerly manager, Columbus division, of the American Rolling Mill Co., has been transferred to Ashland, Ky., as manager of the Ashland division of the company, which property at present is comprised of

two blast furnaces, six 100-ton open-hearth furnaces and blooming mill, bar mill, and six sheet mills, and 22,000 acres of Kentucky coal property. He will also have the direction of the company's West Virginia coal properties, consisting of about 12,500 acres of gas coal in Fayette and Boone counties. In a recent reorganization of the Asland Coal & Iron Railway Co., also owned by the company, Mr. Miller was elected first vice-president and general manager, and also president of The Tygart Limestone Co. The company contemplates constructing additional finishing capacity during the present year.

Arthur Whitcraft, M.E., has assumed charge of the manganese steel sales department of The Hadfield-Penfield Steel Co. with headquarters at Bucyrus, Ohio. Mr. Whitcraft was for a number of years successively with the Marion Steam Shovel Co., American Locomotive Co., and New York Central Railroad, and he was for 12 years with the American Manganese Steel Co. as a sales engineer engaged in the design, application and sale of manganese steel castings.

L. J. Buck has severed his connection with the National Carbon Co., a subsidiary of the Union Carbide & Carbon Corporation, and has become United States sales representative of the British America Nickel Corporation, Ltd., Ottawa, Canada, with offices at the Canadian Pacific Building, 342 Madison Ave., New York. The British America Nickel Corporation is a Canadian organization with Sir Robert Borden as chairman of its board of directors and Hon. Edgar N. Rhodes president. It operates in the Sudbury district of mines with large quantities of proven ores of excellent quality and a modern smelter. Its refinery is located at Deschenes, near Ottawa.

D. K. Bullens, president D. K. Bullens Co., consulting metallurgist, Philadelphia, on March 7 addressed a joint meeting of the Pittsburgh sections of the American Steel Treating Society and American Institute of Mining and Metallurgical Engineers.

W. K. Singleton, formerly sales manager Carnahan Sheet & Tin Plate Co., now the Falcon Tin Plate & Sheet Co., has joined the sales force of the American Steel Co., Pittsburgh.

A. A. Potts has been elected secretary and treasurer and a director of the Pioneer Coal & Coke Co., Pittsburgh, and its subsidiary companies.

F. E. Fitzgerald, manager of sales Pioneer Coal & Coke Co., Pittsburgh, and affiliated companies, has been elected a director of the company and of the Tidewater Coal Co. and the National Transportations Co., subsidiaries.

President James A. Campbell of the Youngstown Sheet & Tube Co., Youngstown, Ohio, left Tuesday evening for a month's stay at Hot Springs, Ark.

William Bassett, as of March 1, retired from the Standard Supply & Equipment Co., Pittsburgh.

Samuel R. Robinson has resigned as foundry superintendent for the Sandusky Foundry & Machine Co., Sandusky, Ohio, to accept the position as metallurgist with the Lorain Steel Foundry Co., Lorain, Ohio. Mr. Robinson was metallurgist for the Philadelphia Roll & Machine Co., Philadelphia, from 1918 to 1921. Previous to that time he was metallurgist for 11 years for the Duquesne Steel Foundry Co., Corapolis, Pa.

It has been estimated that there were, July 1 last, 12,588,949 motor vehicles in the world, of which 10,505,660 were in the United States. No other country reaches 500,000, Great Britain being second with 497,582, Canada third with 463,448, France fourth with 236,146 and Germany fifth with 91,384. All of Europe is credited with 1,110,990, or rather less than New York and Pennsylvania combined.

It has been definitely shown by the Bureau of Standards that very accurate control of the temperature of molten metal is necessary in the determination of gases evolved in vacuo. The higher the metal is heated above its melting point the greater the quantity of gas evolved in a given time.

OBITUARY

LEWIS T. MILLER died at Pottsville, Pa., Feb. 26. He was born in Rochester, N. Y., Aug. 1, 1892, and lived the early part of his life around Rochester and Pittsburgh. After attending the University of Pittsburgh, he went to the Colonial Steel Co. at Colona, Pa., where he served in turn as inspector and assistant paymaster for four years. He was later with the Witherow Steel Co. as paymaster. He enlisted as a mechanic in the aviation section in September, 1917, was in service 22 months until July, 1919, when he was commissioned pilot in the Reserve Corps. After returning from service he again went with the Witherow Steel Co. as assistant district manager of its New York office and was later made district manager. He also served with the Hess Steel Corporation for a short time and with the International High-Speed Steel Co. as general superintendent of its Rockaway, N. J., plant. Since July, 1921, he had been connected with the National Steel Rolling Co., at Schuylkill Haven, Pa., as general superintendent, as well as being interested in work for Hartmann, Duncan & Rogow, Inc.

COL. JOHN LAMBERT, of Joliet, Ill., formerly president of the American Steel & Wire Co., died at his winter home, Pasadena, Cal., March 6, from complications following an attack of pneumonia. Col. Lambert's death ended an active business career, marked by a genius for organization in the field of iron and steel manufacture and distribution. He was born in Lambertville, N. J., Jan. 12, 1847, obtained a common school education and joined the Union forces in the Civil War in 1864. In 1879 at Joliet, Ill., the wire manufacturing firm of Lambert & Bishop was organized, one of the first producers of steel wire fencing in the country. With John W. Gates and Elbert H. Gary, Colonel Lambert was, years ago, one of the national figures in the organization of the steel industry, having been associated with them in the formation of the United States Steel Corporation. He leaves his widow and one daughter.

CAPT. HORACE G. H. TARR, widely known as an engineer of achievement, died unexpectedly March 2 at his home in Philadelphia. Captain Tarr was born in Chillicothe, Mo., in 1844, was educated at Andover Academy, enlisted in the Union Army when 16 years of age, and was soon promoted to captain. He made an admirable record. After the war he was engaged on a number of engineering projects and became associated with the Otis Elevator Co. He afterward became manager of the H. R. Worthington Pump Works, holding that position 17 years and resigning in 1901. At his death he was with the R. D. Wood Co., Philadelphia. He was a member of a number of engineering associations.

SOLOMON SHAW, for 52 years an expert in the iron and steel foundry business in Milwaukee, died Feb. 28 aged 73 years. He was born in Dudley, England, Oct. 1, 1848, and came to the United States in 1868. Mr. Shaw developed many new ideas in molding practice.

JOSEPH HEWES SHEPHERD, mechanical engineer, Blanchard Machine Co., Cambridge, Mass., died March 2 at his home in Needham Highlands. Mr. Shepherd was born in Arlington, Mass. His first business association was with the Baldwin Locomotive Works.

HENRY W. BULLARD, treasurer Poughkeepsie Foundry & Machine Co., Poughkeepsie, N. Y., died Saturday, Feb. 4.

JOHN SARGEANT of Domhoff & Joyce, pig iron brokers, Cincinnati, died last Saturday, March 4, at Buffalo, where he had been receiving treatment for several months.

OTIS H. CUTLER, chairman American Brake Shoe & Foundry Co., died at Miami, Fla., March 4. He was born May 15, 1866, and for a number of years was connected with the Baldwin Locomotive Works.

FRANK E. CABLE, Porter-Cable Machine Co., Syracuse, N. Y., died March 7 at Newton Center, Mass., following an illness of ten days of heart trouble. He was 66 years old.

STEEL MAKING COSTS IMMUNE

Federal Trade Commission Cannot Force Producers to Report Costs

WASHINGTON, March 7.—Holding that manufacturing is not commerce and that the Federal Trade Commission was trying to interfere with commerce, Judge Bailey, in the Supreme Court of the District of Columbia, last Saturday signed an order and final decree making permanent the temporary injunction restraining the commission from compelling independent iron, steel and coke producers to make monthly reports to the commission of their costs of production and other intimate details of their business.

This victory in what is known as the Claire Furnace Co. case, involving 22 producers, is of great importance, and the ultimate outcome is being watched with deep interest by business organizations. The principle embraced in the proceeding is of far-reaching character to all manufacturing enterprises of the country, and the case is clearly a test as to whether the commission has the authority to force producers to make reports to it as to facts which are considered by them to be of a purely private nature. That both the steel producers and the commission consider the proceedings to be of vast importance is evident from the fact that it will be contested through the Supreme Court of the United States.

The decision of Judge Bailey was in accordance with his previously expressed opinion that he would strike out the entire amended answer of the Federal Trade Commission as not stating a sufficient defense and in the nature of a demurrer. Because of this he made the injunction permanent, pursuing a policy similar to that he established in the Maynard Coal Co. case. In open court counsel for the commission noted an appeal which was allowed, and the case now is before the Court of Appeals of the United States in Washington.

The case as it now stands on appeal makes a square issue between the bill of complaint and the amended answer of the commission. The date for argument before the Court of Appeals has not been set. The argument will be made on the case as stated by the pleadings.

The case originated in December, 1919, when the commission called upon the iron, steel and coke makers to produce the data required. Claim was made by them that the commission has no jurisdiction and that its attempt to compel the production of the facts wanted is unconstitutional. Judge Bailey first issued a temporary restraining order against the commission. Various arguments subsequently were made before him, with the result that the permanent injunction and decree were issued.

The producers included in the case are the Claire Furnace Co., Ella Furnace Co., Edgewater Steel Co., Bethlehem Steel Co., Midvale Steel & Ordnance Co., Reliance Coal & Coke Co., Westmoreland-Connellsville Coal & Coke Co., Wierton Steel Co., LaBelle Iron Works, Donner Steel Co., Steel & Tube Co. of America, Cambria Steel Co., Republic Iron & Steel Co., McKeesport Tin Plate Co., N. & G. Taylor Co., Inland Steel Co., Trumbull Steel Co., Youngstown Sheet & Tube Co., Brier Hill Steel Co., West Penn Bridge Co., Wheeling Steel & Iron Co., and Sharon Steel Hoop Co.

James J. Davis, Secretary of Labor, in an address at Lima, Ohio, on Feb. 22, advocated the removal of more than 2,000,000 children from industry, as a means of relieving the unemployment situation. Mr. Davis also advocated not only a living wage, but a saving wage for workers. Further restriction of immigration was also declared to be necessary.

BROADER BUYING

Improvement in Demand for Steel Products in the Mahoning Valley

YOUNGSTOWN, March 7.—In a broader way than at any time in many months, business is coming to independent steel mills in the Mahoning Valley, accelerating schedules. Unless something unforeseen should happen, March gross tonnage placed in this territory should register an appreciable advance over the volume of February sales.

The Republic Iron & Steel Co. has definitely decided to blow in an additional blast furnace, after an idleness of many months, increasing the number of its active stacks to two.

Incoming sheet business shows a broader range, and orders for 400 and 500 tons are coming through with considerably more frequency, whereas a month ago business was largely confined to 25 and 50-ton lots. With exception of sheet makers catering particularly to the automobile trade, delivery is possible within a couple of weeks.

Rather than continue to meet prices on plates which it characterizes as "ruinously low," the Brier Hill Steel Co. has marked up its quotation on this product to 1.65c. per lb. This compares with an actual price at which plate tonnage has moved in competitive districts of 1.35c. The Brier Hill company maintains it cannot accept plate business at a price below the slab market. A small volume of plate tonnage is being placed. The company announces suspension of its 132-in. mill is preferable to its continued operation at a loss.

Another Valley independent is quoting 1.40c. on

plates, with operations on merchant material intermittent.

Open-hearth furnace operations have been materially enlarged within the past two weeks due to the sustained demand for semi-finished material from non-integrated sheet and tin plate interests, and to the broader requirements of finishing units of self-contained interests.

At the beginning of the week, 38 of 51 independent open-hearths were scheduled for production in the Mahoning Valley. Buying of billets and wire rods, in addition to sheet bars, by non-integrated interests, has caused steel making to expand at a more rapid rate than rolling mill production. Finishing mill schedules are stronger all along the line, excepting plate units. Sheet mill capacity is engaged to the extent of about 52 per cent.

Open-hearth sheet bar prices continue firm at \$29 to \$30. With scrap quotations advancing, a Valley independent anticipates an increase in sheet bar quotations of from \$1 to \$2, if buying activity is maintained. An advance in sheet bars, it is pointed out, would likely affect the sheet market. Prices of sheets entered the year firm at 3c. and 4c. for black and galvanized respectively, base gages, and these prices have held since. Blue annealed continues to be quoted at 2.25c., but an advance to 2.40c. in its quotations is "being considered by a Valley interest."

It is generally held that the time is not yet at hand to warrant higher quotations in sheets. The market, however, is likely to be responsive to broader requirements, as makers are unsatisfied with existing prices. One interest which is operating eight sheet mills states that current business is sufficient to enlarge production, which is held down for the time being by lack of steel.

Volunteer Committee to Relieve Unemployment of Engineers

Volunteer committees of engineers to aid in meeting the unemployment situation are being formed in the principal industrial centers of the country. These committees will co-operate with the Employment Service of the American Engineering Council of the Federated American Engineering Societies, whose headquarters are in the Engineering Societies Building, 29 West Thirty-ninth Street, New York. Unemployment has been so widely prevalent among engineers that a big volunteer committee was formed in New York to aid the overtaxed employment service, which for months has had more than 3000 applications for jobs on file, according to the manager, Walter V. Brown.

Frank A. Casey, Billerica, Mass., is in charge of the volunteer work in Boston. In Cleveland the Cleveland Engineering Society has appointed a special committee on employment with C. R. Sabin as chairman. In Bridgeport, Conn., William E. Hogan is heading the movement, while the work in Fairfield County, Conn., is being directed by Paul D. Wright, 309 Edgewood Avenue, New Haven, Conn., and H. R. Audit, New Haven. In New Jersey the committees are being headed by S. B. Austin, Boonton, N. J., and A. F. Johnson, 863 Kenegan Avenue, West Hoboken, N. J., George Beavers is directing the volunteer work in Milwaukee and C. C. Coonan of the Rochester Engineering Society is in charge in Rochester, N. Y.

More Employment in Cleveland

CLEVELAND, March 6.—Industrial employment in Cleveland showed a fair gain during February and more men are now at work in this city than at any time since last May, according to the monthly survey of the Cleveland Chamber of Commerce Committee on labor relations. The figures are based on reports from 100 plants normally employing 500 or more persons. These reported 73,158 employees on their payrolls Feb. 28, as compared with 69,352 on Jan. 31, an increase of 5.5 per cent. The greatest gain was in the automotive field. Eighteen companies making motor cars and accessories on Feb. 28 were employing 8728

persons, as compared with 7440 on Jan. 31, a gain of 17 per cent. The increase in employment in the metal trades, which includes iron and steel plants, was 9 per cent. There was a 10.8 per cent increase in the employment in plants making metals and metal products other than iron and steel. The low point was reached in July last.

Judge Gary on Business Conditions

Judge E. H. Gary, chairman of the United States Steel Corporation, in an interview with a representative of the New York News Bureau, Tuesday afternoon, said:

"Although there has been a gradual, if limited, improvement in business conditions during the last few months, I have seen no substantial evidence of general rapid recovery to normalcy, so called. Probably it is better so. The natural laws applying to business are grinding slowly but surely, and will compel sooner or later stability, progress and prosperity.

"If the laws of the country shall be sufficiently enforced to permit every individual to utilize his talent and energy without forcible interruption, we shall soon see the prosperous conditions for which we have been anxiously and expectantly looking for many months.

"The sun of prosperity is still shining, though it has been unnecessarily obscured."

Announcements were made this week from the general offices of the Locomobile Co. of America, Bridgeport, Conn., automobile and truck manufacturer, that over 200 additional workmen were added to the payroll on Monday, Feb. 27. Col. Elmer H. Havens, president and receiver of the company, states that a greater demand for the company's product is the main cause, and also states that business is "picking up" nicely.

The plan of the Ohio Industrial Commission to establish medical depots in various districts of the State for the benefit of injured workmen is meeting with strong protest, according to the committee on workmen's compensation of the Cincinnati Chamber of Commerce.

RAILROADS UNYIELDING

Testimony Opposes Reduction of Rates in Iron and Steel Products

WASHINGTON, March 7.—The rebuttal testimony of railroad witnesses in the general rate investigation case before the Interstate Commerce Commission clearly shows that the railroad executives have not yielded in the slightest in their opposition to rate reductions. They are still seeking certain "adjustments" independent of any formal proceedings. One of these relates to proposed cuts in rates on iron ore. Apparently the railroad executives feel that by attempting to controvert the testimony given by witnesses who vigorously urged general rate cuts in the basic lines, such as iron and steel and coal and coke, they would make their most effective point toward forestalling sweeping cuts. The rebuttal ended last Saturday.

Arguments will start to-morrow and the case will come to a final close on Saturday of the present week. It is believed that the commission will hand down an early decision. This has been urged by both shippers and carriers and the great volume of testimony that has been taken since the case was begun on Jan. 17, has been analyzed as it proceeded by a large corps of experts of the commission.

While railroad representatives have conceded that rates eventually will come down, they have at all times strongly opposed any general reductions. They have taken the position that the rate structure must be gradually straightened out by adjustments and they have laid considerable stress upon those which have already been made. It is evident that they are fearful of a broad sweep of cuts involving a heavy volume of traffic. In the course of the rebuttal, they have maintained that any reduction being made at the present time would not stimulate traffic. A contrary view has been taken by shippers. With this as their basic idea, the railroad witnesses in their rebuttal testimony devoted a large portion of their attack against reductions in coal, coke, and iron and steel rates.

Mr. Cochran's Statement

In this connection, an elaborate statement was made by H. H. Crocker, assistant coal traffic manager of the Baltimore & Ohio, sharply attacking the testimony of shippers asking for rate cuts in coal and coke, and iron and steel. His testimony was taken to be particularly significant in view of the prevailing opinion that while a general rate reduction is not probable, cuts in rates on coal and other raw products at least are likely to be ordered. Manifestly, however, this opinion can be nothing but a surmise.

Shippers contend that the railroads, realizing the prevalence of this opinion, are attempting to prevent such action, thinking that to do so would also make cuts in rates on iron and steel and other lines improbable. The railroad people contend that their financial condition does not warrant cuts in rates on coal or any other commodity involving a great volume of traffic. The shippers plainly recognize the interdependence of the railroads and industries, but representatives of the carriers argue that reduced rates would not increase traffic and would only further deplete their revenues. The shippers, on the other hand, have argued that reduced rates would increase the volume of traffic to such an extent that there would be a greater net return to the carriers.

Opposed to Reductions

The testimony of Mr. Cochran was in opposition to reductions in rates on coal and coke and iron and steel products. Concerning coal, he strongly denied the testimony given by J. D. A. Morrow, vice-president of the National Coal Association, that reduced coal rates would result in decreased operating costs for railroads, or increased traffic. He also denied testimony of witnesses of steel interests that a reduction in coal rates would be followed by any increase in outbound shipments of steel products, but would only tend to reduce the cost of producing iron and steel. He took the situation of the iron and steel producers as typical of the

situation of other producers throughout the United States, using coal for manufacturing purposes and, as he said, the railroad people "carefully digested the testimony of the representatives of the iron and steel interests for the particular purpose of determining whether a reduction in coal rates would stimulate the movement of traffic or merely operate to reduce the cost of manufacturing iron and steel articles. The testimony is convincing that in any event in the absence of a concomitant reduction in the rates on outbound iron and steel products, a reduction in the coal rates would not be followed by any increase in the outbound tonnage, but would merely operate to reduce the cost of production."

Comment by Shippers

Steel shippers have commented on the testimony of Mr. Cochran as lacking in comprehension of economic facts. In this connection, they pointed to one of his general contentions that even if railroad rates on steel products were reduced, the benefit would be passed along to the consumer. At the outset, steel shippers say, the basic idea of rate making relates to the reasonableness or unreasonableness of the rates and other matters, such as benefits of the ultimate consumer, are extraneous. Moreover, Mr. Cochran, while saying that the ultimate consumer would not be given the advantage of cut rates in steel products, indicated his agreement with steel makers that the prices of their products in many cases are below cost. By reason of this fact, steel interests have pointed out that they can hardly be expected to "pass along the benefits" of rate reductions while losing money. In any event, it is pointed out, prices for finished steel now are lower than at any time since December, 1915, and those for pig iron lower than at any time since September, 1916, despite the much higher costs due to excessive railroad rates.

The trend of prices as a result of rate reductions, manufacturers have stated, would depend upon market conditions but they have stated positively that the steel industry cannot permanently produce at a loss, and unless it does get into heavier production the effect on transportation as a result of reduced volume of traffic will injure the railroad along with the steel industry itself.

Fewer Metal Workers and Lower Wages

Iron and steel plants, according to figures of the Bureau of Labor Statistics, show for January a loss of 7623 employees in 105 establishments. This loss of 6.9 per cent was accompanied by a loss of 16.9 per cent in the half-month payroll, with a corresponding reduction in the average pay envelope from \$44.09 to \$39.35, or 10.7 per cent.

Similar decreases, both in number of employees and in half-month payroll, together with sharp drops in average pay envelopes, were recorded by both the automobile and the car building and repairing industries. Present wages in the automobile industry, on this showing, are slightly below those in the iron and steel mills. Wages in car building and repairing, however, are considerably higher than in either of the other two groups, being \$51.76 in January, which is 31½ per cent above the average pay envelope in the iron and steel industry. This reflects in large measure the continuance of wartime wages in the railroad car shops, against which the railroad managements are now moving.

Period	Number of Establishments	Number of Men	Half-Month Payroll	Average Pay Envelope
Iron and Steel				
January, 1921 ..	106	131,358	\$9,042,235	\$68.84
January, 1922 ..	105	102,918	4,049,534	39.35
December, 1921.	105	110,541	4,873,934	44.09
Automobiles*

December, 1921.	58	56,103	3,354,876	59.79

*Payroll figures are reported as "weekly"; they have been made "semi-monthly" by multiplying by 2 1/6.

Further Gains in Iron and Steel Exports

January Shows Advance Over December—Best Month Since April—Gains in Wire, Wire Rods, Galvanized Sheets, Tin Plate and Rails

WASHINGTON, March 7.—Increases were made in iron and steel and machinery exports, and iron and steel imports, during January, as compared with those of December. Whatever this greater movement of commerce in these basic products may mean in the way of a gradual and permanent improvement in conditions of world economics, they have at least afforded encouragement to students of industrial conditions.

The new classification of iron and steel and machinery exports of the Bureau of Foreign and Domestic Commerce, effective in January, caused a revision of our export table.* The outstanding difference between the new and old classifications is that the present one subdivides products and, with some exceptions, is more specific. The effect on the tonnage, however, is relatively unimportant, because only in a few instances are new items included. Some of these, such as castings and forgings, have been reported previ-

ously by value, but now appear according to both value and tonnage. In view of the fact that these have not been reported by tonnage previous to January, no figures are recorded for the seven-month period, but are included for the single month.

The machinery group has been considerably amplified and subdivided and this group now takes in agri-

Exports, January, 1920, to January, 1922, Inclusive

*Editor's Note: Most of the items in the new classification are identical, or practically so, with corresponding items in the old, permitting direct comparison. Important divergences follow: Sheet bars and skelp have been added to the old group of ingots, billets and blooms. Iron and steel bars are now grouped, where previously they were reported separately; alloy steel bars are now separately reported. Iron plates have been added to the old item of steel plates. Black iron sheets are reported separately, having previously been included under "all other sheets and plates." Strip steel has been added to the old item of hoops and bands. Structural steel, now segregated between plain and fabricated material, includes two old items—"structural steel" and "ship plates, punched and shaped"; the latter is included under fabricated material. Rail fastenings, switches, frogs, etc., take the place of railroad spikes, and cover a much larger group of materials. The heading of the new item "boiler tubes, welded pipes and fittings" is more inclusive than the old "welded pipe and fittings." The wire products, except for wire nails, have been entirely recast. Cut nails are now reported under the general head of "nails, other than wire, including tacks." Radiators and cast house boilers are no longer reported separately. Several new items appear, as shown in the table,

Imports of Iron and Steel—Gross Tons

	January 1921	January 1922	Seven Months Ending January 1921	Seven Months Ending January 1922
Ferromanganese	1,107	1,300	39,098	5,171
Ferroaluminum	213	1,593	5,951	7,835

Manganese ore and oxide	49,699	9,500	440,094	118,479

*Not previously recorded separately.

cultural implements, electrical machinery and vehicles.

While the recovery in iron and steel exports has been comparatively small, it has been continuous since last September. The January movement was the largest since April of last year, when exports totaled 162,592 tons.

Exports in January of this year totaled 160,920 gross tons, valued at \$15,149,174, as against 134,415 tons, valued at \$29,502,448, for December. For the seven-month period ending with January, 1922, the total was 773,706 tons, valued at \$97,898,465. This compares with 3,199,343 tons, valued at \$738,112,894, for the corresponding period one year ago. Exports

Exports by Countries for January, and for the Seven-Month Period Ending January, 1922, of Leading Steel Products

	January, 1922	Per Cent of Total	Seven Months Ending January, 1922
Galvanized Sheets: Gross Tons			
Japan	7,923	49.3	3,927

Sum of Six Items Above:			
Japan	66,922	67.3	220,262

reported for January of last year totaled 547,894 tons, valued at \$137,803,395. These figures vividly reflect the sharp slump in both value and volume of exports during January, and the seven-month period ending with January, 1922, when compared with the same periods of one year ago.

Imports in January of the present year totaled 18,406 tons, valued at \$2,164,062, and for the seven-

month period amounted to 82,216 tons, valued at \$14,833,598. These figures include steel bars, not previously separately reported in our tables. December imports were only 9309 tons, valued at \$1,964,159. For January, 1921, imports totaled 16,822 tons, valued at \$2,549,811, and for the seven months ending with January of last year the imports aggregated 219,286 tons, valued at \$30,787,260.

Imports of manganese ore in January of the present year totaled 9500 tons, valued at \$47,614, and for the seven-month period ending with January, 1922, they amounted to 118,479 tons, valued at \$672,018. Manganese ore imports in December totaled 14,900 tons, valued at \$75,770. For January of last year they totaled 49,699 tons, valued at \$1,036,096, and for the seven-month period ending with that month, they totaled 440,094 tons, valued at \$8,494,380.

Exclusive of agricultural implements and vehicles, machinery exports for January, 1922, aggregated \$17,243,154, and for the seven-month period ending with that month their total value was \$136,497,306. Similar exports in December were valued at \$15,068,-

seven-month period that country took 42,302 tons of rails out of the aggregate exports of 114,628 tons.

Rails constituted the largest single item of export in January. Of the total exported, 26,306 tons were rails weighing 50 lb. and over per yard, while 3364 tons were light rails weighing under 50 lb. per yard.

Of the 25,170 tons of black steel sheets exported in January, Japan took 22,530 tons, or 89.5 per cent, and for the seven-month period that country took 128,896 tons out of the total exports of 154,960 tons, or 83.2 per cent. This movement to Japan indicates that American manufacturers have built up a substantial market there, but also is attributed partly to the fact that the Japanese industry is greatly depressed, owing to its inability to produce as economically as industries of the United States and other countries where operations have long been organized on an efficient basis.

The largest single item of imports was pig iron, the inbound movement of this blast furnace product being 6346 tons, while scrap ranked second, with 2412 tons; and ferrosilicon third, with 1593 tons. Imports of rolled steel were light.

The New Patent Law

President Harding has presented to Edwin J. Prindle, chairman of the Patent Committees of the Mechanical Engineers, the pen with which the Patent Office relief bill was signed. Mr. Prindle, a New York lawyer and engineer, led the fight for the engineers in their nation-wide campaign to wipe out archaic conditions in the Patent Office.

Manufacturers, inventors, scientists, lawyers and other classes joined in the movement, the success of which was described in an engineering announcement as a "great stimulus to the production of American inventions, which is the chief object of our patent system."

The pen was forwarded to Mr. Prindle by George B. Christian, Jr., secretary to the President, and at the same time came a letter from Thomas E. Robertson, Commissioner of Patents, in which he pointed out that the Patent Office victory, won after four years of effort, signalized an outstanding achievement in the public interest. Engineers said that the passage of the patent measure relieved a situation which menaced American industry and invention.

Mr. Prindle explained that the new law added \$451,000 to the payroll of the Patent Office, increasing the salaries of the examiners approximately 45 per cent and the number of examiners 10 per cent. "The bill," he added, "also contains an amendment to the patent law which will make a money recovery possible in all patent infringement cases where the patent has been held to be valid and there has been any substantial use of the invention. Heretofore the rules governing accountings in patent infringement suits have been so technical and illiberal that a money recovery has been impossible in most cases."

"Recently a few decisions have been rendered in which a more equitable principle has been applied to a limited class of infringement cases. The amendment makes the said principle statutory and extends its application to all classes of infringement cases."

Officers of the steel works section, Engineers Society of Western Pennsylvania, elected at the annual meeting at the William Penn Hotel, Pittsburgh, Feb. 28, are: Strickland Kneass, Jr., Youngstown Sheet & Tube Co., chairman; G. M. Goodspeed, National Tube Co., McKeesport, Pa., vice-chairman; T. J. McLaughlin, Carnegie Steel Co., Duquesne, Pa., Barton R. Shover, consulting engineer, Pittsburgh, Charles McKnight, Jr., Carbon Steel Co., Pittsburgh, G. D. Bradshaw, Andrews-Bradshaw Co., Pittsburgh, and A. F. Backlin, American Steel & Wire Co., Pittsburgh, directors.

C. M. Johnson, director research department and chief chemist, Park Works, Crucible Steel Co. of America, was the speaker at the annual meeting of the Steel Works section, Engineers' Society of Western Pennsylvania, at the William Penn Hotel, Pittsburgh, Tuesday evening, Feb. 28.

Exports of Iron and Steel—Gross Tons

	January		Seven Months Ending January	
	1921	1922	1921	1922

096. For January, 1921, their value was \$56,705,507, and for the seven-month period of one year ago the total was \$300,277,127.

Exports of lathes in January were valued at \$64,351, and for the seven months, \$707,036; sharpening and grinding machines at \$43,296 and \$490,508, respectively, and all other metal working machinery at \$445,555, and \$4,774,476, respectively.

It is interesting to observe that Japan was the greatest single source of export of American iron and steel products in January. While this Oriental country has long been a big purchaser of products in this country, Canada is, of course, the greatest permanent consumer outside the domestic market itself, but was second to Japan in January. Japan led in the purchase of such products as steel rails, black and galvanized sheets, tin plate, galvanized wire, and wire nails. Of the 22,870 tons of steel rails exported in January, 21,140 tons went to Japan, and for the

Shipping Iron and Steel Products by River

A. B. Shephard Tells of the Experiences of One Company—Good Time Made, but Handling Charges Were Excessive

WASHINGTON, March 7.—Pointing out that ever since the cessation of the war, the railroad transportation situation has been in such condition, particularly with the high rates prevailing, as to seriously restrict the markets of the iron and steel industries in the Pittsburgh district, A. B. Shephard, of the Jones & Laughlin Steel Co., Pittsburgh, addressed the National Rivers and Harbors Congress at its convention here last Wednesday, and told of the relief that has been sought by turning to transportation on the Ohio and Mississippi rivers. Mr. Shephard explained the work which the company undertook during the past summer for the delivery of its finished products by river transportation to consumers in the South, the West, and Southwest. He said that no attempt had been made to set up a so-called barge line, the company using the barge equipment owned by its subsidiary, the Vesta Coal Co., which carried the products while power for towing was arranged with local steamboat owners. Mr. Shephard said that on Oct. 27, 1921, the first tow departed from Pittsburgh and consisted of half dozen steel coal barges temporarily converted into merchandise carriers. He said that trans-shipping and delivery at various points down the rivers into customers' warehouses were provided. The total shipment delivered on the first tow was about 4000 tons of various products, mostly structural shapes, steel pipe, wire nails and fence material. A second tow was immediately arranged for, Mr. Shephard said, and departed a few weeks later for Louisville, Ky., Evansville, Ind., St. Louis, and Memphis, Tenn., carrying approximately 8000 tons of steel products.

Attracted Much Attention

"The departure, movement and arrival at destination of these two tows," Mr. Shephard said, "attracted widespread attention, not only in the Ohio and Mississippi Valleys, but throughout the country, being hailed, as indeed it was in degree, as marking the return of activities on our inland waterways. Several of the other large steel companies in the Pittsburgh district followed closely each step in the progress of this undertaking, and have since themselves sent considerable quantities of their products to downriver points in the same manner."

Mr. Shephard pointed out that the system operates to give the Jones & Laughlin Steel Co. a wider market for its products than is obtainable under the present high schedule of freight rates and operates similarly for their customers who have received products in this manner.

"It might be stated," continued Mr. Shephard, "that the average saving to the customer who has purchased Jones & Laughlin Steel Co. products delivered by barge has been between \$2 and \$2.50 per ton. As these products were sold in considerable quantities only, it will be noted that the saving on a 1000-ton barge-load, for example, amounts to \$2,000 to \$2,500, which is highly appreciated in these times of close competition and strict economies.

On a Permanent Basis

"It is the intention of the company to establish this service on an efficient and permanent basis, and to continue it as a factor in the general service offered to its customers. Efforts will be made to arrange for delivery of products to points at still greater distances from Pittsburgh, and also for export through New Orleans. It is believed that this business will amount to probably 50,000 tons or more during the present year, and within a short time, if the proper facilities are provided, it will be moving at the rate of 100,000 tons or more per year, and it is not unreasonable to expect that the last

named amount will, in time, more nearly represent a monthly shipment instead of a yearly shipment.

"In preparation for the development of this business, careful survey of the whole situation is being made, together with studies of the most adaptable equipment and the most economical loading and unloading devices.

"Difficulties were encountered in these first shipments both in the movement on the rivers and at the unloading points. Delays were experienced by lack of sufficient water in the river on several occasions. Notwithstanding these delays, and others occasioned by fog and being compelled to tie up occasionally, good time was made. The tow which left the Ohio River (Aliquippa) Works on Oct. 27 docked at St. Louis Nov. 9, practically 14 days for the movement as against 10 days rail delivery.

Can Shorten Time

"With the river improvement completed, this time can be much shortened, possibly to equal the present rail time.

"The terminal facilities for unloading at the delivery points were in general unsatisfactory, and the cost of handling the materials excessive. In some cases the terminal cost exceeded the total transportation cost. This is a condition which will have to be remedied, as it is certain that the future of the river transportation depends largely upon the cheapness and facility with which materials may be loaded and unloaded, and trans-shipped to destination. This fact will have to be fully recognized by the communities on the rivers which now have, along their entire river frontage, no means for unloading barges except possibly the costly and exasperatingly slow old wharf boat methods, and by others which have provided very modern terminals, but with facilities only for handling package goods, having made no provision for handling the weights and lengths encountered in the shipping of steel products.

Two Things Necessary

"It seems obvious, therefore, that before this river transport service can be permanently established it must be recognized by those interested that two things must be done: One is that a reliable stage of water must be made available by the completion of the river improvements, and the other is that provision must be made at the various delivery points for prompt and economical unloading and trans-shipment.

"With these facilities provided, I feel safe in predicting that the traffic on the Ohio and Mississippi rivers will be revived and developed and continue to expand in volume until even the dream of the most enthusiastic advocate of water transportation will be realized, and that, at the same time, the railroad systems reaching the same territories will have all the traffic that they can carry, a condition which when brought about will be an everlasting benefit to the communities located in these valleys and to the country."

Demand of the Congress

At its closing session on Thursday, the National Rivers and Harbors Congress adopted a resolution "demanding" that Congress approve at this session not less than the amount of money recommended by the Chief of Army Engineers as necessary for improving the national rivers and harbors.

Dr. Julius Klein, in an address at the banquet of the congress, said that "the natural advantages enjoyed by our overseas competitors because of their location close to the sea are difficult enough to overcome, but when this handicap is supplemented by staggering transportation charges covering long hauls to water

fronts, the unwilling exporter is up against it." He said that the seriousness of the situation from the export standpoint "will perhaps be realized if we bear in mind the fact that 40 per cent of the manufactured articles exported from this country originated west of

Pittsburgh, east of the Rockies, and north of the Arkansas-Tennessee line."

Vice-President Coolidge said that the "country looks for its present and future development to the use of its waterways, the natural avenues to trade."

President's Plan for American Merchant Marine

He Is Intensely in Earnest and His Ideas Are Finding
Much Support and Some Opposition

WASHINGTON, March 7.—The upbuilding of an adequate, privately owned American merchant marine is now being attempted by the Harding Administration. Easily one of the most fascinating and vital objects of legislation that ever comes before Congress, the course of the program laid out by the President for a merchant marine in his address before Congress last Tuesday is being watched with intense interest. The customarily divergent views on the subject exist to-day as hitherto. The fight ahead plainly is going to be a hard one and meanwhile its outcome is in doubt. The President in his clear and definite message mapped out a program that many, Republicans and Democrats alike, say not only is constructive but one that must be adopted if the long-hoped-for merchant marine is to be created so as to serve the industrial, agricultural and other interests of the country. A bill to this end has been introduced and efforts are being made to pass it at the present session of Congress. But there can be no denying the fact that it faces strong opposition. Aside from the foreign influences, which it is freely charged always attempt to obstruct legislation looking to the upbuilding of an American merchant marine, the Harding program is being opposed by the powerful agricultural bloc in Congress. This has been recognized with considerable discouragement and is held to be particularly unfortunate, inasmuch as it is evident that an American merchant marine would be of as great benefit to the agricultural interests of the United States as it would be to the industrial and other interests. It is firmly contended that unless there is an adequate American merchant marine, talk of building up a great export trade for any of these interests is entirely futile. And it is further argued that unless a privately owned fleet is created now, attempts to do it in the future will be well nigh hopeless.

Much of the opposition is based on the idea of a subsidy, though some of it is believed to be merely using this plea as an evasion. The President never appeared to better advantage than he did in connection with presenting his merchant marine program, and he had no hesitancy whatever in advocating the subsidy plan and to say so in the most direct terms. His doing so has elicited much admiration and the intensity he showed in urging the legislation was the object of much favorable comment. Always manifesting a particular interest in the matter of building up an American merchant marine, the President showed that he had given it careful thought and that he was aware of the influences at work against a merchant marine and the obstacles that must be faced. His program omitted some recommendations which many think ought to have been included, among them repeal of the LaFollette seaman's act, but at the same time, it is broad and comprehensive and carries plans which he feels would accomplish the purpose desired. There is evident also a broader view throughout the country as to merchant marine legislation, and this takes into account the necessity of creating a merchant marine by any method that is practical rather than the insistence upon particular methods. The President, in fact, challenged those opposing his program to offer a satisfactory alternative to the subsidy plan, which, it is estimated, would cost about \$32,000,000 annually, but would mean a vastly greater amount in savings to American shippers. The program really includes both a direct subsidy and indirect aid, and the incen-

tives it holds out may be seen in the following proposals it includes:

Creation of a merchant marine fund by diverting 10 per cent of all customs receipts, netting about \$302,000,000 a year and avoiding alleged complications with regard to treaties if discriminating duties were adopted; all tonnage taxes collected on both foreign and American ships to be added to the merchant marine fund; doubling tonnage taxes, to yield approximately \$4,000,000 annually; one-half of all profits to private owners in excess of 10 per cent to be added to merchant marine fund; establishing of a construction loan fund of \$125,000,000, drawing 2 per cent, and to be used for shipbuilding; deductions from income taxes of shippers equal to 5 per cent of freight paid on goods imported in American bottoms; greater depreciation allowances in income tax returns on ships; waiving of all income taxes when their amount is applied to half the cost of new ship construction; 50 per cent of all immigrants to be carried in American ships; building up of merchant marine reserve to the maximum of 5000 officers and 30,000 men employed on merchantmen, receiving a maximum of \$3,000,000 in pay each year from the Navy; all Government freight and passenger traffic to be carried on American ships whenever possible; army transport service to be turned over to Shipping Board; coastwise shipping laws to be extended to the Philippine Islands so as to confine all trade between the islands and the United States to American ships; preferential rail rates on through shipments on American vessels and co-ordination of rail and water transportation and development of railroad-owned vessels.

The program was indorsed by the National Merchant Marine Association at its convention here last week. It was also the object of some attacks at the convention, but they were few and relatively unimportant. The convention showed itself to be strongly desirous of going on record in favor of the immediate building up of a privately owned American merchant marine, and several speakers made vigorous attacks on foreign influences which are seeking to prevent its being established. Among them were Chairman Lasker and Commissioners Chamberlain and Benson of the Shipping Board, who urged a merchant marine both as a commercial necessity and a naval auxiliary.

* Sixty students in the department of mechanical engineering, University of Wisconsin, Madison, have enrolled in a new course in metallography, or the study of alloys and alloy steels, which is being conducted during the second semester under the direction of Prof. E. D. Fahlberg, of the chemical engineering department. It is stated that the course has been instituted in response to an ever-increasing demand from factories and shops for men who know the heat-treating of metals and alloys and understand the properties of alloys.

To meet the demand for a sliding frame saw suitable for somewhat lighter work than its No. 75 is designed for, the United Engineering & Foundry Co., Pittsburgh, has developed a new size, designated as No. 40, weighing about two-thirds as much as the No. 75. The first saw of the smaller size was built for the International Nickel Co. and equipped with a 36-in. diameter blade, though a 42-in. blade may also be used. It may be assembled with the blade on either the right or left side.

IRON AND INDUSTRIAL STOCKS

Ruling Prices the Past Week Reflected Conflicting Trade Conditions

Ruling prices on iron and industrial shares the past week reflected conflicting trade conditions. For instance, steel stocks held well because of greater plant activity. On the other hand, the passing of the Sloss-Sheffield preferred dividend has its influence on pig iron producers' preferred share valuations notwithstanding greater buying of iron by melters. High prices for raw cotton and grains have been supplemented by lower, thereby lessening the purchasing power of farmers. Farm and textile machinery makers are less secure if quotations on manufacturers' securities can be taken as an index. Retail trade is slowing up, making for conservatism among banking houses, and firmer money rates than accumulations in savings banks warrant.

The range of prices on active iron and industrial stocks from Monday of last week to Monday of this week was as follows:

Allis-Chal., com.. 45 - 47	Lackawanna St.. 44 - 47

American Locomotive Co. Report

The American Locomotive Corp., New York, reports that its gross earnings in 1921 were \$35,711,507.47, and after deducting from this \$30,192,721.90 for the cost of manufacturing, maintenance, administrative expenses, interest on bonds of constituent companies and an allowance for depreciation of \$1,409,838.32 on plant property, there remained a gross profit for the year of \$5,518,785.57, from which there has been deducted an allowance of \$435,000 for estimated United States and Canadian income taxes, the remaining balance of \$5,083,785.57 being the net profit available for dividends, which is equal to \$13.34 per share on the common stock after providing for the regular \$7 dividend on the preferred shares. As 7 per cent had been paid on the preferred stock and 6 per cent on the common stock, a total of \$3,250,000, there remained of the net profits \$1,833,785.57, from which \$1,000,000 was reserved for additions and betterments to plants and \$833,785.57 was credited to surplus. The gross earnings for the year in comparison with those of 1920 show a reduction of about 46 per cent.

It is stated in the report that the volume of domestic business was very materially reduced in 1921 owing to the severe state of business depression. A large volume of foreign business could have been obtained. It is stated, if the company had been willing to accept long-term credit risks.

No construction work was done during the year on the company's proposed new plant in the St. Louis district, and it is the present intention of the company to withhold active development of that property until the general business requirements of the company warrant going ahead.

J. G. Brill Co. in Canada

The annual report of the J. G. Brill Co., which has just been issued to stockholders, indicates that this company has now become well entrenched in its Canadian position. It was only last September that the company took over the Preston Car Works, Preston, Ont., and H. D. Scully, general manager of the Canadian Brill Co., says that, in the intervening five months, the parent company has expended \$500,000 in extending and improving the plant at Preston. Where between 50 and 60 hands were employed last summer the company is now employing 250, with a payroll amounting to \$5,000 per week. The company which is producing one car per day has recently delivered cars to Toronto, Ont., Winnipeg, Man., Victoria, B. C., Sault Ste. Marie, Ont., and to the Hydro-Electric Commission for Windsor and Guelph, Ont. Conductors' cabooses have also been delivered to the Temiskaming & Northern Ontario Railway Commis-

sion. In an interview, Samuel M. Curwen, president of the J. G. Brill Co., of Philadelphia, also president of the Canadian subsidiary, expressed himself as highly pleased with their venture in Canada.

A suit has been filed in the Common Pleas Court of Cincinnati by the Cosmopolitan Bank & Trust Co. seeking to foreclose a mortgage for \$40,000 on the plant of the Bickett Machine & Mfg. Co. The bank seeks a judgment for the entire amount with interest at 8 per cent since June 21, 1915, and also seeks an order for the sale of the property to meet the claim.

Pittsburgh Rolls Corporation Report

The Pittsburgh Rolls Corporation reports for 1921 net profits of \$62,726, equivalent, after preferred dividends, to \$2.45 a share earned on the common stock, compared with net profits of \$108,573 or \$5.37 a share on the common after preferred dividends in the previous year. The income account compares as follows:

	1921	1920
Gross profit from operations.....	\$250,119	\$436,052
Reserve for depreciation.....	91,602	97,468
Interest on funded debt.....	32,486	35,285
Loss on bonds sold and store.....		16,760
Federal tax.....	14,997	85,654
Interest, cash discounts and other income	20,027	
Net profit for year.....	140,061	227,886
Sinking fund provision.....	77,336	119,313
Balance for dividends.....	62,726	108,573
Dividends on preferred.....	28,000	28,000
Balance for common stock.....	34,726	80,573

Earnings of the company were especially poor during the last six months of the year, according to D. L. Hynon, president of the company. From present indications, earnings will continue to be small during the early months of 1922, he said. Last year, \$112,000 of first mortgage bonds were retired without impairing liquid assets.

Canadian Foundries & Forgings

At the annual meeting of the shareholders of the Canada Foundries & Forgings, held in Brockville, Ont., the report presented from the auditors showed an operating loss of \$3,704, after providing for depreciation. The total loss for the year was \$58,211, which takes in interest on bonds, bank interest on loan administration expenses and allows \$12,000 as interest for dividends on investments. This compares with net profits in 1920 of \$39,979 plus \$77,496 in the form of income from investments. Liabilities have been reduced by half a million dollars and reserve of \$200,000 was taken from the surplus to provide against inventory shrinkage, leaving the balance carried forward to profit and loss of some \$930,000, compared with \$1,204,273 a year ago. At the meeting Hon. W. J. Shaughnessy of Montreal retired as a director, and was replaced by Harry B. Housser of Toronto. The officers elected were as follows: President, W. W. Weir of Montreal; vice-president, Hon. George P. Graham; secretary-treasurer, J. H. A. Briggs; general manager, James Arnold; directors, J. H. A. Briggs, C. N. Monsarrat, C. W. Maclean, W. D. Robb, W. W. Weir, James Arnold, E. F. Conway, Hon. George P. Graham, W. T. Sampson, H. B. Housser.

Sloss-Sheffield Dividend Deferred

The Sloss-Sheffield Steel & Iron Co. directors at their meeting last week decided to defer action on the regular quarterly dividend of 1½ per cent on the preferred stock. After the meeting the following statement was issued: "The board of directors, in view of the existing situation in the pig iron market, decided it was in the interest of the company to conserve its cash resources, and accordingly decided not to take action on the preferred dividend at this time."

Report of Interstate Company

The annual report of the Interstate Iron & Steel Co., Chicago, for the year ended Dec. 31, 1921, shows the effects of the period of business depression through which the industry has been passing. Net earnings were \$473,137, as compared with \$1,515,914 for 1920. After deductions for depreciation, reserve for taxes, interest, inventory adjustment and loss on Liberty bonds sold, the net loss for 1921 was \$344,723, as compared with net profits of \$342,953 for the previous year. A payment of \$144,214 in preferred dividends resulted in a total reduction in surplus of \$488,937.

In his annual statement to stockholders E. J. Llewellyn, president, said in part: "The last year has probably been the most critical and difficult year that the iron and steel industry has ever experienced. Deflation of values began in January and ended only with December. The results show that our tonnage for 1921 was about 45 per cent of that for 1920 and the money value in goods shipped to customers about one-third of that shipped in 1920. We reduced inven-

tory values from the beginning to the end of the year about \$284,000. We believe that our inventory values, which are priced at cost or market, whichever is lower at Jan. 1, 1922, will be a good basis from which to operate during the coming year."

Empire Steel & Iron Co. Loss

The Empire Steel & Iron Co. report a net loss for 1921, after charges and federal taxes, depreciation, depletion and inventory losses of \$966,071, contrasted with a net profit of \$446,061 for the previous year. Operating profit in 1921 amounted to \$91,489, total income to \$146,469, interest, expenses and cost of inactive plants to \$450,192, deficit to \$302,652, inventory adjustment to \$280,075, total deficit to \$582,727, depreciation and depletion to \$412,343, making the final deficit \$996,071.

The balance sheet as of Dec. 31 last shows surplus of \$1,802,104, against \$2,804,033 in 1920.

Electric Alloy Steel Co. Report

The Electric Alloy Steel Co., Youngstown, Ohio, booked as much business the first two months of this year as it did all of last year, President Louis J. Campbell informed stockholders March 2 at the yearly meeting.

In 1921 the company sustained an operating loss of \$156,000, and its total deficit, after all charges, including a liberal write-off for depreciation, was \$268,000. It operates a plant at Charleroi, Pa., producing commercial alloy steel bars of crucible and electric furnace qualities, special analysis carbon and high speed tool steels.

The company is constantly establishing new trade connections and has won business recently in sharp competition with other interests. The officers were re-elected.

Industrial Finance

At the recent annual meeting of the Winchester Repeating Arms Co., New Haven, Conn., sales for the past year were given as \$18,248,000, against \$18,042,000 for the year 1920. Losses for the year amounted to over \$1,000,000.

The annual report of the Sullivan Machinery Co., Chicago, for the year ended December 31, 1921, showed net earnings before dividends amounting to \$612,488. The payment of dividends amounting to \$549,497, however, including a dividend paid on Jan. 1, 1922, reduced the total surplus \$37,009. Current liabilities were reduced from \$2,210,271 to \$410,083.

A single bid was entered on the property of the defunct John Obenberger Forge Co., Milwaukee, at the public sale of the assets conducted March 1 by J. F. Gerdie, trustee. The bid was in the sum of \$233,000 and was entered by Adolph H. Weldner, attorney, on behalf of secured creditors. The appraised value of the property is \$955,242. The referee in bankruptcy has declined to accept the bid and instructed the trustee to call for new bids until March 20.

The Motor Wheel Corporation, Lansing, Mich., manufacturer of motor vehicle wheels, metal stampings and other steel products, reports a net profit of \$301,840.89 in 1921, after deductions for Federal taxes. The balance sheets show the company to be in excellent condition, with liquid assets of \$1,812,598.64 and current assets of materials, \$1,939,506.82, a total of \$3,752,105.26. Current liabilities amount only to \$278,691.48. H. F. Harper is president and general manager of the corporation.

The Lima Locomotive Works, Inc., Lima, Ohio, for the year 1921 shows a net income after charges and Federal taxes of \$1,136,591, equivalent after preferred dividends are paid to \$21.51 a share on the \$4,350,000 of common stock. This compares with a net income of \$1,078,780, or \$20.18 a share in the previous year.

The Wheeling Steel Corporation has declared the quarterly dividends of 1 per cent on the preferred A stock and 1½ per cent on the preferred B stock, payable March 18.

Westinghouse Electric & Mfg. Co. has declared the regular quarterly dividends of 2 per cent on its preferred and common stock. The preferred dividend is payable April 15 and the common dividend April 29, both to stockholders of record March 31.

After taking an inventory shrinkage of \$299,114, the Atlas Tack Corporation, Boston, showed a net loss in 1921 of \$463,313, as against a net profit in 1920 of \$130,853 or \$1.37 a share on the \$5,000 outstanding shares. Sales last year were \$1,809,121, contrasted with \$3,044,265 for 1920. The assets and liabilities at the close of 1921 were \$3,082,672, whereas at the close of the previous year they were \$2,437,789.

A meeting of the stockholders of the Standard Steel Car Co. has been called for May 2, at Pittsburgh, to vote on an increase in the capitalization from \$5,000,000 to \$50,000,000.

The annual report of the American Hardware Corpora-

tion, New Britain, Conn., shows net profits after adjustments and depreciation of \$882,545, and a surplus, after \$793,600 paid out in dividends, of \$58,945. In 1920 the net profits were \$1,456,857, dividends \$1,190,400, and the surplus \$266,957.

Employees of the Stanley Works, New Britain, Conn., hardware, are given an opportunity to purchase on easy payments common stock at \$44 a share. Last year about 700 employees bought \$187,200 of common stock.

The Toronto Laundry Machinery Co., Ltd., 1947 Dundas Street West, Toronto, Ont., manufacturers of laundry machinery and ice-making machinery, has assigned to G. T. Clarkson. The company was incorporated in 1903, with \$40,000 capital stock and the late John O'Neill was president and chief stockholder, and J. C. O'Brien was managing director.

Stockholders of Harbison-Walker Refractories Co. will meet May 15, to vote upon a proposition that the capital stock be decreased from \$36,600,000 to \$30,000,000, the decrease to be made by the retirement and cancellation of \$6,600,000 of preferred stock now in the treasury of the company.

Plans of New Companies

George F. Merrell, Inc., is manufacturing its Wash-All washing machine by contract and will probably continue to do so for some time.

The Fire-Grate-Radiator Heating Corporation, 302 West Clinch Avenue, Knoxville, Tenn., will do its own manufacturing and will be in the market at an early date for general equipment for foundry and machine shop.

P. W. P. Mfg. Co., 64 William Street, Newark, N. J., expects to build wireless apparatus.

F. W. Reisman and L. E. Turk, formerly traveling sales manager and treasurer respectively, of Quigley Furnace Specialties Co., have with others organized and incorporated the Keystone Refractories Co. and will manufacture high temperature cements and granular refractories. Offices will be located at 120-122 Liberty St., N. Y. and factory in Jersey City. Mr. Reisman is president and general manager and Mr. Turk secretary and treasurer of the new company.

The Marlin Wire Wheel Corporation, 366 Madison Ave., New York, is the incorporation of the wire wheel business formerly conducted by Marlin-Rockwell Corporation at Philadelphia, under the Rudge-Whitworth patents. The conduct of the business will be the same as formerly, under the name of The Marlin Wire Wheel Corporation.

The Craine-Schrage Steel Co., 6189 Greenwood Ave., Detroit, Mich., has been organized by W. C. Schrage, secretary and treasurer, who was long identified with the Pittsburgh Shafting Co., of Detroit, a subsidiary of the Columbia Steel & Shafting Co. of Pittsburgh, and C. P. Craine, who also was associated with that company for a period of years and later took over the account of the Wyckoff Drawn Steel Co., Pittsburgh, and the Columbia Steel Co., Elyria, Ohio, as district manager of sales. These two men have joined forces with a view of facilitating the two mill representations and carrying an extensive warehouse stock of cold-drawn steel and cold-rolled strip steel.

The Twin Steam Trap Corporation, 1019 Dime Bank Bldg., Detroit, will be in the market for manufacturing equipment within 30 to 60 days.

A. W. Lau, formerly of the Lau Iron Works, has organized the Steel City Iron Co., capitalized at \$100,000, at Youngstown, Ohio, to manufacture ornamental iron and structural steel. The company plans to erect a factory and warehouse in the Spring. It will carry a general stock in warehouses to enable industries and contractors to obtain its products without delay. Among the products it will handle are metal doors, metal window casings, concrete bars and fireproofing materials. Temporary offices have been established at 311 Federal building, Youngstown.

Henry J. Reeve and James E. Fritts have incorporated the Reeve-Fritts Co., 37 South Desplaines Street, Chicago, and will handle all types of metal-working machines. Mr. Reeve was one of the organizers of H. A. Stocker Machinery Co. in 1905 and continued with that company until its consolidation with the Rumely-Wachs Co. in 1917. From that date until about a year ago Mr. Reeve was treasurer of the Stocker-Rumely-Wachs Co., following which he was associated with the Dale Machinery Co. Mr. Fritts also was formerly with the Stocker-Rumely-Wachs Co.

The Loyd Wireless Telephone Corporation, Sixth Avenue at Forty-first Street, New York, has several factories of its own making wireless apparatus, but at the present time it is greatly delayed in making deliveries and expects shortly to place over \$2,000,000 worth of contracts with outside concerns.

Machinery Markets and News of the Works

BUYERS ARE SLOW TO CLOSE

Orders in Small Volume Compared to Inquiries Recently Quoted On

General Business Improvement, However, Brings a More Cheerful Sentiment

Though two months of the new year have passed, very little of the expected improvement in machine-tool business has materialized. The volume of inquiry has been larger than at any time last year, but orders are only slightly more numerous. The trade is hopeful, however, that the larger number of inquiries is a promising sign of better business to come as soon as greater confidence has been established.

A good demand for machine tools from manufacturers of wireless telephone equipment is predicted.

New York

New York, March 7.

The outstanding fact in the machine-tool trade is that the number of orders which have been placed since the first of the year is in very small ratio to the number of machines for which inquiries have been received. The inquiries may, and perhaps do, indicate the interest of tool users in new equipment, but the dearth of orders also indicates that business recovery has not yet proceeded far enough to permit many of them to make the purchases they consider desirable.

No definite trend toward improvement in business in this market was discernible in the past week. The general observation of sellers is that business continues "extremely dull."

The Delaware & Hudson Railroad at Albany, N. Y., has placed an order for a boring mill and will probably place other orders this week, its requirements including a wheel press and a driving-box borer. The Sewell Valley Railroad has bought a 20-ton Niles crane and a 36-in. planer.

Present activity in the crane market is about on a par with previous weeks. One or two new inquiries are reported current and some orders have been placed. Among orders pending, which will probably be placed within the next few days, is the inquiry of the Public Service Production Co., Newark, N. J., for a 25-ton, 50-ft. boom locomotive crane for Burlington, N. J. Among hand power crane builders, but little activity is noted except in parts for replacement.

Among recent sales are: Cleveland Crane & Engineering Co., 60-ton, 24-ft. span, 1-motor, power house crane to the Phoenix Utilities Co., New York, for a power house in Wilkes-Barre, Pa.; Industrial Works, a 20-ton, 50-ft. boom locomotive crane to the Southern Pacific Co., 165 Broadway, New York, for West Oakland, Cal., a No. 3 pile-driver to the Canadian Pacific Railroad, Montreal; and a 10-ton crawler locomotive crane to Stone & Webster for use at Philadelphia; Philip T. King, 30 Church Street, New York, a 20-ton, 60-ft. boom used Ohio locomotive crane to the Industrial Service Co., Lincoln, N. J.; Niles-Bement-Pond Co., a 20-ton overhead traveling crane to the Sewell Valley Railroad Co., Rainelle, West Va.; Dravo-Doyle Co., a Dravo-Doyle Whirley to the Hainesport Mining & Transportation Co., Philadelphia.

Eugene Forrer, Budd Lake, N. J., contemplates building an iron and brass foundry near New York City next summer. He will manufacture pipe fittings of an ew type, also, hotel and bottlers' machinery pumps, valves, stop cocks, etc., and will be in the market for shop equipment.

The National Filter Cloth & Weaving Co., 57 Hope Street, Brooklyn, manufacturer of wire cloth, is having plans

This business has grown amazingly and a number of manufacturers are anticipating increasing their capacity.

The past week has been lacking in significant new developments. There has been a little buying, but on the whole trade is still very quiet. A Cincinnati builder received an order for 15 drilling machines; another company in that city received an order for eight machines. The Fisher Ohio Body Co. has bought a small quantity of shop equipment at Cleveland. The New York Central bought two tools and the Delaware & Hudson is closing on a small list. The Illinois Central is expected to put out a list soon for a year's requirements.

The Monarch Machine Tool Co., Sidney, Ohio, has reduced prices on its lathes 10 per cent.

Manufacturers of electric motors have reduced prices about 10 per cent.

prepared for a one-story brick plant, 70 x 200 ft., on property recently acquired at Hamden, Conn. Equipment will be installed for the employment of about 100 operatives.

The Eastern Malleable Iron Co., Twenty-fifth Street, Troy, N. Y., is taking new bids on revised plans for a one-story power plant on site, 50 x 133 ft.

The Todd Shipyards Corporation, 25 Broadway, New York, is planning for the establishment of a ship repair plant on property at Mobile, Ala., recently acquired from the Mobile Shipbuilding Co. It will be operated as a direct branch of the other plants of the company. William H. Todd is president.

Coal-handling equipment will be installed at the new 300-ton coal bunker, 80 x 123 ft., to be constructed by Michael Di Leo, Port Chester, N. Y. Frank Urso, Stamford, Conn., is architect.

Bids will soon be asked for a four-story ice-manufacturing and cold storage plant, 75 x 110 ft., on Webster Avenue, New York, for E. M. Schildwachter, 4180 Park Avenue, estimated to cost about \$1,000,000 with machinery. William H. Meyer, 1861 Carter Avenue, architect, is completing plans.

The Empire Switchboard Co., Inc., New York, has been organized to take over the plant and business of the Empire Engineering & Supply Co., Fourth Avenue and Twenty-eighth Street, Brooklyn, and will continue the manufacture of electrical equipment. Norman P. Findley, manager of the former company, is president and C. E. Schoninger, secretary.

The Detroit-Cadillac Motor Co., Bernard Avenue, Poughkeepsie, N. Y., will take bids at once for a three-story service and repair building, 63 x 105 ft., at Mill and Washington streets. E. C. Smith, 39 Market Street, is architect.

The Ford Motor Co., Detroit, Mich., will commence the erection of its proposed tractor plant at Green Island, N. Y., early in May, for the manufacture of Fordson tractors, motors, and other automotive products, estimated to cost in excess of \$750,000, including machinery. It will give employment to about 10,000 persons when running full. Construction is well under way on a hydroelectric generating plant for works operation, estimated to cost \$2,000,000. Machinery installation will commence in the spring and it is expected to have the plant ready for service in June or July. Stone & Webster, 147 Milk Street, Boston, are engineers.

Freight-handling and conveying machinery, cranes, etc., will be installed in the five-story warehouse and loft building, and two-story superstructure on a pier 550 ft. long to be constructed at Havana, Cuba, by the Havana Docks Corporation, under a lease for the United Fruit Co., 17 Battery Place, New York. The structures will approximate 220,000 sq. ft. of space. Contract for the building has been let to the Turner Construction Co., 243 Madison Avenue, New

York, and will require more than 13 months for completion. Parsons, Klapp, Brinckerhoff & Douglas, 84 Pine Street, New York, are architects and engineers.

The Driscoll Transmission Corporation, New York, has leased the eighth floor of the building at 416-22 West Thirty-third Street, for headquarters for the production of the Driscoll variable speed transmission. Occupancy will be taken at once. Col. M. W. Thompson is chairman of the board.

Merkel Brothers, Chichester Avenue, Jamaica, L. I., will commence the immediate erection of a three-story ice and refrigerating plant, 60 x 75 ft., adjoining their present works. Louis Allmendinger, 20 Palmetto Street, Brooklyn, is architect.

W. C. Durant, president Durant Motors, Inc., 1819 Broadway, New York, is arranging for the manufacture of a complete four-cylinder, five passenger automobile to sell for \$348. Plans will be developed at an early date for facilities for quantity production with a number of branch works in different parts of the country for assembling. It is understood that the car will be handled by a separate organization, the Durant company contracting for the production only. The regular Durant automobile is now being manufactured at the Long Island City plant of the company, which is operating full under a daily production of 100 cars, and the new automobile will have no connection with this plant.

The Board of Estimate, Municipal Building, New York, is considering an appropriation of \$500,000 for the Department of Plant and Structures, Municipal Building, Grover A. Whalen, commissioner, for the construction of dry docks and shops for municipal marine work. About \$200,000 will be used for the shop buildings and machinery.

The New York Edison Co., Irving Place and Fifteenth Street, New York, will commence the immediate erection of a one-story power house, 50 x 100 ft., at Park Avenue and 188th Street, to cost about \$75,000. A new power house will also be built at Yonkers, N. Y., to cost approximately \$250,000. William Whitehill, Buckley-Newhall Building, Forty-first Street and Sixth Avenue, is architect and engineer.

Charles Cohen, 308-10 Oakland Street, Brooklyn, manufacturer of automobile bodies, has filed plans for a two-story brick addition, 25 x 100 ft.

W. L. Fleisher & Co., 31 Union Square, West, New York, engineers, have leased the two-story building, 50 x 150 ft., on South Washington Place, Long Island City, for a mechanical works and laboratory.

The Central Steamship & Commerce Corporation of New York has commissioned Theodore D. Wells, 11 Broadway, naval architect, to prepare plans for 15 freight vessels, to be equipped with Diesel engine electric drive, power plants, refrigerating machinery, hoisting and freight handling machinery, and other equipment. The freighters are estimated to cost \$5,000,000, and will be used for service between New York and Chicago, on the New York and Welland barge canals.

A vocational department will be installed in the new junior high school to be erected in the Greenville district, Jersey City, N. J., for which an appropriation of \$1,560,000 has been asked. Work will commence at an early date.

Fire, March 1, destroyed the two-story building at Tenth Street and Jersey Avenue, Jersey City, N. J., owned by the Erie Railroad Co., and occupied under lease by the Pullman Co., manufacturer of railroad cars, with loss estimated at about \$50,000, including equipment and supplies.

The Eastern Steel & Wire Co., Newark, N. J., is completing arrangements for the purchase of land on Evergreen Avenue, as a site for a new plant to manufacture carriage springs, agricultural implements and general wire products. Contract has been let to the American Concrete Steel Co., 27 Clinton Street, for a one-story structure, 180 x 520 ft., and ground will be broken about April 1. It is estimated to cost about \$300,000. E. A. Henry, formerly connected with the American Steel & Wire Co., Pittsburgh, is president of the company, which was incorporated recently with a capital of \$1,000,000. It is represented by Blider & Blider, 790 Broad Street.

Officials of the Submarine Boat Corporation, Port Newark, Newark, have organized a third subsidiary to carry out features of its operations, including steel fabricating, boat construction, terminal operations, etc. The new company will be known as the Newark Bay Terminal Corporation, and will develop a freight terminal, with facilities for storing, handling and conveying materials.

Export Opportunity

Anton Frans Mörkel, Nuremberg, Germany, is in the market for machinery for the manufacture of conical and square shaped shafts for writing purposes.

Chicago

CHICAGO, March 6.

The first week in March was very quiet in the local machine tool market. Some sales of individual machines are being made, but in most cases they are either second hand, or new equipment disposed of at low prices. It is evident that buyers are looking for bargains. The railroads have taken no further action on their pending lists, but the Illinois Central is still working on a three-year program and is expected to put out a list for the first year's requirements soon.

An auction on March 2 in liquidation of the equipment of H. C. Williamson's plant at 321 North Crawford Avenue, Chicago, brought out nothing unusual in the way of prices, some being high and others relatively low. It is to be noted, however, that of the extensive list of machines offered, some 40 per cent failed to bring out any bids.

A pending inquiry from the Universal Portland Cement Co., Buffington, Ind., calling for a number of large machine tools, is still unclosed. The Illinois Steel Co. has asked for prices for estimating purposes on a number of carwheel boring machines, axle lathes and other equipment similar to that in its Gary wheel works.

The Filler & Stowell Co., Milwaukee, has ordered a No. 8 Whiting cupola.

Building permits were taken out in Chicago in February for 634 structures, fronting 20,998 ft. and costing \$13,492,800, as against 311 permits involving 10,608 ft. frontage and \$15,366,000 for the corresponding month of last year. It will be noted that gains were recorded in the number of buildings and in frontage, but a decrease in cost. The total cost of buildings covered by permits issued in February, 1921, however, was the highest in the history of the city.

The Popular Mechanics Co., 6 North Michigan Avenue, Chicago, has taken out a permit for the construction of a seven-story printing office building, 85 x 119 ft., at 202-208 East Ontario Street, to cost \$300,000.

The Bassick Mfg. Co., manufacturer of lubricators and automobile accessories, 361 West Superior Street, Chicago, has purchased the one-story plant of F. Edelmann & Co., manufacturers of automobile specialties, 2638 N. Crawford Avenue. The plant contains 62,000 sq. ft. of floor space and is served by the Chicago, Milwaukee & St. Paul Railroad. The Edelmann company has leased space in the Krasberg Building in East Ohio Street, where it will move its factory and assembling plant.

The Alfred Johnson Skate Co., 2812 West North Avenue, Chicago, is receiving bids on a four-story plant, 50 x 138 ft., at West North and Francisco avenues, to cost \$100,000.

Wagner Brothers, dealers in real estate, 6238 Cottage Grove Avenue, Chicago, have let contract for a one-story automobile salesroom and repair shop, 100 x 108 ft., 6521-31 Cottage Avenue, to cost \$25,000.

J. Smith has let contract for a one-story sheet metal shop, 40 x 74 ft., 2118 South California Avenue, Chicago, to cost \$18,000.

The B & B Motor Co., 1106 Granville Avenue, Chicago, has let contract for a one-story garage, 65 x 230 ft., 6019-23 Broadway, to cost \$30,000.

Charles F. Trapp, 5350 West Chicago Avenue, Chicago, has let contract for a one-story Ford automobile service station, 100 x 127 ft., to cost \$45,000.

The Jefferson Ice Co., Bickerdike Street near Grand Avenue, Chicago, has let contract for a one-story ice plant, 124 x 125 ft., 1445 North Crawford Avenue, to cost \$32,000.

W. J. Kehl, 1225 North Maplewood Avenue, Chicago, has awarded contract for a one-story machine shop, 75 x 111 ft., 1722-28 Walnut Street, to cost \$15,000.

An explosion of paint and oil barrels resulted in a fire which destroyed the plant of Shauger & Johnson, sheet metal manufacturers, Atlantic, Iowa, on Feb. 28. The loss is estimated at \$100,000.

The Arcade Mfg. Co., Freeport, Ill., manufacturer of molding machines, hardware products, etc., is taking bids for a three-story addition, 65 x 100 ft., estimated to cost about \$35,000. B. C. Trueblood is treasurer.

The Common Council, Oskaloosa, Iowa, has plans under way for a municipal hydroelectric generating plant on the Des Moines River, near Harvey, estimated to cost about \$350,000, with machinery. The Fargo Engineering Co., Jackson, Mich., is engineer.

Hendrickson Brothers, Wolverton, Minn., operating a sand and gravel plant, are planning for the installation of new equipment, including gasoline cranes, conveying machinery and loading apparatus.

The Swarts Mfg. Co., Inc., Freeport, Ill., recently organized, will take over and operate the plant and business

of the Swartz Iron Foundry, specializing in the manufacture of pistons for automobile engines. Increased production is planned. Carl H. Swartz, heads the company.

Peterson & Johnson, 406 Swedish-American Bank Building, Rockford, Ill., architects, are preparing plans for a one-story power house to be erected in connection with a new local factory, the owner's name being temporarily withheld.

A vocational department will be installed in the three-story and basement high school to be erected at Danville, Ill., estimated to cost about \$500,000. Lewis & Dougherty, 519 Temple Building, are architects.

The Illinois Traction Co., Mayer Building, Peoria, Ill., has preliminary plans under way for a new one-story power house, estimated to cost in excess of \$500,000.

A vocational department will be installed in the new senior and junior high school to be erected at Scottsbluff, Neb., estimated to cost about \$500,000. R. A. Bradley & Co., Hastings, Neb., are architects.

The Casey Hudson Co., automatic screw machine products, states that the report that this company intended to move to Chelsea, Mich., was incorrect, as it has definitely decided not to move out of Chicago.

Philadelphia

PHILADELPHIA, March 6.

A one-story power house will be erected by Martin H. Walrath, Park and Glenwood avenues, Philadelphia, in connection with an addition to his woodworking plant, 67 x 175 ft.

The A. J. O'Neill Co., construction equipment, 1524 Chestnut Street, Philadelphia, is inquiring for a used compressor, capacity about 300 ft. per min. at 50 lb., belt driven or direct connected.

Benjamin Slatko, 336 East Third Street, Philadelphia, manufacturer of lighting equipment, will rebuild his three-story plant, recently partially destroyed by fire.

A power plant will be constructed by Walter E. Knipe & Sons, Hancock Street, Philadelphia, in connection with their new dyeing and finishing works at Wyoming and G streets, estimated to cost \$257,000. W. E. S. Dyer, Land Title Building, is architect and engineer.

The H. T. Palste Co., 3201 Arch Street, Philadelphia, manufacturer of electrical equipment and supplies, has awarded contract to the Turner Construction Co., 1713 Sansom Street, for a new four-story plant, 104 x 108 ft., at Thirty-second and Cherry streets, to cost in excess of \$100,000. Henry T. Palste is president.

The Bureau of Supplies and Accounts, Navy Department will receive bids until March 14, for 29,500 pounds of sheet steel for the Philadelphia Navy Yard; also for 400 ball bearings, and until March 28, for a quantity of bolts, screws, washers, etc.

A power plant, oven equipment, conveying and other mechanical equipment will be installed in the five-story plant, 100 x 100 ft., to be erected by the Tasty Baking Co., 2335 Sedgley Street, Philadelphia, on Hunting Park Avenue, estimated to cost \$150,000. The Turner Construction Co., 1713 Sansom Street, is the contractor.

Hexter & Kahn, Morris Building, Philadelphia, have awarded contract to Harry Gill, Jr., 2515 Germantown Avenue, for a one-story automobile service and repair building, 40 x 235 ft., at 5931-35 Broad Street, to cost \$90,000.

The Henry R. Fell Co., East Carroll Street, Trenton, N. J., manufacturer of concrete roofing tile, will build an addition to double approximately, the present capacity. New mixing, pressing and other machinery will be installed.

The Warren Webster Co., Point and Pearl street., Camden, N. J., manufacturer of heating equipment heating systems, etc., has preliminary plans under way for a new two-story factory on Federal Street. The Ballinger Co., 105 South Twelfth Street, Philadelphia, is architect. Warren Webster is president.

Fire, Feb. 27, destroyed a portion of the plant of the Light, Railway & Equipment Co., Holmes, Pa., manufacturer of mine trucks, rails, switches, etc., with loss estimated at about \$50,000.

The Peters Motor Corporation, Parker & Logan streets, Trenton, N. J., has purchased the former works of the Bethlehem Paper Co., Bethlehem, Pa., for a new plant, including parts manufacture, assembling, etc. Possession will be taken at once and equipment installed. It is proposed to give employment to about 50 persons for initial operations.

John S. Weaver, Lebanon, Pa., will build a new one-story ice-manufacturing plant, 40 x 100 ft., at Weavertown. Plans have been prepared.

A vocational department will be installed in the new two-story junior high school to be erected at Carbondale, Pa.,

for which John Howley, Traders' Bank Building, Scranton, Pa., architect, has been commissioned to prepare plans.

The Defiance Auto Lock Corporation, recently incorporated, is located at 836 Hamilton Street, Allentown, Pa., and advises THE IRON AGE that it will manufacture patented locking devices for automobiles. At first the lock will be manufactured on contract. Later the company expects to have its own shop and will be in the market for stamping press, milling machine lathe, gear cutter, nickel plating outfit and an acetylene welding outfit.

Buffalo

BUFFALO, March 6.

Jewett & Co., stove works, military Road, Buffalo, have awarded contract to the Hydro Construction Co., Mutual Life Building, for a two-story addition, 75 x 95 ft.

The Quale Garage Co., Inc., 2675 Main Street, Buffalo, is planning for a one-story machine and automobile repair shop, 40 x 200 ft. Grant M. Quale is president.

The Fedders Mfg. Co., Inc., 57 Tonawanda Street, Buffalo, manufacturer of automobile radiators, cans and other metal products, has purchased the former plant of the Lauts-Missiquoi Marble Works, Lewis Street, Bridgeburg, Ont., for a new branch plant. Machinery will be installed at once to give employment to about 75 men, to be increased later.

Charles E. Skelton, Syracuse, N. Y., formerly connected with the Skelton-Chapin Co., has organized a company to operate a general machine works at 4025 South Salina Street, for the manufacture of special machinery and parts, with extensive experimental department.

The Yawman & Erbe Mfg. Co., 424 St. Paul Street, Rochester, N. Y., manufacturer of metal filing cabinets, etc., has plans under way for a three-story addition. Smith, Hinchman & Grilles, Detroit, are architects.

Wesley L. Kirchey, 3149 Bailey Avenue, Buffalo, is planning the erection of a one-story machine and automobile repair shop, 32 x 35 ft., in the rear of his present service building.

Electric equipment, hoisting and conveying machinery, etc., will be installed in the elevator plant, 56 x 165 ft., to be erected at Buffalo, by the Archer-Daniels Linseed Co., Twenty-ninth Avenue, S. E., Minneapolis, Minn., estimated to cost \$300,000, including machinery.

The Rochester Gas & Electric Co., 270 Main Street, Rochester, N. Y., will build a new one-story power house on Gorham Street, Canandaigua, N. Y.

John Celinski, Brighton Street, Buffalo, operating a forge shop and general wagon repair works, has plans under way for a one-story addition, 26 x 60 ft.

The Wright Co., Albion, N. Y., recently organized by William D. Wright, Brockport, N. Y., has leased the former plant of the Albion Wood & Metal Products Co., for the establishment of a new factory to manufacture metal and wood specialties.

Cleveland

CLEVELAND, March 6.

Machine tool manufacturers are predicting a good demand for their products from makers of wireless telephone equipment. Popular interest in the radio 'phone has swept the country and manufacturers of wireless telephone apparatus are reported to be crowded with orders. Orders for one or two automatic machines for making radio equipment were placed with a local machine tool builder the past week and inquiries for several other machines have come from the same industry. Some good orders have also been placed for small parts for radio equipment that are made on automatic machines. The manufacture of radio receiving sets will require small machine tools, probably mostly automatic, semi-automatic and screw machines and punch presses.

Local machine tool manufacturers report a marked improvement in the number of inquiries and a slightly better volume of orders. The amount of prospective business indicates that March sales will show a considerable gain over February. A Cleveland machine tool manufacturer has taken an order for a turret lathe for shipment to Japan, his second order from Japan during the past month. When the slump came there was considerable American machinery on hand in Japan, but it is reported that most of this equipment has been disposed of and the trade looks for some activity from this source during the next few months. It is expected that American machinery will be required in Japan for the manufacture of small motor cars, motorcycles and bicycles.

Business with local dealers picked up somewhat the past week, but orders were mostly for single tools. The New York Central Railroad purchased two machines for its Col-

linwood shops. The Fisher Body Ohio Co. placed some additional machine tool equipment.

Inquiry for electrical equipment shows improvement. The General Electric Co. has just booked a 5000-kw. turbine for the Cleveland Cliffs Iron Co., Warren, Ohio, and an order for two out door sub-stations each with three transformers with a total capacity of 66,000 volts for the Mansfield Sheet & Tin Plate Co., Mansfield, Ohio, and for considerable electrical equipment for the Portsmouth, Ohio, plant of the Wheeling Steel Corporation, the latter order including motor generator sets and large variable speed motors.

The Cleveland Tractor Co., Cleveland, has made a reduction from \$795 to \$595 on its new model farm tractor and plans to increase production from 20 to 60 per cent.

The Ridge Tool Machine Co., Elyria, Ohio, recently incorporated, is reported to be in the market for machinery equipment.

The Leesebeare Machine & Mfg. Co., Fostoria, Ohio, has equipped a plant for the manufacture of piston rings, which is being placed in operation.

The Lincoln Tractor & Implement Co., which has been incorporated with a capital stock of \$1,000,000 will establish a plant in Urbana, Ohio, for the manufacture of tractor plows. It purchased the old plant of the North American Chemical Co., which will be enlarged by the erection of a machine shop, 100 x 250 ft., and a steel and gray iron foundry. R. T. Parish is president; George H. McCracken, vice-president; Lawrence H. Norton, secretary, and Joseph Link, treasurer.

The Blake Pump & Condenser Co., Fitchburg, Mass., is reported to be looking for a new factory location in the Central West, and the Alliance Chamber of Commerce, Alliance, Ohio, is negotiating with the company with a view of having it locate in that city.

The plant of the Franklin Tractor Co., Zanesville, Ohio, has been sold to H. E. Bullock, Chicago, for approximately \$35,000. Mr. Bullock was one of the creditors of the company.

The Cleveland waterworks department, which is planning an extension program this year, will be in the market shortly for 95 valves ranging from 12 to 48 in. in size. The order will aggregate approximately \$100,000.

The Standard Slag Co., Youngstown, Ohio, will shortly begin the erection of a new slag manufacturing plant at Bellaire, Ohio.

New England

BOSTON, MARCH 6.

Sales of machine tools were few and far between the past week, but an increase in inquiries for single machines is noted and for that reason sentiment is more hopeful than during the last of February. Buyers in many instances express a preference for good used rather than new tools, because of the disparity of prices. There is a real scarcity of used equipment in this territory that measures up to requirements, which in a large measure explains that small amount of business booked the past week. At the auction sale last Thursday at the Winnisimmet Shipyard, Inc., Chelsea, Mass., the best machine tools brought good prices, while inferior equipment sold at low figures. The shipyard itself was sold to H. F. Winslow, Boston, for \$200,000. It is assessed for \$800,000.

The most important sale this week of new tools was a 36-in. x 22-ft. lathe to a southern New England textile interest. Other sales include a new 11-in. x 5-ft. new South Bend lathe to a Fall River interest and a 9-in. x 3-ft. to a Portland Street, Boston, chemical laboratory, a 10 x 50 in. used plain Norton grinder and a used Whitney hand milling machine to a North Andover, Mass., textile interest, and a No. 40 used Perkins inclinable power press to a Boston manufacturer. A Vermont marble shipper bought two 3-ton cranes, and a Lowell manufacturer a 5-ton three-motor Northern crane. Stone & Webster have not closed on the new Ford crane inquiry.

The Boston & Maine Railroad is in the market for a gear cutting machine. The Boston & Albany has not yet purchased its brass working lathe. The Central Vermont, the Rutland and the Bangor & Aroostook railroads have asked local dealers to furnish preliminary estimates of certain tools contained in lists considered some time back and set aside for a time, which gives hope the lists are to be put out before long. The Boston Elevated Railway Co. is inquiring for turret tool equipment, but has not decided what it will need for its proposed Everett repair shop to be built later. The Barnett Drop Forging Co., Easthampton, Mass.,

wants two or three high speed drill presses, preferably good used tools, and John E. Stein, Milford, N. H. one 100-lb. board drop hammer.

The small tool business shows expansion and in the aggregate suggests considerable activity among certain shops.

Plans are being drawn for an addition to the plant of the Manchester Traction, Light & Power Co., Manchester, N. H. Barry, Cashman & Co., 200 Devonshire Street, Boston, are engineers.

The W. F. Concannon Shear Co., Milford, Conn., shears and scissors, is about to begin manufacture. It recently was organized with a capital of \$20,000.

The Fairmont Avenue, New Haven, plant, American Steel & Wire Co. will be remodeled to accommodate a new slicing department. The cost of alterations is estimated at \$30,000.

The plant of the Hanscom Cutter Works, Hyde Park, Boston, tool manufacturer, was considerably damaged by fire last week.

The Hampshire Electrical Appliance Corporation, capitalized for \$100,000 has been given a charter to manufacture washing machines, irons, other household devices and mechanical appliances. Laurence K. Foote, Southbridge, Mass., is president; Lewis A. Wilson, Worcester, vice-president, and Ethel S. Brosseau, Southbridge, treasurer. The company is seeking manufacturing quarters in Worcester. Mr. Wilson, during the war, was assistant superintendent Osgood, Bradley Car Co., Worcester, and more recently associated with the Crompton & Knowles Loom Works.

Bcaupre Brothers, Franklin, N. H., contemplate rebuilding their foundry. Details have not been worked out.

The announcement in THE IRON AGE on Feb. 23 that the E. Howard Clock Co., Boston, purchased a factory at Peabody, Mass., is denied by the company, which advises that while several factories have been under consideration, including the one at Peabody, no definite action toward the purchase of any property has been taken by the board of directors.

Ricketts & Shaw, Monson, Mass., are considering the installation of new equipment in the power plant at their woolen factory. Reeds & Thorpe, 60 Prospect Street, Hartford, Conn., engineers, will prepare estimates of cost.

The Whitins Machine Works, Whitinsville, Mass., is completing plans for a two-story branch plant, 75 x 160 ft., at Northbridge, Mass. Joseph D. Leland, 41 Mt. Vernon Street, Boston, is architect.

The Oxford Paper Co., Rumford, Me., has completed arrangements for the purchase of the power plant and property of the Rumford Falls Power Co., Rumford. Improvements are being considered. To carry out the acquisition, the company has arranged for a bond issue of \$5,000,000.

The Builders' Iron & Steel Co., 262 Bridge Street, Cambridge, Mass., has construction under way on a new branch plant at Everett, Mass., 70 x 250 ft., and office building, estimated to cost \$65,000. H. F. Thatcher, Malden, Mass., is architect.

A one-story automobile service and machine repair works, 75 x 135 ft., for company cars, will be constructed at Cambridge, Mass., by the National Bottling Co., 28 School Street, Boston, estimated to cost about \$45,000.

The Atlantic Refining Co., 3144 Passayunk Avenue, Philadelphia, has preliminary plans under way for a new branch oil refinery at Fall River, Mass., estimated to cost about \$1,000,000, including equipment.

The Board of Education, Providence, R. I., has plans nearing completion for a new central power house on Pond Street, for service at the high school buildings, estimated to cost \$160,000. Bids will be asked at an early date.

A vocational department will be installed in the proposed junior high school to be erected at Ware, Mass., estimated to cost about \$150,000.

The Savage Arms Corporation, 50 Church Street, New York, has taken title to the plant of the J. Stevens Arms Co., Chicopee Falls, Mass., heretofore held by the Westinghouse Electric & Mfg. Co., Pittsburgh, for approximately \$1,500,000. The purchasing company has been operating at the plant for a number of months.

The Bureau of Yards and Docks, Navy Department, Washington, has completed plans for a new dry dock and power house at the South Boston Navy Yard, and will call for bids under schedule 4550.

The American Electric & Maintenance Co., 51-57 Taylor Street, Springfield, Mass., has work under way on a new plant, 128-130 ft., for electrical repair and parts production. A. M. Soffield is president and general manager.

Detroit

DETROIT, March 6.

The Pere Marquette Railroad Co., Detroit, has plans under way for new car and locomotive shops at Grand Rapids, Mich., to cost about \$1,000,000, including equipment.

The Kirchen Machine Co., Lansing, Mich., has commenced the erection of an addition, to increase the capacity of the general machine department. A portion of the present works will be remodeled.

The Hirsch Mfg. Co., Sturgis, Mich., manufacturer of metal products, has awarded contract to the Citizens' Lumber Co., Sturgis, for a three-story and basement addition, 130 x 200 ft., to cost about \$100,000. Work will commence at once. E. S. Batterson, 405 Hanselman Building, Kalamazoo, Mich., is architect and engineer. C. Hirsch is president.

The Ford Motor Co., Detroit, is arranging to operate power plants of sufficient capacity to provide for all of its works, and has plans under way for increased construction for this purpose. The plant of the Lincoln Motor Co., a recent acquisition, will also be operated by power from the River Rouge generating station of the company. The entire project is estimated to cost in excess of \$400,000.

The Anchor Concrete Machinery Co., Rock Rapids, Iowa, manufacturer of concrete brick and block-making machinery and parts, has acquired the plant and adjoining property of the Adrian Steel Castings Co., Adrian, Mich., for a new factory. Operations will begin at once. The company was incorporated recently with a capital of \$100,000.

Coal-handling and conveying machinery will be installed at the new storage bins, 56 x 200 ft., to be erected by the Schelwo Coal & Coke Co., 6356 Mack Avenue, Detroit. William Hurt is secretary. F. W. Weidmayer, 412 Campau Building, is architect.

The Cadillac Machinery Co., Boydell Building, Detroit, is in the market for a used 53½ Toledo or 80½ Bliss press or equivalent.

Cincinnati

CINCINNATI, March 6.

While no large orders were reported sales the past week showed an improvement over the week preceeding and the indications are that March will show more bookings than February. The largest order during the week was for eight machines. An inquiry for 15 drilling machines came out but is said to be only for appraisal purposes. Most of the inquiries received are for single machines but many manufacturers are looking for much better business as a result of these inquiries. It is expected that several railroad lists will shortly be issued, as manufacturers state some interest is being shown by purchasing agents. The used machinery market is holding up fairly well, although the month of February was poor compared with January. The only price change of note the past week was that by practically all manufacturers of electric motors, reductions of 10 per cent becoming effective Feb. 27.

The Indianapolis Frog & Switch Co., Springfield, Ohio, has purchased 16 acres adjacent to its property and while no immediate building expansion program is planned, the additional ground will be used to provide more trackage for the company and to enable it to turn out a wider diversity of product.

The Boyet-Ledder Mfg. Co., Covington, Ky., has been incorporated with a capitalization of \$15,000 to manufacture mechanical toys. John F. Boyet and Frederick G. Ledder, Covington, are the incorporators.

Baltimore

BALTIMORE, March 6.

An electrically-operated pumping plant will be installed in connection with the proposed new waterworks to be constructed by the Common Council, Williamsport, Md., estimated to cost about \$100,000.

The Hanson Motor Co., Atlanta, Ga., manufacturer of automobiles, has acquired the plant and property of the American Motors Export Co., Jacksonville, Fla., for a branch, maintaining headquarters at Atlanta. The capacity will be increased.

A crane runway, 72 x 702 ft., to cost about \$30,000, will be constructed by the Weyerhaeuser Timber Co., Lexington Building, Baltimore, at First Avenue and Charles Street.

A. E. Anderson and W. N. Canter, Bristol, Va., are organizing a company to establish a plant for the manufacture of steel, brass and other metal specialties.

The Common Council, Enfield, N. C., is taking bids until

March 15 for a new municipal power plant, and pumping machinery for the waterworks department. William C. Olsen, Kinston, N. C., is consulting engineer.

J. C. Steele & Sons, Statesville, N. C., manufacturers of brick-making machinery, are making inquiries for a number of machine tools for installation at their plant, including boring mill, heavy duty lathe, planer, bolt-threading machine, and other equipment.

The Atlantic Ice & Cold Storage Co., Kirkwood, near Atlanta, Ga., is arranging for the erection of a new cold storage plant to cost about \$40,000.

The Pittsburgh Plate Glass Co., Pittsburgh, is contemplating the construction of a four-story addition to the plant of its Rennous-Kleinle Division, 3221 Frederick Avenue, Baltimore, 75 x 205 ft.

The General Purchasing Officer, Panama Canal, Washington, is taking bids, with no closing date stipulated, for 1000 seamless brass condenser tubes.

The Office of the Chief of Air Service, United States Army, Washington, D. C., is taking bids until March 30 for a quantity of seamless annealed copper tubing.

A vocational department will be installed in the high school to be erected at Roanoke, Va., estimated to cost about \$500,000. A similar department will be installed in the new junior high school to be constructed in the South East section, at a cost of about \$130,000. D. W. Persinger is chairman of the board.

The Elizabeth City Iron Works, Elizabeth City, N. C., has plans under way for the construction of a new dry dock and ship repair plant, with general machine shops, estimated to cost close to \$60,000. The installation of a marine railroad is also being considered. Henry and Andrew Sanders head the company.

Indiana

INDIANAPOLIS, MARCH 6.

The Huntington Ice Co., Inc., Huntington, Ind., is contemplating the erection of a new two-story ice-manufacturing plant to cost about \$50,000.

The United States Government Engineers, Evansville, Ind., have surveys under way for a hydroelectric power plant at Newburg, estimated to cost in excess of \$2,000,000.

The Bloomington Brick & Tile Co., Bloomington, Ind., has plans nearing completion for its new works at Unionville, Ind., estimated to cost about \$200,000, including machinery. A. W. Beecher is president.

The Madison County Superior Court has approved of the sale of the plant and property of the Buckeye Mfg. Co., Anderson, Ind., manufacturer of motor driven tractors and engines, to James W. Sanaberry, Anderson, on his bid of \$45,100.

The Midwest Utilities Co., Chicago, a subsidiary of the Commonwealth Edison Co., has acquired the electric plants and property of the Hawks Electric Co., Goshen, Ind., and the Winona Light & Water Co., Warsaw, Ind. The new owner is contemplating extensions in the plants and systems.

Milwaukee

MILWAUKEE, MARCH 6.

Although the machine tool trade is lacking in volume and is devoid of feature, the feeling exists that progress is being made by metal-working industries in getting new business, which sooner or later must be reflected in increased requirements of machine tools. The call for used equipment is relatively better than for new tools, but this is believed to presage the time when the absorption of used equipment will have reached the point where new tools will again have a fair chance of a real market. Foundry operating schedules are steadily increasing and machine shops are feeling a beneficial effect. The automotive industries the past week or two have broadened their inquiries and some milling machine business has resulted. A few sales of miscellaneous machinery have been made to makers of tractor parts and agricultural implements, with improved prospects for more business in 30 to 60 days.

The C. A. Shaler Co., Waupun, Wis., manufacturer of vulcanizing and tire repair apparatus, headlight lenses and other automotive specialties, sustained a loss of close to \$350,000 by fire March 2. The factory, equipment and warehouses are practically a total loss. C. A. Shaler, president and general manager, at present in California, telegraphed March 5 to prepare immediately for the erection of a new plant of fireproof construction, details of which are not yet available. R. B. Dunlap is secretary.

The International Harvester Co., 317 Oregon Street, Milwaukee, will build a garage and service shop costing about \$45,000 at 25-29 Reed Street. Construction contracts have been let.

The Interior Woodwork Co., Park Street and Fifth

Avenue, Milwaukee, is in the market for some additional equipment, for a three-story manufacturing addition, 87 x 158 ft., and a storage and stock addition, two stories, ell-shaped, 90 x 161 ft. The architect is Herman J. Esser, Camp Building. The work will cost about \$100,000 in all.

The Peerless Traveling Goods Co., Mayville, Wis., manufacturer of trunks, bags, etc., has plans for a new factory, two and three stories, 60 x 120 ft., of brick and mill construction, with a separate one-story office building. Considerable new machinery, including special tools for making steel frames and other metal parts, will be installed. The investment is estimated at about \$75,000.

The Mollie Typewriter Co., Oshkosh, Wis., manufacturer of writing machines, is raising \$50,000 by an issue of two-year, 7 per cent notes, to provide additional working funds and finance purchases of supplementary equipment and materials. No extension of buildings is contemplated at present. R. D. Wynn is president and general manager.

The Seamweld Equipment Co., 814 Wanebago Street, Milwaukee, has changed its corporate style to the Fred Pabst Co., and proposes to enlarge its line of activities in the metal-working field. It is controlled by Frederick Pabst, president Pabst Corporation, formerly Pabst Brewing Co., and occupies part of the former brewery group.

The Oswald Jaeger Baking Co., 814-922 Central Avenue, Milwaukee, which is erecting a \$150,000 addition to its bakery, has let the contract for a new refrigeration plant to the Vilter Mfg. Co., Milwaukee.

The Simplex Alarm Co., 129 Michigan Street, Milwaukee, manufacturer of patented burglar alarms and similar specialties, has increased its capitalization from \$75,000 to \$150,000 to accommodate the growth of its plant and business.

The U. S. Tractor & Machinery Co., Menasha, Wis., at its annual meeting authorized an increase in capital stock from \$500,000 to \$1,000,000 and a bond issue of \$250,000 to provide for the construction of a new foundry and additions to the machine shop, assembling floors and storage buildings. These will enable the company not only to manufacture practically all parts of its tractors and tractor implements, but to enlarge the line to embrace other power farm equipment. Officers were re-elected as follows: President, J. M. Robinson; vice-president, G. D. Harris; secretary, Joseph G. Saller; treasurer, A. B. Jensen. Plans are in preparation and it is hoped to start construction work by April 1.

Carl Girnau & Co., 118 South River Street, Eau Claire, Wis., machinists and automobile repairers, have plans for a new shop, 80 x 110 ft., one story, of brick, with steel-trussed roof. With equipment it will cost about \$28,000.

The C. W. Dickover Mfg. Co., Tomah, Wis., has been incorporated with a capital stock of \$25,000 to manufacture shop equipment, fixtures and tools, principally equipment for garages and repair shops. The incorporators are Charles W. Dickover, Alex M. Henry and Earl W. Henry, all of Tomah. The present shop is to be enlarged materially in the spring.

The Madison, Wis., board of public works expects to take bids soon for the installation of two standby generating units, with gasoline engine drive. A portable pumping unit with a capacity of 1000 gal. per minute also will be purchased.

G. A. Huck, Sturgeon Bay, Wis., is organizing a new corporation with a capital stock of \$250,000 to take over the so-called Green stone quarries in Sawyer, a suburb, and install electrically-operated quarrying, conveying, crushing and other machinery, hoppers, screens, etc., estimated to cost more than \$125,000.

The Wisconsin Public Service Co., Green Bay, Wis., has let contract to J. R. McDonald, Iron Mountain, Mich., for a new reinforced concrete dam at Johnson Falls, on the Peshigo River, as the first part of work on a \$500,000 hydro-electric generating project, previously noted. Contracts for the power house will be let within a short time. Specifications of equipment are in preparation. D. R. Pheneck is vice-president and general manager.

The Brill-Saunders Machinery Co., Appleton, Wis., has been organized with a capital stock of \$150,000 by S. A. Saunders, E. L. Brill and W. H. Blake to manufacture machinery, tools and fixtures.

The Board of Education, Superior, Wis., has engaged E. M. Johnson, local architect, to design a new vocational training school building, to be known as the Webster Memorial High School, and cost about \$100,000. Bids will be taken some time in April or May. W. J. Whipple is president of the board.

The Bachman Electric Co., Fond du Lac, Wis., has purchased the entire business and equipment of the M. C. Smith Electrical Repair & Supply Co., and will employ it as a department for rebuilding and repairing motors, rewinding armatures, and otherwise serving industrial electric power

users. M. C. Smith has become associated with the Bachman company as manager of the new department.

O. M. Johnson, River Falls, Wis., has opened a general sheet metal working shop in the Ostness Building. Most of the equipment needs have been provided for.

The American Hide & Leather Co., Chicago, contemplates improvements in its tanneries at Sheboygan, Wis., the principal work being to remodel the power plant and boiler house, install a coal and ash conveyor system and automatic stokers. Edward A. Juul, Sheboygan architect, is preparing plans.

Pittsburgh

PITTSBURGH, MARCH 6.

Activities in the machinery and equipment market lately have been limited. Inquiries the past week have shown a marked falling away and only a few sales of importance have been concluded. Five cranes recently inquired for by the Ritter-Conley Co. have been awarded to Manning Maxwell & Moore, Inc., distributor of the Shaw cranes. The order is for one 10-ton, two 7½-ton and three 3-ton cranes. The latest word about the cranes inquired for by the Wheeling Steel Corporation is that the company is urging makers to have prices in by the latter part of this week, and the expectation is that some, and possibly all of the 20 cranes, will be placed at an early date. There is also a possibility that the National Tube Co. will close soon for a 15-ton crane for its Christy Park works, McKeesport, Pa. Very low prices are understood to prevail for cranes. So few of the makers have any considerable amount of business on their books, that competition for orders is unusually sharp.

Machine tool sales usually are for individual tools, as the shops in and near Pittsburgh are merely replacing obsolete or worn out machines. There is no evidence yet of railroad buying. Eastern systems appear to be recovering less rapidly than those in the West, and railroad equipment manufacturers in this vicinity are not getting much business.

Mechanical conveying equipment, etc., will be installed at the two asphalt plants to be constructed by the county commissioners, Pittsburgh, for the Highway Department. Bids for the buildings and machinery will be asked at an early date. Roy D. Schooley, county road commissioner, is in charge.

D. S. Milloy, Twelfth and Cascade streets, Erie, Pa., manufacturer of planing mill products, has construction under way on a three-story addition, 80 x 200 ft.

A vocational department will be installed in the two-story and basement junior high school to be erected at Twenty-third and Cascade streets, Erie, Pa., estimated to cost \$350,000. W. W. Myers, Library Building, is architect.

The T. & A. Brass Foundry Co., P. O. Box 668, Charleston, W. Va., recently organized, will operate a plant to manufacture roller bearing wheels for traction cars, brass, bronze and aluminum castings, etc. E. T. Thayer is president and manager.

The American Car & Foundry Co., Huntington, W. Va., has issued a call for bids on a general contract for an addition to its plant on Third Avenue, to cost close to \$500,000, including machinery. Headquarters of the company are at 165 Broadway, New York. J. W. Ensign is district manager at Huntington.

The American Thermos Bottle Co., Madison Avenue and Forty-sixth Street, New York, has tentative plans under consideration for a new manufacturing unit at its plant at Huntington, W. Va., totaling about 100,000 sq. ft. of floor space. William B. Walker is president.

The Eagle Mfg. Co., Wellsburg, W. Va., manufacturer of oil containers and other metal products, is planning to immediately rebuild the portion of its factory recently destroyed by fire. W. C. Jacobs, assistant secretary, is in charge.

The Pacific Coast

SAN FRANCISCO, FEB. 28.

The American Aluminum-Metal Products Co., Burbank, Cal., has awarded a contract to R. W. McCrea, Huntington Park, Cal., for its new local plant, estimated to cost close to \$100,000. Richard D. King, 519 Van Nuys Building, Los Angeles, is architect.

A vocational building will be erected by the Board of Education, San Diego, Cal., in connection with its group of high school buildings at Balboa Park, estimated to cost about \$300,000. Theodore C. Kistner, San Diego, is architect.

The Western States Gas & Electric Co., Elks Building, Stockton, Cal., has plans under way for a new hydro-electric generating plant near Placerville, Cal., to comprise two units, each with capacity of about 10,000 kw. Other

units will be constructed later. With transmission system it is estimated to cost in excess of \$1,500,000.

The Ulrich Tubing Drainer Co., Huntington Beach, Cal., manufacturer of oil drainers and other metal specialties, will build a new factory, 48 x 60 ft. Frank Ulrich is head.

The Westinghouse Electric & Mfg. Co., Los Angeles, is completing plans for its new five-story plant at Fifth and San Pedro streets, estimated to cost about \$500,000, including equipment. Noerenberg & Johnson, Los Angeles, are architects.

The Board of Directors, Southern California Edison Co., Los Angeles, has authorized an appropriation of \$22,500,000, to be used during the year for extensions and improvements, including new power plants and equipment, transmission systems, substations, etc.

The Carmichael Irrigation District, Fair Oaks, Cal., has rejected all bids for electrically-operated pumping machinery for its irrigation works, and will call for new bids at an early date.

The General Electric Co., Schenectady, N. Y., with San Francisco offices in the Rialto Building, has acquired about 24 acres at Oakland, Cal., as a site for a new plant, to cost about \$1,000,000. It will be operated in conjunction with the lamp manufacturing plant at West Oakland.

The Thurston & Flavelle Co., Port Moody, Wash., will build a power house and install motors and other electrical equipment in the different departments of its lumber mill. The work will cost about \$60,000.

The Tacoma Ice & Refrigerating Co., Tacoma, Wash., is perfecting plans for a new ice-manufacturing and cold storage plant at Holgate and South Twenty-sixth streets, estimated to cost \$250,000.

The Monroe Shingle Co., Betzen, Ore., is planning to immediately rebuild its shingle mill, destroyed by fire late last year, with loss in excess of \$75,000. A power plant will be constructed and the entire plant electrified, with all machinery operated by individual motor drive. It is estimated to cost about \$100,000.

The City Council, Leavenworth, Wash., has preliminary plans under consideration for a municipal electric power plant.

The Central South

St. Louis, March 6.

The Pennsylvania Tank Line, 25 West Forty-third Street, New York, has awarded a contract to the Kansas City Structural Steel Co., Kansas City, Mo., for new railroad tank car works at Argentine, Kan., consisting of a steel fabricating shop, 80 x 100 ft.; machine shop, 40 x 45 ft., and forge and blacksmith shop, 80 x 100 ft., all one story.

The Kansas City Cold Storage & Warehouse Co., Kansas City, Mo., recently organized, has filed plans for its ice-manufacturing and cold storage plant, estimated to cost \$1,300,000, including machinery. It is a subsidiary of the United States Cold Storage Co., West Thirty-ninth Street and Hoyne Avenue, Chicago. S. Scott Joy, 2001 West Thirty-ninth Street, Chicago, is architect and engineer.

The Automatic Water Pump Mfg. Co., 236 East High Street, Jefferson City, Mo., recently organized with a capital of \$2,000,000 to manufacture automatic pumping machinery and parts, has plans under way for seven buildings, including general iron working department, foundry, machine shop, wood-working department, power house and other structures. The plant will approximate 260,000 sq. ft. of space, and will cost about \$150,000. A list of machine tools and other equipment to be installed is being prepared; bids both for buildings and equipment will be asked in from four to six weeks. Benjamin F. Schuetz is president.

The St. Louis & San Francisco Railroad Co., St. Louis, is arranging its shops at Fort Scott, Kan., to manufacture steel bodies for coal cars used on the system, and will increase the facilities and working force. A portion of the fund of \$485,000, arranged for new equipment during the present year, will be used at the plant. Another appropriation has been made of \$360,000, for rebuilding steel coal cars, including new bodies. For new power plants to be constructed during the year, a fund of \$205,000, has been set aside.

The Graft-Bright Mfg. Co., 441 East Jefferson Street, Louisville, recently organized, will operate a plant for the manufacture of agricultural implements. It is proposed to develop a daily output of 3000 garden hoes, rakes, spades, etc.

A four-story automobile service and repair plant, 130 x 160 ft., for company motor trucks and cars, estimated to cost \$350,000, will be built by the Scruggs, Vandervoort & Barney Dry Goods Co., Tenth and Olive streets, St. Louis. Plans have been prepared. M. L. Wilkinson is president.

The Riverside Light, Power & Gas Co., Abilene, Kan.,

will build a new hydroelectric power plant on local site, estimated to cost in excess of \$100,000. E. P. Callahan is superintendent.

The Pidgeon-Thomas Iron Co., Memphis, Tenn., has had plans prepared for a new steel fabricating shop, one story, 160 x 260 ft. to cost about \$75,000. Work will commence at an early date. E. L. Harrison, Memphis, is architect and engineer.

The Sinclair Refining Co., Coffeyville, Kan., will proceed at once with the erection of its new refinery, work upon which has been suspended for some time. The company will expend about \$3,000,000 on the refinery and other work in this district during the present year. Headquarters are at 111 West Washington Street, Chicago.

The City Commissioners, Parsons, Kan., will take bids up to March 28, for pumping machinery, electrical equipment, etc., for the waterworks system, including a 3,000,000-gal. crank and fly-wheel opposed type pumping engine; 1000 and 1800-gal. motor-driven centrifugal pumps and electrical equipment for the Neosho River pumping station; 1400 and 2100-gal. motor driven centrifugal pumps; two 180 k.v.a. engine-driven generators; two 150-hp. water tube boilers, with accessories and electrical equipment. F. W. Frye is city clerk. Burns & McDonnell, 402 Interstate Building, Kansas City, Mo., are consulting engineers.

The Profit-Sharing Ice Co., 315 James Building, Chattanooga, Tenn., will build a new one-story ice-manufacturing plant, 60 x 100 ft. Bowdre Brown is president.

The Great Eastern Refining Co., Leach, near Catlettsburg, Ky., recently organized with a capital of \$2,000,000, has acquired a site for the construction of a new oil refinery with daily capacity of about 1000 bbl., to cost approximately \$250,000. The output will be doubled in the near future. A large steel tankage department will also be erected. T. H. Gilman is general manager in charge.

The Common Council, Germantown, Tenn., is arranging for the construction of a municipal electric power plant.

The Greenback Brick Co., Greenback, Tenn., is perfecting plans for new works for the manufacture of brick, tile and kindred products, with an initial daily output of about 30,000 bricks. J. L. Jones is proprietor and manager.

The City Council, Nashville, Tenn., is planning to rebuild its municipal electric power plant, recently destroyed by fire with loss of about \$100,000. W. Southgate is city engineer.

The Stafford Motor Works, Twenty-second and Campbell streets, Kansas City, Mo., has awarded a contract to Harvey Stiver, 402 Shubert Building, for a one and two-story machine shop, 65 x 130 ft., to cost about \$36,000. R. A. Curtis, 637 Lee Building, is architect.

The Gulf States

BIRMINGHAM, March 6.

The Collinsville Mfg. Co., Fort Worth, Tex., manufacturer of metal products, has leased the building at 2812 Main Street, Dallas, Tex., for the establishment of a new plant and will remove its present works to the new location. S. A. Menczer is president. J. P. S. Morgan will be manager of the Dallas plant.

The Voth Hardwood Co., Voth, Tex., recently formed with a capital of \$150,000, has acquired the local property of the Keith Lumber Co., and plans a number of additions. An additional band saw mill will be constructed, with machinery to increase the output to 150,000 ft. per day. Lumber handling machinery and conveying equipment will be installed. B. F. Bonner is president, and Carroll Keith, secretary and general manager.

George W. Polk and T. B. Lyster, receivers for the Texas Motor Car Association, Fort Worth, Tex., are arranging for the sale of the company's property, including plant for the manufacture of automobiles and motor trucks, bodies, etc., with machine shop, forge shop, assembly shop, etc.

The Frigid Mfg. Co., 115 Parker Street, Tampa, Fla., recently organized with a capital of \$200,000 to manufacture ice and refrigerating machinery, has acquired a building, 50 x 236 ft., for its plant and will commence the installation of machinery at once. A. N. Duncan is president and treasurer.

The Florida Filter Corporation, 218 West Bay Street, Jacksonville, Fla., lately organized, has acquired a building for the manufacture of water filter equipment. Initial operations will be devoted to the most part to assembling, and equipment will be installed to provide for a capacity of 500 filters a month. The production of parts will be arranged for at outside plants. W. E. Dunbar is general manager.

The Hialeah Producing & Refining Co., 38 Second Avenue, Miami, Fla., E. D. Rice, president, is planning for a

new oil refinery at Hialeah with initial daily capacity of about 1600 bbl. It is estimated to cost about \$100,000.

Fire, Feb. 25, destroyed the machine shop, forge and blacksmith shop, boiler shop and other buildings at the plant of the Gulf & Ship Island Railroad Co., Gulfport, Miss., with loss estimated at about \$75,000.

The Russell Clay Mfg. Co., Equitable Building, Baltimore, Floyd B. Powell, manager, has acquired a plant at Alton, near Birmingham, and will establish works for the manufacture of vitrified paving brick, with initial daily output of about 50,000 brick. Equipment will be installed at once, including about 200 industrial cars.

The Vitrolite Co., 133 West Washington Street, Chicago, with factory at Parkersburg, W. Va., has leased property at 2220 Commerce Street, Dallas, Tex., for a branch plant. Machinery will be installed for cutting, grinding, polishing and finishing the crude vitrolite material from the Parkersburg works.

H. B. Stevens, Naples, Morris County, Tex., has work under way on a new building for an electric power and ice-manufacturing plant for service in this section. It will cost about \$65,000.

The O. K. Battery Co., Dallas, Tex., has leased the building at 2815-17 Main Street, for the establishment of a plant to manufacture electric storage batteries and parts. It is proposed to develop an output of 4,000 batteries a month. C. G. Lippencott is president.

The Valley Ice Co., 1121 Julia Street, New Orleans, La., W. H. McGraw, head, is arranging for the erection of a one-story ice-manufacturing plant with daily capacity of about 100 tons, estimated to cost \$40,000.

The new engineering shop building to be erected by the board of directors, Agricultural and Mechanical College of Texas, College Station, Tex., will comprise machine shops, forge shop, foundry, carpentry, pattern and other mechanical departments, estimated to cost about \$175,000, of which about \$40,000 will be expended for equipment. A list of machinery will be arranged at an early date. A new agricultural building will also be built, to cost \$250,000. The Wattinger Construction Co., Austin, Tex., has the general building contract.

W. E. Hart and Herbert Graves, Fort Worth, Tex., have organized a company with capital of \$200,000 to build a plant to manufacture hand-power laundry and washing machines. Work will commence at an early date. The Industrial Bureau of the Chamber of Commerce, Roscoe Ady, director, is interested in the project. Mr. Hart will be president of the organization.

A vocational department will be installed in the new high school to be erected at Sulphur Springs, Tex., by the local School Board, E. L. Ashcroft, president. Plans have been prepared by Barlebaugh & Whitson, Dallas, Tex., architects.

The Frost-Johnson Lumber Co., Shreveport, La., will consolidate with H. W. Cole, Pine Bluff, Ark., operating a large hardwood mill. The merged company will operate under the Frost-Johnson name, and has plans under way for a new hardwood flooring plant at Shreveport to cost \$300,000, including equipment. The Pine Bluff plant will be continued as a branch. E. A. Frost is president.

Canada

TORONTO, MARCH 6.

The machine-tool business continues on about the same level as that of the past few weeks. Orders are being received in limited numbers for one or two machines with an occasional order for larger quantities, but big lists are absent. Inquiries are increasing, with many considered as good prospects, and it is the general opinion that business is showing slow but steady improvement. The outlook for March is much brighter than either of the two previous months. Salesmen are following up every prospect and in some cases are resorting to price shading when a good order is in view. The demand for drills, taps, reamers, etc., continues steady, with inquiries and a few orders being received for future use. While some shading is being done by dealers no general price revision has been made, although there is a possibility that some reductions may be announced later.

The Standard Steel Construction Co., Welland, Ont., is in the market for a second-hand locomotive crane from 7½ to 10 tons capacity.

It is reported that the plant of the Messervy Battery Co., Brampton, Ont., has been purchased by the Arabol Mfg. Co., New York, and that it will be enlarged and additional equipment installed.

The Thornton Rubber Co., Oshawa, Ont., suffered loss by

fire, Feb. 22, amounting to \$100,000, including building, machinery, etc.

The Canadian National Railways have acquired a large tract of land off the outskirts of Regina, Sask., and will use it for yard, extensions, increased grain handling facilities and for the enlargement of its shops.

There is no possibility at present of a plant being established in Toronto by the Canadian Car & Foundry Co., Montreal, stated W. W. Butler, president of the company, when referring to the report that has been circulated recently that such a move was contemplated.

It is reported that the International Harvester Co., Hamilton, Ont., is negotiating for the purchase of the plant of La Machine Agricole de Montmagny, Montmagny, Que.

Announcement was made by the Chamber of Commerce, St. Thomas, Ont., that the Wood-Gorrie Motors, Ltd., a newly incorporated company, formed for the manufacture of the Warwick light six car in four models, has selected St. Thomas, Ont., for the location of its plant. It has engaged temporary quarters in the factory of St. Thomas Boxes, Ltd., which will be used as an assembling plant. Negotiations are underway for the purchase of a 25-acre site, in the new industrial area. W. B. Wood, Toronto, is president of the company; A. J. Gorrie, Montreal, vice-president; C. R. Collard, Toronto, secretary-treasurer, and W. H. Smith, Toronto, chief engineer and designer. At the outset the company will be an assembling concern only, using standard automobile parts.

The preliminary work for the construction of the plant for the Three Rivers Pulp & Paper Co., Three Rivers, Que., which is capitalized at \$3,000,000 will start this month, and it is expected that the plant will be in operation by the end of 1923.

A manufacturing plant will be constructed at Galt, Ont., by the International Tank & Silo Co., Ltd. It has purchased a 4-acre site on which will be erected a one-story factory, 120 x 200 ft. The company will turn out the same products as those manufactured by the Endlock Mfg. Co., Des Moines, Iowa.

Trade Changes

Noel Cunningham, formerly connected with the Coal Washing Equipment Co., has now become associated with the Hardinge Co., Incorporated, 120 Broadway, New York. This change is due to the acquisition by the Hardinge Co. of all manufacturing and sales rights of the James coal washing equipment, formerly handled by the Coal Washing Equipment Co. This machinery is used for the reduction of the ash and sulphur content of all sizes of anthracite and bituminous coals. Mr. Cunningham has been placed in charge of this new department of the Hardinge Co.

The Stowell Co., founder and manufacturer, South Milwaukee, Wis., has changed the location of its Chicago office from 509 Monadnock Block to 620 McCormick Building. E. B. Hansen will continue as manager of the office.

The American Machine & Foundry Co. has acquired a substantial interest in the Gurney Elevator Co. and it is understood that hereafter Gurney elevators will be manufactured in the plant of the American Machine & Foundry Co. in Brooklyn, in addition to the Gurney Elevator Co.'s plant at Honesdale, Pa. This arrangement was brought about to provide increased manufacturing facilities for the rapidly growing business of the Gurney Elevator Co., partly due to its entrance into the field of high-speed gearless elevators.

The name of the American Sheet Metal Stamping Corporation has been changed to the Henson-Blair Mfg. Co. effective March 1.

The Whiting Corporation, Harvey, Ill., foundry equipment, has established a branch sales office in New York at 126 Liberty St., having discontinued its agency agreement with Wonham, Bates & Goode Trading Corporation, N. Y. J. Rose Bates, now a vice-president of Whiting Corporation, is in charge of the new office. He will be assisted in the New York territory by D. Felderman, Jr. and in the New England States by R. C. Maley, who will open an office at Springfield, Mass. All of these gentlemen were formerly associated with Wonham, Bates & Goode Trading Corporation. The Whiting Corporation has also opened a branch office in Indianapolis, 305 Merchants Bank Bldg., in charge of S. E. Stout, formerly at the main office, Harvey, Ill. Mr. Stout will cover southern Indiana and adjoining cities in Ohio and Kentucky. The company's Detroit office has been moved from Penobscot Building to 206 Stahelin Bldg., 3000 Grand River Ave.

The business of William Wieman & Co. dealer in pig iron, steel, coal and coke, and that of C. S. B. Ward & Co., Inc., dealer in coal and coke, have been merged and will be continued under the name of The Wieman & Ward Co., with offices at 997-998 Union Arcade Building, Pittsburgh. William Wieman is president and treasurer and C. S. B. Ward, vice-president and secretary.

Current Metal Prices

On Small Lots, Delivered from Merchants' Stocks, New York City

The following quotations are made by New York City warehouses.

As there are many consumers whose requirements are not sufficiently heavy to warrant their placing orders with manufacturers for shipment in carload lots from mills, these prices are given for their convenience.

On a number of articles the base price only is given, it being impossible to name every size.

The wholesale prices at which large lots are sold by manufacturers for direct shipment from mills are given in the market reports appearing in a preceding part of THE IRON AGE under the general heading of "Iron and Steel Markets" and "Non-ferrous Metals."

Iron and Soft Steel Bars and Shapes

Bars:	Per Lb.
Refined bars, base price.....	2.53c.
Swedish bars, base price.....	10.00c.

THE IRON AGE

New York, March 16, 1922

ESTABLISHED 1855

VOL. 109, No. 10

Tensile Strength Increase by Cold Drawing

Development of a Law Covering the Tendency of Steel
to Increase in Tensile- - Variations and
Breaking Points in Curves

BY E. J. JANITZKY*

CHANGING relations of tensile strength have been noticed in cold drawing as drafting progresses either from the green or annealed rod, from the process annealed wire, or from the patented rod or wire. By green rod is meant the rod in the natural state, as it leaves the rod mill; the process annealed wire refers to that which has been annealed at about 1100 deg. Fahr. in order to relieve strains without attempting recrystallization; the patented wire rod or wire is in the normalized condition. The scope of this article is necessarily so restricted that it is not possible to consider the mechanical technology of wire drawing, as such.

Treating this subject from a practical standpoint, one is obliged to deal with wire rods of approximately 0.207 in. in diameter, that is, No. 5 American wire gage, since drawing from larger sections would not allow the high range of percentage of reduction that can be obtained normally without intermittent thermal treatment in drawing directly from a smaller rod or wire.

Like all natural laws, those governing the behavior of steel in cold drawing are inexorable, and our understanding of the results obtained depends primarily upon the determination of those laws. It is not claimed that the underlying laws of cold working are unknown, but it has been noted that in literature pertaining to this subject, there is lacking a clear definition and interpretation of those laws.

The most admirable contributions to the subject of cold drawing are:

(1) Goerens, "The Influence of Cold Working on the Properties of Iron and Steel," Carnegie Scholarship Memoirs, 1911, Volume III.

(2) Percy Longmuir, "Some Aspects of Wire Drawing," Iron and Steel Institute, 1912, Volume LXXXVI.

(3) J. F. Tinsley, "How Heat Treating Affects Wire," American Iron and Steel Institute, 1914.

All investigators agree that the tensile strength is increased, while the maximum elongation and the contraction are reduced, by cold working. Goerens concludes by saying, "Summarizing, it may be said concerning the mechanical properties that the tensile strength is increased by drawing in proportion as the deformation of the material is greater. The extent to which this may be carried depends on the composition of the material and on the size of the sections undergoing deformation. The tendency developed by cold working of

steel is hence dependent also on the following three factors:

- "1. The capacity of the material for cold working.
- "2. The chemical composition.
- "3. The original dimensions."

Longmuir concludes, "In neither case does the increase in tensile strength possess an exact ratio to the amount of flow."

As is obvious, the amount of flow can be measured only by the change in the reduction of area, thus:

$$R = \frac{A_0 - a}{A_0} \times 100$$

in which R = reduction in percentage from original area
 A_0 = area of original section in square inches

a = area in sq. in. of section to which wire or rod has been drawn

Based on diameters, this formula reads:

$$R = \frac{D_0^2 - d^2}{D_0^2} \times 100$$

in which R = reduction in percentage from original area
 D_0 = diameter of original section in inches

d = diameter in inches of section to which wire or rod has been drawn

Data from J. F. Tinsley, as given in the following tables, represent three steels, a 0.10-per cent carbon, a 0.50-per cent carbon and a 0.70-per cent carbon steel, as noted in figures and tables.

As is apparent from the tables, the increase over the initial tensile strength of the rod in the foot lb. system is equal to the reduction in per cent, multiplied by 1000. This product, added to the initial tensile strength of the rod, gives the total tensile strength in lb. per sq. in., as recorded experimentally by the tensile test machine.

It is important to note that neither the heat treatment nor the initial size or shape of the section has any influence whatever, in cold drawing, on the rate of increase of tensile strength over the initial tensile strength before drawing. In other words, the original rod or wire may be either a green rod, or it may have been process annealed or patented, and of any shape or section, and still the same formula holds good. The effect of chemical composition will be considered later.

Therefore, the general formula for calculating the tensile strength of cold drawn wire can be expressed by the following:

$$T = \frac{A_0 - a}{A_0} \times 100 \times 1000 + T_0$$

$$\text{or } T = \frac{D_0^2 - d^2}{D_0^2} \times 100 \times 1000 + T_0$$

in which T = the tensile strength after cold drawing.

*Metallurgical engineer Illinois Steel Co., South Chicago

Table I—0.10-Per Cent Carbon Steel (Tinsley)
(Tensile Strength in Lb. per Sq. In.)

No. of Draft as Given by Author	Gage,* In.	Initial Tensile Strength of Rod or Wire T_0	Actual Tensile Strength after Drawing T	Total Percentage of Reduction R	Increase over Initial Tensile Strength of Rod or Wire		Total Tensile Strength of Wire Calculated $A_0 - a$
					Actual ($T - T_0$)	Calculated $A_0 - a$	
					$1000 \times \frac{A_0 - a}{A_0} \times 100$	$1000 \times \frac{A_0 - a}{A_0} \times 100 + T_0$	
2	0.207	68,000	Green Rod				
	0.151		113,000	47.0	45,000	47,000	115,000
3	0.088		150,000	82.0	82,000	82,000	150,000
	0.088	60,000	After first process annealing				
1	0.071		93,000	35.0	33,000	35,000	95,000
3	0.048		130,000	70.0	70,000	70,000	130,000
5	0.034		145,000	85.0	85,000	85,000	145,000
	0.034	62,000	After second process annealing				
1	0.030		82,000	21.0	20,000	21,000	83,000
3	0.021		124,000	62.0	62,000	62,000	124,000
5	0.015		143,000	80.0	81,000	80,000	142,000
7	0.012		151,000	88.5	89,000	88,500	150,500

*As Tinsley's figures give only the percentage of reduction, the gages have been computed.

- A₀ = area of original section in sq. in.;
a = area of section to which wire or rod has been drawn;
D₀ = diameter of original section in inches;
d = diameter of section to which wire or rod has been drawn;
T₀ = initial tensile strength before cold drawing.

However, this formula, which is parabolic in char-

Fig. 1. Curves for Tinsley's 0.10 Per Cent Carbon Steel, with Intermittent Process Annealing. Refer to Table I
Note: In all these figures, on this and the succeeding pages, the dots represent experimental values; the lines show calculated values

acter, does not seem to hold good for the actual curve in its entirety. At a reduction of 90 per cent in a 0.10 per cent carbon steel, there appears to be a break in the curve, and so beyond this point the formula loses applicability in its present form.

By dissecting the actual values, beyond a reduction for which the formula holds good, it is noted that the values for the increase in tensile strength obtained by multiplying the percentage of reduction by 1000 are much too low. One also comes to the conclusion that the new curve, starting from the breaking point, is again parabolic, but steeper in slope than the previous

curve. Further reduction of the wire by drafting shows that there are still more breaking points to be found in the curve.

For the sake of simplicity, let us call the breaking points in the curves, in order of their occurrence as the wire or rod is being drawn, B₁, B₂, B₃, etc., respectively. Using the areas of the wires at which these breaks occur as bases for the new parabolas, and using the total tensile strengths of these cold drawn wires as bases for T₀, the curves beyond these breaking points will follow the formulas given below.

However, these new increases in tensile strengths, that is, beyond the first breaking point, calculated by

Fig. 2. Curves for Tinsley's 0.50 Per Cent Carbon Steel, with Intermittent Patenting. Refer to Table II

using the breaking points as bases, are in proportion to only one-half the percentages of reduction, thus:

$$\frac{A_1 - a}{2A_1} \times 100, \text{ or } \frac{A_n - a}{2A_n} \times 100$$
$$T = \frac{A_1 - a}{2A_1} \times 100 \times 1000 + T_1$$
$$T = \frac{A_n - a}{2A_n} \times 100 \times 1000 + T_n$$

or, generalized, $T = \frac{A_n - a}{2A_n} \times 100 \times 1000 + T_n$
in which T = tensile strength after cold drawing;

Table II—0.50-Per Cent Carbon Steel (Tinsley)
(Tensile Strength in Lb. per Sq. In.)

No. of Draft as Given by Author	Gage,* In.	Initial Tensile Strength of Rod or Wire T_0	Actual Tensile Strength After Drawing T	Total Percentage of Reduction R	Increase over Initial Tensile Strength of Rod or Wire		Total Tensile Strength of Wire Calculated $A_0 - a$

*As Tinsley's figures give only the percentage of reduction, the gages have been computed.

Table III—0.70-Per Cent Carbon Steel (Tinsley)
(Tensile Strength in Lb. per Sq. In.)

No. of Draft as Given by Author	Gage, In.	Initial Tensile Strength of Rod or Wire T_0	Actual Tensile Strength After Drawing T	Total Percentage of Reduction R	Increase over Initial Tensile Strength of Rod or Wire		Total Tensile Strength of Wire Calculated $A_0 - a$
					Actual ($T - T_0$)	Calculated $A_0 - a$	
1	0.185 0.122	160,000	After patenting 212,000	56.0	52,000	56,000	216,000

A_0 = area in sq. in. of wire at which last break in the curve occurred;
 a = area of section to which wire or rod has been drawn;
 T_0 = tensile strength of wire where last break in the curve occurred.

This halving seems to hold good for low and medium carbon steels, whereas in 0.70-per cent carbon and

Fig. 3. Curve for Tinsley's 0.70 Per Cent Carbon Steel, after Patenting. Refer to Table III (Left)

Fig. 4. Longmuir's Tensile Curve from Rod Drawn Directly from 0.201 In. Diameter to 0.023 In. Refer to Table IV (Right)

probably higher carbon steels (it cannot be said definitely, as no data are at hand) as shown in Table VII, the increase in tensile strength beyond the first breaking point in the curves is in proportion to the entire percentage of reduction, thus,

$$\frac{A_1 - a}{A_1} \times 100, \text{ or } \frac{A_2 - a}{A_2} \times 100.$$

Below is a table giving actual and calculated data on a 0.10-per cent carbon steel taken from Longmuir. The figures are excellent for demonstrating three breaking points, the reduction having been carried to 0.024 in., a percentage of 98.6. The following gives the details of the drawing as carried out by Longmuir on the above steel.

Original rod diameter 0.201 in.

0.201-in. rod reduced in 0.001-in. drafts to 0.192 in.
0.192-in. rod reduced in 0.001-in. drafts to 0.176 in.

0.176-in. rod reduced in 0.001-in. drafts to 0.160 in.
0.160-in. rod reduced in 0.001-in. drafts to 0.145 in.

Rod drawn to 7-gage, then to 9-gage wire, and the following samples drawn from the 9-gage wire in 0.001-in. reduction per draft from 0.145 in. to 0.092 in.*

Figures given for 0.145 in., 0.128 in., 0.116 in., 0.104 in. and 0.092 in. in our table.

Rod drawn to 5-gage, 7-gage, 9-gage, 11-gage and 13-gage, and then the following samples drawn from

the 13-gage wire in 0.001-in. reduction per draft from 0.092 in. to 0.072 in. Figures given for 0.080 in. and 0.072 in. in our table.

Rod drawn to 5-gage, 7-gage, 9-gage, 11-gage, 13-gage and 15-gage, and then the following samples drawn from the 15-gage wire in 0.001-in. reduction per draft from 0.072 in. to 0.056 in. Figures given for 0.064 in. and 0.056 in. in our table.

Rod drawn to 5-gage, 7-gage, 9-gage, 11-gage, 13-gage, 15-gage and 17-gage, and then the following samples drawn from the 17-gage wire in 0.001-in. reduction per draft from 0.056 in. to 0.041 in. Figures given in our table for 0.048 in. and 0.041 in.

Rod drawn to 7-gage, 11-gage, 13-gage, 15-gage, 17-gage and 18½-gage, and then the following samples drawn from the 18½-gage wire in 0.001 in. reduction per draft from 0.041 in. to 0.030 in. Figures given in our table for 0.036 in. and 0.032 in.

Rod drawn to 7-gage, 9-gage, 11-gage, 13-gage, 15-gage, 17-gage, 18½-gage and 20-gage, and then the following samples drawn from the 20-gage wire in 0.001 in. reduction per draft from 0.030 in. to 0.024 in. The figures given in our table are for 0.028 in. and 0.024 in.

Analysis of this steel is as follows: carbon, 0.10 per cent; manganese, 0.89 per cent; phosphorus, 0.307

per cent; sulphur, 0.103 per cent; silicon, 0.06 per cent. Table V gives actual and calculated data on the cold drawing of a 0.10-per cent carbon steel. The figures are from an Eastern steel company. Analysis of the steel is: Carbon, 0.10 per cent; manganese, 0.45 per cent; phosphorus, 0.100 per cent; sulphur, 0.045 per cent.

Attention is called to the fact that, whereas in the previous case, as shown in Table IV, the wire was drawn to 0.024 in. and there are three breaking points, in this case the wire has been drawn to 0.035 in. and there are only two breaking points. If the wire had been drawn further, a third breaking point would have been encountered.

Table VI given in the following shows actual and calculated data taken from Longmuir's 0.50-per cent carbon steel. The cold drawing was executed by Longmuir in the following manner:

Original rod diameter, 0.214 in. Original rod reduced to 0.092 in. diameter, 0.001 in. reduction per draft. Figures given in our table for 0.192 in., 0.176 in., 0.160 in., 0.145 in., 0.128 in., 0.116 in., 0.104 in. and 0.092 in.

A 5-gage rod drawn to 7 gage, 9 gage, 11-gage and 13 gage. Then the following samples drawn from the 13-gage wire in 0.001-in. reduction per draft from 0.092 in. to 0.072 in. Figures given in our table for 0.080 in. and 0.072 in.

A 5-gage rod drawn to 7 gage, 9 gage, 11 gage, 13 gage and 15 gage. Then the following samples drawn from the 15-gage wire in 0.001 in. reduction per draft from 0.072 in. to 0.056 in. Figures given in our table for 0.064 in. and 0.056 in.

Analysis of this steel is carbon, 0.48 per cent; manganese, 0.87 per cent; phosphorus, 0.050 per cent; sulphur, 0.039 per cent; silicon, 0.058 per cent.

It has been previously stated that the tensile strength, as calculated by the formulas given in this paper, is not influenced in any way by the shape of the section which is being cold drawn. As proof of this, the following data from Longmuir on a 0.67-per cent carbon steel, drawn in rectangular rather than circular section, is cited:

Analysis of this steel is carbon, 0.67 per cent; manganese, 0.78 per cent; phosphorus, 0.032 per cent; sulphur, 0.027 per cent; silicon, 0.126 per cent.

As the first breaking point for this curve does not occur at a draft given by the author, it was necessary to calculate it. From the figures given by Longmuir the indication was that the breaking point lay at a point between a reduction of 63.7 per cent and that of 72.8 per cent. An interpolation for a reduction of 68

per cent was made, and this taken as a basis for the first breaking point.

It will be noted that, despite the diversified drawing practices of the different investigators whose data were

bon steel the first breaking point seems to take place for a reduction of 90 per cent; in a 0.50-per cent carbon steel, at a reduction of about 80 per cent; and for

Fig. 6. Longmuir's Tensile Curve from Rod Drawn Directly from 0.214 In. Diameter to 0.056 In. Refer to Table VI (Left)

Fig. 7. Longmuir's Curve for 0.67 Per Cent Carbon Steel, Cold Drawn in Rectangular Section. Refer to Table VII (Right)

taken for analysis, and regardless of the difficulty of obtaining accurate results on account of irregularity of section, non-uniform cooling of coil, different finishing temperatures, probable acid brittleness, etc., the tendency of the increase of tensile strength as expounded in this article has been shown to follow a definite law.

In regard to chemistry, the carbon content influences the increase in tensile strength, as drawing progresses, only indirectly. It appears that, the higher the carbon content, the earlier the breaking point in the curve will first occur, thus for a 0.10-per cent car-

a 0.70-per cent carbon steel, at about 70 per cent reduction.

Also, it is to be noted that, from the initial rod to the first breaking point in the curve, carbon has no influence whatever on the rate of increase of tensile strength, whereas beyond the first breaking point, in low and medium carbon steels, the increase is proportional to one-half the reduction from the breaking point used as a base, and in high carbon steels proportional to the entire reduction.

In concluding the author hopes that the question treated may arouse interest so that more light will be thrown on this particular problem.

*It was necessary to calculate this item, as drafts taken by Longmuir were too far apart to determine the first breaking point.

New Gasoline Locomotive

The Industrial Equipment Co., formerly the Cummings Machine Co., Minster, Ohio, has placed on the market the new model gasoline locomotive, shown in the accompanying illustration. It is known as the Minster, Model F, and is made in 6 and 7-ton sizes, and is said to embody several new features.

A Buda engine is used and also Westinghouse starting and lighting equipment, Stromberg carburetor, Duplex governor, Splittorf aero-model magneto with inclosed impulse automatic starter, Hyatt roller bearings, New Departure ball bearings, Willard storage battery and Diamond roller chain. There has been no change in the method of transmitting power from the engine to the wheels, the new model having the

Engine and Drive Disk Assembly Are Combined in One Unit

friction and chain drive used heretofore. The frame is of all-steel box-girder construction, and the axles, jack shaft and friction disk shaft of special high-manganese chrome-alloy steel. Carnegie rolled steel wheels are used.

The engine and drive disk assembly are combined in one complete unit with a two-point suspension, an arrangement intended to assure maximum transmission of power and proper alignment of all working parts. By changing the method of braking a number of parts have been eliminated, it is claimed; when the brake is applied two heavy iron shoes, placed diametrically opposite, grip a steel brake wheel on the jack shaft. This method, it is claimed, is 100 per cent efficient, and with a pressure of about 25 lb. the wheels can be locked. A special feature is claimed in the stationary hand-wheel method of shifting the fiber wheel across the face of the disk to get forward, reverse or change of speeds.

A primer, attached to the engine manifold, is manually operated from the cab, a feature that facilitates starting. For signaling a Fulton exhaust whistle is incorporated. The cab is said to be large, and to contain all control levers conveniently located.

Foreign Loans and American Industries

The National Foreign Trade Council has sent a letter to other trade organizations and chambers of commerce throughout the country requesting their co-operation in a plan which it believes will assist in reducing unemployment in the United States by providing that part at least of the proceeds of foreign loans floated here shall be spent for American products.

The council urges American investors to insist that the underwriters of foreign loans shall require the inclusion in the loan agreement, wherever practicable, of a stipulation covering such use of the loan proceeds. The council points out that it is the settled practice of British and other European bankers to require such a stipulation as a condition precedent to making a foreign loan, and adds that the effect of such a practice in providing employment for the industries of the country furnishing the money is obvious.

The National Foreign Trade Council includes in its membership the United States Steel Corporation,

Standard Oil Co., Pullman Co., Consolidated Steel Corporation, Westinghouse Electric Co., Hupp Motor Car Co., International Harvester Co., American Locomotive Co., General Electric Co., Foundation Co., and American Radiator Co.

Detroit Companies Merged

The Ewing Bolt & Screw Co. has acquired the plant of the Detroit Machine Co., and new capital is being provided for the development of both concerns.

The Detroit Machine Co., located in the east end, on Hillger Avenue, builds machinery, dies, tools, and does general production work, but plans contemplate the sale of the property and the construction of a new plant in the River Rouge, near the Ford steel plant, on property owned by the Ewing Corporation.

The Ewing Bolt & Screw Co. has been in operation less than a year, and manufactures wood screws, bolts and rivets. Myles E. Ewing, president, and J. A. Hale, secretary-treasurer of the company, are now also president and secretary-treasurer, respectively, of the Detroit Machine Co.

David W. Pell, manager of the Detroit Machine Co., has been made production manager at the Ewing Bolt & Screw Co. plant.

The directors are Hal. H. Smith, Frank W. Blair, Arthur T. Waterfall, David W. Pell, A. N. Marion, Myles E. Ewing, J. A. Hale, Detroit; and H. J. Douglas and David L. Rockwell, of Cleveland, the latter being vice-president.

New Cutting Torch

The cutting torch shown in the accompanying illustration is a new design recently brought out by the Davis-Bournonville Co., Jersey City, N. J.

It differs from the company's standard torch in that two tubes instead of three connect the head with the handle, the preheating gases, oxygen and acetylene or other combustible gases being mixed in a chamber between the handle and the head. This change involves a new form of tip, inasmuch as mixing of the preheating gases takes place before the gases reach the tip.

The tubes are silver soldered in the head, which is a copper forging. The ratio of mixed gases is controlled by two needle valves, one having a crossbar handle and the other a knurled disk handle. The cutting oxygen valve is operated by a finger lever connected to a linkage designed so as to hold it in either

Two Tubes, Instead of Three, Connect Head with Handle

the closed or open position. The operator may continue cutting without holding his finger on the trigger, the linkage serving to hold the valve open until such time as he wishes to stop the cut, when reverse pressure on the trigger closes the valve. The pressure of the spring holds it closed until the trigger is again pulled to the open position.

The weight is less than that of the previous model. Provision is made for easily removing the back end in case it becomes necessary to clean the screen or to renew the oxygen cutting valve seat. The tips are of copper and are held in a taper seat by a bushing nut. They are made with the cutting oxygen hole in the center and the preheating holes around it, the number of preheating holes varying from two to six depending on the gas used and the manner in which the torch is applied, also the metal to be cut.

The new torch is said to have superior characteristics for cutting wrought iron, steel and cast iron and the distribution of mixed gases to the tip to assure that all preheating flames are uniform in balance. Gases of low calorific value such as butane, hydrogen, carbo-hydrogen and even illuminating gas, are said to be used efficiently although acetylene is recommended.

Design of a Modern Automobile Plant

Providing the Power, Heating, Water Supply and Other
Services for a 10,000-Employee Development—The
Industrial Institution of the Future

BY PAUL L. BATTEY*

THE location of the power plant was difficult owing to the restricted area of the site and the necessity for non-interference with manufacturing space and routing. It is located practically in the center of the circle of product routing and does not in the least interfere with it. It is also an integral part of the main building structure practically the same superstructure steel work being used as for the remainder of the manufacturing section.

A reinforced concrete coal storage bin is located immediately adjacent and occupies the major portion of the light court between the manufacturing shop section and the stock building. Coal is received on a spur of one of the incoming tracks serving the stock building and concrete depressed track hopper for unloading is located adjacent to the boiler room and under the

Ashes are removed from the hoppers under stokers by means of a steam jet conveyor, which discharges into a concrete bin located just outside boiler room over track, so that ashes can be loaded by gravity chutes into railroad cars or auto trucks. The bin has capacity for four to five days' run and hoppers under grates for full day's run, so that removal may take place at off peak periods. This type of conveyor was chosen for its simplicity, and cleanliness, with particular reference to painting and varnishing. The chimney is of reinforced concrete, and the boiler breeching is of $\frac{3}{4}$ -in. asbestos lumber within a steel framework and lined with 1 in. fire felt pointed up with high temperature cement.

In the turbine room are provided two 2500 and one 3750 kva. generators with suitable turbine and electro-

The Testing Plant at the End of the Assembly Building Has a Steel Structure Designed for Ready Superposition of Additional Stories

electric overhead traveling bucket crane covering the storage bin and the elevated coal bunker over the stokers. The craneway extends out beyond the building thus to cover also a second track from which coal in emergencies can be unloaded directly from cars by the bucket crane. The receiving hopper has a capacity of four cars. The outside storage bin has a capacity for 7500 tons of coal. The overhead bunker has capacity for 400 tons and from this coal is discharged by gravity direct to the stoker hoppers by means of motor driven weighing larry.

An analysis of the coal supply available in the district led to the selection of buckwheat anthracite of about 11,500 B.t.u. calorific value per pound, burned on chain grate stokers with forced draft. The design of flat arch and combustion chambers gives absolutely smokeless combustion.

The boiler plant equipment adopted consists of six water tube boilers of the four drum type, each with a capacity of 200 per cent normal rating of a little over 1200 hp., although maximum economy in operation is obtained at about 1000 hp. The boilers are placed in batteries of two in thoroughly insulated settings. The operating steam pressure is 175 lb., and superheaters for 100 deg. are installed. Boiler room auxiliaries are turbine driven. All coal is weighed and water measured into boilers and daily evaporation record kept. A complete combustion indication and control equipment is provided.

driven exciter units and two 2500 cu. ft. compound two-stage air compressors. In addition to these main units full equipment of turbine driven auxiliary apparatus is provided. The power plant has an equivalent capacity of 8000 kw., including the two air compressor units.

The turbines driving generators are of the mixed pressure bleeder type arranged to utilize all excess exhaust steam throughout the year in connection with the air compressors, heating system and steam requirements for various drying rooms and kilns. Condensers and cooling tower are provided for summer months, the cooling tower, of the forced draft type, being located on the roof of the power house. The power house is immediately adjacent to the dry kilns, the heating units and fans for which are located in a basement room below the kilns connecting with the basement of the power house, so that they are entirely taken care of by the power house operators, besides making possible a short steam connection.

It will further be noted that the power house is very close to the wood shop, from which provision is made to remove all refuse by exhaust line to a separator on the power house roof, from which it leads to storage hopper and chute to two boilers fitted for burning wood refuse. A wood hog prepares all refuse as it leaves the shop.

The water supply developed into somewhat of a problem as the public supply was inadequate. Four 8-in. wells 600 ft. deep were driven on property of the company, the capacity of each being approximately 200 gal. per min., using Weber air lifts with solenoid operated air supply valves arranged for remote control at the power house switchboard. The discharge line from

*Consulting engineer, 123 West Madison Street, Chicago. For the past 2 1/4 years consulting engineer for the Willis Corporation, the Willis Overland Co. and allied interests and formerly vice-president of the Arnold Co., Chicago. Article is concluded from page 656, issue of March 9.

From the Testing Floor the Completed Automobiles Go into the Storage Building and Thence on a Covered Ramp Spanning the Incoming and Outgoing Railroad Tracks Reach the Car Loading Docks

the wells leads to the 750,000 gal. low level reservoir immediately adjacent to the power house. These wells also supply the drinking fountains by means of centrifugal pump circulation.

The large storage reservoir was provided because of the insistence of the insurance companies upon an-

partment, as an analysis demonstrated that the piping of this water to the reservoir would cost no more than the usual down spout and sewer connections. Further, this reservoir, through the excess 250,000 gal. over the fire storage requirement, is utilized as an integral part of the condensing system for the power generating units and water supply to the boilers. Pumping is done in off peak periods, thus increasing the use factor of both the reservoir and the power plant. City water, containing a considerable amount of the incrustible solids, is not used except in emergency. A mixture of the water from the deep wells, which contains only a nominal amount of scale forming solids, and the rain water from the roof makes an excellent boiler water. An analysis of the rainfall records over a period of years indicates that the plant will be provided with an ample supply, using the well water and roof water together.

The decision upon the 750,000 gal. capacity for the reservoir was based upon a careful analysis of all factors of water supply and cost. To have saved all of the roof water would have involved an additional investment for reservoir capacity, the fixed charges upon which were in excess of the cost of otherwise providing the water. The reservoir is an integral part of the building construction, as it is simply the north basement under the 40 ft. shop bay walled off from the rest of the space and waterproofed during construction. This basement was of less importance in its location as factory storage space than the rest of the space on this level, and therefore meant little or no sacrifice in using it for the reservoir.

The plumbing and sewer lines were worked out to provide for modification of the departmental relationship which would probably change the number of employees in these departments. All of the toilet rooms are designed as multiple units exactly alike throughout the entire plant. Waste lines below ground provide for the maximum grouping estimated. All the toilet room compartments and doors are of steel baked enameled and are interchangeable. The doors are fitted with a gravity type of hinge. There are one to four wash bowls in each toilet room, all with uniform arrangement, but the main wash rooms, of which there are two at the extreme northwest and southwest corners of the plant, have each a capacity for approximately 3000 men. The wash sinks in both rooms being uniformly arranged in multiple unit grouping, each pair of sinks for ten men.

In the Light Court Between the Manufacturing Shops and the Stock Building Is a Reinforced Concrete Coal Storage Bin of 7500 Tons Capacity

other source of water supply additional to the city mains and the elevated storage tanks connected to the sprinkler system and fire lines. The required reservoir capacity was 500,000 gallons, and as it involved considerable investment, effort was made to turn it to as many other uses as possible. In addition to the city water line connection and the discharge from the deep wells, a large portion of the rainwater from the roof is piped to the reservoir through a sedimentation com-

The Car Storage Floor of the Storage Building Is Reached Directly at One End from the Testing Room, and at the Other End at This Level Is the Platform Connecting with the Ramp to the Shipping Docks

Close to each wash unit is located a group of lockers so that every employee has a locker immediately adjacent and practically an equal distance from his wash sink. Each of these wash rooms is provided with local hot water heating tanks.

The plant is heated throughout, with the exception of the shipping docks, with exhaust steam. The motor shop, assembly, test and stock buildings are heated by direct wall radiation, and the new manufacturing bays are heated with indirect Sirocco fan units located on the several balconies along the center line of the shop. The fan units provide for air circulation in the summer months. Steel plate and other stock carried in the basements under the 40 ft. bays is highly susceptible to corrosion on account of the salt atmosphere. The basements are used as return air ducts, the crane hatchway at each end of the 60 ft. crane aisles serving as inlets to the basement for recirculation of a large portion of the air in the shop and the intake of the fan unit connecting by duct to the basement at the center of the bay. The fan units have connection to the roof from which inlet the proper amount of fresh air is introduced into the shop. The distribution of warm air from the fans is accomplished by means of flat ducts

fuel oil tanks are provided, together with a full complement of steel tanks of various sizes for the storage of other materials.

A complete system of pumps and pipe line distribution is installed supplying with fuel oil the heat treatment furnaces and the heater units for the enameling ovens, together with a number of other miscellaneous furnaces for the manufacturing department. Local oil heating equipments throughout the plant are duplicated as far as possible and furnaces are of regenerative type.

An item which may be of interest is a new type of heating equipment installed in connection with the enameling ovens. Each of the ovens is provided with a "Merrill process" unit, consisting of heat absorber, of Foster superheater elements, circulation pumps, and welded pipe radiation sections in the ovens, of the locomotive superheater type, valves, connecting pipes and expansion tank. This system is essentially the same as an ordinary hot water heating system with high flash point oil used for the circulating medium, the ovens carrying a temperature of 450 deg. The heating units are located immediately under the ovens in each case in tile walled compartments. Complete automatic control

From the 400-Ton Overhead Bunker in the Boiler Room the Coal is Discharged to the Stoker Hoppers Through a Weighing Larry. The larry may be seen in the background

located immediately under the overhanging balcony platforms, the concrete floor on top and the supporting floor beams forming three sides of the duct, it being simply necessary to close the bottom with properly ribbed sheet steel with adjustable outlets located on 20 ft. centers throughout the shop. This location for the distribution ducts makes the usual clumsy blast fan duct system happily absent and puts the distribution ducts in the best possible position from a heating and circulating standpoint, and further entirely eliminates any interference with the installation of shaft hanger supports under the balcony structures. The entire piping system for exhaust steam distribution for heating was welded on the job and is a most excellent example of the economy and character of work resulting from this improved method of making up piping. Bends are used wherever possible with resulting flexibility.

The receiving and storage of fuel oil, lubricating oils, paints, varnish and other miscellaneous inflammable materials is taken care of in a specially constructed reinforced concrete vault 32 x 240 ft. located beneath the east shipping dock at the extreme north end where means for gravity unloading from tank cars and trucks is provided. Duplicate 50,000 gal. concrete

equipment is provided of both temperature and pressure types so that the regulation in the ovens is expected to be fully equal to those of the electrically operated type.

Owing to the situation with regard to the supply of electric power and because of the unusually favorable location with regard to fuel oil supply, it was decided that the direct heating method adopted would show a large saving as compared with electric heating and at the same time provide equally as good regulation and cleanliness, these being the principal advantages of the electric ovens. Two ovens have been equipped with an oil heated closed circuit, direct radiation hot air system, which promises good results.

All necessary locations in the plant are supplied by piping systems for gasoline and kerosene, with substations for distribution of lubricating oils, cutting compounds, etc. Tanks for the storage of gasoline are below ground adjacent to the oil room and arranged to be filled by gravity from tank cars or trucks, a water displacement system being used for tanks and distribution.

A complete bell automatic telephone plant of 200 stations is located in the center of distribution with ample outside trunk line connections. Extensive sys-

tams for watchmen's clock, fire-alarm and auto-call is provided.

The best possible floor is provided where men stand at work in all manufacturing space.

Cresoted blocks known to the trade as Kreolite are used throughout the plant. So far as is known, this installation contains the largest area of wood block floor in any industrial plant. This type of floor is considered as near ideal as is possible to provide from the standpoint of permanence and satisfactory trucking.

The entire plant is co-ordinated on 20 ft. centers, the bays being numbered from the northwest corner south and from the same corner along the north of the corresponding bays are lettered. Floor levels are identified by suffixed numbers so that it is possible to describe any spot 20 ft. square, in the plant by one or two figures, a letter and suffix figure.

In construction the multiple unit idea was developed along many lines because of its reduction in cost and expedition of work. The original make-up of forms was used through the entire work and upon completion of many of the sections were sold for a unit built garage with an accompanying erection plan* thus realizing three times the usual salvage value. Some 800 oak trees upon the site were removed and by a small temporary sawmill cut into railroad ties for the track work and smaller pieces cut into foot blocks for shop containers. Some of the quantities involved in the construction carry an idea of the size of the plant, such as 70,000 cu. yd. of earth excavation, 75,000 cu. yd. of concrete work, 10,000 tons of steel, both reinforced and structural, 350,000 sq. ft. or about 8 acres of steel sash windows, 30 acres of wood block floors, 7000 horse power electric motors and $1\frac{1}{2}$ miles of railroad track. The maximum force of construction men employed on the work was approximately 2000 and had it not been for the delay due to general business conditions, the entire work would easily have been completed in a little over a year. Eighty per cent of the structural steel is represented in six different pieces.

Expansion and the Future

It was decided in the beginning to make provision for only approximately 25 per cent future additional space, which could be obtained by three additional stories on the test building, and the rebuilding of the old mill constructed motor shop, by extension of the unit construction embodied in the new plant, if at some later time developments in the construction of automobiles should involve the necessity for providing this additional space. The possibility of any material enlargement of the plant was definitely disposed of with the conception of limiting the number of employees to approximately 10,000 men, as it was thought undesirable to have a larger aggregation in one location. One of the principal reasons for the choosing of the Newark district for the location of this plant was its distance from the vortex of automobile production and its diversity of manufacturing which from many economic aspects is highly advantageous, as compared to the extremely specialized centers.

This plant within itself is, however, an example of extreme concentration and while embodying many useful and effective conditions, from the standpoint of production and supervision, it is the writer's firm belief that generally with the future will come further decentralization and reduction in size of plant units for economic reasons involving the human element rather than the physical equipment. Too little consideration is given to environment of men employed in factories and our present labor situation is largely the result of concentration of industry in large units where the human relationship is entirely lost in the magnitude of organization. Henry Ford's pioneering in the division of his factories into comparatively small units sufficiently removed from each other, properly co-ordinated, (and here the wireless telephone and aeroplane may be useful) should bring back the old-fashioned harmonious relationship between the "old man" in charge, who knows by name all "the boys" who are getting out the work. Mr. Ford having previously pioneered in the development of quantity production, is quite the logical one to take the lead in the decentralization of the industry. There is one factor in connection with this move-

ment, however, which should receive consideration, and that is the inherent tendency for the pendulum to swing from one extreme to the other and where a happy compromise is again the best answer.

Industry in general and, in fact, our entire civilization, seems to be entering upon a new era which will bring within a comparatively few years widespread changes. The entire development centers around increased facilities for the production and distribution of electrical energy. Our railroad facilities have frequently been called the arteries of the nation, but now comes a complete new nerve system through which the control and distribution of industry, of transportation and commerce will be affected. With the realization of a complete network of electric power distribution, inter-connecting power production plants of large capacity and economic location as to hydraulic and fuel energy supply, complete electrification of trunk line railroads will quickly follow and this, together with the general establishment of permanent roadways throughout the country, with the broad adoption of automotive equipment for short haul traffic, will bring about further decentralization of industry and population. Workers will again begin to live normal open air lives in homes and factories, as under the new conditions practically every comfort and advantage of city life would be available, in what are now considered isolated locations. In other words, the logical evolution of co-ordinated power supply, transportation and industry will bring us back to the conditions of previous generations in home life and happy, useful employment, where all can feel personal interest in work and the spirit of craftsmanship be reborn.

There is a further phase of unified power distribution which will materially affect industry and that is the use of coal for other than power production purposes. With electrification, 25 to 30 per cent increased capacity of the railroads would be available for commercial purposes by the freeing of rolling stock and trackage from the handling of their own fuel supply. Factories, offices, homes and public buildings will, however, have to be supplied with heat in our climate and until this can be done electrically, due to betterment of diversity and load factors of power system, coal or oil will probably have to be used.

Electric heating has the inherent disadvantage, roughly, of the 10 to 1 conversion ratio and cannot be generally adopted until we begin to design our factories, buildings and homes along the line of greater heat conservation, similar to what is being realized in the present industrial electrically heated ovens and insulated domestic cooking ranges, with not inconceivably, regenerative heating systems. Such construction practically adapted would insure cool and comfortable buildings in summer months and above all, conserve our diminishing coal supply. It would greatly relieve congestion of transportation from unnecessary fuel movements, and cleanse the atmosphere of partially consumed products of combustion.

General development along these lines is undoubtedly a matter of many years owing to present investments, but it is not a thing that would under ordinary circumstances be accomplished by broad, simultaneous application. It is entirely conceivable that in the near future, with these general possibilities before us, entirely new methods of building construction, with the idea of heat conservation, will be developed, and who couldn't be happy in a factory (where many men spend the larger proportion of their daylight hours) when supplied with an abundance of sunlight, pure air and cheerful physical and social environments, whether he be manager or worker; and happiness is the goal of civilization and the foundation of permanent nations?

Those interested in the scientific congress which is to be held by the Association of Engineers graduated from the technical school of Liege can obtain a detailed list of the questions to be discussed by addressing a request to the secretary-general of the association at 16, Quai des Etats-Unis, Liege, Belgium. The technical meetings are scheduled for June 11 to 16 inclusive and simultaneous with these will be conducted an exhibition, which will extend to July 14.

Design of Open-Hearth Furnaces

Regenerator Computations for the Volume and Weight of Checkerwork Required—Temperature Changes Based on Time of Reversals

BY A. D. WILLIAMS*

IN THE IRON AGE of Feb. 12, 1920, page 475, several rules were given for arriving at the amount of checkerwork required. According to Gruner, from 50 to 70 lb. of checker brick were required per pound of coal burned per reversal. In the case considered 188 cu. ft. of gas was used per second, each pound of coal producing 70 cu. ft. of gas. The coal consumption, therefore, is 2,686 lb. per second. The weight of checker brick for this amount of coal would be from 60 lb. to 85 lb. According to this rule, the amount of checker brick would be:

For 15 min. (900 sec.) reversals.. 50 to 1 70 to 1
120,220 lb. 188,320 lb.
54,540 kg. 76,360 kg.
20 min. (1200 sec.) reversals.. 54,540 kg. 76,360 kg.
160,300 lb. 224,430 lb.
72,720 kg. 101,810 kg.
25 min. (1500 sec.) reversals.. 200,410 lb. 280,550 lb.
90,910 kg. 127,250 kg.

Told suggests 6m³ 00 (212 cu. ft.) or 2850 kg. (6283 lb.) of brick per cubic meter (35.3 cu. ft.) of air per second per 100 deg. Cent. (180 deg. Fahr.) rise in temperature. According to this rule the checker brick would be:

$$2850 \times 8.51 \times 9 = 218,250 \text{ kg. (478,900 lb.)}$$

$$6 \times 8.51 \times 9 = 459 \text{ m}^3 \text{ 65 (16,228 cu. ft.)}$$

	Gas on Gas	Air on Air	Gas on Waste Gas	Air on Waste Gas
The free volume required for the passes may be determined:				
Q _a of gas, air, products of combustion, cu. ft.	188	300	181	270
t _o average in checker, Deg. Cent.	850	750	1,200	1,100
Deg. Fahr.	1,562	1,382	2,192	2,012
1 + at for average t _o	4.120	3.753	5.404	5.087
Q _i = Q _a × (1 + at) = cu. ft.	775	1,126	978	1,360
Temperature change, average, Deg. Cent.	700	900	800	1,000
Deg. Fahr.	1,260	1,620	1,440	1,800
With a temperature change of 360 deg. Fahr. (200 deg. Cent.) per second, the average time in the checker will be, seconds	3.5	4.5	4.0	5.0
Basing the pass volume on the gas and air heating time, the volume required = cu. ft.	2,713	5,067

Fig. 4. Convection Factor Curves Based on Longmuir Experiment

This last is reasonably close to the quantities arrived at, providing Told referred to the chambers at one end only.

The weight of the checker brickwork will be determined upon the basis of a temperature change of 200 deg. Fahr. (111 deg. Cent.), 70 per cent of the brick being considered effective. The specific heat average of fire brick is about 0.25. Its weight, 112 lb. per cu. ft. = 1800 kg. per cu. m.

15 minute, 900 second cycle:

Gas: 6,937,000 ÷ [200 × 0.25 × 0.70] = 198,180
Air: 12,690,000 ÷ [200 × 0.25 × 0.70] = 362,580

20 minute, 1200 second cycle:

Gas: 9,250,000 ÷ 35 = 264,260
Air: 16,920,000 ÷ 35 = 483,400

25 minute cycle, 1500 seconds:

Gas: 11,562,000 ÷ 35 = 330,300
Air: 21,150,000 ÷ 35 = 604,250

The volume occupied by the checker brick = weight × 1 + 112 = 0.008929 F.

On this basis, the cubic feet of brick required =

For 15 minute, 900 second cycle..... 1,770 8,237
20 minute, 1200 second cycle..... 2,360 4,316
25 minute, 1500 second cycle..... 2,949 5,395

Regenerators Continued
Average time in checker of waste gases, revised to pass volume:

Seconds - 2.774 3.726
Average temperature change per second, revised: Deg. Cent. 288 268
Deg. Fahr. 518 482

Total checker volume = pass volume plus brick volume:
for 15 minute cycle = cu. ft. 4,483 8,304
for 20 minute cycle = cu. ft. 5,073 9,353
for 25 minute cycle = cu. ft. 5,662 10,462

The percentage volume and area of passes and brick will be = 15 minute cycle,
brick = 39.48 39.00
passes = 60.52 61.00
20 minute cycle, brick = 46.53 46.02
passes = 53.47 53.98
25 minute cycle, brick = 52.08 51.57
passes = 47.92 48.43

To provide a margin for contingencies, the 25 minute cycle will be used. Using square passes, the side of the square for the pass unit will be = $\sqrt{0.4792}$ = 0.6923
= $\sqrt{0.4843}$ = 0.6960

Portion of unit square occupied by brick = 1.0000 - 0.6923 = 0.3077
1.0000 - 0.6960 = 0.3040

Making the wall between the passes 2.5 in., and making passes for both chambers alike, the side for the unit square = 2.5 ÷ 0.3077 = 8.125 in.
The brick thickness = 2.500 in.
Side of square pass = 5.625 in.

15 min. 900 sec.	5,245,000	9,477,000	6,937,000	12,690,000
20 min. 1200 sec.	6,994,000	12,636,000	9,250,000	16,920,000
25 min. 1500 sec.	8,742,000	15,795,000	11,562,000	21,150,000

Any change in the assumptions made will alter these values in a corresponding manner. The change in temperature of the gas and air and the waste gases will vary the quantity of heat available. The cyclic change in temperature may be varied, and this will change the volume of brick required to store up the heat, and the surface required for heat interchange. The heat storage capacity must be sufficient to supply the desired preheat and the loss through the chamber walls, when on air or gas. Too much checker adds to first cost. Too small a checker increases operating cost. The conditions will be changed by other fuels, as well as by changes in the ratio of the air supply.

As the unit pass has been made the same for both of the chambers, the volume of brick and pass for the air checker will be changed slightly, as follows:

Brick volume = $10462 \times 0.5208 =$ cu. ft. 5449
 Pass volume = $10462 \times 0.4793 =$ cu. ft. 5013

The pass unit will be different with different wall thicknesses, and several variations might be tried in arriving at a desirable arrangement. The lineal amount of checker is found by dividing the brick and pass volumes by the area of brick and pass in a unit pass:

Area of unit pass $\frac{\text{Gas}}{\text{Air}}$
 $= 8.125 \text{ in.} \times 8.125 \text{ in.} \div 144 = 0.45844 \text{ sq. ft.}$
 Area of pass
 $= 5.625 \times 5.625 \div 144 = 0.21973 \text{ sq. ft.}$
 Area of brick = difference = 0.23871 sq. ft.
 Lineal ft. brick for
 $\frac{\text{Gas} = 2949 \div 0.23871 = 12,353 \text{ ft.}}{\text{air} = 5395 \div 0.23871 = 22,600 \text{ ft.}}$
 $\frac{\text{pass for gas} = 2713 \div 0.21973 = 12,347 \text{ ft.}}{\text{air} = 5067 \div 0.21973 = 23,070 \text{ ft.}}$
 A checkerwork height of 23 ft. has been assumed, to illustrate the effect of the high checker. On this basis the number of passes will be:
 $\frac{\text{for gas} = 12,347 \div 23 = 537}{\text{for air} = 23,070 \div 23 = 1003}$
 The ground area occupied by the checkerwork will be:
 $\frac{\text{for gas} = 5662 \div 23 = \text{sq. ft. } 246.35}{\text{air} = 10462 \div 23 = \text{sq. ft. } 454.90}$

Any convenient length or width of chamber that will give this area may be used. Preferably, when a square pass is used, the length and width of the chambers should be multiples of the pass dimensions, the length of both chambers being the same. The chamber length will be: $(8.125n + 2.5) \div 12 = l$, in which $n =$ number of passes. Preferably, the number of passes should be changed to give an even number of passes in the width and length.

Let $n = 40$, then $l = 27 \text{ ft. } 3\frac{1}{2} \text{ in.} = 27.29 \text{ ft.}$
 For the width let $n = 14$ and 26, then
 $l = 9.48 \text{ ft. } 17.60 \text{ ft.}$
 The nearest inch values would be used in practice, but the decimals of a foot are here used for convenience.
 The number of passes will revise to:
 The area occupied will revise to, sq. ft. 258.70 480.30
 The checker volume will revise to, cu. ft. 5,950 11,040
 The heating surface per pass = sq. ft. 44.06
 The total heating surface in sq. ft. = 24,675 45,830
 The total area in the passes = sq. ft. 118.63 228.51
 Perimeter of one pass, lineal feet. 1.875
 Perimeter, total in lineal feet. 1,012.6 1,950.0
 Average velocity, ft. per second, gas and air = 6.532 4.928
 Waste gases = 8.243 4.971
 Meters per second, gas and air = 1.99 1.50
 Waste gases = 2.51 1.52

For the usual checker construction, the method of arriving at the heating surface is somewhat similar to the above, the space occupied by the brick being $0.5208 \div 0.29 = 1.79$ rows per foot; and the gage or space between being $0.4792 \div 1.79 = 0.2677 \text{ ft.} = 3 \frac{3}{16} \text{ in. (about).}$

From these figures the heating surface may be arrived at, as well as all of the other data necessary in determining the size of the checker chambers for gas and air. When properly laid to secure stability, a 9-in. shape makes a checker which gives the maximum heat storage utilization of the volume occupied.

	Gas on Gas	Air on Air	Gas on Waste Gas	Air on Waste Gas
Regenerators Continued				
Heat transfer per second				
Total B.t.u. =	5,828	10,530	7,708	14,100
Per sq. ft. B.t.u. =	0.2362	0.2298	0.3124	0.3077
Per m ² , calories =	0.6407	0.6233	0.8474	0.8346
Average temperature differential gas to brick or brick to gas:				
Deg. Cent.	175	175	175	175
Deg. Fahr.	315	315	315	315
Convection factor to still air, according to Langmuir curve, Fig. 4, calories per m ² per sec.	0.294			
Correction factor for velocity =				
$K = \sqrt{\frac{35 + v}{35}}$ =	2.59	2.30	2.86	2.31
$v =$ velocity in cm. per second				
Convection corrected for velocity in calories, per m ² per second	0.7615	0.6763	0.841	0.6792
In B.t.u. per sq. ft. per sec.	0.2807	0.2493	0.310	0.2504

These transfer values seem to indicate the provision of sufficient heating surface for the desired rate of heat transfer to take place. Langmuir's work is probably as accurate as obtainable, but the writer has assumed that his temperature differential holds with higher initial temperatures, his values being based upon still air at 80 deg. (27 deg. Cent.). Whether these assumptions are correct or not cannot be fixed without further research.

All of the computations are based upon an assumed rate of fuel consumption, and will vary as that rate changes. Other variations will be introduced by different fuels, and different working conditions, than those which were fixed initially for the base of the computation. However, there is no basic reason why the design of a furnace cannot be reduced to rational methods. When the method of operation and the design are

fixed, it is possible to predict the fuel consumption within a reasonable margin, as well as the performance of the furnace as a heat-transfer apparatus. The main difficulty in arriving at the heat losses from the exterior walls of the checker chambers arises more from their exposure to stray air currents and variations of the cycle of operation. When the cycle is fixed, these losses can be reduced to mathematical analysis.

Observations on the Surface of Liquid Steel*

Microscopic Examination of Particles Thrown Off—Optical Pyrometer Observations

BY COSMO JOHNS

THE appearance of liquid steel as it flows from the launder of an acid open-hearth furnace was described in a communication by the author to the Faraday Society,† while the evidence for the existence of the vapor of iron or steel was reviewed in the course of a lecture‡ to the West of Scotland Iron and Steel Institute. Attention was specially drawn to the fact that an optically clean surface can be observed to persist for an appreciable length of time.

An optical pyrometer using monochromatic light of a suitable wave length is a very convenient instrument for exploring such a liquid metal surface. The higher the temperature of the steel the longer does the liquid steel preserve its oxide-free surface. This can very conveniently be studied if a small quantity of liquid is poured into an open chill mold. If the temperature is sufficiently high and the pouring carefully done, the upper surface remains clear for several seconds, but, as the freezing point is approached, an oxide film begins to form and soon covers the surface. The same thing can be observed when liquid copper is poured into an open mold and is allowed to freeze.

The preservation of the optically clean liquid metal surface was attributed by the author to the presence of the vapor of the metal, and the subsequent formation of the oxide film to the lowering of the vapor pressure as the freezing point of the liquid metal was approached. The presence of vapor of iron or steel above the bath of the open-hearth furnace seemed necessary to explain the gradual accumulation of oxide of iron, chiefly Fe_2O_3 , in the pores of the silica bricks that line the hearth, and the well-known emission of reddish-brown iron oxide fume from the chimney during the stage in manufacture known as the boil.

When, however, this apparently rather obvious explanation was again advanced§ it failed to secure acceptance, and a marked divergence of views was apparent among those taking part in the discussion which followed. Professor H. Louis doubted the possibility of iron vapor being formed, and suggested the possibility of the formation of iron carbonyl. Dr. W. H. Hatfield could not agree as to the vaporization of iron, and said that if a stream of metal were watched the conviction grew that the occluded gases were coming off and protecting the stream, and that if iron vapor were present there would be ocular evidence of its combustion and the formation of oxide.

Professor Carl Benedicks thought that the main reason for the preservation of the surface was that the stream carried the air along with it, and that it was not running through air, but was protected by a covering of nitrogen. Only E. H. Saniter agreed with the author, that the facts could best be explained on the assumption of the vaporization of iron.

In the face of this divergence of opinion, it was clear that further experimental evidence was desirable, and the object of this communication is to submit this further evidence. When a stream of steel, such as has been described above, is closely observed, a continuous shower of brilliant sparks can be seen to be ejected from the surface. Most of them end their flight as luminous objects by exploding with a brilliant flash. The length of the flight depends, of course, on their initial velocity and angle of emergence, but it is also related to the temperature of the steel and its chemical composition. The "sparks" can be collected in the exploded state and also examples found where disruption had not occurred.

From their examination it could be seen that the miniature explosion, which had ended the luminous career of so many, was caused by the accumulation of gas in the interior globule of steel during its oxidation in the course of its flight through the air, and that the hollow sphere of iron oxide had ruptured when the pressure became too great. Sometimes rupture occurred with the formation of two hemispheres and sometimes by the blowing out of a portion of the shell less in size than a hemisphere.

The most probable explanation is that small globules of the steel are detached as a result of turbulence, and projected away from the surface as spray. These globules during flight would become oxidized and the gaseous products of the combustion of the carbon would accumulate in the interior, as oxidation progressed from outside to inside. It is just possible, however, that this explanation is not complete, and that their life history is not so simple.

Now, above the stream of steel, and easily distinguished from the sparks, a well-defined fume can be seen, rising like smoke from the liquid metal surface and floating away to a considerable distance. It is evolved in greatest quantity near the tap-hole where it emerges into the air. There does not appear to be any graduation from "sparks" to fume; the sparks are distinct entities and can be separately distinguished from the fume. Samples of the fume were, therefore, collected—a few sparks would be included, but they would not be many in number. The sample could be collected on suitable collecting surfaces placed some distance away, but as the sample would represent only the portion that had been sorted out by gravity at that particular point it might not be representative. A simpler method was to use a magnet and collect the fume a few feet above the surface of the steel.

An examination of the samples made it clear that the method of collection could be decided by convenience alone, for the fume was found to consist of small globules of iron oxide, most of them beautifully spherical. When the collection was made by allowing the falling particles to be caught on a receiving surface, the size of the globules did not vary much, and the absence of extremely small spheres was noticeable. The fume collected with a magnet over the stream contained examples of all sizes, including a few "sparks," which could be distinguished.

There was, however, one very striking difference in habit between the globules, constituting the fume, when

* A paper read before Section B of the British Association, at Edinburgh; Reprinted from *Engineering*.

† Cosmo Johns, "The Determination of the Temperature of Liquid Steel under Industrial Conditions." Transactions of the Faraday Society, Vol. XIII, 1918.

‡ Cosmo Johns, "The Solid and Liquid States of Steel," Journal of the West of Scotland Iron and Steel Institute. Lecture delivered December 20, 1918.

§ Journal, Iron and Steel Institute, No. 11, 1919, page 180 et seq.

collected with a magnet and those caught at a distance on a receiving surface. Those collected by gravity displayed no tendency to adhere or to attract each other. Owing to their spherical form it was difficult to retain them on a glass slide for examination.

On the other hand, those collected with a magnet displayed a marked tendency to run together and form straight or curved lines, in which spheres of all sizes could be seen. Occasionally small groups of these little spheres could be observed, but the more common habit was to string themselves out in straight or curved lines, which could be moved about on the glass slide without coming apart, unless the length of the string of spheres was excessive.

This habit of adhering, and forming strings or groups, on the part of the globules that cooled in a magnetic field appears to be similar to that recently described by Professor Elihu Thomson* as characteristic of the "smoke" given off by the iron arc when used for electric welding. The agglomerating habit is, therefore, to be ascribed to the cooling of the iron oxide globules in a magnetic field which has rendered them magnetic.

The investigation was now directed to determining the origin of the fume. If it proved to be a form of spray, finer than the larger form which gave the sparks, then no light would be thrown on the nature of the medium, if any, protecting the surface of the liquid steel from oxidation. If, however, it could be shown that the minute globules represented the vapor phase of the metal after condensation and oxidation, an explanation would have been found. Samples of steel were, therefore, carefully collected from steel of varied but unknown composition.

Now, an analysis of the fume, when recalculated to an oxygen-free basis, would enable fume and original steel to be compared. If the fume was mere fine spray, then the oxygen-free fume and original steel would have analyses in substantial agreement. If the fume represented condensed and oxidized vapor, then differences should appear for, on theoretical grounds, the various metals which are soluble in iron and can be investigated, in various concentrations, as alloy steels, would not be expected to vaporize at the same relative rate.

Fume samples from several steels of varying compositions were collected and analyzed.† When recalculated to an oxygen-free basis, they were all consistent in that the alloy metals differed as regards their percentage from those in the original steel, and made it clear that the fume in great part, if not almost entirely, represented the condensed and oxidized vapor of the steel.

As the investigation will be continued, only one analysis will be given here, and that one contains the largest number of dissolved metals. The sample was carefully collected, and the oxide globules separated from the small quartz and fireclay particles and other impurities, which had been swept up from the sides of the launder by the strong convection currents found near the liquid steel. The ratio of the percentage of each metal in the original steel and its percentage in the fume, recalculated on an oxygen-free basis, was as follows:

Element	Original Steel	Fume
Tungsten	1	0.58
Chromium	1	0.97
Iron	1	1.00
Nickel	1	1.23
Manganese	1	2.50

These values should be regarded as approximate only.‡ They serve to decide the point at issue, for they can represent only the vapor of a complex alloy steel whose constituents have evaporated at differential rates. They cannot possibly be construed as proving that the fume is the oxidized spray of the steel. As in many other recorded investigations, the solution of the immediate problem in hand only serves to suggest many new ones. Though it is proved that the fume

does represent the condensed and oxidized vapor of the steel, it does not follow that the ratios tabulated give the absolute rate at which each of the metals evaporate at the temperature of liquid steel.

There are difficulties in securing samples sufficient in weight for reliable analyses from steels of known composition. When collected with a magnet any non-magnetic material in the fume would escape collection. If the cooled fume be collected as it falls at some distance, then gravity separation would have been effected and the result is unknown. Collecting the fume by aspiration or some other method from near the surface of the steel involves difficulties which have not been overcome. Thus there are considerable difficulties in collecting the sample. Then the results which have been obtained suggest that the degree of concentration of the various metals have some effect on the rate of evaporation, and it is just possible that the presence of other elements in the solution is a factor not entirely negligible.

A search through relevant literature, admittedly not complete, failed to disclose any experimental work on the nature of the vapor of alloy steels. Our knowledge of the state of molecular association of the elements, in such a complex liquid alloy as that studied, is practically nil. What is clear, however, is that a most interesting field of research has been opened out. The work is of great scientific interest, but it also has important industrial applications. The use of optical pyrometers for the determination of the temperature of liquid metals has been successful only where the method of observation has been standardized, and the pyrometer readings used directly for comparison without any attempt being made to apply corrections to obtain real temperatures.

The presence of the vapor of the steel as a protecting atmosphere around the stream would mean that the absorption of the light emitted by the liquid metal would vary with the angle of observation. The condensed and oxidized vapor rising in a cloud would also mean considerable absorption of light. The phenomena are not confined to steel, for they should be still more marked with the non-ferrous alloys, especially those containing the more easily vaporized elements, and possibly explains the difficulty experienced in applying optical methods for the determination of their apparent or real temperatures.

Papers to Be Read at Foreign Trade Convention

"A Foreign Trade Policy for Americans" will be the subject of an address by James A. Farrell, president United States Steel Corporation, at the ninth National foreign trade convention in Philadelphia, May 10, 11 and 12, over which Mr. Farrell will preside. His address will be the keynote of the campaign for a great business and industrial revival in this country.

Mr. Farrell will emphasize the necessity for a definite foreign trade policy if America's export trade leadership is to continue. He will stress the importance of foreign trade to the prosperity, not only of American industries but to the public in general.

Financing and expansion of the nation's overseas commerce is the primary purpose of the convention. It will be a working gathering from the opening to the final session.

Charles M. Muchnic, vice-president American Locomotive Sales Corporation, will make an address on "The Factor of Depreciated Currency in Competition."

Under the general topic of export sales promotion, J. W. Mason, vice-president American Surety Co., will talk on "Bonded Service as a Selling Argument." "The Essentials of a Market Survey" will be discussed by William Menkel of the Association of National Advertisers.

New concrete docks and warehouses will be constructed in the Parana River ports of Baradero and Villa Constitucion, Argentina, for the accommodation of river boats, according to Trade Commissioner George S. Brady. The work will be under the direction of the Argentina director of navigation and ports, and approximately 700,000 pesos will be spent at each port.

* Nature, June 23 and July 14, 1921.

† I have been much indebted to J. H. Huxley, F.I.C., A.R.S.M., under whose supervision the several analyses were made, for the interest he has taken in the investigation.

‡ A less complete series of varying ratios was communicated at the time the paper was read.

Thermal-Limit Motor Starter

A thermal-limit starter which is said to permit an induction motor to exert six or seven times its normal power for a limited period, at the same time protecting it from a prolonged overload as small as 25 per cent, has been developed by the Monitor Controller Co. of Baltimore. The device is also said to take care of changes in temperature automatically, protecting the motor under all conditions of operation.

The starter, known as the Thermaload, is shown in the accompanying illustrations, and consists of a 3-pole

The Starter Consists of a Three-Pole Magnetic Contactor and a Thermal Limit Relay. The expansion unit is shown in the insert in the cover

magnetic contactor and a thermal-limit relay, mounted on a slate panel and inclosed in a metal cabinet. It is operated by push buttons from one or more points. The apparatus is said to give overload and low-voltage protection, prevent damage from single-phase running of polyphase motors and yet give full current, full voltage and full-torque start. It is available in all sizes up to 3 hp. 110 volts single phase, 5 hp. 220 volts single phase, 110 volts polyphase, 10 hp. 440 volts single phase, 220 volts polyphase. All sizes are available in voltages up to and including 550 volts.

The thermal-limit relay consists essentially of two units which expand between a fixed support and a hinged contact arm, the arm being arranged in a way to multiply the motion of the expansion units several times at the contact. Each expansion unit consists of a double-wall tubular receptacle, the inner wall being smooth and closed at one end and the outer wall corrugated and closed at both ends, the construction being shown in the insert. The space enclosed between the walls is filled with tetra-chloride of carbon, a non-corrosive, non-freezing liquid. The thermal element which operates the expansion unit consists of a form-wound coil of asbestos-insulated wire attached to a piece of insulating material by brass eyelets which are formed under pressure around the end of the wire, forming the terminals. These eyelets register with two brass binding posts and are clamped by brass screws. The binding posts furnish mechanical support as well as serving as electrical connections.

The full-load rating of the thermal element is stamped on the sheet insulation and all elements have the same mechanical dimensions. A relay can be changed from one rating to another merely by inserting the proper elements. The small amount of power

required to operate the relay, 2.14 watts, is said to be an outstanding feature. The resistance also is said to be extremely low and likewise the voltage drop. The low resistance permits using resistance wire of large diameter, affording a self-supporting element, capable of withstanding rough usage.

Develops Heavier Storage-Battery Tractor

There is a tendency to use the electric storage-battery tractor in harder service than heretofore, they often being called upon to operate in soft-dirt yards, in pulling loads up inclines and under other similar heavy-duty conditions. For this service a new and heavier tractor, built in two models, has been placed on the market by the Elwell-Parker Co., Cleveland.

The 4-wheel tractor for steel-plant or foundry service is shown in the illustration, the other model being a 3-wheel machine for heavy duty around the congested floors of a warehouse. As compared with the company's other types the new design is characterized by several new features.

The battery compartment has openings at both the top and back so that the battery can be taken out either way. Solid side plates are used instead of loose plates that are in danger of being torn off in case the tractor rubs against some obstruction. The dash grooves into a wood bumper strip set in the side channel of the frame, this bumper strip being protected by a 1/4-in. metal strip. The weight of the motor has been increased 65 lb. An additional safety feature is that when the operator leaves his seat he not only opens the circuit breaker but sets the brake.

A new type of spring suspension is provided. Coil springs are used in which oil-saturated wool waste is packed, the oil from which runs down through the axle blocks to the axle guides which are provided with renewable liners. This permits a side sway of the truck without forcing the wheels out of alignment. The 3-wheel tractor has a spring suspension on the fork of the single front wheel similar to the rebound spring fork of a motorcycle. The power plant is supported on this forward end by a ball socket. A ball and socket steering rod extends from the lower end of the

When the Operator Leaves the Seat the Circuit Breaker Opens and the Brakes Set

steering column to a single lever attached to the center of the axle, with right and left ball and socket reach rods connected to the wheel knuckles. A pressure oiling system is used.

The 4-wheel tractor has 2-wheel steer and 2-wheel drive. Its draw-bar pull capacity is 675 lb. normal, and 2600 to 2700 lb. maximum and its no-load speed is 530 ft. per min. Its weight with Edison battery is 4375 lb. The 3-wheel tractor has a draw-bar pull capacity of 450 lb. normal and 1800 to 1900 lb. maximum and a no-load speed of 600 ft. per min. It swings on a 5 ft. 4 in. radius. Its weight with Edison battery is 3050 lb. Both types have three speeds in either direction.

SILICA AND FIRE BRICK

Production and Other Statistics of Refractories Manufacturers' Association

CHARTS prepared by the Refractories Manufacturers' Association, giving production, shipments and stocks, new orders minus cancellations, unfilled orders, new orders and cancellations of fire clay and silica brick have been issued covering the month of January, and going back to January, 1919.

In January this year shipments of fire clay brick reached 40 per cent of the monthly economical producing capacity, exceeding production by about 2 per cent, while there was a decrease of about 3 per cent in the stock. New orders ran above 40 per cent of producing capacity, resulting in a slight gain in the

normal output of 25,448,838 silica brick; the 1921 figures on 27,305,500 brick. For fire clay brick, the 1919 figures are based on an output of 71,572,186 brick; the 1920 figures on 73,526,103, and the 1921 figures on 78,645,942 brick; all expressed in 9-in. equivalents.

Tandem Cold Strip Mills for Worcester Company

New precision 6 x 4-in. tandem cold rolling mills for flat strip steel which are being built by the United Engineering & Foundry Co. for the Worcester Pressed Steel Co., Worcester, Mass., will be installed ready for operation about May 10. An exclusive feature is the adjustment of the rolls by means of wedges instead of screws. This is to insure an accurate adjustment of the rolls for gage and to eliminate the lost motion possible with screw adjustment. The mills will be equipped with steel rolls 6 in. in diameter, with 4 in.

Chart "A" Shows the Divergence of Production and Shipments. Where production exceeds shipments, the degrees of divergence are shown above the zero line, and vice versa. Chart "B" shows the divergence of production and new orders. Where production exceeds new orders, the degrees of divergence are shown above the zero line, and vice versa. Chart "C" shows the divergence of shipments and new orders. Where shipments exceed new orders, the degrees of divergence are shown above the zero line, and vice versa. Chart "D" shows the divergence of stock and unfilled orders. Where stock exceeds unfilled orders, the degrees of divergence are shown above the zero line, and vice versa.

unfilled orders, since cancellations were practically nil. The silica brick chart shows similar drifts. Shipments reached 30 per cent of capacity and, while production moved upward, it was less than the gain in shipments and there was a substantial decline in stocks. Unfilled orders increased, since new orders gained and, like fire clay, cancellations were unimportant.

These data are furnished not only to the members of the association, but also to the Department of Commerce. The figures are based exclusively on reports from members of the association and, while not a full report on the industry, furnish an excellent picture of the activities of a large majority of refractories manufacturers. The 1919 and 1920 figures are based on a

(Charts for Silica Brick; the Charts for Fireclay Brick Are Similar)

face, the maximum width of stock that will be rolled on these mills being 3½ in. The wider and heavier sizes will be produced in the Worcester company's present equipment of two-high and three-high mills, which produce strips from 3 to 15 in. with a capacity of 70 tons per day.

The minimum delivery speed of the mills operated in tandem will be 201 ft. per minute, while the maximum may be 350 ft. per minute. Each mill will be driven by a 60 to 70-hp. adjustable speed direct-current motor controlled by a special automatic controller. The motor driving the No. 1 mill has a 1.69 to 1 range in speed and the motor driving the No. 2 mill has a 2 to 1 range. A new motor driven coiling reel will be installed with these mills. This reel will be fitted with a spool only 8 in. in diameter to produce tight small core coils for annealing or shipping without the necessity of an extra recolling operation.

PITTSBURGH BASING POINT

Northwestern Companies Claim Practice Prevents Competition

MINNEAPOLIS, March 10.—Hearings of the Federal Trade Commission in the taking of testimony in its complaint against the United States Steel Corporation, in the Pittsburgh basing point case begun here March 1, were brought to a close yesterday. Examiner J. W. Bennett adjourned the hearing to March 20, when it will be resumed in Chicago.

The second week of the testimony taking was somewhat livelier than the first week, the prosecution saving its most important witnesses until toward the close of the session. Railroad, State and county officials were brought into the second week and officials of the Minneapolis Steel & Machinery Co., Minneapolis, and American Hoist & Derrick Co., St. Paul, also added interest to the hearing.

Probably outstanding among the individual witnesses was George M. Gillette, president Minneapolis Steel & Machinery Co., who has been a fabricator of steel for 32 years and who has consistently and vigorously opposed the Pittsburgh basing practice since its inception about 20 years ago.

Mr. Gillette was the principal witness on the final day of the hearing. He made the assertion that several independent steel rolling mills acting independently and competitively could compel the United States Steel Corporation to cease its Pittsburgh basing practice. On the other hand, he said, the corporation could swing the independents to harmonize in any policy it promulgated.

Eighty per cent of the annual steel consumption of the Minneapolis Steel & Machinery Co., Mr. Gillette said, had been purchased from Duluth and Gary since the opening of the Duluth mill, and that prior to the opening of the Duluth mill, the bulk of the steel consumed by the company had been purchased in Gary. The trade field of his company, Mr. Gillette said, had gradually been reduced, as Eastern competitors took up the manufacture of lines which the Minneapolis concern was featuring. Foreign business, he said, had been practically wiped out in the last few years through the alleged advantage of Eastern competitors gained by the Pittsburgh basing practice.

Witnesses testified that the following alleged toll had been taken in Minnesota through operation of the Pittsburgh basing practice; \$32,472 in school buildings erected in Minnesota from 1919 to 1921; \$12,262 in steel in University of Minnesota buildings erected since 1916; \$40,420 in bridges erected by the State Highway Commission in 1920; \$33,920 in bridges erected by the State Highway Commission in 1919; an amount three times as great as that alleged to have been contributed by the State said to have been paid in by counties in bridge construction.

Samuel A. Chalmers, building inspector for the Minnesota Department of Education, testified that in the years 1919 to 1921, inclusive, school buildings erected in Minnesota cost \$10,155,056.

A. H. Schuett, structural engineer for the same department, testified that 5077 tons of steel went into the buildings.

Downer Mullen, secretary of the Minnesota State Board of Control, said University of Minnesota buildings erected since 1916 cost \$3,923,623. Mr. Schuett said the steel entering into the construction of these buildings was 1916 tons.

J. T. Ellison, bridge engineer for the State Highway Commission, testified that contemplated bridge construction in the next two years would far exceed that of the two previous years.

Both W. W. Corlett, general solicitor, and C. A. Severance, counsel for the corporation, objected strenuously to the admission of testimony such as that offered by Minnesota State officials regarding steel consumption on the grounds that it was irrelevant. Examiner Bennett noted the objections, but allowed the testimony to stand.

R. J. Elliott, assistant purchasing agent for the

Northern Pacific, and E. T. Stone, purchasing agent for the Soo Line, testified as to the amount of the annual steel consumption of their roads, the latter placing his consumption at 2503 tons annually, and the former, his figure at 3200 tons annually, some items being excluded, however.

W. O. Washburn, partner in the American Hoist & Derrick Co., St. Paul, testified that his company had undergone the experience of witnessing its Eastern business dwindle to a negligible quantity, because, he said, of Eastern competition aided through the Pittsburgh basing practice. Machines sold by his company in the East, the principal field of trade for his products, Mr. Washburn said, were marketed only on their merits or through predetermined preference.

O. W. Morton, purchasing agent, American Hoist & Derrick Co.; R. B. Deatherage, purchasing agent, and E. H. Reudelsterz, sales manager, Puffer-Hubbard Mfg. Co., Minneapolis, and E. J. Ellertson, assistant secretary of the Russell Grader Mfg. Co., Minneapolis, were the other witnesses during the week.

The testimony, in general, was to the effect that competition to the east of Chicago by Northwest fabricators of steel was maintained at a loss to the Northwest competitors, whereas competition in the West with Eastern manufacturers was maintained with each about on an equal basis. Only in the immediate Northwest are the Northwest concerns at an advantage over Eastern competitors, it was asserted.

Mr. Severance and Mr. Corlett objected to any form of testimony not bearing directly on the competition issue, and in a few instances their objections were sustained. Frequently they were able to gain from the witnesses statements tending to discredit other bits of testimony and also to obtain admission of ability of the Northwest manufacturers to compete successfully in most sections of the country.

Slight Improvement in Pennsylvania

HARRISBURG, PA., March 13.—Conditions in the metal trade in Pennsylvania are believed to be on the verge of picking up, according to the semi-monthly report of the Pennsylvania State Department of Labor and Industry, just issued.

The metal trades show some improvement, according to this report, in most of the districts. Altoona, however, reports "no noticeable improvement." Erie said that there is a slight improvement, while Johnstown says that the industry "has shown considerable life" recently. McKeesport declared the iron and steel works are operating better than during all of 1921. "No particular change" was noted in Pittsburgh. The Harrisburg district reported 3900 men in the metal and machinery trade out of employment.

The number of unemployed throughout all of Pennsylvania showed a decrease of about 5000 during February, according to the bulletin. The unemployed on March 1 was 308,450 as compared to 313,835 on Feb. 1.

Secretary Hoover Will Stay in Cabinet

WASHINGTON, March 14.—In a letter addressed to Mayor J. Hampton Moore of Philadelphia last Friday, Secretary of Commerce Herbert Hoover declined the offer of the position as director-general of the Sesqui-Centennial exposition to be held in that city. Mr. Hoover stated that the President had strongly expressed the wish that he remain in the Cabinet, and added that he felt that, having undertaken the reorganization of the Department of Commerce in the hope that he may build it into a greater service for the community, he would not be justified in abandoning that task until it has reached further advancement. The offer made to Mr. Hoover carried an attractive salary.

A paper on "Ball Steel" was presented before the monthly meeting of the Detroit Chapter of the American Society for Steel Treating, March 13, by H. G. Freeland, metallurgist Hoover Steel Ball Co., Ann Arbor, Mich.

Air-Gas Inspirator for Gas Furnaces

The surface combustion low-pressure air-gas inspirator heretofore used exclusively on the furnaces of the Surface Combustion Co., 366 Gerard Avenue, New York, has been redesigned for use with any make of gas furnace. The device is shown in the accompanying illustration.

The manufacturers claim that this inspirator is essentially a gas furnace carburetor. The entire operation of a furnace equipped with this device is controlled through one valve. An increase or decrease of

Air-Gas Inspirator for Gas Furnaces

the air supply automatically increases or decreases the gas so that the mixture proportions remain in a constant fixed ratio. The gas cock is used only when starting or stopping and is either full on or full off; no adjustment of it is required. With this system it is said that no explosive mixtures are possible in any part of the distribution mains, as the gas and air are mixed only at the point of supply to the burners.

The advantages claimed are automatic supply of the exact proportions of air and gas to the furnace under all conditions of operation; thorough and homogeneous mixing just prior to entering the furnace, and instantaneous combustion.

Combination Portable Drill and Grinder

A combination portable electric drill and grinder is being placed on the market by the Wodack Electric Tool Corporation, Chicago.

The combination tool is shown in the illustration and is intended for drilling metal or wood. It has a drilling capacity of $\frac{1}{8}$ to $\frac{1}{2}$ in. in steel and when used as a grinder carries a 6 by $\frac{1}{4}$ in. grinding wheel. Two separate speeds are provided, slow speed for drilling and high speed for grinding. The motor which is of the universal type can be operated on both direct and

Combination Drill and Grinder. The motor can be operated on both direct and alternating current

alternating current of the same voltage and develops $\frac{1}{2}$ hp. under load. The switch is located in the top handle and is of the quick make-and-break automatic-stop type permitting close control of the tool.

Aluminum castings and ball bearings are used throughout. The weight complete is 18 lb. All components, including the motor, are built at the company's factory.

The Bethlehem Spark Plug Co., Inc., Bethlehem, Pa., has contracted to fill the entire spark plug requirements of the Packard Motor Car Co., of Detroit. About 250,000 plugs are required each year.

Fluorspar in 1921

The fluorspar shipped from mines in the United States in 1921, according to Hubert W. Davis, of the U. S. Geological Survey, amounted to approximately 35,600 net tons, a decrease of 81 per cent as compared with 1920. The general average selling price per ton f.o.b. cars at shipping points for all grades of fluorspar in 1921 is estimated at \$19.89, which is \$5.37 less than the average price in 1920. The total shipments in 1921 were the lowest recorded for any year since 1908. The shipments from Kentucky exceeded those of Illinois for the first time since 1904.

Imports of fluorspar into the United States in 1921 showed a decrease of 75 per cent as compared with those in 1920. The imports in 1921 were equivalent to about 22 per cent of the domestic shipments of fluorspar of fluxing grade, as compared with about 16 per cent in 1920.

Reports from steel manufacturers who produce about two-thirds of the basic open-hearth steel made in the United States show that they consumed 46,341 net tons of fluorspar in 1921, as compared with 80,545 tons in 1920. This group of steel manufacturers also reported stocks of fluorspar on hand Jan. 1, 1922, amounting to about 19,800 tons, as compared with 45,125 tons on Jan. 1, 1921. These reports therefore show that these steel plants consumed only 1,216 tons of fluorspar more than they had in stock at the beginning of 1921.

Precision Angle and Measuring Irons

The angle irons shown at the left in the accompanying illustration and the measuring irons at the right have been placed on the market recently by the Simplex Tool Co., Woonsocket, R. I.

The angle irons are of cast iron and carefully worked out to size, so that each size is shaped to accommodate the work intended for it. Three sizes are made from 4 x 5 x 5 in. to 8 x 10 x 12 in., and are de-

Angle Irons Are Shown Above and Measuring Irons at Right

signed to provide a variety of combinations suitable to the general run of work in any shop.

The measuring irons are designed to be clamped to the table of any machine and are said to be especially adaptable for accurate boring purposes. By setting them parallel to the machine table, they are useful in locating or measuring a variety of work and can be used also for clamping work that is to be machined. To facilitate setting up a slot for keys is provided in the bottom, as shown. The irons are of close-grained iron castings, with front face and bottom ground accurately and square. Two sizes are furnished, $2\frac{1}{2}$ x 6 x 12 in. and 4 x 8 x 21 in.

The Republic Iron & Steel Co., Youngstown, Ohio, has blown in No. 4 blast furnace in its Haselton group at Youngstown on basic iron, due to increased merchant demands and broader open-hearth furnace operations, requiring more iron for steel-making. The company is now producing iron from two furnaces in this complement. No. 5 stack has been active for more than four years.

K. L. Flickinger, secretary-treasurer of the Niagara Stone Products Co., Youngstown, Ohio, announces that operations have started at the company's dolomite and limestone quarries at Bellefontaine, Ohio. Present capacity of the property is 500 tons of road stone per day and 100 tons of agricultural stone.

Chrome and Nickel-Molybdenum Steels¹

Comparison with Other Alloy Steels for Automobile Use— Forging and Machining Qualities—Nickel- Molybdenum for Case-Hardening

BY C. N. DAWE

IN venturing to cover this pertinent subject it should be stated that there are so many more data yet to be obtained that it is impossible, at this time, to make a definite statement that fully covers the situation with regard to the application of commercial chrome-molybdenum steels. Such propaganda has been spread with reference to these steels and so much has been written regarding the history, possibilities, sources of supply and physical properties obtained, that there

that the recent papers of Dr. John A. Mathews¹ and Dr. G. W. Sargent² be read.

Molybdenum Steel Usage

The Studebaker Corporation of America has had made and shipped to its plants over 2000 tons of molybdenum steels of various analyses. This steel has been put through production in the form of rear axle shafts, transmission gears and shafts, steering knuckles,

Fig. 1. Curves Showing the Relation Between the Drawing Temperature and the Average Merit Index for Various Alloy Steels

Fig. 2. Curves Showing the Relation Between the Average Merit Index of Alloy Steels and the Size of the Section Quenched

are many consumers as well as manufacturers who are looking on in a doubtful yet open frame of mind, desiring to gain further information, particularly with reference to application.

It is with this in mind that I present some actual data with reference to commercial molybdenum steel, noted from the viewpoint of a large consumer and not that of a fabricator or salesman. We, as consumers, attempt to strike rock-bottom and note what the material will actually do under production requirements.

I wish to emphasize the fact that every manufacturer of automobiles and automobile parts has his own peculiar problems and that frequently the means to an end in one plant is not applicable in another; therefore, there undoubtedly will be some criticism and discussion of the publication of the information given herein, although it is presented from a strictly neutral attitude and with no idea of promoting or discouraging the use of molybdenum steels.

A theoretical discussion of the causes of the manner in which molybdenum steels act will be avoided, since this phase already has been well covered by those whose opinions and discussions carry much more weight because of their many years of experience in the manufacture and application of molybdenum steels. For those who are sufficiently interested, it is recommended

steering-knuckle pins, ring gears and drive pinions; in fact, all parts for which alloy steel is specified.

Our first efforts were to determine the advisability of the adoption of that class of chrome-molybdenum steel which would be adaptable to heat-treated forgings such as steering knuckles, steering arms and rolled axle shafts, water quenching of these being desired. By a process of elimination it became clear that steel containing molybdenum approximating 0.30 to 0.40 per cent, with chromium 1.00 per cent and carbon above 0.30 per cent, should be avoided when water is desired as the quenching medium and where cracker shearing is used. An analysis showing a carbon content below 0.30 and above 0.23 per cent, with a chromium content of 0.70 to 0.90 per cent and molybdenum 0.30 to 0.40 per cent, gives satisfactory results with water as a quenching medium, there being no cause for concern pertaining to the development of quenching cracks.

As a rule, our first interest is turned toward the physical properties of a steel as compared to those with which we already are acquainted. Having this in mind, an extensive test was run involving the pulling of approximately 400 tension pieces turned from heat-treated stock varying in size from 3/8-in. round to 2-in. square. The sizes used were 3/8, 1 and 1 1/2-in. rounds and 2-in. squares. The three smaller sizes were obtained by forging down from the 2-in. square hot-rolled forging bars. The 2-in. square test pieces were taken directly from the bar, no work having been put upon them.

Wide Treatment Range Not Necessary

The wide heat-treating range of a given steel is a

¹From a paper presented at the annual meeting of the Society of Automotive Industries in New York, Jan. 10 to 13. The author is metallurgical engineer Studebaker Corporation of America, Detroit.

²See THE IRON AGE, Feb. 24, 1921, p. 505.

³See Transactions American Society for Steel Treating, vol. 1, p. 589.

property upon which great stress always seems to be laid but, in our tests, no attempt has been made to determine this. In this present day of accurate metallurgical control we do not need a 100 to 200-deg. quenching range. What we as consumers are mostly interested in is to determine the lowest quenching temperature that can be used commercially and still obtain the maximum physical properties. With this in mind, quenching temperatures ranging from 1550 to 1650 deg. Fahr. were used in the case of the chrome-molybdenum,

average of results including good and bad, which we must admit is the proper way to form conclusions on a problem of this kind. The chemical analyses of the various types of steel tested are shown in Table 1.

Quenching and Drawing Temperatures

As has been stated, three quenching temperatures were used for each type of steel for each size, except for the 2-in. square as noted. Also, three drawing temperatures were used for each quench for each size, 1000,

Table 2—Results of Tests of 1/2-In. Round Steels

Chrome-molybdenum	1,550 to 1,650	1,200	100,980	118,900	26.5	68.4	9	92.3
Chrome-vanadium	1,550 to 1,650	1,200	113,000	131,323	23.6	60.6	9	75.2
Chrome	1,550 to 1,650	1,200	97,111	113,699	21.7	64.8	9	65.0
Chrome-nickel	1,475 to 1,575	1,200	94,804	111,800	21.7	65.0	9	64.0

chrome-vanadium and chrome steels, while 1475 to 1575 deg. Fahr. were used with the chrome-nickel steel.

Methods of Testing

To obtain results as nearly accurate commercially as possible, each group of test pieces was quenched from a production furnace in the same manner as small forgings would be handled in receiving similar treatment. The drawing operations were carried on in a laboratory electric furnace so that the effect of the

1100 and 1200 deg. Fahr.; that is, nine pieces of 1/2-in. round stock were quenched from a given quenching temperature and three were drawn at 1000 deg., three at 1100 deg., three at 1200 deg. Fahr., and so on through the series. The results obtained, as shown by averages, are given in Tables 2, 3, 4 and 5.

Generally speaking, in performing tests of the above nature where we desire to note a comparison of the physical properties of certain steels in terms of the elastic limit, ultimate strength, reduction of area and percentage of elongation, sometimes we are confused because of the variations we obtain, and because it is practically impossible, over a large number of test pieces, to hold any one or two factors constant so as to note the variation in the remaining factors. If we could heat-treat the test pieces so that the elastic limit would be the same in all, the variation in the other three remaining factors would tell the story.

The Merit Index for Comparison

After having made hundreds of tests, the question then presents itself as to how best to interpret the results obtained. Without entering into any discussion on this point, I take the liberty of using the merit index suggested by H. T. Chandler, and presented in a paper

Table 1—Chemical Analysis of Various Types of Steels Tested

	Chrome-Molybdenum, Per Cent	Chrome-Vanadium, Per Cent	Chromium, Per Cent	Chrome-Nickel, Per Cent
Carbon	0.260	0.320	0.310	0.280
Manganese	0.570	0.750	0.850	0.720
Sulphur	0.020	0.033	0.012	0.012
Phosphorus	0.025	0.025	0.020	0.020
Chromium	0.800	1.030	0.910	0.580
Molybdenum	0.360
Vanadium	0.160
Nickel	1.270

drawing temperature would be defined sharply. The physical properties we obtained, true to our expectations, showed occasional variations which were to our

Table 3—Results of Tests of 1-In. Round Steels

Grade of Steel	Quenching Temperature	Drawing, Deg. Fahr.	Yield Point as Elastic Limit, Lb. per Sq. In.	Ultimate Strength, Lb. per Sq. In.	Elongation in 2 In., Per Cent	Reduction of Area, Per Cent	Number of Tests Made	Merit Index
Chrome-molybdenum	1,550 to 1,650	1,000	153,880	162,200	19.4	55.9	9	69.7

Chrome	1,550 to 1,650	1,000	124,872	138,066	17.0	57.9	9	53.1
Chrome-nickel	1,475 to 1,575	1,000	120,860	136,088	18.1	59.9	9	58.0
Chrome-molybdenum	1,550 to 1,650	1,100	112,400	129,000	24.7	64.7	9	84.6
Chrome-vanadium	1,550 to 1,650	1,100	127,100	139,300	23.4	58.3	9	74.3
Chrome	1,550 to 1,650	1,100	99,706	116,528	20.6	63.8	9	61.5
Chrome-nickel	1,475 to 1,575	1,100	103,740	121,330	21.1	63.6	9	65.2
Chrome-molybdenum	1,550 to 1,650	1,200	99,320	117,400	27.1	66.7	9	88.8
Chrome-vanadium	1,550 to 1,650	1,200	101,950	116,500	26.9	64.8	9	83.4
Chrome	1,550 to 1,650	1,200	86,390	112,766	21.9	68.2	9	67.7
Chrome-nickel	1,475 to 1,575	1,200	92,590	111,013	22.1	65.5	9	65.2

dislike, but were fairly evenly distributed over the four types of steel. In this connection, in nearly all cases, in publishing the physical properties of a given steel there is such an exact uniformity of the superiority of one steel over another, or such an exact uniformity in the variations of the elastic limit and ultimate strength with respect to the elongation and reduction of area under different treatments, that it is apt to throw an element of doubt into the mind of one who can appreciate the very peculiar and pronounced variations that do exist under the most accurate handling of test pieces. The ultimate findings of the tests given herewith, however, were derived from a very broad

by John D. Cutter², and of expressing the results obtained above in terms of the equation

(I = 0 1/2 e (E + S) + (100 - R)

where

- I = the merit index
- e = the percentage of elongation in 2 in.
- E = the elastic limit in terms of 1000 lb. per sq. in.; in the tests it is taken as the yield point
- R = the percentage of reduction in area
- S = the ultimate strength in terms of 1000 lb. per sq. in.

The results are noted in Tables 2, 3, 4 and 5, while a general average is shown by the curves in Figs. 1 and 2. The above data or tests have indicated to us that

²See Transactions of the American Society for Steel Treating, vol. 1, p. 138.

chrome-molybdenum steel for heat-treated automobile parts has considerable merit. In view of the fact that this steel apparently can be produced in unlimited quantities with no danger of shortage of molybdenum, and because it has been produced and sold at a lower price than its closest competitor, chrome-vanadium steel, its adoption has been sanctioned.

Forges Easily and Scales Readily

With reference to its action through various stages

The next step consisted in obtaining a higher carbon steel to lower the quenching temperatures required and to find, if possible, a steel that would give the desired results by a single quenching temperature after carbonizing. The chemical composition of the heats obtained ran very consistently as follows: Carbon 0.190, manganese 0.546, sulphur 0.010, phosphorus 0.025, chromium 0.700 and molybdenum 0.370 per cent.

The first tests made on the above analysis apparently warranted an extensive trial of this grade and,

Table 4—Results of Tests of 1½-In. Round Steels

Grade of Steel	Quenching Temperature	Drawing, Deg. Fahr.	Yield Point as Elastic Limit, Lb. per Sq. In.	Ultimate Strength, Lb. per Sq. In.	Elongation in 2 In., Per Cent	Reduction of Area, Per Cent	Number of Tests Made	Merit Index
Chrome-molybdenum	1,550 to 1,650	1,000	147,900	157,600	20.3	57.0	9	72.2
Chrome-vanadium	1,550 to 1,650	1,000	129,800	140,200	20.9	57.6	9	66.6
Chrome	1,550 to 1,650	1,000	101,370	122,178	18.1	60.8	9	51.6
Chrome-nickel	1,475 to 1,575	1,000	108,860	123,036	18.7	61.1	9	54.1
Chrome-molybdenum	1,550 to 1,650	1,100	118,500	131,900	24.0	64.4	9	84.3

Chrome	1,550 to 1,650	1,100	86,770	109,710	21.9	65.0	9	61.4
Chrome-nickel	1,475 to 1,575	1,100	87,720	110,492	22.3	65.5	9	64.0
Chrome-molybdenum	1,550 to 1,650	1,200	92,900	112,400	26.9	68.8	9	88.7
Chrome-vanadium	1,550 to 1,650	1,200	102,400	118,600	26.5	67.0	9	82.8
Chrome	1,550 to 1,650	1,200	78,250	103,453	23.7	67.2	9	65.6
Chrome-nickel	1,475 to 1,575	1,200	80,417	103,577	24.6	67.8	9	70.3

of production, I would say that it forges entirely satisfactorily, with the particular advantage that the scale formed breaks away from the forgings very easily. With proper composition and for sizes within ordinary limits, it cold shears as readily as the other grades of commercial alloy steels. It responds very readily to the heat-treating operations, the percentage of forgings falling outside of the required Brinell hardnesses being very small.

As to its machining qualities, no figures can be given to corroborate the claims that have been made with regard to the reduction of tool costs and the like. However, we have satisfied ourselves by noting the machinability of the tonnage that has passed through our shops that chrome-molybdenum steel machines at least as well as the best there is. We have not heard of a failure of any part made of this steel out of the 50,000 cars that have thus far been produced since its adoption.

Case-Hardening Grades

Very few if any data have been recorded regarding the case-hardening grades, especially from the viewpoint of the consumer. Our first attention was to note whether any of the various grades of the low carbon steels could be applied to case-hardened gears, knuckle pins and shafts. The Studebaker Corporation

as a result, steel for 5000 cars was ordered. Upon getting into production with this material, with which all transmission parts and rear axle gears and drive pinions were produced, certain peculiarities were noted that ordinarily could not be observed with a few trial test pieces, the principal one perhaps being the fact that a satisfactory core fracture could not be obtained regularly; that is, after subjection to shock, the fracture would not show what is commonly called toughness but have a crystalline or granular appearance. This condition is particularly objectionable in parts that are subjected to a straightening operation and in clash gears.

A further investigation proved that to obtain much better results, the part to be heat treated had to be subjected to prolonged heating above the critical temperature of the core to bring about the proper condition before quenching and the lower heat for hardening had to be applied as quickly as possible to prevent the core from being subjected to lengthy heating at the lower temperature. This can be expressed more practically by stating that a certain gear, when heated for exactly 3 min. in a lead pot at 1425 deg. Fahr. and then quenched in oil was a fairly satisfactory product; but, if held 4 min. or more in the lead pot at the same temperature, it

Table 5—Results of Tests of 2-In. Square Steels

Grade of Steel	Quenching Temperature	Drawing, Deg. Fahr.	Yield Point as Elastic Limit, Lb. per Sq. In.	Ultimate Strength, Lb. per Sq. In.	Elongation in 2 In., Per Cent	Reduction of Area, Per Cent	Number of Tests Made	Merit Index
Chrome-molybdenum	1,550 to 1,600	1,000	108,500	125,400	27.6	62.0	2	85.0
Chrome-vanadium	1,550 to 1,600	1,000	104,400	119,500	24.2	61.5	2	70.3
Chrome	1,550 to 1,600	1,000	94,375	113,050	20.7	61.3	2	55.4
Chrome-nickel	1,475 to 1,575	1,000	96,250	113,690	19.9	62.5	2	57.9
Chrome-molybdenum	1,550 to 1,600	1,100	100,500	117,200	25.4	66.5	2	82.6
Chrome-vanadium	1,550 to 1,600	1,100	112,800	127,800	24.3	59.0	2	71.3
Chrome	1,550 to 1,600	1,100	89,750	105,700	21.8	65.0	2	59.0
Chrome-nickel	1,475 to 1,575	1,100	89,375	111,350	21.8	65.0	2	62.5
Chrome-molybdenum	1,550 to 1,600	1,200	78,800	100,600	29.0	70.0	2	86.7
Chrome-vanadium	1,550 to 1,600	1,200	107,500	123,800	23.4	59.0	2	66.1
Chrome	1,550 to 1,600	1,200	77,875	99,375	24.2	68.5	2	68.1
Chrome-nickel	1,475 to 1,575	1,200	78,750	102,900	25.3	68.7	2	73.4

is a large user of case-hardened gears and must demand the best commercial grade of steel for the purpose.

The chemical composition of the first heat experimented with showed carbon 0.130, manganese 0.400, sulphur 0.025, phosphorus 0.016, chromium 0.610 and molybdenum 0.350 per cent. This analysis was abandoned for the reason that such high temperatures were required for double heat treatment as would prove commercially impracticable. Quenching directly from the carbonizing box and using a single lower heat for hardening did not produce the desired results as regards core fracture.

became very brittle. This prolonged heating necessary above the critical temperature indicates, I think, a sluggishness peculiar to chrome-molybdenum steels and may account for the higher drawing temperature permissible in the forging grades.

[The author here discusses the effects of carbonizing and hardening and gives a table of physical tests of steels after case-hardening.]

To obtain the best possible results with the case-hardened parts it was necessary to quench from the carbonizing box into oil and follow this by the regular double heat treatment and a final draw at 375 to 400 deg. Fahr., each operation being carefully timed.

There are two particular advantages that should be noted, however, in that chrome-molybdenum steel will take on a given case-depth in 10 per cent less time than chrome-nickel steel; also, there will result an average increase in Shore hardness of 5 to 7 points.

Nickel-Molybdenum Steel for Case-Hardening

In spite of the fact that we have not received any complaints with regard to failures of case-hardened parts of chrome-molybdenum steel, and I feel assured we will not in the future, we have seen fit to discontinue this particular grade for this particular purpose. Chrome-nickel steel apparently still holds the first place among commercial steels for case-hardening of important parts, but it is the opinion that nickel-molybdenum steel will be a serious contender. At present we have a heat of approximately 100,000 lb. of nickel-molybdenum steel of the following analysis: Carbon 0.130, manganese 0.380, sulphur 0.022, phosphorus 0.020, nickel 1.580 and molybdenum 0.200 per cent. This material is being made into gears, knuckle pins and the like. It is stated that this steel should prove a serious contender with chrome-nickel steel for case-hardening purposes, because of its ability, in the hot-rolled condition, to harden in oil after carbonizing. This statement may not be wholly clear to some, but it is a fact that a piece of hot-rolled steel of a given composition after carbonizing will not harden in oil to the degree that a piece of the same composition will if first subjected to forging.

The steering-knuckle pin has been one of our problems. This pin is made from $\frac{3}{4}$ -in round hot-rolled stock and from alloy steel. It is case-hardened and a

Shore hardness of 70 is required after final grinding. It always has been necessary to water-harden this piece, irrespective of the type of steel we use and, as a result, there is always a certain percentage of loss due to straightening. To illustrate, in one lot of 1949 nickel-molybdenum pins carbonized and hardened in oil, only 10 fell below 75 above hardness, none was lost in straightening or because of softness after final grinding. This we think is a remarkable record in view of the fact that chrome-nickel, chrome-vanadium, chrome-molybdenum and $3\frac{1}{2}$ per cent nickel steels have all been tried without success.

To summarize this portion of the subject briefly, our observations lead us to believe that, for carbonizing purposes, chrome-molybdenum steels should prove entirely satisfactory for parts in which hardness alone is the chief factor, but should be considered carefully before being used for important parts in which combined toughness and hardness are requisite, such as gears, steering-knuckle pins and the like.

The results thus far obtained with nickel-molybdenum steel are very satisfactory in every way when compared with chrome-nickel steel, with the added advantage of the greater hardness that can be obtained from an alloy steel of the former type.

There are many more details that could be added to the above, but I feel that they might serve to confuse rather than enlighten those desiring a frank statement of conditions pertaining to two important grades of chrome-molybdenum steel. In connection with the oil-hardening and spring steels we are at present in the midst of exhaustive investigation, but are not yet in a position to express an opinion.

Electrically Operated Japanning Oven of New Design

Built on Sectional Bookcase Principle—Details of First Installation—Accessory Equipment

AN electric japanning oven built on the sectional bookcase principle, making it easy to lengthen or shorten and permitting installation of additional adjoining units, has been brought out by the Ohio Body & Blower Co., Cleveland. The sides of the oven are built of sheet-steel panels, 2 ft. wide, that fit into a specially designed joint. The joint seals the panels both on the inside and outside of the oven.

In this design the use of tee iron in joining the sections of the oven, or other supporting members, is eliminated and the use of bolts extending through the side walls, also. The sides of the oven are thus completely insulated. The only structural members are channels at the bottom and light angles at the top to make the structure rigid. The oven is easily assembled, a feature which reduces erecting costs.

The oven is ventilated by a Sirocco blower, direct connected to a motor located on top of the oven. The

exhaust outlet is placed in the center of the oven floor, and cold air inlets are provided at the front of the oven on each side of the doors. The cold air passes through the heating units at each side and when heated rises to the top of the oven. The action of the fan in exhausting the air at the bottom provides a constant circulation and uniformity of temperature throughout the oven. A red light shows at the side of the oven when the exhaust system is operating, and should the fan stop, the light goes out. The doors have thrust ball-bearing hinges so that their operation is easy.

The first oven of this design, which is illustrated, has been installed at the new plant of the Lima Sheet Metal Products Co., Lima, Ohio, for use in japanning automobile parts and other sheet metal stampings. The entire equipment in the japanning department was installed by the Ohio Body & Blower Co. An overhead double-track conveying system extends through the

Arrangement of Japanning Department. The dipping tank and carrier are shown at the left, with the drip board beneath the carrier

The Sides of the Oven Are of Sheet-Steel Panels That Fit into a Special Joint. No bolts are used. The interior view below shows the heating units

oven, which has doors at both ends. The conveying equipment was supplied by the Loudon Machinery Co., Fairfield, Iowa. The oven is 16 ft. deep, 11 ft. wide and 9 ft. 6 in. high. It has 42 heating units and is of 105 kw. capacity, the electric current being supplied at 220 volts, 3-phase, 60 cycles. The heat is automatically controlled by a Taylor Instrument Co. thermostat providing a range of temperature from 100 to 530 deg. Fahr. Parts are japanned in various colors, some of which require much lower baking temperature than others, and for this reason the wide range in temperature control was provided.

The work is dipped in a portable dipping tank at one end of the japanning room and this has two side wheels and a swivel wheel at one end. After dipping it is hung from a sectional rack that is suspended from the overhead carrier and drips upon a drip board beneath. When fenders or other large parts are being japanned, the lower part of the rack is removed and the parts are suspended from the upper framework. If the parts are small the entire rack is used as shown in the illustration, the work being suspended from the cross members that are inserted as required. The racks are 8 ft. long, 7 ft. wide and 4 ft. 6 in. high. Six racks are used, two being placed in the oven at one time.

The track system is arranged so that the rack does not turn when reaching the right angle turn in the track in front of the oven, but retaining its relative position, passes into the oven sideways. After leaving the oven the rack with its load is pushed along the track to its assembling and shipping department, where there is a return track leading back to the dipping tank.

Tests have shown that from a cold oven the temperature has been brought up to 450 deg. in 1 hr. and 500 deg. in 1 hr. 45 min. A temperature of 350 deg. in an hour is guaranteed. The maximum baking load, including conveyor, is 3500 lb. per hour. The current consumption has been shown by test to be approximately 75 kw. for an hour.

Hardwood Association Reorganizes

The American Hardwood Manufacturers' Association has adopted the recommendation made last week of the board of directors that it disband and organize

an association of lumber men to gather statistics and distribute them to the public and perform other services. The action was recommended in view of the recent decision of the Supreme Court in the so-called Hardwood Lumber case, which held that the open competitive plan and the use by the association of its organization to influence prices was illegal. L. C. Boyle, general counsel of the association, in explaining the purpose, said: "It is a new and an original departure from former methods whereby an independent corporation renders service on equal terms to the buyer and the seller." The name of the new organization will be the American Hardwood Institute, and J. E. Starke of Memphis has been appointed to perfect the organization.

Advocates of Metric System Organize

WASHINGTON, March 14.—That proponents of the metric system are going to stimulate efforts looking to the establishment of this plan of measurement, has become evident. An organization of the local section of workers for the installation of the metric system and the passage of the Britten-Ladd bill was effected last Friday night at George Washington University Law School. Officers were elected as follows: President, E. J. Henning, Assistant Secretary of Labor; vice-president, G. F. Weeks, editor of the *Mexican Review*; second vice-president, Dr. H. L. Hodgkins; secretary and treasurer, W. Peters.

The executive committee consists of Dr. Harvey Wiley, chairman; John Barrett, S. J. Macfarren, Dr. C. L. Parsons, and Stephen Kramer, Assistant Superintendent of Schools.

It is also proposed to name an "educational" committee in order to acquaint the people of the country with the alleged benefits that would arise from the metric system. Senator C. F. Ladd, of North Dakota, spoke of an amendment to his bill which would provide that in 1926 all Government specifications and engineering works be done with the use of the metric system.

Owing to the continued high cost of materials entering into industrial plant construction, the Youngstown Steel Co., Youngstown, Ohio, is not likely to proceed this year with its proposed mechanical puddling plant at Warren, Ohio. Several years ago the company acquired a site at Warren and planned to proceed with its plant this year. The mechanical puddler which it will employ is the invention of E. L. Ford of Youngstown.

Large Press for Drawing Axle Housings

Competition between guns and armor plate in the construction of warships seems to be somewhat paralleled in the last few years in the pressed metal industry, between presses and stampings. The large double-crank toggle drawing press shown in the accompanying illustration, built recently for the Crosby Co., Buffalo, by the E. W. Bliss Co., Brooklyn, N. Y., is a typical result of the see-sawing tendency between the expanding requirements of the stamping trade and the equipment needed to keep pace with them.

The press illustrated is for use in drawing pressed-steel axle housings for automobile trucks. These housings, which are intended to replace those of cast iron formerly used, are drawn in two sections and welded together, the material being $\frac{3}{8}$ -in. steel. The

Power is Transmitted to the Outside Slide from Both Ends of the Press. This is followed also in connection with the crankshaft which operates the inner slide

press is of tie-rod construction, twin-driven and triple-gear, the ratio of the gearing being 85 to 1. The gears of the entire train are of steel with machine-cut teeth.

Power is transmitted from the main driving gears to the outside slide or blank holder through a series of toggles and a dwell of 120 deg. is obtained. The number of toggles and connections incorporated is the lowest consistent with the most efficient results. To maintain this simple and effective construction and at the same time avoid torsional strain, the power is transmitted to the outside slide from both ends of the press. This is followed also in connection with the crankshaft which operates the inner slide, this being twin driven by means of a driving gear on either end.

The small number of connections or links used in transmitting power to the outer slide is intended to assure the minimum of power consumption, and also to afford simple, compact and strong construction with minimum of wear. The connection pins are hardened and ground, which is intended as a further provision against wear.

The adjustment of the inner slide or plunger is made by a 15-hp. motor mounted on the front of the crown. The machine itself is driven by a 100-hp. motor and controlled by a powerful hand-actuated friction clutch of the double-grip type. The distance from bed to inner slide, stroke down and adjustment up, is 59

in.; and from the bed to the outer slide, 56 in. The stroke of the inner slide is 28 in.; that of the outer slide, 20 in. The area of the bed is 60 x 116 in.; the area of face of blankholder, 60 x 102 in., and area of face of plunger, 36 x 86 in. The weight of the press is 600,000 lb. (300 ton).

Wages of Sheet and Tin Plate Workers

YOUNGSTOWN, March 14.—Wage rate of sheet workers in mills operating under the sliding scale of the Amalgamated Association of Iron, Steel and Tin Workers will continue at 26 per cent above base for the March-April period, as result of the bi-monthly examination of sales sheets March 11 at Youngstown. The examination disclosed an average price of 2.80c. per lb. on Nos. 26, 27 and 28 gage black sheets shipped by mid-Western mills during the 60-day period ending Feb. 28. This same average was revealed at the settlement two months before and the wage rate is therefore unchanged. It compares with a peak of 5.80c., the average price developed on September-October, 1920, shipments of sheet steel.

Tinplate, however, declined from \$4.80, the average disclosed two months ago, to \$4.75 per base box, and affected workers will therefore sustain a reduction of one per cent of the base rate, or an actual working cut of two-thirds of one per cent from the rate paid in January and February. Under the new rate, workers in the tin plate division of the industry will be paid 18½ per cent above base.

Whereas sheets show a firmer tendency, the current tin plate market is \$4.60, and employees in tin mills are therefore due for another reduction at the settlement in June.

James H. Nutt, secretary of the Western Sheet and Tin Plate Manufacturers' Association, acted for the employers, as usual, while M. F. Tighe of Pittsburgh, president of the Amalgamated Association, represented the interests of employees.

Tool Builders' Standardization Committee

The National Machine Tool Builders' Association has appointed the following members to act as a general committee on standardization in co-operation with a similar committee of the American Society of Mechanical Engineers:

Automatic Screw Machines: E. C. Henn, National Acme Co., chairman; R. S. Brown, New Britain Machine Co.; E. E. Blundell, Cleveland Automatic Machine Co.

Shapers: R. T. Hazelton, Cincinnati Shaper Co., chairman; C. L. Cameron, Gould & Eberhardt; J. M. Mills, Smith & Mills. Grinders: A. C. Hoeflinghoff, Cincinnati Grinder Co., chairman; Wigalow Blanchard, Blanchard Machine Co.; James N. Heald, Heald Machine Co.

Planers: George Lahgen, Cincinnati Planer Co., chairman; C. C. Swift, Ohio Machine Tool Co.; E. M. Woodward, Sr., Woodward & Powell Planer Co.

Milling Machines: Charles S. Gingrich, Cincinnati Milling Machine Co., chairman; E. J. Kearney, Kearney & Trecker Co.; B. P. Graves, Brown & Sharpe Mfg. Co.

Drilling Machines (radial and upright): Arthur C. Pletz, Morris Machine Tool Co., chairman; E. A. Herrcke, Hoefer Mfg. Co.; Reed, Prentice Co., Worcester, Mass.

Turret Lathes: R. F. Flanders, Jones & Lamson, chairman; Oskar Kylin, Foster Machine Co.; Charles Meier, Acme Machine Tool Co.

Policy as to Open Price Associations

WASHINGTON, March 14.—Misunderstanding appearing to have arisen over the recent correspondence between Secretary of Commerce Hoover and Attorney General Daugherty regarding the particular character of trade associations with which the Department of Commerce could rightly continue to co-operate in statistical and other matters of commercial advancement, Mr. Hoover last week issued a statement saying that the department makes no interpretation of the Sherman law. It does have to decide in what sort of association work it can rightly co-operate, Mr. Hoover said, but the department does not find a basis of co-operation with the so-called open price association, and never has.

Labor and Its Legal and Moral Status*

Development of American Labor Policies in 35 Years-- Collective Responsibility Must Accompany Collective Activity

BY WALTER GORDON MERRITT

WE are the only nation which has what is known as labor litigation, because we are the only nation which recognizes that industrial rights are entitled to enforcement, as against the activities of combinations, in the civil courts of our land, on the application of a private party seeking protection.

To understand the full significance of this situation, I want to call your attention to the policy of government toward business and capital. The first great restrictive regulation was the passage of the Interstate Commerce act in 1887, to meet evils caused by unfair rebates as between different classes of shippers. We laid down the law then and there that railroads must serve everybody with impartiality, and upon the same terms and the same basis.

In 1890 we passed the Sherman anti-trust law, which, in effect, was designed for the protection of the public and to keep open the channels of interstate trade and commerce, so that the commodities of any producer could flow into the markets without obstruction, and the consumers could purchase them as they saw fit.

Then in 1914 we passed the Federal Trade Commission act, which declares that any unfair methods of competition are illegal. In other words, we have practically bridged the chasm between law and morals by declaring that, if any competitor attempted unfair competition toward another competitor in the course of interstate trade, his practices would be condemned by the Federal Trade Commission, and an injunction could be issued to restrain those practices. Then we passed the Federal Reserve act, designed to protect any interference with competitors through unfair methods in extending credit and financial aid to the respective concerns engaged in business.

So we have erected a great structure designed for the protection of the individual liberty of every business man and every corporation engaged in business, designed to keep open the doors of trade, the doors of opportunity, so that any person may go into business without being confronted with an artificial obstruction.

Some of us think that those laws have gone too far in the manner in which they have been interpreted by the courts, but we must protect the liberty of people to engage in business, and so far as these laws are designed to do that, they are laws which all should support. Sometimes the real test as to the value of a law is as to what that law has avoided, rather than what that law undid. In other words, what would big business do in the absence of any restrictive laws of this kind—not what these laws have done to change conditions as they found them existing.

How All This Affects Labor

Now, coming to the labor situation, which is the point of our particular discussion, I want to take up the application of those laws to labor organizations, to show the extent to which this country has at last become committed to the policy of industrial liberty, as against the policy of conscripting men to join organizations, or conscripting business men to operate solely on a closed shop basis.

In 1893 we had a strike in Chicago, carried on by the American Railway Union, against the hauling of Pullman cars by the railroads, because the Pullman cars were then so-called "acab" cars. In other words, we went through a strike tending to coerce the railroads to discriminate against a certain class of article, which discrimination, under the Interstate Commerce act, was

declared to be unlawful. That policy has been repeated frequently, in more or less different forms, since that time.

In the summer of 1920 there was considerable disturbance in New York, caused by the Transportation Trades Council, composed of all the truckmen, of all the men engaged in handling materials at steamship lines, the men who absolutely had control of the products as they came through and out of the port of New York. That organization declared that any merchandise which had been made in open shops should not be handled by them. In other words, open shop merchandise should not pass through the port of New York.

That organization laid down the rule, through its longshoremen branches, that no merchandise should be received or transported by any steamship company, which was delivered by non-union workmen; and so, through a citizens' committee, organized out of the big civic organizations in New York, we had to maintain a trucking system of our own, in order to do the work which the union truckmen in New York refused to do, and what was the result? As we carted the materials down to the steamship lines, the steamship employees said, "No, we won't allow the steamship companies to transport materials which have been handled by non-union workmen," and they threatened the steamship companies with a strike, if those materials were taken and served by these public carriers.

We had again a repetition of the Debs case there. We had again a violation of that same principle which was supposed to have been taken care of by the Interstate Commerce act. So it became necessary to go into our State and Federal courts for injunctions, which were secured against the employees and against the steamship companies themselves—in effect, ordering them to serve the public with impartiality, regardless of whether the goods they were called on to carry had touched the hands of a non-union man or not.

Any other principle is going to leave us all in the slough of despond. It would mean that a street railroad company, which attempted to haul a non-union man, might suffer a strike; it would mean that the telephone service might be cut off from a non-union worker, because it was threatened with a strike; it would mean that baggage transportation of all kinds, in the nature of public service, should be denied to people and to property disapproved by the employees of the particular companies who were under public duty to transport those materials. That question has been fairly well cleared up in this quarter of a century.

Labor and the Sherman Law

The Sherman anti-trust law came to the test, as to whether or not it was applicable to organizations of labor as well as to organizations of capital. The primary purpose of that law was to give the public an opportunity of being served by anybody who wanted to serve it, to give the public the right of commercial suffrage in purchasing any line of articles which anybody wanted to put on the market, as against obstructive combinations which might prevent those commodities from getting into the public market, where people could purchase them as they saw fit.

In 1920, at the time the American Federation of Labor was engaged in a policy of carrying on boycotts throughout the country, the members had evolved a scheme for the purpose of promoting their organization, whereby certain concerns, which they singled out for attention, would not be allowed to distribute their goods, because of boycotts being conducted against

*Abstract of paper read Feb. 13 before Pittsburgh convention of American Boiler Manufacturers' Association.

wholesale or retail merchants who dared to purchase those goods. The question arose, "Does that violate the Sherman anti-trust law?"

Litigation has finally settled, in the United States Supreme Court, that combinations of labor to obstruct the channels of interstate trade, and to deny consumers benefits to which they were entitled through free competition, were as much in violation of the Sherman anti-trust law as were capital obstructions; so we strengthened the foundations of our jurisprudence, designed for the protection of the freedom of trade and commerce, as against combinations of labor or capital, throughout the United States.

Labor's Anti-Injunction Movement

In 1914, the first State, I believe, to pass an anti-injunction law was Massachusetts, the good old conservative champion of individual rights. The purpose of this and similar laws was to declare that the workman's right to work was not a property right. The courts have always declared that the right to work, which is the means by which the workman acquires property, is as much a property right as the money with which he fills his purse. Now labor had run into this difficulty:

In attempting to promote their organizations, their men would go into the courts and get injunctions protecting the freedom of men to work, and protecting the freedom of men to carry on business as they saw fit, and the result was that this policy of conscripting men to join labor organizations had been much retarded. So the only theory to be advanced was to strip the courts of this power to protect these rights, to strip the unorganized workman and leave him naked and defenseless against this combined, economic power; to do as Herbert Crowley said in his book, "Abandon the non-union workman in the way in which he has been abandoned in Great Britain."

When this law was passed in Massachusetts, one of those strange things happened, which is the very irony of fate. At that time there was trouble between the I. W. W. and the hod-carriers' union of the American Federation of Labor. The I. W. W. men were being driven off buildings because of strikes threatened by the American Federation of Labor, which demanded that only its men be employed, and that members of the I. W. W. be not employed. So the I. W. W. went to court and said, "We want an injunction against the hod-carriers' union, to protect us in our right to work."

That case went on up, and the Supreme Court of Massachusetts had to pass upon the validity of that law. It said, "If before the law these people would be entitled to an injunction, does this law deny them the right to an injunction? Oftentimes it appears that the workman's right to work is his sole property right. Now, is it fair class legislation that he should be put upon a lower plane of protection, in reference to his sole property right, than are other people in connection with their property rights? As it is not fair, the law is unconstitutional and void, and the I. W. W. should receive their injunction against the hod-carriers' union of the American Federation of Labor."

This is history of tremendous importance.

How the British Situation Differs

Now, we are up against the fundamental proposition as to whether our present policy will be continued. In Great Britain the opposite policy prevails. Every labor organization there is beyond the reach of civil process. A labor leader can go out and libel your wife, can maim one of your employees, or can dynamite your factories, and you cannot hold the labor union responsible for what that man did in behalf of the labor union. You cannot bring the labor union into the civil courts and get private protection, and the result is that you can get no protection whatsoever. The labor organizations are privileged institutions; they are what I call outlaws, because they are beyond the reach of law.

In Great Britain the railroad employees may strike against hauling coal produced by non-union workmen, or imported from foreign countries. Society has no rights as against that sort of thing. There is no limit

tation upon the use of the economic power of a labor union in Great Britain under the law, because they are entirely freed from any restriction of that kind. We probably could not pass such laws in this country, because we are a country of limited powers, by virtue of the restrictions of our constitution; but in Great Britain you can pass a law saying that red-haired men shall be employed and that bald-headed men shall not, and it would be a valid law, because it is unlimited in its powers.

Where collective action tends to deprive a man of the freedom of his own decision, of his right to carve out his own destiny, collective action has gone too far. Where collective action means that men voluntarily gather together to accomplish in a group what they cannot accomplish individually, then collective action is on the right track. Whatever virtues there are in collective self-help, it must be remembered that the pillar stones of this nation are individual initiative, individual character and individual enterprise. So, as I have often said, I don't believe any man should be obliged to sell his birthright to any class for a mess of pottage. I believe the right to remain unorganized is just as sacred as the right to organize, and I believe that any institution that grows by force rather than service, which is seeking to conscript people into the organization and hold them there by artificial authority, which lifts the institution above all ordinary laws of reward and punishment, is an institution which will become in the end a public bane and not a public benefit.

Ironton Fire Brick Co.'s New Plant

The Ironton Fire Brick Co., Ironton, Ohio, has just recently increased its capital to enable it to make extensive improvements at the plant at Ironton and also develop a large acreage of newly acquired fire clay land in Carter county, Ky., in the heart of the famous Olive Hill fire clay region. The building of two new 32-ft. inside diameter, round, down-draft, double-bottom kilns, a new steam heated concrete drying floor and the complete rebuilding of the ground clay storage bins, elevators, etc., together with the installation of a measuring device which enables the company to measure positively and accurately any desired mixture of clays, gives it a plant at Ironton modern in every particular.

A 1500-ft. double track railroad switch has been built at Bradmyer, Carter county, Ky., on the Lexington division of the Chesapeake & Ohio Railway, from which point the company is now shipping clay to the plant at Ironton. A 2800-ft. tramway connects the clay tippie at the switch with the mine, and one man, single handed, can deliver any number of cars loaded with clay from the mine to the tippie by gravity.

There are 712 acres of clay land, which has been estimated to furnish enough clay to last 100 years, manufacturing at the rate of 100,000 brick per day. The clay deposit is exceptionally fine—a recent analysis showing a fusion point of 3254 deg. Fahr., and analyzing:

Silica	51.97	Lime	0.60
Alumina	45.07	Magnesia	0.46
Ferric oxide	1.57	Alkalies	0.61

Plans are now being laid for the erection of a modern brick plant at the mines in Kentucky, where a plant site has already been provided. E. F. Myers is president and general manager.

New British Steel Announced

As the result of research work carried out by H. H. Ashdown and others at their Openshaw works at Manchester, Armstrong, Whitworth & Co. have produced a steel, known as Vibrac. What is claimed for the new steel is that in addition to responding satisfactorily to even higher mechanical requirements, particularly in respect to elastic limit, than those obtained from nickel-chrome steels, it may, subject to any normal treatment, after tempering, be either furnace cooled or cooled in air, thus cutting out risks of distortion, and yet will give higher impact values than nickel-chrome steel treated under the most favorable conditions.

Blind Efficiently Operate Machine Tools

Siemens-Schuckert Works in Berlin Conduct Series of Experiments to Determine Proper Training Methods

BY HUBERT HERMANN

OVER 150 of Germany's 3122 war blind have been trained by the Siemens-Schuckert Works, Berlin, Germany, to be self-supporting machine tool operators.

Experiments were first started in 1916 with men who were almost totally blind. They were first placed among the able-bodied on work of either a manual nature or as helpers, but the results were unsatisfactory, as the production was inadequate even under strict supervision. Separating the blind from the other work-

may be operated only when both hands are upon the safety handles. Moving parts generally are inclosed.

The lower left view is that of a blind man using pillar shears. These are guarded between the knife and table to prevent injury to the hands.

The upper right picture covers the operation of drilling and sinking holes used for metal parts. In sinking, the work is held in a suitable chuck and the drill is depressed until it comes in contact with a stop. In drilling, the piece is introduced into a gage having

Machines and Fixtures Equipped for Operation by the Blind and the Crippled Blind

ers was then tried, but this also proved unsatisfactory. Successful results were finally obtained when they were put to work operating machine tools, as in this capacity they developed an efficiency greater than that of women workers with unimpaired vision. The results were sufficiently satisfactory to enable them to attain an earning capacity that permitted of self-support entirely by their own efforts in various manufacturing departments.

The married blind are housed as near as possible to the works to reduce the dangers and inconveniences of traveling, while the single workers are provided for in a home suitably appointed and equipped for their welfare.

The center picture of the accompanying group shows a blind man performing turning work on a guarded lathe fitted with various gages and safety chucks.

The upper left-hand cut shows how a punch press and similar types of machines are equipped so that they

an abutment and the drill is depressed until the stop is reached.

The lower right-hand picture shows the use of a bench drill. This may be operated by a treadle by means of wire rope, the operator being without the right arm.

The principal condition upon which the proposed location of the plant at Hammond, Ind., by the Jones & Laughlin Steel Co., was contingent, has been complied with as the result of the passage of a bill in Congress, providing for the improvement of the west branch of the Indiana Harbor ship canal. The bill now goes to the President for his signature.

The Saucon plant of the Bethlehem Steel Co., Bethlehem, Pa., has resumed operations after an idleness of several weeks. Enough orders are on hand to maintain operations at least for one month.

Simplex Machine Time Calculator

This calculator, to be used in computing time required for machine tool operations, has been brought out by the Simplex Calculator Co., Box 184, York, Pa., and patents are pending. The device is designed to cover the general machine tool field, being applicable to rotating or reciprocating work or tools. It consists of a cylinder within an aluminum case, and a slide rule of special design attached to an extension of the base.

For use in connection with rotating work for tools, such as lathe, boring mill, drill press or milling operations, the cylinder carries tables indicating r.p.m. for diameters of $\frac{1}{4}$ in. to 10 ft. at all ordinary cutting speeds. The range of speeds shows above the slot at left.

The number of r.p.m. of a given piece of work is read in the slot opposite the diameter, directly under

Constants Shown on the Rotating Cylinder Are Used on the Slide Rule to Compute Rates

the cutting speed selected. This number is transferred to the rule, which bears four scales, indexed successively: feed, r.p.m., length and time. Locating this number on the r.p.m. scale of the slide, it is moved directly under the number representing the feeds per inch on the feed scale. The indicator is then moved along the length scale to the number representing the length of cut. Directly under this number, on the fourth scale, the result or time in minutes is read. Thus, all the operations necessary to complete a problem for rotating work or tools, requires but one setting of the cylinder, one movement of the slide, and one movement of the indicator on the rule.

In connection with planer, shaper, slotter or any other reciprocating tool, the procedure is similar. The area planed per minute at various forward and return speeds and feeds are read on the cylinder through the slot on right hand end of case. After determining the total area of surface to be planed, by multiplying length by width, either mentally or by the use of the rule, it remains only to divide this number by the area planed per minute. With one setting of the slide in the rule, the quotient or time required is read on the fourth scale under the end of slide.

This instrument was designed primarily for rate setters, estimators, and those whose duties require the daily or frequent predetermination of time for machine operations. It is a convenient desk size, being about 16 in. long and about 3 lb. in weight. With its use pencil calculations are entirely eliminated, computing time greatly reduced, and chance for errors minimized. The simplicity of its operation enables its use by anyone familiar with the practical side of machine tool operations.

Railroad Wage Reductions Sought

A hearing on general railroad wage reductions was opened before the United States Railroad Labor Board at Chicago on March 7. The wage controversies embraced in the hearing involve 205 railroads and 25 unions. The wages of the various crafts will be considered in the following order: shop crafts, maintenance of way employees, clerks, signalmen, dispatchers, firemen and oilers, and telegraphers. J. W. Higgins, executive secretary Association of Western Railroads, gave testimony on behalf of 101 Western railroads in support of wage reductions for shop men ranging from

4c. to 27c. per hour. For employees paid on a monthly basis, decreases ranging from \$10.02 to \$11.28 a month have been requested. For track and common laborers, laborers in the maintenance of way department, laborers around shops, station and platform employees and common laborers in station forces now receiving wages in cents an hour, authority has been asked to pay the prevailing rates for similar work in the territory employed. For inexperienced clerks, reductions ranging from \$7.50 to \$17.50 per month are asked. Mr. Higgins contended that the railroads should not be forced to pay higher rates of wages than are paid in outside industries for similar work. He asserted that the roads are not asking for the low level of pre-war wages. On the contrary, for most classes of employees the proposed scales are 50 to 100 per cent higher than those paid in 1915.

Parallel or Angle Plate Grinder

The Van Dorn Electric Tool Co., Cleveland, has brought out a 12-in. parallel or angle plate grinder for mounting on large lathes in grinding shafts and large rolls. It may be attached also to the vise of a milling machine, the head of a planer, shaper or boring machine for cylindrical or surface grinding. Grinding tools of this type are being made with a vertical supporting plate, but it is claimed that with the use of a 30 deg. angle plate the tool is more rigid, there is less overhang and the adjustments are more accessible, adding to the convenience in operation.

The tool has a 12 by $1\frac{1}{2}$ in. grinding wheel mounted on a shaft 1 in. in diameter at the grinding wheel end. The minimum distance from the angle-plate bolt, extending through a slot in the plate, to the center of

Used on Large Lathes in Grinding Shafts and Rolls. Can be used also on milling machine, planer, shaper and boring machine

the spindle is 8 in., and the shortest distance from the face of the wheel to this bolt is therefore 14 in. To determine whether the tool can be used on a given lathe and the maximum diameter of work in that lathe, the cross feed and compound rest are moved to their extreme outward positions and the distance from the center of the tool post to the center of the spindle is measured. This distance should exceed 14 in. and the excess over the distance represents the maximum radius of the work.

The machine is 19 in. overall, the overhang of the wheel from the center of the angle plate is $10\frac{1}{2}$ in., the diameter of the motor housing $8\frac{1}{4}$ in. and the maximum height of the wheel spindle above the rest is $9\frac{1}{2}$ in. The driving motor has a normal capacity of $1\frac{1}{3}$ hp. with a maximum momentary overload of $2\frac{1}{2}$ hp. The alternating-current stator and direct-current field assembly are interchangeable in the same frame and easily removed. The speed is 1800 r.p.m. Ball bearings are used throughout, these being mounted in dust proof housings. At the grinding-wheel end a double row of ball bearings take both the thrust and radial loads. Forced ventilation is provided by centrifugal fans. The weight is 175 lb. net.

Arguments on Railroad Rate Reductions

Attorneys for Carriers and Shippers Address Interstate Commerce
Commission at Conclusion of Hearings
—Doubt as to Decision

BY L. W. MOFFETT

WASHINGTON, March 14.—Pleas that no general rate reductions in railroads should be made at this time were strongly presented before the Interstate Commerce Commission by attorneys for the carriers in arguments in connection with the rate investigation case which finally came to a close yesterday after the time for closing the proceeding had again been extended. Counsel for shippers, who, for the most part, urged contrary pleas, insisted that industry cannot be revived until freight rates are reduced. There were some attorneys for shippers, however, who either did not ask for rate reductions or cautioned against any serious cuts that might endanger the revenues of the carriers, but took occasion to ask that if there were any cuts made the particular interests for which they appeared should be permitted to share in the reduced rates.

Among those urging cuts were representatives for the iron and steel, coal, and lumber industries, to mention some of the basic lines seeking lower railroad rates. It was evident throughout the hearings and arguments that the commission does not propose to precipitate any action in the way of general cuts in rates that it feels might injure the finances of the carriers. At the same time, it was plainly acquainted with the unfortunate plight of industries which are producing at a loss on account of high freight rates, but it is a question that can only be answered by the forthcoming decision, expected to be handed down soon, whether the commission is convinced that lower rates would stimulate traffic sufficiently to yield as great or greater net revenues to the carriers than now prevail. This is a matter it is compelled by duty to decide.

Necessity for Reduction

Whatever the outcome may be, it is the firm opinion of shippers, even those showing the most sympathy toward the railroads, that industry cannot be restored to a normal basis until rates are substantially lowered, and not merely reduced slightly. They recognize, however, that the carriers still face high labor costs, although they are in a position to go into the market and buy supplies on a comparatively low basis as the result of liquidation by the iron and steel and other industries. The position was taken by some that general rate reductions will have to be left to natural and gradual processes. But other shippers think immediate substantial cuts are necessary and would be beneficial to the carriers and shippers alike.

Arguments for the carriers were closed by Alfred P. Thom, general counsel for the Association of Railway Executives, who, while covering the general situation throughout the country as it applies to the carriers, took the same attitude that other attorneys for carriers had taken. The railroad attorneys were all in accord with the opinion of Henry Wolf Bikle, assistant general counsel of the Pennsylvania Railroad Co., that the economic situation has a wider basis than the rates and fares of railroads and is the result of the dislocation of industry and the destruction of values produced by the world war. Until this dislocation is corrected, it was pointed out, and new values created by productive effort, real prosperity cannot return; that this return will necessarily be gradual, and that any effort to accelerate it "artificially by striking at the transportation industry will produce reactions which would defeat the very purpose intended to be accomplished." Low earnings of carriers were repeatedly cited and it was declared that while expenses of operation have been to some extent diminished, they have not been diminished to such an extent as to permit further general reduc-

tions in rates, unless these reductions are preceded by reduction in wages. Mr. Bikle said that a 1 per cent reduction in freight rates would mean something over \$4,000,000 to the carriers of the country; that no one seemed to think that any stimulation of business would result short of at least a 10 per cent reduction, and that it was obvious "that such a reduction would be impossible." He further said that the testimony indicated that no stimulation of business would result from reductions of this character since the depression in business had resulted irrespective of the reductions in prices by producers, and that a small additional reduction which might be possible if the freight rates were reduced would "certainly have no more effect than the large reductions in prices already made." Shippers made a directly opposite argument.

Ore Mining Interests

Speaking for ore mining interests in New Jersey, and most of the steel industry of the country, except Buffalo district producers, Charles S. Belsterling appeared before the commission last Thursday afternoon and strongly urged cuts in railroad rates as being necessary to restore normal activity in the iron and steel markets. Asked by Commissioner Meyer what specific reductions he recommended, Mr. Belsterling said that the 40 per cent increase in rates effective on Aug. 26, 1920, should be wiped out as to iron ore and limestone; that rates on coal should be substantially lowered, and that rates on ore from New Jersey mines should be accorded equality with ex-lake and import ore rates. Iron and steel rates also should be reduced, he said, in line with any proposals that may be made to cut class rates.

Commissioner Potter asked Mr. Belsterling if the steel people should not give the commission cost figures and prices that are necessary to start the industry again. Mr. Belsterling pointed out that the evidence put into the record by iron and steel manufacturers showed plainly that they are producing in many lines at a loss and that rates being such a big item in steel production they must be reduced if the public is to be induced to begin buying again on a normal basis.

Mr. Belsterling insisted that the depression in iron and steel has been particularly prolonged unwarrantedly and uneconomically by high rates on finished material. He declared that the depression is not due to a lack of a desire or of power to buy but the refusal to buy at peak prices.

"The public will buy if prices are low enough," he said. "The steel industry has liquidated but the railroads have not, and the depression is the result. It is not possible to bring steel prices down to a normal level unless freight rates are brought down."

He pointed out that there was no commodity that is transported in interstate commerce in which the freight rate is of more importance than steel as it affects the consumer, because it requires from six to seven tons of raw material to produce a ton of finished material. It was insisted that steel manufacturers cannot forever continue to produce at a loss as they are doing to-day with railroad rates on a war basis. Replying to contentions of counsel for railroads during rebuttal proceedings that the public would not benefit if rates on iron and steel products were lowered, Mr. Belsterling said that the public would benefit.

Rates from New Jersey Mines

To show the high rates on iron ore from New Jersey mines, Mr. Belsterling says there is a charge of \$2 per ton for a haul of 75 miles as against the import

rate of \$1 per ton from Constable Hook, N. J., to Bethlehem, Pa. It was declared that a buyer was in the market recently for 100,000 tons of pig iron, but that the eastern Pennsylvania blast furnaces could not compete for the business on account of the low import and high domestic rates. But few blast furnaces are operating in eastern Pennsylvania, it was said, while not more than one mine in New Jersey is operating. In 1920, said Mr. Belsterling, ore shipments from lower lake ports to Eastern furnaces at a rate of \$1.50 per ton totaled 3,500,000 tons, from New Jersey mines they amounted to 500,000 tons and import shipments totaled 1,250,000 tons. With a rate of \$2.25 in 1921, respective shipments were declared to have been 20,000, 100,000 and 1,300,000 tons.

Combatting the views of Mr. Belsterling as to recommendations for rate reductions, Francis B. James, representing iron and steel interests in the Buffalo district, protested against cutting rates on iron ore from lower lake ports and urged reduction in rates on coal and coke. His argument was in line with testimony given by Buffalo producers and as made on several occasions with regard to plans to reduce ex-lake ore rates from lower ports to interior furnaces. He maintained that the rates on iron ore from and to the points mentioned are only 37.08 per cent of the rates on coal to lake front furnaces, although prior to the advance in rates on June 25, 1918, rates on ore were 50 per cent of the rates on coal.

"The carriers should first remove the monstrosity in the freight rates structure at the head of the lakes as to the ore rates and then reduce the coal and coke rates in line with the ore rates and after the coal and coke rates have been reduced relatively, so as to make them relatively just and reasonable as compared with the ore rates, then the ore rates and coal and coke rates should be simultaneously reduced," said Mr. James.

Proposed Reduction

He said that the trunk lines handling ex-lake ore had formulated a plan to file on March 16 tariffs, proposing to make effective on April 17, a 20 per cent reduction. It also has been reported that the reduction proposed is 14 per cent. The charge was made by Mr. James that the carriers are proposing to cut their rates on ex-lake ore so they would be able to say they had so depleted their revenues that they could not afford to make reductions on coal. By this means, he said, they would increase the disproportion between rates on ore and coal, which, he said, using the pre-war level as a base, was as 62 to 165.

He also charged that the tariffs of the carriers reducing by 28 per cent rates on ore other than ex-lake, filed to become effective April 1, were intended as an entering wedge to reducing ex-lake ore rates, the 28 per cent cut removing the 40 per cent advance of 1920. He quoted the resolution of the Trunk Line Association at its meeting on Feb. 24 when it also went on record in favor of restoring import iron ore rates, which have been reduced, to the basis in effect on Dec. 31, 1921. The resolution also called for restoration of rates on chrome and manganese ores to the basis in effect on the date named and where they were published as import rates they should be published effective April 1 as domestic rates.

Mr. James not only attacked the proposed cuts in ore rates and called for suspension of tariffs providing such action, but attacked the rebuttal evidence of the carriers as being an effort to prevent a reduction in the rates on coal. One effect of the heavy increases in rates on fuel, Mr. James said, is that steelmakers find it cheaper to allow their investment in by-product coke plants to lie idle and buy beehive coke. This, it was stated, reduced railroad tonnage because by-product ovens use 57,000,000 tons of coal to produce 40,000,000 tons of coke, and the carriers are given the latter tonnage in place of 57,000,000 tons of coal.

Cost of Pig Iron

F. L. Ballard, speaking for the Eastern Pig Iron Manufacturers, said the freight cost of assembling raw materials to make a ton of pig iron was \$18 and the selling price was only \$20.50, compared with a cost of

nearly \$24. The blast furnace interests, it was said, had deflated their costs except the cost of freight on their inbound material. He remarked that the pig iron industry is not of a mushroom growth, but had been established where it is in pre-revolutionary war days. High freight rates, Mr. Ballard said, had helped to cut the production to about one-fourth of normal.

Whatever the justification for the opinion may be, considerable significance was placed on the argument of Wilbur LaRoe, Jr., who appeared on behalf of his partner, former Chairman Edgar E. Clark of the Interstate Commerce Commission, who is ill as the result of an operation. Mr. Clark was to have spoken for the Chicago Association of Commerce. Mr. LaRoe said that a moderate reduction on all commodities, if any were possible, would be the only wise course for the commission to follow. He explained that he had not an opportunity to consult with Mr. Clark, but felt that he was presenting his general idea correctly. He said that the former chairman had taken the position of his client only after having considered it for himself.

"The association is not asking for a reduction in rates," said Mr. LaRoe, "although the business of its members has been restricted in such a way as to suggest that the percentage increases in rates caused the restriction. Its position is that if any reduction can be made, it should be given to all freight and that picking out this, that or the other commodity would lead to discrimination and dissatisfaction. The burden of freight rates falls on the whole nation."

Moderate Reduction

Chairman McChord asked Mr. LaRoe what he called a moderate reduction. The latter suggested 10 per cent, with nothing beyond 15 per cent. He argued against the more or less generally circulated suggestion that commodity rates might be cut with advantage to the country, but not class rates. He referred to such a procedure as being untenable and as tending to increase the advantage of the big shipper and the disadvantage of the smaller shipper. Doubt was expressed that statistics in the record warranted any reduction in any rates, but said that if the commission comes to a different conclusion, the Chicago Association of Commerce was firmly of the opinion that the benefit should be given to every article and not to selected ones. He admitted, however, that the record "seemed to show the country needed help in the form of reduced freight rates." He was strongly opposed to a reduction in passenger fares, thus taking a position diametrically opposite to that of attorneys for some State commissions.

"Wouldn't it be better for industry to stabilize itself on the present freight rates than to make a reduction of, say, 10 per cent now, and hold out a hope of another reduction in, say, six or eight months from now?" asked Commissioner Potter.

"Stabilization and certainty about freight rates certainly would be the best thing that could happen to the country," replied Mr. LaRoe, who conceded that certainty regarding freight rates was one thing the commission could not assure.

Attorney Rush C. Butler, representing the National Coal Association, strongly urged reductions in rates on bituminous coal, saying that rates on this product should be given special consideration because of its economic importance. He contended that lower rates on bituminous coal will reduce the unit operating expenses of the carriers; reduce the cost of materials and supplies used by them; reduce the market price of fuel coal to carriers and that such savings in coal costs alone will be sufficient to compensate for a substantial reduction in rates on fuel. He estimated that reduced rates on coal of 60c. per ton would release nearly \$1,000,000 a day in additional purchasing power which would be a strong stimulus to business revival and said the coal rates should not only be reduced but reduced to the bottom. Lower freight rates on industrial coal, he said, will also tend to re-establish normal production in industry. Over 50 per cent of the delivered cost of coal, it was declared, consists of freight rates. The average freight rate on soft coal was said to be \$2.27 per ton while the average price of soft coal f.o.b. mines is \$2.13 per ton.

Blast Furnaces of Hoskins Works at Lithgow, New South Wales, Australia

THE accompanying illustrations will serve to show the character of the blast furnace plant at Lithgow, New South Wales, Australia, of the Hoskins Iron & Steel Co., Ltd. Each of the two blast furnaces has four hot stoves. Alongside of each stack is one of the hot stoves and behind the stack and the one hot stove are the remaining three. The four hot stoves and the stack thus occupy a rectangle in plan.

The smaller photographic reproduction shows the open air sandcasting beds which are spanned by a 120-ft. crane. One of the crane runways may be seen and also the dust catchers. A vertical raw material elevat-

ing equipment serves both furnaces. Turbo-blowers are used for the blast, one of a capacity of 40,000 cu. ft. per min. at 18 lb. per sq. in. and two of 20,000 cu. ft. capacity.

At the Lithgow works, besides making pig iron and ferromanganese, the company produces steel blooms and billets, rails and fastenings, and structural, spring and agricultural steel. There is an iron mine at Cadia, 100 miles from Lithgow, and a limestone quarry 35 miles from Lithgow. There is a coke oven at Lithgow and also one at Dapto. The company makes cast iron pipe at Rhodes and at Sydney.

BRITISH FOREIGN TRADE

Further Increase in Steel Exports in January—
Sharp Decline in Imports

The January official returns of British foreign trade in steel and iron shows that the upward swing in exports, which has been a feature of recent months, was continued in January. The total exports were 261,119 gross tons, excluding iron ore and including scrap. This compares with 211,314 tons in December and with an average per month of 93,804 tons in the third quarter of last year. In January, 1921, the exports were 233,114 tons.

Iron and steel imports in January were 100,178 tons or much less than the influx late in 1921. In the last quarter these imports were 163,687 tons per month. In September they were 229,391 tons. The following table shows comparative data:

British Steel Exports and Imports, Gross Tons			
	Exports		Imports
October, 1921.....	161,683		189,536
November, 1921.....	202,059		184,064
December, 1921.....	211,314		132,463
January, 1922.....	261,119		100,178
Average per month, 1919.....	188,519		50,801
Average per month, 1920.....	274,881		128,685
Average per month, 1921.....	144,885		152,734
Average per month, 1913.....	420,757		195,264

The trend of some of the principal exports is shown by the following data:

Principal British Exports, Gross Tons			
	Average per Month		January
	1913	1921	1921 1922
Pig iron.....	78,771	8,602	13,561 24,409
Steel rails.....	41,676	14,698	17,953 35,928
Steel plates.....	11,162	10,673	26,218 4,851
Galvanized sheets.....	38,506	17,635	19,774 55,560
Steel bars.....	20,921	8,927	17,362 18,225
Tin plates.....	41,808	18,873	33,822 34,275
Black plates.....	5,679	1,178	1,426 2,643
Steel sheets.....			5,625 6,803

Exports of steel rails, galvanized sheets and tin plate have shown the most marked recovery in the above products.

Pig iron imports in January were 31,346 tons as compared with a monthly average in 1921 of 55,564 tons.

Iron ore imports in January were 193,244 tons,

which compares with a monthly average in 1921 of 157,298 tons.

Manganese ore imports in January were only 3806 tons. In 1921 they were 14,405 tons per month and in 1913 they were over 50,000 tons per month.

Poor Outlook for Machinery in Far East

The outlook for selling very much American machinery in the Far East does not look promising according to B. A. Tozzer, Cleveland sales manager of the Niles Tool Works and the Pratt & Whitney Co., who recently returned from a 14-months trip during which he visited China, India, Japan, Java and other Far Eastern countries for the purpose of seeing what the prospects were in those countries for selling machine tools. Mr. Tozzer made a brief reference to the machine tool situation in the Far East in an address before the Cleveland section of the American Society of Mechanical Engineers, March 7, which for the most part was devoted to a story of his experiences during his trip and the description of scenes shown by lantern slides, a large number of which he exhibited.

"There is no manufacturing, as we understand it, in the Far East," said Mr. Tozzer. "There are no factories where they make things in quantities. Labor saving machinery does not appeal to the people over there because labor is so cheap. The arsenals, ship yards and railroad shops are the only shops where they use high grade machinery. Some machinery is required for repair work of various kinds, but outside of the three fields I named we cannot compete for business because of the low grade, cheap machinery made in Germany and Japan."

Freight Rates Reduced

As a result of efforts by the Traffic Bureau of the Youngstown, Ohio, Chamber of Commerce freight rates on iron and steel and other commodities from the Mahoning and Shenango Valleys to North and South Carolina have been placed on the Pittsburgh basis. This effects a saving up to 6c. per 100 lb. on shipments of iron and steel products. An effort is being made to effect a similar equalization on shipments from the Youngstown district to Kentucky and Tennessee.

COAL STRIKE OUTLOOK

Efforts to Prevent Work Stopping--Need of Continuous Production

WASHINGTON, March 14.—With the approach of April 1, the date set for the strike of union bituminous and anthracite coal miners, the Government, through Secretary of Labor Davis, still is attempting to bring about conferences between bituminous mine operators and miners. Anthracite operators and miners have agreed to meet and will have a conference in New York to-morrow. Refusal of coal operators of western Pennsylvania and southern Ohio bituminous fields to meet miners for the purpose of negotiating new wage agreements has complicated the situation, and unless they change their attitude it is believed by Government officials that a strike is inevitable.

Nothing has come from Government sources to verify reports that the President, acting on the precedent of former President Roosevelt in the anthracite situation of 1904, might use the powers of his office to force an agreement between the operators and miners. While it is evident that the country is showing less concern over the threatened strike than it would have if it were scheduled to take place during the cold months, it is claimed here that the situation requires the most serious attention.

Granting that the output of non-union mines is sufficient to keep industries going at their present rate of operation and that even transportation would be hurt but little for the present, the view is taken that production should be continued on a normal basis in order to prevent a fuel famine next winter. Meanwhile, production of soft coal continues to increase slowly. The total output for the week ending March 4, including lignite and coal coked, is estimated by the Geological Survey at 10,536,000 net tons, an increase of 162,000 tons, or 1.6 per cent over the week preceding. Production is still some 2,600,000 tons short of the maximum reached just before the mine strike of 1919, an even 500,000 tons less than in the third week of last October, when consumers were expecting the railroad strike.

Until the forthcoming report on stocks as of March 1, is ready the present level of stocks will not be known with certainty, but according to the Geological Survey it will probably require putting another 10,000,000 tons into storage to raise consumers' reserves to the level reached at the close of the war. Since Jan. 1, production has exceeded consumption and it is claimed that consumers have added materially to their stocks.

The Geological Survey estimates that the output of bituminous coal in 1921 totaled 407,000,000 net tons.

Opposed to Ore Rate Reduction

WASHINGTON, March 14.—In a formal statement filed yesterday with the Interstate Commerce Commission by Attorney Francis B. James, representing Buffalo district iron and steel producers, request is made that the commission suspend all tariffs reducing rates on iron ore. As is known, railroads have filed tariffs proposing a reduction of 28 per cent, on April 1, of rates on iron ore, except ex-lake ore, in official classification territory.

Mr. James says in a statement that the carriers also propose to make a reduction of 20 per cent in the ex-lake ore rates and that tariffs for this purpose will be filed about March 16, to become effective about April 16. The statement of Mr. James reaffirms the contention of Buffalo producers that rates on coal should be reduced first. It is charged that the carriers at the last moment "are resorting to many ingenious devices to shrink their revenues on other species of traffic so as to persuade the Interstate Commerce Commission not to reduce the rates on coal."

Mr. James also states that "the carriers admit that the proposed reduction in rates on iron ore is a part of a scheme to equalize assembling costs, a principle universally condemned by the commission." The tariff reducing rates on ore, it is said, should be suspended

so that the whole subject may be investigated. Mr. James contends that to allow these tariffs to go into effect, "entailing a tremendous reduction of revenue to the carriers, merely means that the carriers will urge that there can be no reduction in coal rates." It is added that coal rates to Buffalo and vicinity are relatively too high as compared with ore rates.

February Construction Far Ahead of Last Year

February construction activity was 73 per cent greater in volume than it was in the corresponding month of last year, according to the F. W. Dodge Co. The total amount of contracts awarded last month in the 27 Northeastern States of the country amounted to \$177,365,000, an increase of 7 per cent over January, and the second largest February total on the Dodge company's record.

A significant feature of the February construction record is the increase in business buildings over January. The increase in square feet of space contracted for was 30 per cent, and the increase in total cost was 65 per cent. February business buildings amounted to \$39,180,000, or 22 per cent of the month's total, an unusually high percentage for this class, which was exceeded only by residential building, amounting to \$75,703,000, or 43 per cent of the total. Public works and utilities took third place, amounting to \$21,193,000, or 12 per cent of the total.

The accumulated volume of construction since the first of the year has been 60 per cent greater than in the first two months of last year. Contemplated new work reported in the first two months has amounted to over \$800,000,000, or more than double the amount of work placed under contract in the same period.

Corporation's Unfilled Orders Decline in February

The unfilled business on the books of the United States Steel Corporation as of Feb. 28 last amounted to 4,141,069 tons, or 100,609 tons less than reported on the books Jan. 31. In January the unfilled tonnage decreased 26,736 tons; in December, increased 17,872 tons; in November and October, decreased 35,287 and 273,841 tons respectively; in September, increased 28,744; whereas previously decreases were reported each month from August, 1920. A year ago the unfilled business amounted to 6,933,867 tons, or 2,792,798 tons more than on the books Feb. 28, last. At the close of February the Steel Corporation had less unfilled business on its books than it had before since December, 1914. The monthly unfilled tonnage since January, 1920, compares as follows:

	1922	1921	1920	1919
Jan. 31.....	4,241,678	7,573,164	9,285,441	6,684,268
Feb. 28.....	4,141,069	6,933,867	9,502,081	6,010,787
Mar. 31.....		6,284,765	9,892,075	5,430,572
Apr. 30.....		5,845,224	10,359,747	4,800,685
May 31.....		5,482,487	10,940,465	4,282,310
June 30.....		5,117,868	10,978,817	4,892,855
July 31.....		4,830,324	11,118,468	5,578,661
Aug. 31.....		4,531,926	10,805,038	6,109,108

The largest total of unfilled orders was on April 30, 1917, when it was 12,183,083 tons. The lowest was on Dec. 31, 1910, at 2,605,747 tons.

Bonds for Schneider et Cie. Offered

J. P. Morgan & Co. are offering at a price approximating par an issue of \$10,000,000 7½ per cent bonds of Schneider et Cie., the well known French steel manufacturer with principal works at Creusot.

Machine Tool Builders to Meet in April

The National Machine Tool Builders' Association will hold its spring meeting at the Hotel Traymore, Atlantic City, N. J., April 25 and 26.

of March 3, 1879.

Capital Charges and Labor Costs

It is profitable to note the change in the attitude of manufacturers toward capital charges in production costs. In appraisals recently of properties of a number of steel companies, for instance, iron ore rights providing a 30-year supply were not valued at much more than those providing a 20-year supply, the advantage of the longer period being rated much lower than would have been the case a few years ago.

Comparisons are also being made between blast furnaces, the most recently constructed, which involve all conceivable refinements for reducing the muscular effort necessary for operation and the slightly older furnaces whose designers were not so extremely particular.

Just after the armistice every one who contemplated improvements laid great stress upon what appeared to be the obvious necessity of reducing the employment of labor to the absolute minimum. Labor, to use a general though somewhat unfortunate term, appeared destined to be permanently scarce, at least in periods involving maximum production, and manufacturers were prepared to go to greater lengths than ever before in investing capital for reduction in the amount of labor required. The feeling in the past few months has been that the pendulum has swung too far.

A broader study of economic conditions might have prevented men from going so far in their appraisals of the future of labor supply. It is not necessary to produce goods for which there are no consumers, and the test frequently applied to mathematical formulas might have been used. Suppose we produced everything by entirely automatic means, what would be the condition? The channels of trade could be kept open only by men finding work in new occupations, and so radical a change could be effected only very gradually. Scarcity of labor ordinarily develops from savings being spent too rapidly, and therefore at a pace that cannot be maintained. That is equally true whether the savings are spent on things that do not last or in investment construction that does last.

This is not the first time that men have changed

their appraisals as to the amount of capital that may properly be tied up. The boom in Connellsville coking coal land of somewhat more than ten years ago will be recalled. Connellsville coal changed hands at prices up to \$2,000 and \$2,500 an acre, and when in 1909 an attempt was made to form a combination of the merchant properties in the Connellsville region the prices asked by many operators ranged from \$3,000 to \$4,000 an acre. Computation readily showed that to carry the coal at such values required coke as produced to yield a margin which the market had never afforded and therefore was not very likely to furnish. The dénouement was marked by the interesting event of the United States Steel Corporation, which had never held such exalted views of the value of coal in the ground, buying the Colonial Coke Co. properties from the Pittsburgh Coal Co. at a price involving about \$1,000 an acre for the 7000 acres.

To choose between a large capital outlay and a small current expense and a smaller capital outlay and a larger current expense requires particular farsightedness, for the capital charge once shouldered is permanent, whereas the current expense may be modified from time to time. Especial care is needed when the question is one of deciding upon a capital investment that involves spending the money upon labor, for if labor becomes more plentiful the replacement cost of the facilities constructed decreases while at the same time their economy—the dollars in labor that they save—is reduced.

Aside from the rapid increase in British steel exports in January to a figure far in excess of the American total, as shown elsewhere in this issue, the outstanding feature is the expansion in exports of British galvanized sheets. The January movement was 55,560 tons, a figure not approached since the pre-war days. In 1912 and 1913 the monthly averages were 54,900 and 63,500 tons respectively. The recent expansion dates from October, galvanized sheets now approximating one-fifth of the total exports, or not far below the pre-war movement. In decided contrast there is not only the low volume of total iron and steel exports from the United States, but also the more marked decline in

our shipments of galvanized sheets, approximating in recent months only about one-third of those before the war.

Fortunate Deflation in Steel

As consumers look back over the period of liquidation in steel they have reason for congratulation that strong hands were in control. Large though losses have been, they easily might have been far greater had there not been resistance to demands for drastic cuts. The recessions in late 1920 were sharp and prices fell rapidly to proximity with pre-war levels, which were everywhere made a measure of deflation. Nearer the pre-war basis for a long time (and still so) than any products save those of the farm and a few non-ferrous metals, conspicuously copper, the descent in prices was nevertheless not so precipitous as to prevent the disposal of accumulated consumer stocks. More than one steel user, as a result of this orderly readjustment, has been saved from going to the wall. Overwhelmed at the end of 1920 with shipments from a number of sellers, whereas he expected to be served by only one of those from whom he bought, the steel user has had all of 1921 for distributing his surplus in a market of gradually receding prices. At the outset, to be sure, he did find prices dropping at a rate of \$4 per ton per month, but for most of 1921 the rate was less than \$2 per ton and at the year end less than \$1. There is some satisfaction in realizing that conditions might have been worse. Losses admittedly great might have been widely disastrous if the leaders in the trade had not realized that price was a secondary factor in a market glutted with materials and that required as extended a deflation as possible.

Not "Economic Hallucinations"

In a recent address on "Some Economic Hallucinations," by Theodore H. Price, editor of *Commerce and Finance*, the so-called cycle theory of business depressions was sharply attacked. Mr. Price said that the theory assumes an alternation of business prosperity and prostration and insists that because we have been successful for a time we must then be unsuccessful for a while. He declared that most people have surrendered themselves to the theory so completely that they often bring on hard times by vociferously insisting that they are due. The "agonizing deflation" through which we have recently passed he considered to be largely attributable to the fact that some highly placed personages who had the power to make their prophecies come true were obsessed with a belief in the cycle theory.

Mr. Price uses extreme language in stating the theory, and he is to some extent right if we grant that it is adhered to rigidly and that at certain definite times there will be business depression. Such a conviction will unquestionably have a depressing influence and help to end prosperity. Some people certainly have made the theory of cycles mechanical and have followed it too far. In Ohio for many years Farmer Benner issued prophecies based on the cycle theory and won a fame that endured for a considerable time, but finally ended in a crash. Despite the fact that Benner often made a hit in his prophecies, he sometimes failed in part,

and in 1907 failed completely when he not only did not foresee the panic of that year but predicted great prosperity.

It is true that business history shows periods of prosperity and depression which have come with a measure of regularity, and it certainly cannot be maintained that all belief in the recurrence of depression in the industrial world is due to hallucinations. Human nature being what it is, every period of prosperity has brought transgression of economic laws, and the broken laws would not be denied their penalty. Great harm has been done, however, by gloomy forebodings. Much can be accomplished by not looking for depression at any time and to ameliorate conditions when prosperity wanes. Much has been accomplished by the Federal Reserve Bank, with its adjustment to credit requirements, and other ways of meeting financial stress and unemployment will be found.

Mr. Price also calls an hallucination the belief that the world is poorer as a result of the war. He claims that nearly all of the products of human energy are consumed or wear out in seven years, whether we are at peace or war, and hence that we are not poorer on account of the war. He overlooks the tremendous energy wasted by war, which if applied to the aims of peace would have accomplished results of great value. There was also tremendous loss in efficiency during the war and for several years after, that has not been recovered and probably will not be in a long time.

Mr. Price stands on better ground when he opposes the belief that we cannot prosper unless we continue for all time to sell more than we buy, collecting the difference between the accounts in cash. We must both buy and sell, and so long as the buying and selling are profitable, the balance of trade is not the all-important consideration.

Pig Iron Shrinkage in 1921

Production of pig iron in 1921 is officially reported at 16,688,126 tons, of which 16,593,396 tons was coke and anthracite iron. As the production figures month by month were compiled by THE IRON AGE, the year's total of coke and anthracite given in the issue of Jan. 5 being 16,543,686 tons, or only 50,000 tons different from the official figure given now, the chief interest in the statistics at this later date is in the details. The distribution by grades varied little from 1920 to 1921, even though there was a decrease of 55 per cent in the total. Malleable, forge and ferromanganese each decreased about 65 per cent, while Bessemer and basic decreased less than 54 per cent.

A remarkable divergence in the 1921 statistics is the small proportion of steel-making iron reported as being made for sale. In 1920 12.8 per cent of the basic iron production was given as made for sale, while in 1921 the proportion was only 7.3 per cent. In the case of Bessemer and low phosphorus iron the decrease was from 9.1 per cent to 7.3 per cent. It may be suggested that in 1921 some steel works sold pig iron which had originally been made for their own use and that all such iron may not have been reported as having been made for sale when as an actual fact it was not made for sale, the sale being a subsequent development. In that event the consumption of pur-

chased iron would not be altogether so small as suggested by the statistics, but the fact would remain that merchant furnaces did not make the iron.

Taking all grades of pig iron, the percentages of the total reported as being made for sale were as follows, beginning with the first year for which these particulars were reported:

1913	20.8	1916	28.5	1919	28.0
1914	21.6	1917	30.1	1920	29.0
1915	28.7	1918	27.6	1921	22.4

The year 1921 is seen to have been unique among the years covered. The divergence is different in character from the change which occurred before 1913 when steel works that had been buying iron built furnaces of their own, partly because they desired to have the advantage of using molten iron. In a few instances the end was attained by buying merchant furnaces.

Assuming that the merchant furnaces delivered no basic iron in molten condition, the proportion of steel works basic iron delivered molten changed only from 83.9 per cent in 1913 to 84.9 per cent in 1920, but in 1921 the proportion dropped to 78.2 per cent. This drop is no doubt attributable chiefly to the intermittent and irregular operation of basic open-hearth furnaces last year, particularly in the early months, cold pig iron being accumulated at works whose regular practice involved direct metal.

The badness of the year 1921 has already been sufficiently commented upon, but mention may be made of the appearance the 1921 pig iron production will present in the annals that will be consulted in the future. There have been other years of light production, but none that represented nearly so great a backward step. The production in 1865 was the lightest in three years, while 1876 showed the lightest in five years, 1894 the lightest in six years and 1908 the lightest in seven years, but the production in 1921 was the lightest in thirteen years. In that respect the year leaves a record that cannot well be beaten. The rate of production at the beginning of this month, as indicated by our blast furnace report last week, was 30 per cent above the average rate in 1921.

Pyrites Cinder and the Blast Furnace

Before the war the greater part of the sulphuric acid output of the country was made from iron pyrites. To-day probably 75 per cent of the pyrites formerly so used has been displaced, acid being made by the burning of brimstone which can be obtained at a lower cost. The change is reflected in the imports of pyrites. In 1912 and 1913 about 975,000 tons was imported in each year. In 1920 imports declined to 332,600 tons and in 1921 to only 216,200 tons.

These facts have a bearing also on the pig iron industry. For many years the cinder from the burned pyrites, commonly known as "blue billy," accumulated in large heaps in the yards of acid manufacturers. Later a campaign was undertaken which resulted in the selling of this cinder to blast furnace plants, and the use of a certain amount of pyrite cinder in blast furnace mixtures has continued to the present time. Recently the question of swollen blast furnace linings, due to

an absorption of zinc by the brick, was discussed in these columns. With the exception of the pyrites coming from Spain, that which was used by American acid makers contained a moderate amount of zinc which remained in the cinder. It is reasonable to infer that blast furnaces which used blue billy freely had marked trouble from the zinc-impregnated brick. Now that pyrites cinder is to figure in blast furnace mixtures to a much smaller extent than before, less zinc-carrying material will be charged and the troubles due to zinc impregnation should largely disappear.

CORRESPONDENCE

Liquidation of 50 Per Cent Ferrosilicon

To the Editor: We have noted with great interest your editorial on page 597 in THE IRON AGE, March 2, on the subject of the extreme post-war liquidation in regard to 50 per cent ferrosilicon.

Everything that you say is true, although you might have enlarged on the point that, because of lack of tariff protection, what little business there has been available has largely gone to foreign producers.

It is truly stated by you that war demand was such an incentive to the installation of new plants that they were developed in excess of to-day's needs. There is very much more electric furnace plant installation for making 50 per cent and higher grades of ferrosilicon than the country can possibly keep busy in the next several decades; and yet, essential as these plants were during the war, it appears that the industry is going to be destroyed and the country once more left dependent on outside or foreign supply, as a result of the dilatory action of Congress in respect to the tariff bill.

Prices at present obtainable for any grade of ferrosilicon are notoriously unprofitable, but there are many users of the commodity who cannot understand or believe this, assuming that because somebody is willing to sell them there must naturally be a profit in the transaction. The real truth is that electric furnace operators making ferroalloys were left at the end of the war with electric power contracts which in many if not in most cases require payment for the power whether it can be used or not. This situation brings to each producer the question of whether to lose some money on the finished product or perhaps more money in paying for power unconsumed; and is the chief explanation why ferrosilicon is selling below its cost of production to-day.

The writer feels quite sure that the other producers of ferrosilicon will, as he does, appreciate your remarks on this subject, and believes there is opportunity to enlarge upon them.

PAUL J. KRUESI,

President, Southern Ferro Alloys Co.
Chattanooga, Tenn., March 7.

Cobalt Magnet Steel

To the Editor: With reference to the interesting announcement on page 350 of your issue of Feb. 2, in which you quoted from the *London Ironmonger*, we beg to mention for the sake of interested parties that the cobalt magnet steel referred to is the invention of P. R. Kuehnrich, chairman Darwin & Milner, Ltd., Sheffield, one of the best known authorities on empirical research work on special alloy steels and the inventor of a number of them, well known to the trade, as for instance, the so-called cobaltchrom steel. Cobalt magnet steel is the product of the Cobalt Magnet Steel Co., Ltd., Sheffield, represented in the United States by Darwin & Milner, Inc., 403 Long Avenue, Cleveland.

DARWIN & MILNER, INC.

Cleveland, March 11.

REVISING STEEL SCHEDULE

Many Changes Said to Have Been Agreed Upon by Majority of Senate Committee

WASHINGTON, March 14.—Revision of the steel schedule of the permanent tariff by Republicans of the Senate Committee on Finance is said to have been tentatively completed except as to several items. Those chiefly under discussion are understood to relate to the ferroalloy section. The committee apparently has reduced House rates on those products but has not as yet fixed the duty on ferromanganese. It is said that manganese ore has been placed on the free list as compared with the duty of 1c. per pound of metallic manganese in the Fordney House bill, and that consideration is being given to the fixing of a ferromanganese duty of 1c. per pound of manganese while the House gave a duty of 2 1/5c. per pound when containing in excess of 1 per cent of carbon and 2 1/5c. per pound and 23 per cent ad valorem when containing less than 1 per cent of carbon. Tungsten ore is said to have been made dutiable at \$9 per 20 pounds of tungstic trioxide as compared with 45c. per pound of metallic tungsten in the House bill, which provides no unit basis. Ferrotungsten, made dutiable at 72c. per pound on tungsten content and 15 per cent ad valorem in the House bill, is said to have been given a duty of 9/10c. per pound for each per cent of tungsten content and high-speed tungsten steel and all alloy steels containing tungsten are said to have been made dutiable at 35 per cent ad valorem.

The pig iron duty of \$1.25 per ton in the House bill is reported to have been increased to the Payne-Aldrich rate of \$2.50 per ton. Rates on ferrosilicon are also reported to have been lowered as well as those on magnesite. While it is said there have been a number of changes in phraseology of the steel schedule, it is reported that as to the general line of rolled steel products no great changes have been made in the House bill, but that some suggestions of manufacturers to make the schedule more scientific have been adopted.

Tentative preparation of the steel schedule has followed conferences held here between members of the Finance Committee, steel makers, ferroalloy producers and others, including those interested in magnesite, etc.

The committee is unable to say when the tariff bill will be reported, but it is said that so much progress has been made that prints of the bill are about ready, and that introduction in the Senate will follow soon; it is claimed that the bill has been written in two forms, one on an American valuation and the other on the foreign valuation plan, the latter taking higher duties than the former, where ad valorem duties apply; many duties are said to have been transferred to a specific basis in order to avoid as much as possible the difficulties as to assigning import levies.

Merger of Rolls Manufacturers Progressing

PITTSBURGH, March 13.—Negotiations which have been in progress for several months, looking toward a merger of three of the leading manufacturers of rolls and rolling mill equipment of the country, are approaching the final stages and an official statement is expected in the next few weeks. The companies involved are the Mackintosh-Hemphill Co., the A. Garrison Foundry Co. and the Pittsburgh Iron & Steel Foundries Co. J. Ramsey Speer, chairman Pittsburgh Iron & Steel Foundries Co., has played an active part in this combination, the fundamental reasons for which are economies of operation and a concentration of products. Although not official, it may be said authoritatively

that the controlling factors in the A. Garrison Foundry Co. have sold out their interests and will not be active in the affairs of the new company.

Order for Freighter Placed

CLEVELAND, March 14.—An order for a 450-ft. lake boat for the coal and stone trade has been placed with the Manitowac Ship Building Corporation. This is the first order for a freighter that has been placed with an American Great Lakes shipyard this season.

Dennison K. Bullens, author of "Steel and Its Heat Treatment," was the speaker of a joint dinner and meeting of the Pittsburgh Chapter, American Society for Steel Treating and the Pittsburgh Chapter, American Institute of Mining and Metallurgical Engineers, held Tuesday, March 7, at the Bureau of Mines Building, Pittsburgh.

COMING MEETINGS

March

Refractories Manufacturers' Association. March 15, 16 and 17. Annual meeting, Chicago. Secretary, F. W. Donahoe.

Taylor Society. March 16 to 18. Midwinter meeting, City Club, Philadelphia. Managing director, Dr. H. S. Person, 29 West Thirty-ninth Street, New York.

April

National Federation of Construction Industries. April 3, 4 and 5. National conference, Drake Hotel, Chicago. Association headquarters, Drexel Building, Philadelphia.

National Metal Trades Association. April 19 and 20. Annual meeting, Hotel Astor, New York. Secretary, Louis W. Fischer, Peoples Gas Building, Chicago.

American Gear Manufacturers' Association. April 20, 21 and 22. Annual meeting, Hotel Lafayette, Buffalo. Secretary, E. D. Hamlin, 4401 Germantown Avenue, Philadelphia.

American Supply and Machinery Manufacturers' Association and Southern Supply & Machinery Dealers' Association. Joint Meeting, April 24 to 26, Birmingham. E. D. Mitchell, 233 Broadway, New York, is secretary of the American association and A. M. Smith, Smith-Courtney Co., Richmond, Va., is secretary of the Southern association.

National Machine Tool Builders' Association. April 25 and 26. Spring convention, Hotel Traymore, Atlantic City, N. J. General manager, E. F. DuBrul, 817 Provident Bank Building, Cincinnati.

Society of Industrial Engineers. April 26 to 28. Spring meeting, Hotel Statler, Detroit. George C. Dent, business manager, 327 S. La Salle Street, Chicago.

American Electrochemical Society. April 27 to 29. Spring meeting, Baltimore. Acting secretary, Dr. Colin G. Fink, 110 Park Avenue, New York.

May

Iron and Steel Institute. May 4 and 5. Annual Meeting, Quarters of Institution of Civil Engineers, London, England. Secretary, George C. Lloyd, 28 Victoria Street, S. W., London.

The National Supply and Machinery Dealers' Association. May 8, 9 and 10. Seventeenth annual convention, Marlborough-Blenheim Hotel, Atlantic City. Secretary, T. James Fernley, 505 Arch Street, Philadelphia.

American Society of Mechanical Engineers. May 8 to 10. Spring meeting, Atlanta, Ga. Secretary, Calvin W. Rice, 29 West Thirty-ninth Street, New York.

National Association of Manufacturers. May 8, 9 and 10. Annual Convention, Waldorf-Astoria Hotel, New York. General Offices, 50 Church Street, New York.

National Foreign Trade Council. May 10 to 12. Convention, Philadelphia. Secretary, O. K. Davis, 1 Hanover Square, New York.

National Sheet Metal Contractors' Association. May 15 to 19. Convention and exposition, Cadle Tabernacle, Indianapolis.

National Association of Purchasing Agents. May 15 to 20. Annual convention and exposition, Exposition Park, Rochester, N. Y. Secretary, H. H. Heydon, 19 Park Place, New York.

American Iron, Steel & Heavy Hardware Association. May 23 to 25. Annual meeting, Hotel Washington, Washington. Secretary, A. H. Chamberlain, Marbridge Building, New York.

American Society for Steel Treating. May 25 and 26. Sectional meeting, Pittsburgh. Secretary, W. H. Eisenman, 4600 Prospect Avenue, Cleveland.

Iron and Steel Markets

INCREASE IN DEMAND

Larger Scale of Operations Continued

Coal Strike, Spring Demand and the Effort to Raise Prices Are Leading Factors

An increased demand for steel products is more plainly indicated, but throughout the trade great care is taken lest its extent be overstated. Operations continue at the higher rate shown by February statistics. For the Steel Corporation they are slightly under 60 per cent this week and for the whole industry are probably between 55 and 60 per cent.

Buyers and sellers are watching closely for developments in three directions—the coal strike, spring demand, and the effort of the steel companies to advance prices on plates, shapes and bars.

A strike at union mines on April 1 is everywhere expected and there is more disposition this week to believe that some of the recent buying of steel was precautionary. Non-union mines can increase their output, but some independent steel companies have only union properties. As to spring demand for steel, it is not considered to have figured largely in the buying of recent weeks and its volume remains to be gaged.

Results from the effort to advance prices on plates, shapes and bars cannot be measured as yet, but several steel companies are now holding for 1.50c., while others have advanced \$1 to \$2 above their low quotations. The Steel Corporation, it appears, did not go below 1.35c. in the recent breaks and 1.40c. is now more commonly maintained on the three heavy products than in a number of weeks.

A factor not easily determined is the amount of protection given consumers at the low prices. The immediate effect of the higher quotations has been favorable in the heavy products, and there is less pressure for low prices on other forms of finished steel.

The gradual broadening of railroad demand is not to be underestimated as a hopeful feature. The last rail order is 18,000 tons for the Chesapeake & Ohio. For the New York Central 1000 box cars have been placed and indications are that the St. Paul, which has inquired for 1000 cars, will actually buy 4500. This road is inquiring for 50 locomotives and the Florida East Coast has bought 10.

Indications are that miscellaneous railroad buying will be a considerable factor in the near future. For track supplies there are numerous small orders apart from 5000 kegs for the Pennsylvania and 3000 kegs for the Southern Pacific. At Chicago 2c., Pittsburgh, is the price, but in Eastern Pennsylvania business has been done as low as 2.20c. at mill. The rail mill at Gary is turning out 35,000 tons per month and bookings are sufficient to maintain this rate through the year.

The Steelton mill of the Bethlehem Steel Co., which has been out of the girder rail market for several years, is now actively competing for trolley line business. Boston reports contracts for 4700 tons in the past week.

Including 11,850 tons for an ore dock at Superior, Wis., for the Great Northern, fresh structural steel work totaled over 83,000 tons. Awards were, roughly, 24,000 tons.

Improvement in the demand for sheets continues and the operation of the mills is better than in several months. Automobile buying is larger. Bookings of the American Sheet & Tin Plate Co. last week were the heaviest in two years.

Recent buying of steel bars at Chicago, while largely for replenishment, has been in part for seasonal needs. Bar mills are not likely to feel the effect of the advances in farm products for some months.

Jobbers have been buying wire and nails more freely and in some cases have acquired stock for the coming season.

Export trade has improved in spots and on a few products slight advances have been secured. New inquiries for rails for Japan amount to 18,000 tons and some rail business is pending in Brazil.

Many sales of foundry pig iron for prompt delivery are being made and there is evidence of increasing melt, particularly in the East, but transactions are not large and they have caused no advance from the low prices recently named in Buffalo, Birmingham and some other centers. At Pittsburgh basic pig iron is 25c. higher, going to \$18, Valley, on a sale of 1000 tons.

Recent buying of steel scrap and blast furnace turnings by several steel plants in the Pittsburgh district at advancing prices has caused a flurry in the scrap market as dealers have tried to cover on their orders. The highest prices since early in 1921 have been realized.

Pittsburgh

PITTSBURGH, March 14.

On the whole the effect of the recent lifting of quotations on plates, shapes and bars upon the general steel market has been favorable, although the new base as yet has little or no foundation in sales and the claim is made by the important buyers of these products that they still are able to place business at 1.35c. to 1.40c. There is no question that the general structure of prices has been strengthened by the action of the leading Pittsburgh independent, which has been followed by all other independent companies. The Carnegie Steel Co. has not made a public announcement as to prices for some time, contenting itself with going along with the general market.

A good many wavering orders have been driven in by the advance and if the market actually has not reached the new basis, at least there has been almost complete disappearance of quotations of less than 1.40c. Another favorable development of the withdrawal of the extremely low prices on the heavy tonnage products has been to lighten the pressure for lower prices on other lines of finished steel. When plates, shapes and bars could be bought as low as 1.30c., buyers of other products naturally felt that prices of these other products could not be maintained and were inclined to order sparingly.

For some time past it has not been a lack of needs so much as a lack of confidence in the maintenance of prices that has retarded business. The market reflects a more cheerful undertone, but the idea that a return

--	---

to normal conditions is immediately ahead finds few subscribers.

Increase in the orders for plates, shapes and bars has not been so great as to make it necessary for the mills to advance delivery dates against new business. Improvement in the demand for sheets continues, and there is now a better general operation of the mills than before in several months. Bookings of the American Sheet & Tin Plate Co. last week were the heaviest for any week in about two years. Business in wire products still is good and there has been no let down in the specification for tin plates. There is a livelier market in strips and makers of nuts, bolts and rivets in this district, for the first time in more than a year, are talking more cheerfully about business. Tubular goods prices show a firmer tendency, although some recent business in line pipe is understood to have been placed at very low prices.

The pig iron market is slightly firmer, although not much activity is apparent. The impending strike of union coal miners is attended by very little excitement

in the fuel market, but there is a pretty lively situation in scrap iron and steel, due to the efforts of sellers to cover against recent sales.

Of the 140 blast furnaces in this and nearby districts, 62 now are in blast and steel plant operations, taking in both steel works and finishing mills, average between 55 and 60 per cent of capacity.

Pig Iron.—Business does not show much life, but the market shows considerable firmness on all grades and actually has advanced 25c. per ton on basic, of which we note a sale of 1000 tons at \$18, Valley furnace. There also has been a sale of 600 tons of this grade at \$18 by the Republic Iron & Steel Co., and since both transactions were subject to competition, it is plain that there no longer is any basis for a price of less than \$18, Valley furnace. Only small lots of Bessemer iron are being moved by Valley furnaces, but these invariably have been at \$19.50, and as far as Valley furnaces are concerned the market is hardly quotable at less. There is a pretty steady demand for foundry iron, but few of the sales are individually large. The market on this

grade is well established at \$19 for No. 2. A sanitary ware manufacturer with plants in this district and the South has entered the market for the April requirements for the local plants, amounting to about 2000 tons each of plain No 2 and No. 2X. This interest is reported to have closed for the second quarter requirements of its Southern plant amounting to 9000 tons, at \$15, Birmingham, for the base grade.

We quote Valley furnace, the freight rate for delivery to the Cleveland or Pittsburgh district being \$1.96 per gross ton:

Basic	\$18.00
Bessemer	19.50
Gray, forge	18.75
No. 2 foundry	19.00
No. 3 foundry	18.75
Malleable	19.00

Ferrolloys.—Interest in ferromanganese on the part of steel makers is increasing and while most of the inquiries are for small lots, a few of fair size recently have come out. A Buffalo steel maker is in the market for 1200 tons of 80 per cent material. We note a sale of 500 tons to a Valley steel works and it is currently reported that the Carnegie Steel Co. recently took an order for 2000 tons from a Pittsburgh district independent. This lot is understood to have brought the full quotation of \$62.50, seaboard. Commercial producers, however, appear more eager for business and all are not adhering rigidly to that base, except on carload lots. On the basis of recent sales and quotations against large inquiries, the market now is quotable at \$60 to \$62.50, Atlantic seaboard. An Eastern maker of spiegeleisen has announced quotations of \$35, furnace, for 20 per cent material and \$30 for 16 to 19 per cent. There has been hardly enough demand lately to provide a real test of these prices. The impression prevails that less can be done on large lots. The market for 50 per cent ferrosilicon is inactive and nominal.

We quote 78 to 82 per cent ferromanganese, \$60 to \$62.50 c.i.f. Atlantic seaboard for domestic and English. Average 20 per cent spiegeleisen, \$35 furnace; 16 to 19 per cent, \$30 furnace; 50 per cent ferrosilicon, domestic, \$55 to \$60 furnace, freight allowed. Bessemer ferrosilicon is quoted f.o.b. Jackson and New Straitsville, Ohio, furnaces as follows: 10 per cent, \$36.50; 11 per cent, \$39.80; 12 per cent, \$43.10; 13 per cent, \$47.10; 14 per cent, \$52.10; silvery iron, 6 per cent, \$25; 7 per cent, \$26; 8 per cent, \$27.50; 9 per cent, \$29.50; 10 per cent, \$31.50; 11 per cent, \$34; 12 per cent, \$36.50. The present freight rate from Jackson and New Straitsville, Ohio, into the Pittsburgh district is \$4.06 per gross ton.

Billets, Sheet Bars and Slabs.—Sales of forging billets are fairly numerous, though usually in small lots, the going price being \$32, base. Semi-finished steel does not yet reflect the enlargement of finishing mill operations, there being little open market demand for soft billets, slabs or sheet bars. Non-integrated sheet and tin plate makers appear to be covered by contracts for sheet bars. Those equipped to roll billets into bars or slabs into plates or skelp can buy the finished products more cheaply than they can make them. There is no change in prices.

We quote 4 x 4-in. soft Bessemer and open-hearth billets at \$28; 2 x 2-in. billets, \$29; Bessemer and open-hearth sheet bars, \$29; slabs, \$28; forging billets, ordinary carbons, \$32, all f.o.b. Youngstown or Pittsburgh mills.

Wire Rods.—The market is firm but not especially active as far as domestic users are concerned. Makers generally are quoting \$36, Pittsburgh, or Youngstown, for the base size of soft rods and small lots are moving on that basis. Export sales are reported at \$35, but this represents an advance since it transpires that business was done as low as \$33 a few weeks ago. Prices are given on page 761.

Steel Skelp.—Prices remain indeterminate in the absence of important inquiries and sales. With higher prices quoted on plates, however, an effort is being made to boost the price of skelp and 1.50c. is quoted though 1.40c. is nearer the base of such sales as are made.

Wire Products.—Some uncertainty exists as to the real base of bright and annealed wire and there are rumors that less than \$2.40 base per keg is being done on nails. So far as manufacturers in this district are concerned, the market is \$2.25 base per 100 lb. for wire and \$2.40 base per keg for nails, and these figures are rigidly observed. The doubt about wire prices undoubtedly arises from the fact that when makers au-

thorized the acceptance of nail orders at \$2.40, it was assumed by district offices that a like reduction applied on wire, putting the price to \$2.15, and business was accepted on that understanding and could not well be repudiated. Reports of price cutting on nails are denied. Business is fairly active but still is below the average of other years at this particular season.

We quote wire nails at \$2.40 base per keg, Pittsburgh, and bright basic and Bessemer wire at \$2.25 base per 100 lb., Pittsburgh.

Iron and Steel Pipe.—Prices of merchant steel pipe are firmer, as those makers who recently were making special price inducements to secure orders have either withdrawn them or are showing less desire for business at the figures they recently named. Business in this line is steady, but few, if any, of the makers are sold up to a point where there is any question of early deliveries. Oil well goods are moving with a little more freedom and there has been a fair number of line pipe orders. Among the latter was one of 1200 to 1500 tons of 6-in. and 8-in. to a Pittsburgh oil company with wells in West Virginia and in the West; also 28 miles of 6-in. and 26 miles of 8-in. for the Wyoming field, all of this business going to a Valley manufacturer. The market for line pipe still is a buyers' affair. Makers of wrought iron pipe report a steady but not very active demand for merchant pipe. Card discounts are given on page 761.

Sheets.—Continued improvement is noted in the demand for sheets, the feature of which is its diversity. Metal furniture manufacturers lately have been ordering freely and there is an improved demand from the automotive industry, while material for building work is in strong demand. The American Sheet & Tin Plate Co. last week had the largest bookings and specifications of any week in about two years, its business even exceeding that of the week before. This company last week operated 78 per cent of its sheet mills. Independent companies also are getting larger orders and are running between 65 and 70 per cent of capacity. Sheets easily are the most active of the finished products and adherence to quoted prices is more rigid than it has been, not only on black and galvanized, but on blue annealed stock. Prices are given on page 761.

Tin Plate.—Container manufacturers are specifying freely on contracts and there is still a high rate of operation of the mills, this being particularly true of the independent units, which are averaging about 80 per cent. There are few of the independents without a backlog, some not being in a position to take on additional business for shipment before May. This condition finds reflection in a firmer tone to prices. An Eastern maker is understood to have withdrawn some very low prices recently named on Pacific Coast business. The leading interest is running about 65 per cent of capacity and this with 80 per cent by the independents means an average for the entire industry of approximately 75 per cent.

We quote standard production coke tin plate, \$4.60 per base box f.o.b. Pittsburgh for carload lots.

Steel Rails.—There has been no special change in light rails, either as to prices or demand. The Carnegie Steel Co. still is quoting 1.45c. base, and is getting a fair run of orders and specifications at that figure. Independents are trying to get the same price, but are not letting orders get away at 1.40c. base. Demand is not very brisk.

We quote 25 to 45-lb. sections, rolled from new steel, 1.40c. base; rolled from old rails, 1.35c. base; standard rails, \$40 per gross ton mill for Bessemer and open-hearth sections.

Cold-Finished Steel Bars and Shafting.—The firmer tendency in hot-rolled bars has not yet been reflected in the price of cold-finished bars, which remains at 1.90c. base, and still is being shaded occasionally on orders that are attractive from a rolling standpoint. Business is better than it was earlier in the year and is well diversified. One maker in this district in checking up this month's business in comparison with that of last month and with March of last year, finds that this month shows a gain over February of close to 50 per cent and over that of March last year of more than 300 per cent. In general, however, the trade admits

that there is still room for considerable improvement. Ground shafting holds at 2.25c. base, mill, for carload lots.

Hoops and Bands.—A pretty strong effort is being made to stabilize hoops at 1.90c. base, Pittsburgh, and some business is being booked at that figure, although buyers with desirable orders still are able to place them at \$1 to \$2 per ton less. The market in bands is not very well defined and while the official quotation is 1.90c. base, Pittsburgh, it is admitted that no business is possible at that figure. Bands appear to be quotable generally at 1.75c. to 1.85c.

Hot-Rolled and Cold-Rolled Strips.—Recent betterment in business is well maintained, the feature of the buying being its diversity rather than the size of the individual orders. Cold-rolled strips are holding well at 3.50c. base, Pittsburgh, and now that the mills have a fair accumulation of orders in hot-rolled strips, there is more disposition to seek prices that will reduce the loss which sales of less than 1.90c. base involve.

Nuts and Bolts.—Orders with makers in this district are more numerous than they have been, but individually they run pretty small and consequently lack volume. Evidently there is not yet enough business to give all a share because concessions from quotations still are reported. Discounts are given on page 761.

Rivets.—Business is better, but the improvement is in the number rather than in the size of the orders. A feature is that demand now is coming from widely scattered sources and no longer is largely confined to tank builders as was the case recently. Leading makers deny having abandoned quotations of \$2.25 and \$2.35 base, per 100-lb. on heavy rivets, and claim to be getting specifications against contracts for small rivets taken at 70, 10 and 10 per cent off list. On the other hand, it is well established that a few sizable orders for small rivets have attracted an additional 5 per cent on top of the quoted discount of 75 and 10 per cent off list. Some bolt and nut makers have taken orders for certain sizes of rivets as low as \$1.90 base, per 100 lb. Prices and discounts are given on page 761.

Spikes and Track Bolts.—Railroads seem to have covered against their early spring requirements and standard spikes now are rather inactive. The Pennsylvania Railroad recently closed for about 500 kegs for the Central Region and for a larger quantity for the Eastern Region. A report that the Chicago, Burlington & Quincy Railroad recently bought a large quantity of spikes is denied. The market on standard spikes in small lots is quoted at \$2.10 base, per 100 lb., but on large lots the railroads have been able to negotiate tonnages down to \$2 base, per 100 lb. Track bolts still are quoted at \$3 base, per 100 lb. in carloads, but the market is rather weak at that price and on less than carloads, business has been done at much less than the usual 1c. per lb. extra over carload lots. Prices are given on page 761.

Iron and Steel Bars.—The effect of the recent advance to 1.50c., base, by most companies has been to crystallize the market, as far as sales are concerned, at around 1.40c. There is no question that the mills allowed regular customers to get under cover prior to the advance, and if there have been any sales at the new quotations, they have involved unimportant tonnages. Makers of iron bars in this district still are holding to 2c. to 2.10c. for refined iron, but note no material improvement in demand.

We quote steel bars rolled from billets at 1.40c. to 1.50c.; reinforcing bars, rolled from billets, 1.40c. to 1.50c. base; reinforcing bars, rolled from old rails, 1.30c. to 1.40c.; refined iron bars, 2c. to 2.10c. in carloads, f.o.b. mill, Pittsburgh.

Structural Material.—Recent advance in price of plain material to 1.50c., base, by most companies is regarded by important fabricating interests as nothing more than an effort to stave off demands for tonnages at 1.30c., base, or less. The claim is made that orders can be placed yet at 1.35c. to 1.40c., and of course there is much tonnage on which the mills have given the fabricating shops protection, at around these prices. There has been a complete dearth of structural awards among the shops here, but inquiries are numerous and hopes still run strong of a good spring business. Prices are given on page 761.

Plates.—The new price of 1.50c. as yet has found little, if any, basis in sales, and as a selling price the present market appears to be quotable at 1.40c. Much business which was pending, however, has been driven in by the advance in asking prices.

We quote sheared plates, $\frac{1}{4}$ in. and heavier, tank quality, at 1.40c. to 1.50c., f.o.b. Pittsburgh.

Boiler Tubes.—Business in steel tubes steadily is increasing, but there is not yet enough to give all a share and prices remain favorable to buyers. An effort is being made to put prices on a more profitable level, but not much headway yet can be reported. Card discounts are given on page 761.

Coke and Coal.—The market gives little sign of the impending strike of union coal miners. Activity is not of a pronounced sort in either coke or coal and if prices show any definite tendency, it is toward lower rather than higher levels. Spot furnace coke still is quotable at from \$3.25 to \$3.50 per net ton oven, while spot tonnages of foundry grade are moving at \$1 per ton premium over furnace fuel. There have been a few sales of both grades at 25c. per ton above the maximum figure, but lately demand has been a little less insistent for tonnages for stocking and \$3.50 for furnace coke and \$4.50 for foundry grade have become common maximum. The Lackawanna Steel Co., which recently inquired for 15,000 tons of beehive oven coke a month for second quarter delivery, is reported to have closed at \$3.50 per net ton oven. Coal prices are easier within about the recent quotations of \$1.50 to \$1.75 for mine run steam for prompt shipment; \$1.75 to \$2 for mine run by-product, and from \$2.15 to \$2.40 for mine run gas coal.

Old Material.—The market maintains a very firm undertone, although there has been a considerable contraction in buying by melters in the last two weeks. The market gains its strength from the fact that those who took orders a short time ago from the steel mills in this and nearby districts still are endeavoring to cover them and are obliged to offer pretty attractive prices to secure supplies. Offerings of industrial scrap are pretty limited and the railroads at present appear to be providing the bulk of the available supply. Bids of \$15 for heavy melting steel have found no response and it is doubtful whether much of this grade to-day could be had at \$15.50. The market is stronger on blast furnace material, notably on good clean borings, while machine shop turnings lately have sold as high as \$11. The market remains rather dull on the foundry grades.

We quote for delivery to consumers' mills in the Pittsburgh and other districts taking the Pittsburgh freight rate, as follows:

Heavy melting steel, Steubenville, Follansbee, Brackenridge, Monessen, Midland and Pittsburgh.....	\$15.00 to \$15.50
No. 1 cast, cupola size.....	15.75 to 16.25
Re-rolling rails, Newark and Cambridge, Ohio; Cumberland, Md.; Huntington, W. Va., and Franklin, Pa.....	15.00 to 15.50
Compressed sheet steel.....	13.00 to 13.50
Bundled sheets, sides and ends.....	12.00 to 12.50

Collecting Fuel Reserves

YOUNGSTOWN, OHIO, March 14.—Steel companies are building up substantial fuel reserves against possible disruption at union coal mines April 1. Interests operating by-product coke ovens are fortifying themselves in particular. Stocks are sufficient for four to six weeks' furnace operation at curtailed rate. Railroads report coal shipments to Valley plants have shown big gains past two weeks.

Chicago

CHICAGO, March 14.

Betterment in mill operation continues to keep pace with the gradual but steady expansion in demands. The Illinois Steel Co. has fired its fifteenth furnace, giving it seven active stacks at Gary, six at South Works and two at Joliet, and it has increased its ingot output to 65 per cent of capacity. Its Gary works is exceptionally busy, being on an 80 per cent operation basis. All of the bar mills at that plant are running double turn for the first time in over a year. The rail mill is producing at the rate of 35,000 tons a month with sufficient bookings to sustain that rate of operation for the rest of the year. The new rail mill of the Inland Steel Co. is also operating, having started last week. This company is also on a satisfactory production basis, with all of its No. 1 plants running double turn and its No. 2 plant single turn. Its steel output is about 60 per cent of ingot capacity.

In keeping with improved bookings, market sentiment is better and prices are steadily growing firmer. Independent mills throughout the country, sick of taking business at a loss, are advancing their prices. While the advance in plates, shapes and bars announced by the Inland Steel Co. last week, has not yet been followed by the local Steel Corporation mill, it would not be surprising if such action would be taken soon, provided market conditions seem to justify it. There is no question that the market on these products has been too low, but it is not yet clear whether the buying movement now in its incipency has acquired sufficient momentum to sustain an advance.

Much recent buying is directly attributable to the low level of prices. Railroad cars, for example, have been purchased on practically a pre-war basis. On the other hand, it would appear that the railroads themselves anticipate an advance in prices, because they are now trying to close contracts for several months' requirements of such commodities as plates, shapes, bars, tie plates, bolts and spikes. The mills, however, are unwilling to accept such contracts at current prices.

The Republic Iron & Steel Co. to-day announced an advance in bar iron to a minimum of 1.60c., Chicago.

Pig Iron.—Local iron is firm at \$20, base, local furnace, and a fair amount of business is being closed at that figure. While most current orders are rather small, a number of contracts for second quarter have been closed, ranging from 100 tons to 2000 tons each. Fairbanks, Morse & Co., which was in the market for 3500 tons of foundry and malleable iron, has closed for 1000 tons at the market. A north Chicago melter has bought 300 tons of Southern foundry at \$15 base, Birmingham. Current inquiries include 1000 tons of Northern foundry for Chicago delivery, 1000 tons of Southern foundry for a Michigan melter, and 200 tons of foundry for Indiana shipment. A local melter is in the market for 100 tons of low phosphorous iron and an outside foundry wants 300 tons of the same grade of iron. It is intimated that Jackson County producers will soon announce an advance in silvery iron.

Quotations on Northern foundry, high phosphorous malleable and basic irons are f.o.b. local furnace and do not include a switching charge averaging 70c. per ton. Other prices are for iron delivered at consumers' yards, or when so indicated, f.o.b. furnace other than local.

Lake Superior charcoal, averaging	
sl. 1.50, delivered at Chicago.....	\$28.00
Northern coke, No. 1, sl. 2.25 to 2.75	20.50
Northern coke, foundry, No. 2, sl.	
1.75 to 2.25.....	20.00
Northern high phos.....	20.00
Southern foundry, sl. 1.75 to 2.25.....	\$20.77 to 21.67
Malleable, not over 2.25 sl.....	20.00
Basic.....	20.00
Low phos., Valley furnace, sl. 1 to 2	
per cent copper free.....	30.00
Silvery, sl., 8 per cent.....	32.32

Ferroalloys.—A Chicago consumer is in the market for 250 to 500 tons of ferromanganese. This commodity is strong, at least one producer having announced an advance to \$65, seaboard. A recent sale of 50 tons of spiegeleisen to a local buyer was closed

at approximately the market. Fifty per cent ferro-silicon is inactive and prices are nominal.

We quote 78 to 82 per cent ferromanganese, \$70.30, delivered; 50 per cent ferrosilicon \$56 to \$57.50, delivered; spiegeleisen, 16 to 18 per cent, \$40.10, delivered.

Railroad Equipment.—The New York Central has divided an order for 1000 steel hopper cars equally among the American Car & Foundry Co., the Pressed Steel Car Co., the Standard Steel Car Co. and the Pullman Co. It is intimated that the St. Paul, which is in the market for 1000 box cars, will actually buy 4500 cars. The same road is inquiring for 50 Mikado type locomotives. The Florida East Coast has placed an order for seven Pacific type engines and three switchers with the American Locomotive Co.

Cast Iron Pipe.—Current bookings are satisfactory and prices are firm. Fort Dodge, Iowa, takes bids on 260 tons March 26. The American Cast Iron Pipe Co. is reported to have been awarded 200 tons for Wausau and 150 tons for Madison, Wis.

We quote per net ton, f.o.b. Chicago, as follows: Water pipe, 4-in., \$46.10 to \$47.10; 6-in. and above, \$42.10 to \$43.10; class A and gas pipe, \$3 extra.

Bars.—Demand for soft steel bars continues to broaden and it is becoming apparent that buying is not solely for replenishment purposes but is also in preparation for seasonal needs. Consumers' stocks, with some notable exceptions, are low and they must be built up to take care of business which will develop in the spring months. Ruling prices remain unchanged, although recent advances by independents here and in the East have given the market a firmer tone. The betterment in demand for steel has not been accompanied by any material increase in bar iron or hard steel bar business. Bar iron mills continue to operate intermittently and no rail-carbon steel bar mill is running better than single turn.

Mill prices are: Mild steel bars, 1.50c. to 1.60c., Chicago; common bar iron, 1.55c. to 1.60c., Chicago; rail carbon, 1.50c., mill or Chicago.

Jobbers quote 2.28c. for steel bars out of warehouse. The warehouse quotation on cold-rolled steel bars and shafting is 3.40c. for rounds and 3.90c. for flats, squares and hexagons. Jobbers quote hard and medium deformed steel bars at 1.90c. base. Hoops, 3.13c. Bands, 2.88c.

Sheets.—There are still evidences of resistance on the part of buyers, but prices remain firm and bookings are gradually increasing. Better tonnages are coming from the automobile industry as well as from other lines. The mills of the Inland Steel Co. are operating at capacity, with 30 days' work ahead.

Mill quotations are 3c. for No. 28 black, 2.25c. for No. 10 blue annealed and 4c. for No. 28 galvanized, all being Pittsburgh prices, subject to a freight rate to Chicago of 38c. per 100 lb.

Jobbers quote: Chicago delivery out of stock, No. 10 blue annealed, 3.38c.; No. 28 black, 4.15c.; No. 28 galvanized, 5.15c.

Wire Products.—Jobbers are buying wire and nails more freely and in some cases are building up stocks for the coming season. There is less contracting ahead than is usually the case at this time of the year, but orders are more numerous and the aggregate bookings of mills larger than a few weeks ago. Demand from jobbers in Middle Western States shows considerable improvement, but business from the Northwest is still light owing to the severe weather conditions there. Prices are firm on finished products, but wire rods are moving at about \$33.50, Pittsburgh. For mill prices, see finished iron and steel, f.o.b., Pittsburgh, page 761.

We quote warehouse prices f.o.b. Chicago: No. 9 and heavier black annealed wire, \$2.85 per 100 lb.; No. 9 and heavier bright basic wire, \$3 per 100 lb.; common wire nails, \$3 per 100 lb.; cement coated nails \$2.50 per keg.

Warehouse Prices.—Local jobbers have reduced prices on bars, bands, plates, shapes, and rivets. The new quotations are published under appropriate paragraphs.

Rails and Track Supplies.—Demand for track materials remains active, numerous orders for spikes and bolts having been placed. Most of the orders were individually small, a notable exception being 3000 kegs of spikes placed with a local mill by the Southern Pacific. Prices are fairly firm, the lowest quotation reported being 2c., Pittsburgh, which was named on 500 kegs of spikes bought by a Chicago road. Rail specifications are increasingly liberal, but new orders are few. The Chesapeake & Ohio, which was in the mar-

has placed 18,000 tons of rails, has placed 7000 tons with the mill and is understood to have distributed the remainder among other producers.

Standard Bessemer and open-hearth rails, \$40; light rails rolled from new steel, 1.50c. to 1.60c., f.o.b. makers' mills. Standard railroad spikes, 2.05c. to 2.10c., Pittsburgh; track bolts with square nuts, 3.05c. to 3.10c., Pittsburgh; tie plates, steel and iron, 1.65c. to 1.75c., f.o.b. mill; angle bars, 2.40c., f.o.b. mill.

Plates.—The Sinclair Oil Co. has placed an order for 10 additional storage tanks with the Chicago Bridge & Iron Works and also 10 with the Graver Corporation, making a total of 30 tanks, the steel for which, amounting to 9000 tons, will be furnished by the Illinois Steel Co. Specifications received from carbuilders coupled with a steadily increasing number of orders from miscellaneous sources are resulting in more satisfactory mill operations. The price situation remains unchanged, although one local producer is quoting a minimum of 1.60c., mill.

The ruling mill quotations range from 1.50c. to 1.60c., Chicago. Jobbers quote 2.38c. for plates out of stock.

Bolts and Nuts.—Demand is improving slowly and prices, while still weak, continue to grow steadier. Efforts of buyers to close contracts for second quarter at current discounts have proved unsuccessful. Makers who have been willing to take spot business at a loss in order to keep their plants in operation refuse to take on commitments for three months ahead on that basis.

Jobbers quote structural rivets, 3c.; boiler rivets, 3.10c.; machine bolts up to $\frac{3}{4}$ x 4 in., 60, 10 and 10 per cent off; larger sizes, 60 to 10 off; carriage bolts up to $\frac{3}{4}$ x 6 in., 60 and 10 off; larger sizes, 55 and 5 off; hot pressed nuts, square and hexagon tapped, \$3.75 off; blank nuts, \$4 off; coach or lag screws, gimlet points, square heads, 65 and 5 per cent off. Quantity extras are unchanged.

Structural Material.—As the building season approaches, the construction field is becoming more active. New fabricating projects are more numerous and lettings are heavier than for some weeks. Confidence in the successful stabilization of the local labor situation is indicated by the award of the general contract for the London Guarantee Life Assurance Building to the Thompson-Starrett Co. About 4500 tons of fabricated material is involved, which is expected to be let soon. The general contract for the Belden Hotel, another local project involving 4000 tons of steel, is about to be awarded. Plain material prices are unchanged, although they are firmer owing to the fact that one local mill is now quoting a minimum of 1.60c., f.o.b. works. Fabricating awards include:

Indianapolis Athletic Club, 1425 tons, to McClintic-Marshall Co.

Northern Pacific Railroad, bridges for various locations, 2700 tons, to American Bridge Co.

Hotel Rowe, Grand Rapids, Mich., 344 tons, to Rochester Bridge Co. and Vierling Steel Works.

New building for Vienna Model Bakery, Chicago, 166 tons, to Butler Street Foundry Co.

Buoyus Co., foundry, South Milwaukee, Wis., 250 tons, to Worden-Allen Co.

Bucyrus Co., machine and erecting shop, Evansville, Ind., 250 tons, to Worden-Allen Co.

Jones Island sewage disposal plant, power and boiler houses, Milwaukee, 530 tons, to Milwaukee Bridge Co.

State University of Montana, gymnasium, Missoula, 182 tons, to Minneapolis Steel & Machinery Co.

Pending business includes:

Medical Building, Detroit, 1270 tons, general contract to Bass Construction Co., Cleveland.

Loop Motor Hotel, Chicago, 2000 tons, Glaver & Dinkelberg, architects.

The mill quotation on plain material ranges from 1.50c. to 1.60c., Chicago. Jobbers quote 2.38c. for plain material out of warehouse.

Steel Castings.—No further orders for car castings have been let, but a number involving considerable tonnage are still pending. Outside of castings for railroad cars, there is little business in the market. Prices are holding fairly well, although some isolated instances of cutting are reported.

Old Material.—Some very substantial purchases of heavy melting steel have been made at from \$12.50 to \$12.75 per gross ton delivered. While this buying is conspicuous because of the tonnage involved, consumptive purchases of other grades are more numerous and have resulted in advances commensurate with the increased strength of the market. Foundry operations

are gradually expanding and it is notable that orders for cast grades are more plentiful, although most of them are individually small. Although there has been some recent buying of wrought iron grades, it has now subsided and it is to be noted in this connection that bar iron mill operations are not improving materially, their condition being in marked contrast with that of the steel mills, which have made important gains in output since the first of the year. The bidding of dealers on railroad lists indicates their confidence in a sustained upward swing in prices. Current offerings include the Louisville & Nashville, 10,000 tons, of which 4500 tons is rails, and the Pullman Co., 650 tons. Owing to a typographical error, shoveling steel was quoted last week at \$11.25 to \$12.75. The quotation should have been \$11.25 to \$11.75. This grade has since advanced.

We quote delivery in consumers' yards, Chicago and vicinity, all freight and transfer charges paid, as follows:

Per Gross Ton	
Iron rails	\$16.00 to \$16.50
Relaying rails	20.00 to 25.00
Cast iron car wheels	16.50 to 17.00
Rolled or forged steel car wheels	14.00 to 14.50
Steel rails, rerolling	13.00 to 13.50
Steel rails, less than 3 ft.	13.50 to 13.75
Heavy melting steel	12.50 to 12.75
Frogs, switches and guards cut apart	12.50 to 12.75
Shoveling steel	11.75 to 12.25
Low phos., heavy melting steel	14.00 to 14.50
Drop forge flashings	8.50 to 9.00
Hydraulic compressed sheet	8.50 to 9.00
Axle turnings	8.50 to 9.00

Per Net Ton	
Iron angles and splice bars	14.25 to 14.75
Steel angle bars	11.50 to 12.00
Iron arch bars and transoms	16.00 to 16.50
Iron car axles	20.00 to 20.50
Steel car axles	13.50 to 14.00
No. 1 busheling	9.25 to 9.75
No. 2 busheling	6.25 to 6.75
Cut forge	11.00 to 11.50
Pipes and flues	7.50 to 8.00
No. 1 railroad wrought	11.25 to 11.75
No. 2 railroad wrought	11.00 to 11.50
Steel knuckles and couplers	12.50 to 13.00
Coil springs	13.00 to 13.50
No. 1 machinery cast	14.25 to 14.75
No. 1 railroad cast	13.50 to 14.00
Low phos. punchings	11.50 to 12.00
Locomotive tires, smooth	10.50 to 11.00
Machine shop turnings	5.75 to 6.25
Cast borings	7.00 to 7.50
Stove plate	12.50 to 13.00
Grate bars	11.00 to 11.50
Brake shoes	11.25 to 11.75
Railroad malleable	12.00 to 12.50
Agricultural malleable	12.00 to 12.50

Acquires Stock of the Pittsburgh Rolls Corporation

The Union Steel Casting Co., Pittsburgh, has purchased at private sale a large block of the capital stock of the Pittsburgh Rolls Corporation, Pittsburgh. The plants of both companies are located in the Lawrenceville district of Pittsburgh and it is the intention of the Union Steel Casting Co. in making this purchase that the two plants shall work in close harmony. No changes will be made in the organization or management of the Pittsburgh Rolls Corporation other than the retirement of some directors who have sold their stock and whose places will be filled by officers of the Union Steel Casting Co.

The Pittsburgh Rolls Corporation, (Phoenix Roll Works) has operated in the same locality for more than 50 years. It was first under the name of Bowman, Boyd & Bagley, then James B. Young & Co., and later Seaman, Sleeth & Co., this being the firm name for a number of years prior to 1917, when the Pittsburgh Rolls Corporation succeeded to the business. During these several changes of firm names, the plant has been known as the Phoenix Roll Works, the home of Phoenix rolls, which have had and still are finding wide use not only in rolling mills in this country, but in most parts of the world. Present officers of the company are D. L. Eynon, president, Q. S. Snyder, vice-president and treasurer and P. M. Fleming, secretary.

The Union Steel Casting Co., organized in 1899, has grown from small beginnings to one of the leading steel foundries of the country. Its officers are C. C. Smith, chairman, J. P. Allen, president, J. B. Henry, vice-president and general superintendent, S. H. Church, vice-president, G. W. Eisenbeis, treasurer and W. C. Eichenlaub, secretary.

Philadelphia

PHILADELPHIA, March 14.

Practically all of the independent steel companies have followed the lead of the Jones & Laughlin Steel Co. in announcing a price of 1.50c., Pittsburgh, on plates, shapes and bars. Some of these advances went into effect late last week and others dated from Monday of this week. Buyers were given a few days in which to send in their specifications at the former prices and the result was the booking of a very substantial tonnage in the past week. On specific projects, protection was given for longer periods and the market situation will doubtless be confused during the next week or two by reports that orders are still being taken at the old prices. The independent mills are said to be adhering firmly to 1.50c., Pittsburgh, on all new business, but no orders of any size have been placed at the higher level. It is still possible to buy the heavy tonnage products at 1.40c., Pittsburgh, but apparently all outstanding quotations below the latter figure will be acted upon shortly by buyers, or will be withdrawn by the mills if orders are not forthcoming within a reasonable time.

Pig Iron.—Aside from reported buying by two cast iron pipe companies of about 5000 tons each, there has been no very important pig iron business in the past week. Orders aggregating a few thousand tons additional have been booked, but as a rule do not exceed a few hundred tons each, and specify delivery over the remainder of second quarter. The American Engineering Co. and the Sanitary Co. of America each bought about 1000 tons. No selling for third quarter has been done, so far as reported, but one pipe company has indicated its desire to cover for that period. The uncertainty of the coke situation deters Eastern furnaces from selling so far ahead. The price situation on foundry iron is unchanged. Furnaces are quoting from \$19.50 to \$20, furnace, on No. 2 plain and 50c. per ton higher on No. 2 X. The furnaces, however, continue to equalize freight rates in competition with sellers having a freight rate advantage. A small tonnage of gray forge has been sold at \$19.50, furnace, with \$1.26 freight. In other grades of pig iron there is practically no interest, this being particularly true of steel-making iron. The Alan Wood Iron & Steel Co. will put out its No. 3 furnace this week, leaving only one stack, No. 2, in blast. The Robeson furnace went out last Saturday on account of lining trouble. The Thomas Iron Co. plans to let Alburdis go out at the end of the month unless the coke situation looks better.

The following quotations are, with the exception of those on low phosphorus iron, for delivery at Philadelphia, and include freight rates varying from 81 cents to \$1.54 per gross ton:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	\$20.76 to \$20.84
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.26 to 21.34
Virginia No. 2 plain, 1.75 to 2.25 sil.	26.24 to 26.74
Virginia No. 2X, 2.25 to 2.75 sil.	27.24 to 27.74
Basic delivery eastern Pa.	19.84
Gray forge	20.50 to 21.00
Malleable	22.50 to 24.00
Standard low phos. (f.o.b. furnace)	30.00
Copper bearing low phos. (f.o.b. furnace)	28.00

Plates.—The immediate effect of the advance in the plate price to 1.50c., Pittsburgh, by all independent makers has been to create a scramble among buyers to cover to the former prices. A good deal of business was placed in the past week, mostly at 1.35c., Pittsburgh, the mills giving their customers a few days in which to get in their specifications. In the case of specific projects on which fabricators are submitting bids, protection was given for a longer period, but on all new inquiries every maker of plates in the Eastern district is now quoting 1.50c., Pittsburgh. The leading interest, however, has not announced that its price has gone above 1.40c. It may require a week or so to clarify the present price situation, but at the moment the market may be quoted at 1.40c. to 1.50c., Pittsburgh. A number of large plate inquiries are still pending, among which is one coming from several car builders and shipyards which are figuring on the 2000 to 4000 70-ton steel freight cars inquired for by the Norfolk & Western. These cars will require from 22,000 to

44,000 tons of steel. Eastern fabricators are figuring on a steel pipe job for Seattle, Wash., which will require 12,500 tons of plates and a New York State pipe project calls for 2500 tons of plates, but the contract has not yet been awarded. A Philadelphia shipyard, which is bidding on a Great Lakes boat, is asking prices on 1500 tons of plates. The steel for the 47 locomotives to be built by the Baldwin Locomotive Works for the Chicago, Burlington & Quincy Railroad, amounting to 2000 tons, has been placed with the Lukens Steel Co. New locomotive inquiries include one for 50 engines from the Chicago, Milwaukee & St. Paul and one from the Monon for 20. It is reported that other roads will soon be in the market for new power equipment. A disturbing feature in the market is the quantities of salvage plates that are being offered for sale, with prices in some instances as low as 1.20c., Philadelphia.

Structural Material.—Bids are being taken this week on the new Ledger Building, which will require 2000 tons of steel, and on a hotel to be built at Locust and Juniper streets, requiring 1000 tons. Bids close March 24 on a city pier, requiring 4000 tons. Though price protection has been given by the mills on most of the projects on which bids are now going in, 1.50c., Pittsburgh, is being quoted on all new inquiries by the independent mills. The market may be quoted at 1.40c. to 1.50c., Pittsburgh.

Bars.—Many buyers covered their requirements in steel bars at the former prices before the advance by independents to 1.50c., Pittsburgh. Considerable tonnage was booked last week. Bar mills are operating at a fairly good rate on immediate specifications. Bar iron is offered at 1.35c. to 1.40c., Pittsburgh, but there is very little business.

Sheets.—The mills are adhering firmly to 2.25c. on blue annealed, 3c. on black and 4c. on galvanized, f.o.b. Pittsburgh, but concessions, it appears, have been offered by jobbers who apparently have specified heavily against old contracts entered into at prices lower than the mills now quote. These concessions have amounted in some instances to \$2 or \$3 a ton.

Track Supplies.—The Pennsylvania Railroad has placed about 100,000 tie plates and 5000 kegs of spikes. The Norfolk & Western is expected to release numerous requisitions shortly for bolts, nuts, staybolt iron and other repair material.

Warehouse Business.—Local jobbers have reduced the price on cold rolled steel 25c. per 100 lb.

Old Material.—Eastern scrap dealers have had one of the busiest weeks since 1920, but their orders have come chiefly from the Pittsburgh district, where a good demand exists, particularly for heavy melting steel and blast furnace turnings. On moderate-sized sales to eastern Pennsylvania mills and in line with advances at Pittsburgh, the local market shows many higher quotations this week, averaging about 50c. per ton.

We quote for delivery at consuming points in this district as follows:

No. 1 heavy melting steel	\$12.50 to \$13.50
Scrap rail	12.50 to 13.50
Steel rails, rerolling	15.00 to 15.50
No. 1 low phos., heavy 0.04 and under	18.00 to 19.00
Cast iron car wheels	16.00 to 16.50
No. 1 railroad wrought	15.00 to 16.00
No. 1 yard wrought	13.00 to 13.50
No. 1 forge fire	10.00 to 10.50
Bundled sheets (for steel works)	10.00 to 10.50
No. 1 busheling	11.50 to 12.50
No. 2 busheling	9.00 to 10.00
Turnings (short shoveling grade for blast furnace use)	10.75 to 11.25
Mixed borings and turnings (for blast furnace use)	10.75 to 11.25
Machine-shop turnings (for rolling mill and steel works use)	11.00 to 11.50
Heavy axle turnings (or equivalent)	11.50 to 12.00
Cast borings (for steel works and rolling mills)	12.00 to 12.50
Cast borings (for chemical plants)	15.00 to 15.50
No. 1 cast	17.25 to 17.75
Railroad grate bars	14.00 to 14.50
Stove plate (for steel plant use)	14.00 to 14.50
Railroad malleable	13.00 to 13.50
Wrought iron and soft steel pipes and tubes (new specifications)	13.00 to 13.50
Shafting	15.00 to 15.00
Iron car axles	No market
Steel car axles	17.00 to 18.50

New York

NEW YORK, March 14.

Pig Iron.—A period of quiet has followed the recent buying, but there is positive evidence that the melt is being slowly increased and numerous sales of small tonnages have been recorded. There has been some selling of charcoal iron on the basis of \$22.50 Michigan furnace, or \$32.60 New York, a reduction of \$7 from the price which prevailed until about two weeks ago. The strike in Brooklyn and Long Island City foundries on account of a reduction of wages of molders from \$6.50 for an eight-hour day to \$6.00 has been compromised on the basis of \$6.25, and the men have resumed work. Letting of the contracts for the segments of the vehicular tunnel is still delayed, but it is regarded as virtually settled that the contracts will be awarded as stated in THE IRON AGE of March 2, page 622.

We quote delivered in the New York district as follows, having added to furnace prices \$2.52 freight from eastern Pennsylvania, \$5.46 from Buffalo and \$6.16 from Virginia:

East. Pa. No. 1 fdy., sil. 2.75 to 3.25	\$22.52 to \$23.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	22.02 to 22.52
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	21.52 to 22.02
Buffalo, sil. 1.75 to 2.25	23.46 to 23.71
No. 2 Virginia, sil. 1.75 to 2.25	28.16

Iron Ore.—Leading eastern furnacemen are not in sympathy with Buffalo furnaces in opposing the proposed reduction by the railroads in the carrying rate on iron ore, but believe that it would be well to allow this reduction to go into effect, so that a similar reduction on coal and coke could be made later. The controversy among various interests connected with the manufacture of iron is considered unfortunate at the present time, adding, as it does, another element of uncertainty to the situation.

Ferroalloys.—The demand for ferromanganese does not increase and inquiries embrace 1000 to 1500 tons, with very few sales reported in the last week. A sale of 100 tons of British alloy is noted. Prices continue firm and unchanged at recent levels. Demand for spiegeleisen is moderately active and fair sales of the lower grades are reported at prevailing quotations. A large producer in New Jersey recently started up a furnace, the output of which is largely booked for some little time. There is no interest in manganese ore and quotations continue nominal. Business in 50 per cent ferrosilicon continues moderate with sales confined to the needs of consumers for fairly early delivery. A middle western consumer is understood to have booked 500 tons at \$55, delivered. Quotations follow:

Ferroalloys

Ferromanganese, domestic, seaboard, per ton	\$62.50
Ferromanganese, British, seaboard, per ton	\$62.50
Spiegeleisen, 16 to 19 per cent, furnace, per ton	\$29.00
Spiegeleisen, 20 per cent, furnace, per ton	\$30.00
Ferrosilicon, 50 per cent, delivered, per ton	\$55.00 to \$60.00
Ferrotungsten, per lb. of contained metal	40c. to 50c.
Ferrochromium, 6 to 8 per cent carbon, 60 to 70 per cent Cr., per lb. Cr., delivered	12c. to 14c.
Ferrovanadium, per lb. of contained vanadium	\$4.00

Ores

Manganese ore, foreign, per unit, seaboard	25c. to 26c.
Tungsten ore, per unit, in 60 per cent concentrates	\$2.00 up
Chrome ore, 40 to 45 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard	\$20.00 to \$25.00
Chrome ore, 45 to 50 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard	\$25.00 to \$27.00
Molybdenum ore, 85 per cent concentrates, per lb. of MoS ₃ , New York	50c. to 60c.

Finished Iron and Steel.—Although the Midvale and the Bethlehem companies have joined the Jones & Laughlin Steel Co. in advancing the price of plates, shapes and bars to 1.50c., Pittsburgh, the market is not firmly established at that level. Some companies apparently are still willing to take business at figures lower than 1.50c., though it is predicted in the trade that a more general adoption of the 1.50c. quotation by the mills will become effective this week. Under the present condition it is difficult to tell what the market price is on plates, shapes and bars for the reason that undoubtedly a good part of the business closed within the past week had been quoted upon prior to the advance. The general opinion is that the heavy tonnage products will be stabilized at about 1.40c., Pittsburgh, with a little more firmness in shapes than in plates and bars. It probably will take a week or so, however, to determine just how firmly the mills will stand for

higher prices, particularly those mills which have not publicly made known their attitude. The New York, New Haven & Hartford Railroad a few days ago placed 1100 tons of plates, shapes and bars at a price reported to be 1.35c., Pittsburgh, while 1500 tons of deformed bars for a Cuban pier job was bought by a New York contractor at 1.30c., Pittsburgh. The latter transaction is of course regarded as one for export. Plates have been sold within the past few days, even in comparatively small lots, at 1.35c., Pittsburgh, though it is stated that to-day a buyer might find it difficult to place an order at lower than 1.40c. Export prices have stiffened somewhat except in Canada, where plates, shapes and bars have been sold in the past week on the basis of 1.30c., Pittsburgh. Wire products and sheets are firm for domestic trade and have stiffened slightly for export. An effort is being made to hold tin plate at \$4.60 per 100 lb. base box, Pittsburgh. Railroad business shows a degree of promise and it is the expectation of car builders that several new inquiries for cars will be sent out within the next few weeks. The New York Central Railroad will receive bids up to March 22 on 3000 tons of plates, shapes, bars, axles, track supplies, etc. The Pennsylvania Railroad has inquired for 250 all-steel passenger cars and the Louisville & Nashville is inquiring for 25 passenger cars. The American Locomotive Co. has received an order from the Florida East Coast Railroad for 10 locomotives. Structural steel work is in fair volume, with new projects showing a slight increase in number. New work includes:

City of Philadelphia pier, 4000 tons, bids closing March 24.
Y. M. C. A. building at Middletown, Ohio, 250 tons.
Hospital at Poughkeepsie, N. Y., 250 tons.
Library at Columbia University, New York, 1600 tons.
Apartment house at West End Avenue and Eighty-eighth Street, New York, 400 tons.

Jobs awarded include the following:

Public Library, Philadelphia, 4000 tons, to American Bridge Co.
Boiler plant in Los Angeles, Cal., 750 tons, to a local fabricator.
Residence for Mrs. Alexander Hamilton Rice, Fifth Avenue, New York, 400 tons, to American Bridge Co.
Building for Hudson Trust Co., Hoboken, N. J., 300 tons, to Olmter Iron Works.
Office building in Boston for Ira G. Hersey & Sons, 1000 tons, to New England Structural Steel Co.
Power house extension at New Bedford, Mass., 400 tons, to McClintic-Marshall Co.
Ten oil tanks for Sinclair Consolidated Oil Corporation, 3000 tons, to Chicago Bridge & Iron Works.
Building for American Car & Foundry Co. at Huntington, W. Va., 600 tons, to American Bridge Co.
Two steel stacks, Brooklyn Edison Co., 400 tons, to Chicago Bridge & Iron Works.

No decision has been announced by the New York Central Railroad on the bridge across the Hudson River at Castleton, N. Y., requiring 23,000 tons of steel. It is reported that the work may be divided between the lowest two bidders. B. Goldberg & Son, 166 Jackson Avenue, Long Island City, N. Y., is in the market for 300 tons of steel sheet piling.

We quote for mill shipments, New York, as follows: Soft steel bars, 1.78c.; plates, 1.78c.; structural shapes, 1.78c.; bar iron, 1.73c. to 1.88c. On export shipments the freight rate is 28.5c. per 100 lb. and the domestic rate is 38c.

Cast-Iron Pipe.—The market continues active, particularly in purchases by private interests. There is also a moderate amount of municipal buying, chiefly on awards to contractors. One of those recently placed, but for which the pipe involved has not yet been purchased, calls for 590 tons of cast-iron pipe. Another tender, which will be opened March 22, by the Department of Water Supply, Gas and Electricity, New York, involves about 800 tons for installation in the Borough of Bronx. On the whole the market is extremely optimistic and prices continue stiff. We quote per net ton, f.o.b. New York, as follows: 6-in. and larger, \$47.30; 4-in. and 5-in., \$52.30; 3-in., \$52.30, with \$4 additional for Class A and gas pipe.

High Speed Steel.—The market continues quiet and prices weak. The majority of sales are now being made at about 75c. per lb. for 18 per cent tungsten, high speed steel.

Warehouse Business.—The market is quiet and prices weak. It is generally believed that a downward

revision of prices will be made within the next week or ten days. Activity continues in the brass and copper market, where prices are holding up fairly well except on copper sheets, which are off about $\frac{1}{4}$ c. per lb. Wrought iron and steel pipe is unchanged. We quote prices on page 776.

Coke.—The market is not as active as it was during the recent flurry, but prices are strong, and \$4.50 is the prevailing price on foundry grades with some companies asking \$4.75 and even more. By-product coke is still quoted at \$8.59 delivered to points on the Pennsylvania, Erie and Lackawanna railroads, and \$9.15 on the Central of New Jersey.

Old Material.—The slight improvement evident during the past few weeks has suddenly developed into a distinct upward trend. Prices on No. 1 heavy melting steel have advanced to as high as \$15.50 per ton in the Pittsburgh district and buying prices in the New York market are from \$9 to \$9.50 per ton, with some actual transactions reported to figure back to a basis of \$9.75 New York. This advance has resulted in some instances in rerolling rails, which are now at about the same price, being sold for heavy melting steel. Despite the evidently favorable outlook, dealers feel that it may be only temporary. The present buying is largely confined to western Pennsylvania mills, those in the East still adhering to a policy of low prices and not seeming to be particularly anxious to buy.

Buying prices per gross ton, New York, follow:

Heavy melting steel, yard.....	\$9.00 to \$9.50
Steel rails, short lengths, or equivalent.....	9.00 to 9.50
Rerolling rails.....	9.25 to 9.75
Relaying rails, nominal.....	27.00 to 28.00
Steel car axles.....	10.00 to 10.50
Iron car axles.....	17.50 to 18.50
No. 1 railroad wrought.....	9.50 to 10.00
Wrought iron truck.....	8.50 to 9.00
Forge fire.....	4.75 to 5.25
No. 1 yard wrought, long.....	9.00 to 9.50
Cast borings (clean).....	7.00 to 7.50
Machine-shop turnings.....	5.25 to 5.75
Mixed borings and turnings.....	5.50 to 6.00
Iron and steel pipe (1 in. diam., not under 2 ft. long).....	7.75 to 8.25
Stove plate.....	10.50 to 11.00
Locomotive grate bars.....	10.00 to 10.50
Malleable cast (railroad).....	8.00 to 8.50
Cast-iron car wheels.....	10.50 to 11.00

Prices which dealers in New York and Brooklyn are quoting to local foundries, per gross ton, follow:

No. 1 machinery cast.....	\$16.50 to \$17.00
No. 1 heavy cast (columns, building materials, etc.), cupola size.....	15.50 to 16.00
No. 1 heavy cast, not cupola size.....	15.00 to 15.50
No. 2 cast (radiators, cast boilers, etc.).....	10.50 to 11.00

Cleveland

CLEVELAND, March 14

Iron Ore.—Railroads in the central territory have filed with the Interstate Commerce Commission new tariffs making a 20 per cent reduction on ore rates from Lake Erie ports to interior furnaces, the new rates to become effective April 17. The new rates are considerably above the rates that prevailed before the present rates were placed in effect. The Buffalo and other lake front blast furnace interests that have opposed efforts to secure lower rail rates on ore unless a reduction is granted on coal and coke rates, have asked a suspension of the proposed rates. It is believed that a decision will be handed down without delay by the Interstate Commerce Commission which has already spent considerable time in investigating the rate situation in respect to these commodities. With the reduction in rail rates, the railroads also plan to place in effect on the same date a 20 per cent reduction in ore handling charges. The present rail rates, being a flat 40 per cent advance over previous rates, were placed in effect Aug. 26, 1920, a corresponding increase in dock handling charges being made a month later. On Oct. 20 last, a temporary reduction of 28 per cent was made in rail rates on ore to remain in effect until Jan. 1, this bringing rates virtually back to where they were before the 40 per cent advance. In December the railroads agreed to extend the reduced rates until March 31, but the Interstate Commerce Commission refused to grant this extension, evidently as the result of the opposition of the lake front blast furnace interests which claimed that a reduction on ore rates without a reduction on coal and coke rates was a discrim-

ination against them. There is some belief in the ore trade that the railroads will shortly place in effect a temporary reduction in ore rates from the mines to upper lake ports, to remain effective during the season or possibly until the Interstate Commerce Commission hands down its decision in the pending ore rate case. The rates as they existed from 1917 to 1920, the present rates and the new rates, are as follows, the figures showing the line haul rate and not including the dock handling charge:

	New Rate	Present Rate	Rate Previous to 1920
Valley.....	\$0.73	\$0.91	\$0.65
Dover, Leontia and New Castle.....	0.785	0.98	0.70
Midland, Pa.....	0.885	1.105	0.79
Pittsburgh.....	1.02	1.275	0.91
Johnstown.....	1.15	1.44	1.03
Jackson and Hamilton from Toledo.....	0.80	1.00	0.715
Jackson from Cleveland.....	0.995	1.245	0.89
Ironton.....	1.11	1.385	0.99
Lehigh and Schuylkill Valleys.....	1.725	2.155	1.54
Sparrows Point.....	1.78	2.225	1.59

The dock charge for handling direct shipment ore from the rail of the vessel to the car was 6 cents from 1917 to 1920. It is now 8 $\frac{1}{4}$ c. and will be reduced to 7c. The handling charges on dock ore are to be reduced as follows: Handling from vessel to stock pile, from 22 $\frac{1}{2}$ c. to 18c., and from stock pile to car, from 14c. to 11c. The 14c. dock charge for handling from hold to rail of vessel, which is borne by the shipper, is reduced from 14c. to 11c.

The freight reduction on direct shipment ore, including the reductions in the charges for the handling from the vessel, amounts to 21.5c. per ton for the Valley and 30c. for Pittsburgh, or equivalent to 55c. and 60c. reductions, respectively, on the cost of making a ton of pig iron.

We quote delivered lower lake ports: Old range Bessemer, 55 per cent iron, \$6.44; Old range non-Bessemer, 51 $\frac{1}{4}$ per cent iron, \$5.70; Mesabi Bessemer, 55 per cent iron, \$6.20; Mesabi non-Bessemer, 51 $\frac{1}{4}$ per cent iron, \$5.55.

Pig Iron.—Furnaces are still making a fairly large number of sales of foundry iron, but the volume of business fell off during the week owing to the absence of any large lot orders. The business booked was mostly in lots of 200 tons and under. One lake furnace interest reports sales aggregating over 4,000 tons during the week in small lot orders. An order for 500 tons was placed by a Cleveland manufacturer of printing machinery. The market is fairly firm, the price situation showing virtually no change. Most of the business was booked at \$19 for No. 2 foundry iron. No inquiries developed from points regarded as highly competitive, but sellers who have been quoting \$18.50 for iron for shipment to points where competition is keen, have shown no disposition to hold out for higher prices for this competitive business. The only inquiry of any size is from a Quincy, Ill., consumer for 1,000 tons of foundry iron for the second quarter. Shipments on contracts continue good and if they hold up at the present rate, March shipments will be larger than during any previous month for a year.

Quotations below are f.o.b. local furnace for Northern foundry iron, not including a 56c. switching charge. Other quotations are delivered Cleveland, being based on a \$1.96 freight rate from Valley points, a \$3.36 rate from Jackson and a \$4.67 rate from Birmingham:

Basic.....	\$19.71
Northern No. 2 fdy., sil. 1.75 to 2.25.....	\$19.00 to 19.50
Southern fdy., sil. 1.75 to 2.25.....	22.17
Ohio silvery, sil. 8 per cent.....	30.86
Standard low phos., Valley furnace.....	32.00

Semi-finished Steel.—A northern Ohio mill has purchased 3000 tons of sheet bars at \$29, Youngstown. The market is apparently well established at that price.

Finished Material.—The price advance to 1.50c. in steel bars, plates and structural material by the leading Pittsburgh independent producer has been followed by similar advances by several of the other larger independent mills, but the Carnegie Steel Co. is still quoting the 1.40c. price. Unless the Steel Corporation also advances prices, some of the independent mills are not expected to hold to the 1.50c. base for lots of any size, for independent mills cannot hope to book much business at premium prices of \$2 a ton. The Cambria Steel Co. has advanced its price on steel bars, plates and structural material to 1.50c. for car lots and over and to 1.60c. for less than car lots. The stiffening of the market has brought out considerable business at the 1.40c. price from consumers who will stock up to

avoid the possibility of paying higher prices. Quite a number of others have placed contracts for three months' requirements. Some orders have been taken at the 1.50c. price, but these have been for very small lots. The Great Northern Railroad will build a new dock at Superior, Wis., which will require 11,850 tons of steel, including structural material, plates and 800 tons of hard steel bars, and in addition it has an inquiry out for 750 tons of structural material for bridge work. This is the only inquiry that developed for round tonnage during the week. The fabricating contract for the Kresge Building, Cleveland, has been awarded to the Massillon Bridge & Structural Co. Hard steel reinforcing bars are quiet and weak. While the usual quotation is 1.40c., a desirable inquiry will doubtless bring out a lower price.

Sheets.—While the market is generally very firm, offerings are appearing in sheets classed as shop worn at some concession from regular prices. New demand is not active, few sales of over car lots being reported.

Jobbers quote steel bars, 2.36c.; plates and structural shapes, 2.46c.; No. 9 galvanized wire, 3c.; No. 9 annealed wire, 2.50c.; No. 28 black sheets, 3.75c.; No. 28 galvanized sheets, 4.75c.; No. 10 blue annealed sheets, 3.10c.; hoops and bands, 2.96c.; cold-rolled rounds, 3.25c.; flats, squares and hexagons, 3.75c.

Coke.—The demand for coke has quieted down. Most foundries have put in good sized stock to avoid danger of a shortage, should a coal strike interfere with production. Prices are firm, little, if any, Connellsville coke being available under \$4.50 per net ton.

Bolts, Nuts and Rivets.—The demand for bolts and nuts continues to gain, although orders are generally for small lots. A local maker has booked three carloads for shipment to England this month. Although there is still some shading of regular quotations, prices are stiffening up somewhat. The demand for rivets has improved, but the largest orders are for car lots. A leading local maker is adhering to 2.10c. to 2.20c. for structural and boiler rivets respectively, but concessions from \$1 to \$2 a ton are being made.

Old Material.—The demand for heavy melting steel became fairly active during the week. Youngstown, Canton and Warren mills are credited with round lot purchases. As the result, the price on this grade has stiffened. It is understood that mills paid as high as \$16 for No. 1 railroad steel. A Pittsburgh dealer is reported to have sold heavy melting steel at \$16 for delivery at Denora, is offering that price for this grade delivered at that point, \$15.50 for delivery to Monessen and \$12 for borings and turnings and \$11.50 for busheling for Pittsburgh delivery. There is some activity in compressed steel, which is slightly firmer. There has been no buying by Cleveland mills. Dealers doubt whether the present stiffening of prices will hold.

We quote per gross ton, f.o.b. Cleveland, as follows:

Heavy melting steel.....	\$13.00 to \$13.25
Steel rails, under 3 ft.....	12.75 to 13.25
Steel rails, re-rolling.....	14.50 to 15.00
Iron rails.....	12.00 to 12.50
Iron car axles.....	18.00 to 19.00
Low phosphorus melting.....	13.50 to 14.00
Cast borings.....	9.00 to 9.25
Machine shop turnings.....	8.75 to 9.00
Mixed borings and short turnings.....	8.75 to 9.00
Compressed steel.....	10.00 to 10.25
Railroad wrought.....	12.00 to 12.50
Railroad malleable.....	12.50 to 13.00
Light bundled sheet stampings.....	7.00 to 8.00
Steel axle turnings.....	9.50 to 10.00
No. 1 cast.....	15.00 to 16.00
No. 1 busheling.....	9.00 to 9.25
Drop forge flashings, over 10 in.....	9.00 to 9.25
Drop forge flashings, under 10 in.....	9.25 to 9.75
Railroad grate bars.....	12.75 to 13.00
Stove plate.....	13.00 to 13.25
Pipes and flues.....	8.50 to 9.00

British Pig Iron and Steel Output for February

LONDON, ENGLAND, March 14 (By Cable).

The production of pig iron in Great Britain in February was 300,100 gross tons and that of steel ingots and castings 415,000 tons. These compare with an output of 288,000 tons of pig iron and of 327,500 tons of steel in January. The February pig iron is the largest since last March. The steel output compares with a monthly average of 403,350 tons for the six months preceding February and following the coal strike.

Cincinnati

CINCINNATI, March 18.

Pig Iron.—Increased activity was noted in the market during the past week. A number of sales of from 100 to 200 tons were negotiated, and from points scattered throughout the territory. Sellers see in these sales the best evidences of returning prosperity, as most of them were booked for immediate shipment, indicating that stocks of foundry yards are at a very low point. A local jobbing foundry bought 100 tons, another 200 tons, and several others single carloads. A central Ohio implement manufacturer was a buyer of 150 tons and a gas engine manufacturer is reported to have taken 300 tons of malleable. A central Ohio manufacturer also placed an order for 400 tons. Stove shops are reported fairly busy, an Indiana melter placing an order for 400 tons, and two stove shops in Michigan inquiring for 500 to 1000 tons each. There is also an inquiry current for 2000 tons from Illinois, 1000 tons of malleable from Chattanooga, and 500 tons of foundry iron from Cleveland. The Standard Sanitary Mfg. Co. is in the market for 1000 tons for Louisville, and there are several inquiries from outside the territory for 100 to 300 tons. Prices show little change as compared with last week, and \$15, Birmingham, is now regarded as the Southern market, though several furnaces are holding for \$15.50 and \$16. Southern Ohio prices remain unchanged at \$18.50 to \$19, though in places where the furnace has a distinct freight advantage, \$19.50 has been done. Chicago iron at \$20 has practically been eliminated as a factor in this market.

Based on freight rates of \$4.50 from Birmingham and \$2.52 from Ironton, we quote f.o.b. Cincinnati:

Southern coke, sil. 1.75 to 2.25 (base).....	\$19.50 to \$20.00
Southern coke, sil. 2.25 to 2.75 (No. 2 soft).....	20.00 to 20.50 "
Ohio silvery, 8 per cent sil.....	30.02
Southern Ohio coke, sil. 1.75 to 2.25 (No. 2).....	21.02 to 21.52
Basic, Northern.....	21.02
Malleable.....	21.52 to 22.02

Finished Material.—While it is a little early to note the effects of the price increases made by independent mills on the heavier products, the hope is expressed that there will be a stabilized price condition which will be of great advantage to the steel industry. Some small orders have already been booked at the new prices and considerable business is reported placed before the new prices went into effect. As indicating the trend of events, a number of buyers attempted to place orders for second quarter at the prices recently in effect, but in all cases mills refused to book the business. Price advances by independent mills have had the effect of strengthening the market somewhat on other products and as a result fairly good buying of sheets for second quarter delivery was in evidence during the week. The wire market also is stiffening somewhat and less is heard of shading of prices on nails, which are apparently firm on the basis of \$2.40 per keg Pittsburgh. Wire products moved in fair volume and some business was also placed for cold-rolled strips. In the structural field, the announcement of increased prices by independent mills has created somewhat of a stir and one large construction company is understood to have withdrawn all its outstanding bids. Several lettings of importance were noted during the week. The Indianapolis Athletic Club, involving 1450 tons, has been awarded to the McClintic-Marshall Co. and the steel for the Wilde Bank Building, Indianapolis, involving 500 tons, will be fabricated by Hetherington & Berner, Indianapolis. Revised plans will be submitted on the Moose Temple at Hamilton, on which all bids were rejected. Several new projects of importance will shortly come up. The United States Government has plans prepared for a parcel post building to be erected in Cincinnati. This building will be 280 x 300 ft., three stories. Harry Hake of Cincinnati is the architect. The Union Labor Temple Association, Louisville, Ky., has let the contract for the excavation work on the new Labor Temple building to be erected in that city at a cost of \$300,000. This building will be a five-story brick and steel structure and will contain, besides offices, an auditorium seating 2000 people. Schenck & Williams,

Dayton, Ohio, will shortly take figures on a 14-story bank building at Ashland, Ky., and plans have been completed for a school building at Cincinnati to cost \$250,000. Plant operations are improving. The Newport Rolling Mill Co. will put on two additional sheet mills this week, giving them eight mills in operation. Fires will be lighted in the open-hearth furnaces at the Andrews Steel plant and steel making will commence about March 20. The American Rolling Mill Co. plants at Middletown will continue to operate full time and the Zanesville mills of the same company will be on a 50 per cent basis. At the Ashland plant, operations will continue the same as last week, but it is expected that the sheet mills at this plant will be put on before the end of the month. At Portsmouth, the Whitaker-Glessner Co. will maintain its present rate.

Warehouse Business.—Structural steel and reinforcing bars are moving in fair volume from local warehouses. Jobbers of wire products also report improvement during the week. The nail market shows signs of stiffening. Prices are being fairly well maintained, although it is reported that some shading on cold-rolled products is being done, and it would not be surprising if lower quotations were in effect within the next week.

Tool Steel.—A slight improvement is noticed in the tool steel market and while orders are still small, they are more numerous. Prices show no change, the usual quotations on 18 per cent tungsten high speed steel being 85c. per lb.

Iron and steel bars, 2.75c. base; hoops and bands, 3.35c. base; ship and plate, 2.85c. base; reinforcing bars, 2.82 1/2c. base; cold rolled rounds, 1 1/2 in. and larger, 3.50c. base; under 1 1/2 in. and flats, squares and hexagons, 4c.; No. 10 blue annealed sheets, 3.60c.; No. 28 black sheets, 4.25c.; No. 28 galvanized sheets, 5.25c.; wire nails, \$2.75 per keg base; No. 9 annealed wire, \$2.60 per 100 lb.

Coke.—The coke market is slowing up somewhat, but prices are holding fairly well. Connellsville coke is firm at \$3.50 for furnace and \$4.50 for foundry. Wise County is quoted at \$5.25 for foundry and New River at \$7.50.

Old Material.—The scrap market is showing signs of returning activity, and prices are higher on some grades. A steel plant in this district bought a small tonnage of heavy steel and turnings during the week, and some blast furnace borings and turnings were sold to a furnace in the South. Foundry scrap is in light demand.

We quote dealers' buying prices, f.o.b. cars:

	Per Gross Ton	
Bundled sheets	\$4.50 to \$5.00	
Iron rails	11.50 to 12.00	
Reinforcing rails, 50 lb. and up.	24.50 to 25.00	
Reinforcing steel rails	10.00 to 10.50	
Heavy melting steel	9.50 to 10.00	
Steel rails for melting	9.50 to 10.00	
Car wheels	12.00 to 12.50	
	Per Net Ton	
No. 1 railroad wrought	9.00 to 9.50	
Cast borings	4.00 to 4.50	
Steel turnings	3.00 to 3.50	
Railroad cast	12.00 to 12.50	
No. 1 machinery	11.00 to 14.50	
Burnt scrap	7.50 to 8.00	
Iron axes	16.00 to 16.50	
Locomotive tires (smooth inside)	9.00 to 9.50	
Pipes and flues	3.50 to 4.00	

Boston

BOSTON, March 14.

Pig Iron.—Fresh weakness has developed in this market as a result of competition between Buffalo and eastern Pennsylvania furnaces. Buffalo iron, which a week ago was believed to be established on a \$18.50 furnace base, this week was offered at \$18, or \$23.46 delivered New England points. At least one eastern Pennsylvania interest met this delivered quotation, which brings the furnace price down to \$19.40. Interests which purchased eastern Pennsylvania iron this week claim to have done better than the equivalent of \$18 furnace, Buffalo. The actual tonnage available and turned over in this territory was considerably less than during the previous week, which in a large measure explains the keen competition. All eastern Pennsylvania iron sold, however, was not at reduced prices. A Massachusetts foundry bought 100 tons No. 2X at \$20.50 furnace or \$24.56 delivered, and numerous car lots of No. 2X and No. 1X were taken at \$20.50

and \$21 furnace, respectively. Other sales for the week include 500 tons No. 2X to a Vermont foundry, 200 tons No. 2X to a Maine stove maker, 200 tons silicon 2.75 to 3.25 to a Connecticut interest, and 100 tons No. 2X to a Providence, R. I., melter, mostly eastern Pennsylvania iron. Deliveries in all but the last instance, which is for immediate, are for second quarter shipment. The situation, insofar as Virginia and Alabama irons are concerned, is unchanged. Sales are limited to an occasional car lot of special analysis for mixture purposes at prices heretofore established in this market.

We quote delivered at common New England points as follows, having added to furnace prices \$4.06 freight from eastern Pennsylvania, \$5.46 from Buffalo, \$6.58 from Virginia and \$10.66 from Alabama:

East. Penn., sil. 2.25 to 2.75	\$23.06 to \$24.81
East. Penn., sil. 1.75 to 2.25	23.06 to 24.56
Buffalo, sil. 2.25 to 2.75	23.46 to 23.96
Buffalo, sil. 1.75 to 2.25	23.46 to 23.96
Virginia, sil. 2.25 to 2.75	29.58
Virginia, sil. 1.75 to 2.25	29.08
Alabama, sil. 2.25 to 2.75	26.66
Alabama, sil. 1.75 to 2.25	26.16

Finished Material.—Street railway companies have placed orders for girder and T-rails. Sales of the former include 2200 tons to the Boston Elevated Street Railway Co., 1600 tons to the United Electric Railways, 640 tons to Stone & Webster, and 300 tons to the Springfield Street Railway Co. and the Worcester Consolidated Railway. The Boston Elevated Railway also bought approximately 1300 tons T-rails. The Boston & Maine Railroad has closed on 2200 kegs of track bolts, but has not made known its rail requirements. The Turner Construction Co.'s purchase of 700 tons of reinforcing bars is the outstanding feature of a more active market for that product. The McClintic-Marshall Co. is awarded 3500 tons structural steel for a Park Square, Boston, building, 650 tons for a Boston Elevated Railway inspection shop, 500 tons by Stone & Webster for a New Bedford, Mass., power house extension, and 350 tons for a Cranston, R. I., coal pocket. The New England Structural Co. is awarded 500 tons for an office building at the corner of High and Congress streets, Boston, 300 tons for another office building on Kilby Street and 150 tons for a building on Winter Street. Bids have been asked on approximately 700 tons for a Boston restaurant, on 275 tons for a Christian Science Church, Cambridge, Mass., and numerous smaller tonnages. There is a large prospective tonnage overhanging the market, which probably will be closed shortly in view of the advance in mill prices. New York interests have been awarded 450 tons for a local lighting and power plant addition. The Turner Construction Co., Boston, has awarded 350 tons of column cores to the Berlin Construction Co. New England plants of steel companies are increasing operations. Recent shipments from the Wickwire-Spencer Steel Corporation, Worcester, have been larger than at any period since August, 1920.

Warehouse Business.—Local warehouse interests have reduced prices on cold-rolled steel 25c. per 100 lb., on open-hearth spring steel 50c. and have made a slight cut on 3/16 in. plate stock. Otherwise prices remain as heretofore. They report individual orders as continuing small, but more of them, and an increase in daily shipments from stock as contrasted with last month. The market on stove bolts is now 80 per cent discount whereas heretofore it was 70 and 10 per cent. Business in bolts and nuts shows steady but slow expansion. Sheet zinc is down 1/4c. per lb. to 9 1/4c. base.

Coke.—Both the New England Coal & Coke Co., Boston, and the Providence Gas Co., Providence, R. I., continue to report good sized bookings of by-product foundry coke shipping instructions and some new business. In one instance, the producer previously accumulated a reserve stock, consequently with the increased shipments it has not been necessary to increase plant production. The market for both plants' product is \$10.15 delivered where the local freight rate does not exceed \$3.40 a ton. Practically no Connellsville district by-product foundry coke is coming into New England.

Old Material.—The undertone of the old material market unquestionably is firmer, not so much because of any actual increase in bookings as to an increase

in actual and tentative inquiries from both inside and outside this territory. Certain dealers are quoting No. 1 machinery cast as high as \$17.50 to \$18 delivered, but a majority are doing perhaps 50c. less. The market on heavy melting steel is 50c. to 75c. higher, with sellers holding off on bids for anything lower. There continues a very good demand for turnings and borings of all kinds, but more especially cast iron chemical borings.

The following prices are for gross ton lots delivered consuming points:

No. 1 machinery.....	\$17.00 to \$17.50
No. 2 machinery.....	15.00 to 15.50
Stove plate.....	14.50 to 15.00
Railroad malleable.....	13.00 to 13.50

The following prices are offered per gross ton lots f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.....	\$9.00 to \$9.25
No. 1 railroad wrought.....	10.50 to 11.00
No. 1 yard wrought.....	9.50 to 10.00
Wrought pipe (1 in. in diam., over 2 ft. long).....	7.00 to 7.25
Machine shop turnings.....	5.00 to 5.25
Cast iron borings, rolling mill.....	8.50 to 9.00
Cast iron borings, chemical.....	9.00 to 9.50
Blast furnace borings and turnings.....	5.00 to 5.25
Forged scrap and bundled skeleton.....	4.00 to 4.50
Street car axles.....	11.50 to 12.00
Shafting.....	12.00 to 13.00
Car wheels.....	11.00 to 11.50
Rerolling rails.....	9.50 to 10.00

Birmingham

BIRMINGHAM, ALA., March 14.

Pig Iron.—Every feature of the Birmingham iron market gathered strength last week with the exception of price. That remained at \$15.50, with \$15 admitted as base on large tonnages by at least one operator. Business came in large volume as it had done for two weeks and average tonnages were larger. A Southern stove foundry took 750 tons at \$15.50 and numerous lots of 200 to 500 tons were booked in St. Louis territory. One maker, who went out of the market for March on account of oversold condition, re-entered during the week for second quarter on the base of \$15.50 and immediately made bookings. A Louisville concern took 1000 tons and a St. Louis concern added 500 tons to an order for 1200 tons already placed, the new iron to be principally for April and May delivery. Central Ohio took 100 tons for April delivery and Atlanta ordered several cars for April delivery. One maker said: "We have had the three best weeks in a year consecutively. We have sold more iron week by week than in any like period in the past year. Tonnages of the individual consumer are larger than heretofore." One maker said: "We entered January and February with little or no iron for those months on our books. We came into March with March capacity nearly booked. By the end of the first week in March, we had booked March make and 6000 tons over. That means large stock reduction." One maker has less than 500 tons on yards. Frank H. Crockard, president Woodward Iron Co., said: "The market has broadened remarkably. If the pace maintains, there will be increase in furnace production." Very little iron has been taken by pipe concerns, the bookings being by the general foundry trade.

We quote per gross ton f.o.b. Birmingham district furnaces as follows:

Foundry, sillon 1.75 to 2.25.....	\$15.00 to \$15.50
Basic.....	14.00 to 14.50
Charcoal, warm blast.....	30.00

Finishing Mills.—The third consecutive week of capacity operations in the open hearth department of the Tennessee company was recorded. The Connors Steel Co. continued the operation of its hoop and band mill. The American Steel & Wire Co. is at about 60 per cent and new wire drawing business is coming in handily. The Gulf States Steel Co. is making about the same schedule as American Steel & Wire Co.

Coal and Coke.—Both coal and coke are in greater demand with production increasing. Each coke maker seems to be waiting for the other to raise base above \$5, but none has taken the lead. Furnace resumption and larger takings by railroads feature the increased demand for coal. Bunker business at Pensacola and New Orleans is understood to be picking up.

Old Material.—Cast scrap remains scarce and tends

to advance in price, but has not yet done so. Steel has become firmer, but the market price is shaded on large transactions.

We quote per gross ton f.o.b. Birmingham district yards as follows:

Steel rails.....	\$11.00 to \$12.00
No. 1 steel.....	10.00 to 11.00
No. 1 cast.....	14.00 to 15.00
Car wheels.....	13.00 to 14.00
Tramcar wheels.....	12.00 to 13.00
No. 1 wrought.....	12.00 to 13.00
Stove plate.....	11.00 to 12.00
Cast iron borings.....	6.00 to 7.00
Machine shop turnings.....	4.00 to 5.00

Buffalo

BUFFALO, March 14.

Pig Iron.—While the volume of inquiry is an encouraging sign of better business, the price situation is still unsatisfactory from the selling point of view. The \$18 market is still the rule, but some tonnage has been closed at \$18.50. Inquiry is scattered and in a total of 6500 tons on which prices were asked from one furnace, the whole was made up of 35 to 40 separate inquiries. About 10,000 tons has been sold and on two sales of 1000 tons each the consideration was \$18. An inquiry from a Massachusetts buyer for 1000 tons has not found Buffalo furnaces responsive because of the effort to have this tonnage spread over third and fourth quarter delivery. Nothing has been booked beyond July delivery. The greater portion of inquiry coming to Buffalo furnaces is from Eastern users.

We quote f.o.b. per gross ton Buffalo as follows:

No. 1 foundry, 2.75 to 3.25 sh.....	\$19.00 to \$19.50
No. 2X foundry, 2.25 to 2.75 sh.....	18.50 to 19.00
No. 2 plain, 1.75 to 2.25 sh.....	18.00 to 18.50
Basic.....	18.00 to 18.25
Malleable.....	18.50 to 19.00
Lake Superior charcoal.....	26 14

Finished Iron and Steel.—Bars, shapes and plates have been more in demand and with wire products and tin plate business materially increased, the situation is more encouraging than in many months. Pipe and sheet business has not improved in the same ratio as other products, but the price of sheets has held without change in the face of stiff competition. Wire nails and barbed wire demand has been especially brisk. The leading bar mill is quoting 1.40c., Pittsburgh, and while no large tonnages have been taken, the run of orders is more satisfactory. The City of Toronto is inquiring for 1000 tons of plates for use in waterworks extension.

Warehouse Business.—Adjustment of warehouse prices in the Chicago district has not had any effect in Buffalo to date.

We quote warehouse prices f.o.b. Buffalo as follows: Structural shapes, 2.65c.; plates, 2.65c.; plates, No. 8 gage, 3.35c.; soft steel bars and shapes, 2.55c.; hoops and bands, 3.15c.; blue annealed sheets, No. 10, 3.40c.; galvanized steel sheets, No. 28, 5.25c.; black sheets, No. 28, 4.25c.; cold-rolled strip steel, 5.90c.; cold-rolled round shafting, 3.40c.

Old Material.—Settlement of a controversy over the purchase of heavy melting steel on a contract made two years ago when the ruling quotation was \$28 has brought about an unusual situation in this market. The buyer—a leading bar and billet maker—has settled by splitting the difference between the original consideration and the present market. The contract originally called for 25,000 tons at \$28, but when the market dropped below that figure, the buyer declined to accept further delivery. The settlement just reached—\$21—will affect the trend of business, as dealers will be more interested in filling this old contract than seeking new business at \$13.50. Generally the situation is brighter and before the settlement referred to was agreed upon, some large movements of steel at \$13.50 were made.

Pipes and flues.....	\$7.25 to \$7.75
No. 1 railroad wrought.....	11.25 to 11.75
No. 2 railroad wrought.....	10.75 to 11.25
Steel knuckles and couplers.....	12.00 to 12.50
Coil springs.....	12.75 to 13.25
No. 1 machinery cast.....	13.75 to 14.25
No. 1 railroad cast.....	13.25 to 13.75
Low phosph. punchings.....	11.00 to 11.50
Locomotive tires, smooth.....	10.00 to 10.50
Machine shop turnings.....	5.50 to 6.00
Cast borings.....	7.00 to 7.50
Stove plate.....	12.50 to 13.00
Grate bars.....	10.50 to 11.00
Brake shoes.....	10.50 to 11.00
Railroad malleable.....	12.00 to 12.50
Agricultural malleable.....	12.00 to 12.50

St. Louis

St. Louis, March 14.

Pig Iron.—An increasing demand for pig iron is reported and there is a better feeling in the trade. The number of carload orders is greater, and there also is a disposition among buyers to take on greater quantities. The market for Northern iron is firm at \$20, Chicago, and there has been some complaint that even at this price it has been difficult to get prompt shipments of certain grades. The result has been that Southern iron is coming in for a greater call, especially as it commands a lower price delivered in this territory at present. The only producer in this district is now running on basic iron, and its stock of foundry iron is about exhausted; however, it expects to turn back to foundry iron by April 1. Inquiries are coming in now more generally for later delivery. A Western melter wants 1500 to 2000 tons of foundry iron for over the next 60 to 90 days. A Western melter is in the market for 3000 to 5000 tons of basic. An Indiana melter wants 2000 to 3000 tons. An inquiry for 500 to 800 tons of malleable for an Illinois melter, which has been pending for several weeks, is still open. Scattering inquiries of from a carload to 150 tons total about 1500 tons. A few sales were made during the week of Southern iron for water and rail shipment, on the basis of \$16, Sheffield, or \$19.44 St. Louis.

We quote delivered consumers' yards, St. Louis, as follows, having added to furnace prices \$2.80 freight from Chicago and \$5.74 from Birmingham:

Northern foundry, sil. 1.75 to 2.25...	\$22.80
Northern malleable, sil. 1.75 to 2.25...	22.80
Basic.....	22.80
Southern foundry, all rail, sil. 1.75 to 2.25.....	\$20.74 to 21.24
Southern foundry, water and rail, sil. 1.75 to 2.25, f.o.b. St. Louis.....	19.44

Finished Iron and Steel.—A much improved condition is reported in the markets for finished iron and steel. Plates, shapes and bars are in greater demand, and sheets are beginning to move. The smaller fabricators, who have been buying right along, report a much better business in store fronts, repair work and other lines to which they cater. The larger fabricators are beginning to feel the effects of spring business, and they, too, are buying more freely, the market being at the point where they believe that prices are right. The price of 1.50c., Pittsburgh, established by the Jones & Laughlin and other independents, has not yet been met by the Steel Corporation. The outlook for a revival of building in St. Louis has been made decidedly brighter by the acceptance of a reduction of 15 per cent in the wage scale of the Bridge, Structural and Iron Workers' Union, from \$1.25 to \$1.06½ an hour, effective April 1, this being the third union to accept a reduction from the basic wage of \$1.25 an hour. The Majestic Theater, Dallas, Tex., will require 450 tons of structural steel, already placed, and 100 tons of reinforcing bars, not yet bought. The Decatur Bridge Co. got the contract for 90 tons of structural steel for two high school buildings at Springfield, Mo., and for 160 tons of steel for the parcel post building in St. Louis. Rolla Wells, receiver for the United Railways, will soon ask the Federal Court for authority to buy 50 new steel cars for the Grand Avenue line at a cost of \$10,000 each. Railroad inquiries during the week were few and inconsequential. Warehouse prices are lower, the reductions being made because of the belief that the spread between mill prices and warehouse prices was too great. Demand at warehouses is light.

For stock out of warehouse we quote: Soft steel bars, 2.37½c. per lb.; iron bars, 2.37½c.; structural shapes, 2.47½c.; tank plates, 2.47½c.; No. 10 blue annealed sheets, 3.47½c.; No. 28 black sheets, cold rolled, one pass, 4.15c.; cold drawn rounds, shafting and screw stock, 3.50c.; structural rivets, \$3.09½ per 100 lb.; boiler rivets, \$3.19½; tank rivets, 7/16-in. and smaller, 65 and 5 per cent off list; machine bolts, large, 60-10 per cent; small, 60, 10 and 10 per cent; carriage bolts, large, 55-5 per cent; small, 60 and 10 per cent; lag screws, 65-5 per cent; hot pressed nuts, square or hexagon blank, \$4; and tapped, \$3.75 off list.

Coke.—Foundry coke is in increasing demand. The majority of foundries are carrying small stocks, barely more than 30 days' supply. Purchasers of all grades are insisting on immediate shipment. There

has been some heavier buying in anticipation of a coal strike. Connellsville coke is selling at from \$4.50 to \$5.

Old Material.—The market for old material continues to improve, and is much stronger, nearly all items being marked up from 50c. to \$1 per ton. However, only one large consumer has come into the market, the others contending that the present advance is only a "dealers' boom" and the prices will seek lower levels within the next few weeks. On the other hand, the dealers believe that an upward swing has started, and they feel that the consumers will eventually begin buying at the higher levels. Railroad offerings before the market this week follow: Mobile & Ohio Railroad, 750 tons; United Railways Co., St. Louis, 1500 tons; Wabash Railway, 500 tons; Kansas City Southern Railway, 750 tons; Terminal Railway Association, 1800 tons; St. Louis & San Francisco Railway, 750 tons, and Santa Fe, 1800 tons.

We quote dealers' prices f.o.b. consumers' works, St. Louis industrial district and dealers' yards, as follows:

Per Gross Ton	
Old iron rails.....	\$14.00 to \$14.50
Steel rails, rerolling.....	12.50 to 13.00
Steel rails, less than 3 ft.....	12.50 to 13.00
Relaying rails, standard section.....	23.00 to 28.00
Cast iron car wheels.....	15.00 to 15.50
No. 1 heavy railroad melting steel.....	10.50 to 11.00
No. 1 heavy shoveling steel.....	10.00 to 10.50
Ordinary shoveling steel.....	10.00 to 10.50
Frogs, switches and guards, cut apart.....	10.50 to 11.00
Ordinary bundle sheet.....	4.50 to 5.00
Cast steel bolsters.....	11.00 to 11.50

Per Net Ton	
Heavy axle and tire turnings.....	6.50 to 7.00
Iron angle bars.....	13.00 to 13.50
Steel angle bars.....	11.00 to 11.50
Iron car axles.....	18.00 to 18.50
Steel car axles.....	13.00 to 13.50
Wrought iron arch bars and transoms.....	15.50 to 16.00
No. 1 railroad wrought.....	9.50 to 10.00
No. 2 railroad wrought.....	9.00 to 9.50
Railroad springs.....	11.00 to 11.50
Steel couplers and knuckles.....	11.00 to 11.50
Locomotive tires, 42 in. and over, smooth inside.....	8.50 to 9.00
No. 1 dealers' forge.....	8.50 to 9.00
Cast iron borings.....	5.50 to 6.00
No. 1 bushing.....	8.50 to 9.00
No. 1 boilers cut in sheets and rings.....	6.00 to 6.50
No. 1 railroad cast.....	13.50 to 14.00
Stove plate and light cast.....	12.50 to 13.00
Railroad malleable.....	10.50 to 11.00
Agricultural malleable.....	10.50 to 11.00
Pipe and flues.....	7.50 to 8.00
Heavy railroad sheet and tank.....	6.00 to 6.50
Light railroad sheet.....	3.50 to 4.00
Railroad grate bars.....	10.50 to 11.00
Machine shop turnings.....	3.00 to 3.50
Country mixed iron.....	6.50 to 7.00
Uncut railroad mixed.....	9.50 to 10.00
Horseshoes.....	9.50 to 10.00
Railroad brake shoes.....	10.50 to 11.00

San Francisco

SAN FRANCISCO, March 8.

Pig Iron.—While a rather quiet condition prevails on the Coast, there is a little better demand developing, though gradually. Strengthening exchange rates and a firm tendency in ocean freights has played an important part in decreasing the business here in Continental pig iron in favor of domestic material. During the past two weeks or so, it is reported by a large dealer that around 1000 tons has been sold for Gulf shipment, the market being about \$28, ex-ship, San Francisco, for 1.75 to 2.25 silicon analysis. As far as can be ascertained, foreign iron is being held for from \$30 to approximately \$33. One prospect in sight is an inquiry in this market from Oregon for 1000 tons of foundry pig iron. Another from Los Angeles is for 100 tons of basic pig. Otherwise, demand is mainly for small lots.

Coke.—A good business has been done during the fortnight just passed. The regular steady demand has been felt, together with some special inquiry, as from the Southern Pacific Co., which after having placed 600 tons, is again in the market for an additional 600 tons on March 11. Recently there has been some trading for shipment from New Orleans, it being estimated that around 1200 tons has been sold, prices ranging from \$18 to about \$21, according to grades, ex-ship. Likewise, English coke has been in

demand, Tacoma and Los Angeles each having taken 500 tons, the price approximating \$20, ex-ship.

Finished Iron and Steel.—The Coast markets continue to show improvement, although the betterment is coming very gradually. There seems to be a more buoyant sentiment among the trade, which after the lessons of the past, however, is not disposed to expect too much. The opening of spring favors an enlargement of operations, both from private and State sources. Freight rates are still a problem, which undoubtedly is a deterrent influence, but it is hoped a readjustment will soon be reached. Perhaps the best single deal of recent date is the placing of 1000 tons of structural steel to be used on a new structure being erected by the State at Sacramento. The Steel Corporation was lowest bidder. For the erection of a cannery at Sacramento for the California Packing Corporation about 350 tons of steel will be required. The contract has not yet been let. A bank building to be constructed at Sacramento will require a fair tonnage, but this is not determined to date. Much interest is centering in Seattle at present, where a pipe line and paving work is contemplated. It is reported the paving of First Avenue will require \$120,000 for steel work. Prices seem to be reasonably steady and generally are unchanged. The Pacific Gas & Electric is in the market for a second hand locomotive.

Cast Iron Pipe.—There is little change in the situation along the Coast, which except for the pipe line job in Seattle is only moderately active. Prices appear steady to firm at around \$33, base.

Old Material.—After the heavy buying of the past month, scrap consumers are virtually out of the market, having liberal supplies on hand. There is little indication of greater foundry expansion at this time, which accordingly means a rather limited consumption. Heavy melting steel has developed a certain weakness, prices now ranging around \$9, gross ton delivered at mill, or slightly better. Cast iron scrap is quiet at from about \$21 to \$23.

Improved Demand for Refractories

PITTSBURGH, March 13.—Although the present month began as if it would be a dull one in refractories, the rise in iron and steel plant activities appears to have stimulated the demand and the past few days have been marked by a considerable swelling both in inquiries and sales. Manufacturers still note no tendency on the part of consumers to abandon a policy of covering only actual needs, but the very fact that stocks of refractories at the iron and steel plants have been allowed to get dangerously low and also to become much broken up, means that needs are greater and more urgent. The supply situation appears to be getting slightly stronger, because during the past few months shipments of most kinds of brick have been running somewhat ahead of production and this has resulted in a reduction in the stocks in first hands.

There is not enough business yet to give all makers a share and competition for orders is keen enough to keep prices in buyers' favor. It is established that a price of \$28 per 1000 for Pennsylvania silica brick has not entirely disappeared, but most makers are holding to \$30 and intimations are heard of a possible advance of \$2 per 1000 about April 1. On Pennsylvania high duty fire clay brick \$32 per 1000 is more of a minimum quotation than a selling price. Concessions from quotations also are reported on magnesite and chrome brick.

We quote per 1000, f.o.b. works:

Fire Clay	High Duty	Moderate Duty
Pennsylvania	\$32.00 to \$35.00	\$30.00 to \$32.00
Ohio	30.00 to 35.00	28.00 to 30.00
Kentucky	32.00 to 35.00	30.00 to 32.00
Illinois	32.00 to 35.00	30.00 to 32.00
Missouri	32.00 to 35.00	28.00 to 32.00
Silica Brick		
Pennsylvania		30.00
Chicago		35.00 to 37.00
Birmingham		10.00
Magnesite Brick		
Standard size per net ton (f.o.b. Baltimore)		53.00
Chrome Brick		
Standard size, per net ton		40.00 to 42.00

PRICES MORE STEADY

Moderate Improvement in the Youngstown District —Production Increasing

YOUNGSTOWN, March 14.—Less price unsettlement marks the iron and steel situation, following the advance by a number of companies on bars, shapes and plates to a 1.50c. minimum. Buyers, including both jobbers and manufacturing consumers, are placing tonnages with more freedom. Price advances are being talked of in manufacturing circles affecting other lines, but are being held in abeyance until a heavier backlog is built up on makers' books.

Improved sentiment in the steel market has appreciably affected the scrap market. In this district the old materials market is firmly at \$15.75 to \$16 for heavy melting, while hydraulically compressed sheets command from \$13.25 to \$13.50. Lighter grades of scrap continue scarce. While there has been a drop in buying by Valley plants, purchases by the National Tube Co. for its Lorain plant and by independents in close competitive territory have maintained scrap prices at these levels.

Furnace interests in the Valleys figure that the 20 per cent freight rate reduction on iron ore from lower lake ports will produce a saving in iron-making costs of between 35c. and 40c. per ton. The reduced rate, granted by the carriers to become effective April 15, will affect both the line haul and dock charges.

Plant schedules in the Mahoning Valley are on a slightly broader basis this week, as compared with last week. The rate of active steel-making capacity remains the same, with 38 of 51 independent furnaces charged. The Carnegie Steel Co. is pouring from 14 open hearths, giving the Valley a total of 52 active units, out of 66. Two additional pipe furnaces have been fired, 10 of 17 being active, four of the Republic Iron & Steel Co. and six of the Youngstown Sheet & Tube Co. Makers report there is somewhat better demand both for line pipe and casing and for merchant stock from jobbing interests.

COAL WAGE CONTROVERSY

Differences as to How Conferences of Employers and Employees Shall Be Held

PITTSBURGH, March 13.—The chief bone of contention in the impending strike of the bituminous coal miners, on April 1, is whether the operators and officials of the United Mine Workers of America shall confer by districts in reaching a wage scale, or, as has been the practice for several years past, for the operators of the so-called central competitive fields to collectively confer with the union officials. Operators in most districts have expressed a willingness to treat with their men in their respective districts on the question of a new scale to replace the present one, which expires by limitation on March 31. The union leaders in some districts have shown a willingness to go along with this idea, but John L. Lewis, president of the United Mine Workers of America, has specifically forbidden such conferences. The operators in Pennsylvania, Ohio, Illinois and Indiana, those States comprising the central competitive fields, favor dealing with their own men and are opposed to a collective bargain, the result of which forms a basis of wages for all union miners in the United States and Canada.

The Pittsburgh Coal Producers' Association, at a meeting last week, again went on record in opposition to a collective conference, but repeated a former offer to confer with the men employed in the mines embraced by the association.

"We will deal with our own men in western Pennsylvania," says a statement issued by the association, "union or non-union, on a working agreement, with the exception of a check-off, but we will not be a party to a scale for Ohio, Indiana and Illinois. The operators of the Pittsburgh district believe that the practice whereby a common scale was set up for Pennsylvania, Ohio, Indiana and Illinois to be economically unsound."

British Iron and Steel Market

Prices Stiffening on Galvanized Sheets, Tin Plate and Coke—Black Sheets Easier—Labor Deadlock Continues

(By Cable)

LONDON, ENGLAND, March 14.

No settlement has yet been reached in the engineering and shipbuilding labor disputes.

Home consumers of pig iron, realizing that lower prices are improbable at present, are showing more interest and forward contracts are being arranged. There is a fair amount of export buying. Hematite is less active and buyers are disinclined to pay the enhanced prices.

Sellers of Bilbao Rubio ore are asking 27s. (\$5.80) ex-ship Tees.

Home demand for steel is affected by the industrial upheaval and steel makers will be unable to continue for long unless there is an expansion in the export trade. Prices are firm, with concessions less easily obtainable.

Continental business is quiet. French foundry pig iron is held at £5 5s. to £5 10s. (\$22.57 to \$23.65) f.o.b. Luxemburg, and Belgian foundry iron may be had at £5 to £5 5s. (\$21.50 to \$22.57) f.o.b.

French, Belgian and Luxemburg merchant bars are all quoted at £8 to £8 10s. (1.54 to 1.63c. per lb.) f.o.b., for May and June delivery. German merchant bars are held at £8 5s. (1.58c. per lb.) f.o.b., for April and May shipment. French structural beams are obtainable at £7 12½s. to £8 (1.46 to 1.54c. per lb.) f.o.b., for April and May business. Belgian beams are quoted at £7 12½s. to £7 15s. (1.46 to 1.49c. per lb.) f.o.b., for April and May delivery.

German 3/16-in. plates are held at £8 (1.54c. per lb.) f.o.b., for April and May shipment. Belgian

3/16-in. plates are quoted at £8 12½s. to £8 15s. (1.65 to 1.68c. per lb.) f.o.b., for April and May delivery. Belgian sheet bars are obtainable at £6 12½s. to £6 15s. (\$28.49 to \$29.02) f.o.b., for March shipment. Luxemburg billets are held at £7 (\$30.10) f.o.b., for March and April business. Belgian billets are quoted at £6 10s. (\$27.95) f.o.b., for March delivery.

Tin plate quotations for forward shipments are slightly harder on increased business. There have been moderate-sized sales to France, Holland, Scandinavia, Germany and the Near East. Wasters are easier; 20 x 14-in. are held at 16½ to 17s. (\$3.60 to \$3.65) f.o.b., ex-stock.

There is increased business in galvanized sheets, but no important parcels have been involved. Prices are stiffer. Japan is buying to usual specifications. Black sheets, 6 x 3 ft., 107 lb., are being sold at £15 10s. (2.97c. per lb.) net, f.o.b.

We quote per gross ton, except where otherwise stated, f.o.b. maker's works, with American equivalent *figured at \$4.30 per £1 as follows:

Durham coke, delivered.	£1 10s.	\$6.45
Cleveland No. 1 foundry	4 15	20.42
Cleveland No. 3 foundry	4 10	19.35
Cleveland No. 4 foundry	4 7½	18.31
Cleveland No. 4 forge...	4 10	19.35
Cleveland basic	4 10	19.35
Hematite	7 0*	30.10*
East Coast mixed	5 0 to 5 2½	21.50 to \$22.04
Forromanguese	15 0 & 14 10*	64.50 & 62.35*
Rolls, 60 lb. and up...	8 0 to 9 10	34.40 to 40.85

*Export price.

General Conditions Unsatisfactory—Tin Plate Market Slow—The Basset Process

LONDON, ENGLAND, Feb. 22.—The recent marked improvement in gilt-edged securities has given certain quarters "furiously to think," and a good deal is being said about the wonderful improvement in trade which will shortly be seen. On the other side of the picture we have Sir Alfred Mond, the minister of health, openly stating that he has official information from the Master Cutler in Sheffield that his men were giving up their employment in order to draw the dole.

These two illustrations are in direct opposition to each other, but so far as the iron and steel trades are concerned, this country has a long way to go before conditions can approach anything like normal. From information recently received we learn that the shipbuilders have refused their employers' proposal to withdraw the cost of living bonus. High cost of production the slump in merchant shipbuilding and the finish of naval shipbuilding has caused Sir W. G. Armstrong, Whitworth & Co., to close their steel works at Elswick. There has been a considerable demand of late from the continent for coal and coke with the result that prices of these commodities have been advanced, thereby increasing the cost of the manufacture of iron and steel, and it is on account of this that Sir W. G. Armstrong, Whitworth & Co., have had to take this drastic step.

The demand for pig iron is only moderate and, with the position further complicated by increased costs of fuel, makers are naturally undecided as to relighting additional furnaces. There has been a little spurt in buying for export, Italy and Germany taking a few parcels, the latter being shipped to Hamburg but destined, it is stated, ultimately for Czecho-Slovakia. The price of No. 3 Cleveland pig iron is maintained at 90s. for home and export. In the hematite market, dear fuel has already made itself felt, consumers finding that they must now pay more money than they had to do a

week ago, it being very hard to obtain supplies of East Coast hematite for less than 97s. 6d. The demand on both home and export account is by no means large, but sufficient to absorb the present rate of output, and the question of putting in additional furnaces is in abeyance while the uncertainty of costs remains.

In the finished iron and steel departments, works are not so keen in taking orders at prices so very much below cost as they have been, while the big makers are rigidly adhering to the prices they have quoted for so many weeks. Works are badly in need of specifications and plants are only working part time. Tin plates are in a bad way, selling prices being far below cost and works are gradually closing down, with the result that output at the present time is certainly no more than 45 per cent. Consumers are only purchasing on a hand-to-mouth scale. A good deal has been heard of American competition in the Far East in tin plates, black sheets, wire and wire nails and latterly galvanized sheets, and there is no doubt that our makers will have to give their very closest attention to this in the future.

Several schemes are being put forward in this country which will directly benefit the iron and steel trades, among them being one involving a sum of £17,000,000 for the electrification of railroads in the south of England. Employment will be found for several thousands of men for a period of four to five years.

Sheffield makers of steel works plant and equipment have been busy on orders for M. Basset, the French metallurgist, who is stated to have discovered a process for making steel direct from iron ore. Part of the plant has been already shipped, consisting of 200-ft. cylinders each 12 ft. in diameter. Each cylinder when lined with firebrick and fully charged weighs about 400 tons. The Sheffield steel makers do not seem to be perturbed to any large extent, pinning their faith on the efficacy of the Siemens open-hearth, electric and crucible furnaces.

The Marunouchi Building, Under Construction in Tokio for the Mitsubishi Shoji Kaisha, by George A. Fuller of the Orient, is an Example of Modern Type of Building Now Being Erected in Japan. This will be the largest modern office building in the Far East, covering two acres and containing 350 offices, two restaurants and 11 elevators. The insert shows progress on the building Sept. 1, 1921, while the large photograph shows the building on Jan. 1, 1922.

JAPANESE TRADE ACTIVE

Numerous Bar Inquiries—Black Sheet Buying Increases—Rails Active—Large Tin Plate Inquiry

NEW YORK, March 14.—Exports to Far Eastern markets continue to show distinct improvement, and in addition exporters dealing with South America report a considerable increase in inquiries and a few orders from this source. Although inquiries for bars have taken the lead during the past few weeks, but little business is reported closed on this commodity, largely because of the price demands of Japanese buyers. During the past week a slight increase in black sheet inquiries has been registered. One of the large Japanese export houses has been obtaining bids on a tonnage of about 2000 tons of small-sized bars and other exporters are handling inquiries varying from a few hundred tons up to two and three thousand tons. The withdrawal of the foremost independent from a 1.30c. per lb. base on steel bars to higher quotations evidently has not appreciably affected export quotations, as it is reliably reported that sales are still being made to Canadian consumers on a 1.30c. per lb., Pittsburgh base, by other interests.

The Imperial Government Railway tender for about 6500 tons of 60-lb. rails for Japan, similar to the one recently placed in the United States, has been closed but cable information as to the low bidder has not yet been received. Bids have also been submitted on 20 miles of 100-lb. rails, c.i.f. Dairen, Manchuria, for the South Manchuria Railway Co. This tender is also similar to one recently placed in the United States by this company. Bids will be opened March 19. Government buying has also included about 2000 tons of structural steel for bridge construction, which was placed with one of the large Japanese export houses.

Among current inquiries of fairly large size is

one calling for about 22,000 base boxes of tin plate.

Recent buying has included light rails, wire, wire nails, black sheets, bars and structural material. One exporter in New York recently sold 200 tons of steel angles obtained from resale lots of the United States Government and is now quoting on an additional 100 tons to the same Japanese buyer. The purchaser requires unused angles but does not object if the material is slightly rusted. Another exporter has booked about 20 miles of 12-lb. rails to a Japanese importer.

Black sheet purchases, it is estimated by conservative Japanese interests, will total annually about 8000 tons for the districts of Tokio and Kobe alone. These estimates are based only on the probable annual consumption of black sheets for fireproofing purposes, necessary because of new municipal ordinances requiring fireproof roofs.

According to a Japanese exporter recently returned from Japan, there is some uneasiness on the part of the more conservative elements at the present increased buying contrasted with the export situation of the country. There has been speculation in iron and steel on a small scale, which has been consistently discouraged by the conservatives and the Government, who fear that unsoundness may again develop in the financial structure of the country.

A joint dinner of engineers, to celebrate the quarter centennial of the Rochester Engineering Society, is to be held in the Powers Hotel, Rochester, Saturday evening, March 19. Members of eight organizations will participate and John R. Freeman will address the meeting on "Engineering Observations In China and the Far East."

After being closed for more than a year, the Stroudsburg, Pa., car shops of the Erie Railroad have reopened on full time. The plant has been leased to the Meadville Machinery Co.

TRADE CHANGES

The South Bend Lath Works, New England office and warehouse, 65 Oliver Street, Boston, has been discontinued. H. B. Washington, manager, will represent the company in the Middle-West and western Canada. Present plans are to market the company's product through New England machine tool representatives of other lines. This allotting of representatives will be under the supervision of Vernon A. Campbell, heretofore associated with Mr. Washington in the Boston office, not only in New England but in New York State east of Syracuse and in Canada east of Kingston, Ont., as well.

The Traders Steel & Pipe Co. announces that, effective March 1, it has changed its corporate name to the Sawhill-Moreland Co., and has removed its offices from the Conestoga Building to 2529 Oliver Building, Pittsburgh. D. V. Sawhill, formerly in the sales department of the Youngstown Sheet & Tube Co., is president and treasurer, and E. M. Moreland, for a number of years with the Carnegie Steel Co. in a sales capacity, is vice-president and secretary. The company does a general brokerage and merchant business in pig iron, ferro-alloys and semi-finished and finished steel products.

The Lakeside Forge Co., Erie, Pa., in addition to its district sales offices in New York at 30 Church Street, in Cleveland at 402 Bangor Building, in Philadelphia at 1218 Chestnut Street, has opened up offices in Detroit at 1354 Penobscot Building and in Indianapolis at 334 North Capitol Avenue. All of these offices are industrial sales offices not connected with the jobbing or dealer end of the business.

William M. Orr, for the past six years associated with the Thomas H. Hayward Co., Pittsburgh, as of March 1, severed that connection and has gone into business for himself under the name of the William M. Orr Co., with offices at 1635 Oliver building, Pittsburgh. The new company will be sales agent in western Pennsylvania, West Virginia and eastern Ohio for the Mueller Metals Co., Port Huron, Mich., and will do a general brokerage business in pig iron and ferroalloys.

The name of the Ball Engine Co., Erie, Pa., has been changed to Erie Steam Shovel Co. This change was made because the company is now making exclusively Erie steam shovels and cranes, the engine business having been sold. Although the manufacture of the steam engines was discontinued about two years ago, it has been necessary to more than triple the plant capacity in the past six years to take care of shovel and crane business. This enlarged plant is now running day and night, with full force on each shift. There has been no change in the assets, policies, management or personnel of the company—the change is in name, only.

The Detroit offices of the Whiting Corporation, formerly the Whiting Foundry Equipment Co. of Harvey, Ill., have been changed from 570 Penobscot Building to 3000 Grand River Avenue.

The Detroit offices of the American Brass Co. have been moved from 435 Book Building to 3-113 General Motors Building. Charles F. Craig is Detroit agent of the company.

The Utility Compressor Co., which has maintained offices in Detroit and plant at Adrian, Mich., has moved its general offices to Adrian.

The National Spring & Wire Co. has moved its general offices from Albion, Mich., to Detroit.

The S. L. Jackson Co., Detroit, has taken over the Auto Trimmers Supply and the Iron Products Co., both of Detroit, and both Michigan corporations. The company deals in upholstery and top materials, bolts, screws, nuts, etc.

Theodore Geissmann & Co., McCormick Building, Chicago, has been appointed district sales representative the Standard Seamless Tube Co., Ambridge, Pa.

The Betts Machine Co., Rochester, N. Y., has closed its New York sales office at 50 Church Street, but has not yet announced its plans for representation in the New York district.

The Dale Machinery Co., dealer in machine tools, has moved from 53 Lafayette Street, New York, to the National City Building, 17 East Forty-second Street, New York. A warehouse has been leased at 255 Pearl Street.

The address of the St. Louis office of Stewart Industrial Furnaces has been changed from the Railway Exchange Building to 420 Wainwright Building.

The York, Pa., plant of the American Foundry Equipment Co. is getting ready for bigger business by moving from the old location on North Street to larger and better adapted quarters on East Market Street, adjacent to the Maryland & Pennsylvania Railroad. The company's molding machines, flasks, jackets, and pattern mounting sundries are manufactured at this plant. Sand cutting machines, sand blast equipment, dust arresters, and core machines will continue to be manufactured at the main plant, 2935 West Forty-seventh Street, Chicago.

Ralph M. Sitterley, foreign sales manager, 149 Broadway (Singer Building), New York, announces the establishment of his offices at 149 Broadway, where he will act as foreign sales manager of American manufacturers of electrical specialties, marine supplies, automotive products and equipment. He expects to leave for Europe in April.

Plans of New Companies

The Conemaugh Iron Works, Latrobe, Pa., is a reorganization of the Blairsville Iron Works Co. The products are ingot molds and cast iron enamel ware.

The Brake Equipment & Supply Co., 80 East Jackson Boulevard, Chicago, has been incorporated for the purpose of manufacturing air brake repair parts such as valves, valve seats, copper gaskets, etc., for locomotive air compressors.

The T-A Brass Foundry Co., Charleston, W. Va., recently incorporated, was conducted formerly on a partnership basis. It is now putting on the market a patented trolley wheel equipped with roller bearing and an oil cellar that carries enough oil to run about ten days. The company will be in the market at various times for copper, tin and zinc.

The Arrow Mfg. Co., Harrisburg, Pa., will manufacture electrical and mechanical equipment for automotive service. The work will be done by contract. Contracts have not yet been awarded.

The Eclipse Auto Signal Co., Inc., Cedar Springs, Mich., is having electric automobile direction signals manufactured by contract, and will continue to do so until some time in the early fall.

The Ray P. Farrington Co., Philadelphia, acts as selling agent in the Philadelphia territory for Follansbee Brothers Co., Pittsburgh; the Falcon Steel Co., Niles, Ohio, and the Falcon Tin Plate Co., Canton, Ohio. R. P. Farrington, president, was formerly the district representative of the Trumbull Steel Co., later acted in that capacity for the Falcon Steel Co. and the Newton Steel Co. and, about the first of the year, was appointed representative for Follansbee Brothers Co. and the Falcon Tin Plate Co., having given up the agency of the Newton Steel Co. about a year ago. W. W. Keefer, 2nd, secretary and treasurer, was formerly connected with the Midvale Steel Co., later was with the Tacony Steel Co. in the capacity of special agent and was for two years the sales manager of the Mid-West territory with offices in Cleveland. The company handles a number of sheet and tin mill specialties which, with its tonnage lines, cover practically the whole range of sheet and tin plate manufacture.

The Bethlehem Steel Co.'s New York sales offices have been removed from 111 Broadway to the Cunard Building, 25 Broadway.

The Rochester Terminal & Canal Corporation, Rochester, N. Y., has been incorporated and has acquired dockage and storage facilities on the New York State barge canal. It will engage in the transportation of bulk commodities on the barge canal. A warehouse will be built at Rochester to be equipped with conveyors, coal chutes and other loading machinery. An order has been placed with the Kingston Dry Dock & Construction Co. for 10 barges of 500 tons capacity each. Additional barges will be built as the volume of business increases.

The Crescent Truck Co., recently organized, will locate at Lebanon, Pa., on property of the Hunsicker Engineering Co. The two concerns are independent and the Hunsicker Engineering Co. continues to do business as in the past as engineer, founder and machinist, manufacturing cars, forgings and special machinery.

The Graetz & Knight Mfg. Co., Worcester, Mass., belting, is now operating full time and employing 900.

The Liddell Electric Mfg. Co., Bridgeport, Conn., has received orders for radio apparatus aggregating \$100,000.

The Lehigh Valley Coal Co., Hazleton, Pa., has plans in preparation for the construction of a new coal washery at its properties between Jeanesville and Beaver Meadow.

Prices Finished Iron and Steel, f.o.b. Pittsburgh

Freight Rates

Freight rates from Pittsburgh on finished iron and steel products, in carload lots, to points named, per 100 lb., are as follows:

Philadelphia, domestic	\$0.36	Kansas City	\$0.815
Philadelphia, export	0.365	Kansas City (pipe)	0.77
Baltimore, domestic	0.35	St. Paul	0.665
Baltimore, export	0.355	Omaha	0.815
New York, domestic	0.38	Omaha (pipe)	0.77
New York, export	0.385	Denver	1.35
Boston, domestic	0.405	Denver (wire products)	1.415
Boston, export	0.285	Pacific Coast	1.665
Buffalo	0.295	Pacific Coast, ship plates	1.335
Cleveland	0.34	Birmingham	0.765
Detroit	0.325	Jacksonville, all rail	0.555
Cincinnati	0.325	Jacksonville, rail and water	0.46
Indianapolis	0.345	New Orleans	0.515
Chicago	0.38		
St. Louis	0.475		

The minimum carload to most of the foregoing points is 36,000 lb. To Denver the minimum loading is 40,000 lb., while to the Pacific Coast on all iron and steel products, except structural material, the minimum is 80,000 lb. On the latter item the rate applies to a minimum of 50,000 lb., and there is an extra charge of 9c. per 100 lb. on carloads of a minimum of 40,000 lb. On shipments of wrought iron and steel pipe to Kansas City, St. Paul, Omaha and Denver the minimum carload is 46,000 lb. On iron and steel items not noted above the rates vary somewhat and are given in detail in the regular railroad tariffs.

Rates from Atlantic Coast ports (i.e., New York, Philadelphia and Baltimore) to Pacific Coast ports of call on most steamship lines, via the Panama Canal, are as follows: Pig iron, 55c.; ship plates, 75c.; ingot and muck bars, structural steel, common wire products, including cut or wire nails, spikes and wire hoops, 75c.; sheets and tin plates, 60c. to 75c.; rods, wire rope, cable and strands, \$1; wire fencing, netting and stretcher, 75c.; pipe, not over 8 in. in diameter, 75c.; over 8 in. in diameter, 2 1/2c. per in. or fraction thereof additional. All prices per 100 lb. in carload lots, minimum 40,000 lb.

Structural Material

I-beams, 3 to 15 in.; channels, 3 to 15 in.; angles, 3 to 6 in., on one or both legs, 1/4 in. thick and over, and zees, structural sizes, 1.40c. to 1.50c.
Sheared plates, 1/4 in. and heavier, tank quality, 1.40c. to 1.50c.

Wire Products

Wire nails, \$2.40 base per keg; galvanized, 1 in. and longer, including large-head barbed roofing nails, taking an advance over this price of \$1.25 and shorter than 1 in., \$1.75; bright Bessemer and basic wire, \$2.25 per 100 lb.; annealed fence wire, Nos. 6 to 9, \$2.25; galvanized wire, \$2.75; galvanized barbed wire, \$3.05; galvanized fence staples, \$3.05; painted barbed wire, \$2.55; polished fence staples, \$2.55; cement-coated nails, per count keg, \$1.90; these prices being subject to the usual advances for the smaller trade, all f.o.b. Pittsburgh, freight added to point of delivery, terms 60 days, net, less 2 per cent off for cash in 10 days. Discounts on woven-wire fencing are 70 1/2 per cent off list for carload lots; 69 1/2 per cent for 1000-rod lots, and 68 1/2 per cent for small lots, f.o.b. Pittsburgh.

Bolts and Nuts

Machine bolts, small, rolled threads, 70, 10 and 10 per cent off list
Machine bolts, small, cut threads, 70 and 10 per cent off list
Machine bolts, larger and longer, 70 and 10 per cent off list
Carriage bolts, 1/2 in. x 6 in.;
Smaller and shorter rolled threads, 70 and 10 per cent off list
Cut threads, 70 per cent off list
Longer and larger sizes, 70 per cent off list
Lag bolts, 70, 10 and 5 per cent off list
Flow bolts, Nos. 1, 2 and 3 heads, 60 and 10 per cent off list
Other style heads, 20 per cent extra
Machine bolts, c.p.c. and t. nuts, 1/2 in. x 4 in.;
Smaller and shorter, 65, 10 and 5 per cent off list
Larger and longer sizes, 65 and 10 per cent off list
Hot pressed sq. or hex. blank nuts, \$5.50 off list
Hot pressed nuts, tapped, \$5.25 off list
C.p.c. and t. sq. or hex. blank nuts, \$5.25 off list
C.p.c. and t. sq. or hex. blank nuts, tapped, \$5.00 off list
Semi-finished hex. nuts;
1/4 in. to 9/16 in. inclusive, 80, 10, 10 and 10 per cent off list
Small sizes S. A. B., 80 and 10 per cent off list
1/2 in. to 1 in. inclusive, U. S. S. and S. A. F.,
70, 10, 10 and 10 per cent off list
Stove bolts in packages, 80 and 3 tens and 5 per cent off list
Stove bolts in bulk, 80, 3 tens and 2 1/2 per cent off list
Tire bolts, 70, 10 and 5 per cent off list
Track bolts, carloads, 3c. base
Track bolts, less than carloads, 3.75c. to 4c. base

Upset and Hex. Head Cap Screws

1/4 in. and under, 80 and 10 to 80, 10 and 10 per cent off list
9/16 in. to 1 in. 80 and 10 to 80, 10 and 10 per cent off list

Upset Set Screws

1/4 in. and under, 80, 10 and 5 to 85 per cent off list
9/16 in. to 1 in. 80, 10 and 5 to 85 per cent off list

Milled Square and Hex. Cap Screws

All sizes, 75 and 10 to 80 per cent off list

Milled Set Screws

All sizes, 70, 10 and 10 per cent off list

Rivets

Large structural and ship rivets, \$2.00 to \$2.10
Large boiler rivets, 2.10 to 2.20
Small rivets, .75 and 10 off list

Wire Rods

No. 5 common basic or Bessemer rods to domestic consumers, \$36; chain rods, \$36; screw stock rods, \$41; rivet and bolt rods and other rods of that character, \$36; high carbon rods, \$43 to \$46, depending on carbons.

Railroad Spikes and Track Bolts

Railroad spikes, 9, 16-in. and larger, \$2 to \$2.10 base per 100 lb. in lots of 200 kegs of 200 lb. each or more; spikes, 1/2-in., 5/8-in. and 7/16-in., \$2.15 to \$2.25 base; 5/16-in., \$2.15 to \$2.25 base. Boat and barge spikes, \$2.15 to \$2.25 base per 100 lb. in carload lots of 200 kegs or more, f.o.b. Pittsburgh. Track bolts, 3c. base per 100 lb. Tie plates, \$1.75 per 100 lb. Angle bars, \$2.40 per 100 lb.

Terne Plates

Prices of terne plates are as follows: 8-lb. coating, 200 lb., \$9.30 per package; 8-lb. coating, 1 C., \$9.60; 15-lb. coating, 1 C., \$11.80; 20-lb. coating, 1 C., \$13; 25-lb. coating, 1 C., \$14.25; 30-lb. coating, 1 C., \$15.25; 35-lb. coating, 1 C., \$16.25; 40-lb. coating, 1 C., \$17.25 per package, all f.o.b. Pittsburgh, freight added to point of delivery.

Iron and Steel Bars

Steel bars, 1.40c. to 1.50c. from mill Refined bar iron, 2c. to 2.10c.

Welded Pipe

The following discounts are to jobbers for carload lots on the Pittsburgh basing card:

Steel			Butt Weld			Iron		
Inches	Black	Galv.	Inches	Black	Galv.	Inches	Black	Galv.
1/4	54 1/2	28	1/4	36 1/2	18 1/2	1/4	36 1/2	18 1/2

Production of Pig Iron in the United States in 1921

THE special statistical bulletin of the American Iron and Steel Institute giving production of pig iron for the past year shows a decided decrease in all grades and the most striking change is in charcoal iron, the production having fallen from 323,396 tons in 1920 to 94,730 tons, a decrease of 70.7 per cent as compared with a decrease of 54.8 per cent of all pig iron. Looking at the production by States, the Indiana-Michigan territory makes the best showing, evidently due largely to the greater activity at Gary, the decrease in this district being 35.58 per cent. The great States of Pennsylvania, Ohio and Illinois did fairly well with decreases ranging from 50 to 55 per cent, and Alabama a trifle

below 50 per cent. But the other Southern States, including the border State of Maryland, made a very poor showing, ranging from a decrease of 93.12 per cent in Tennessee to 71.9 per cent in Maryland. The Eastern territory also made a poor showing. Of the leading grades of pig iron the largest decrease was in malleable, 65.11 per cent, while the steel making grades made a somewhat better showing.

Of the total production, 16,688,126 tons, 9,530,981 was produced in the first half and 7,157,145 in the second half year. The production of charcoal pig iron in the second half was only 24,795 tons, or 0.35 per cent of the total iron.

New York

NEW YORK, March 14.

All the markets are moderately active and prices in most cases are steady to firm. The copper market is fairly active and prices are stronger. Only moderate activity has characterized the tin market and prices are easier. Buying and consumption of lead continue steady. Sales of zinc have been in fair volume and prices have stiffened.

Copper.—The last few days have been some of the most active this year. Inquiries and sales have not embraced large quantities individually, but in the aggregate the total has been fairly large. They have included both domestic and foreign consumption with the latter predominating and prices obtained for foreign shipment have netted a larger profit than those for domestic delivery. The tone of the entire market is fairly optimistic, but buying is confined for the most part to early deliveries, consumers not being certain yet as to far future commitments. Electrolytic copper for early or 30-day delivery is generally regarded as a minimum at 13c., delivered, or 12.75c., refinery, with some sellers asking a minimum of 13.12½c., delivered, or 12.87½c., refinery. There are also some sellers who will quote these prices as far ahead as May and some will even quote June delivery if combined with May or earlier.

Tin.—The market for Straits tin has not been featured by heavy sales, but the buying which has been reported has been spread over the week, with some business transacted almost every day, both spot and future delivery being involved. Taking the week as a whole there were two days which were the most active. On one day about 300 to 400 tons, mostly future shipment, was sold with dealers and consumers participating, and on another day, while the total was not as large as this, a fair business was done, mostly for future shipment. Most market observers have generally expected a decline and this was realized yesterday when sterling exchange fell to the lowest point in the last month and with it prices for tin also declined. As usual these influences originated in London where unfavorable political conditions predominated and as a result spot Straits tin to-day was quoted in New York at 29c. In London quotations stood at £142 15s. for spot standard, £144 10s. for future standard and £145 5s. for spot Straits. While these prices are not lower than a week ago, they had been higher since then and therefore represent a decline. Arrivals thus far this month have been 4950 tons with 4670 tons reported afloat.

Lead.—Business in this market continues in a steady stream and the healthy condition which has prevailed for so many weeks continues with no change in prices. The leading interest still quotes 4.50c., St. Louis, or 4.70c., New York, for wholesale lots for early delivery, while independents are selling on a basis of 4.40c., St. Louis, or 4.70c. to 4.75c., New York and eastern points.

Zinc.—The market for prime western has strengthened in the last week and quotations are slightly higher at 4.65c. to 4.70c., St. Louis, or 5c. to 5.05c., New York, for early or 30-day delivery. Sales are confined to moderate amounts for early consumption and

while this phase of the market is a little more active than a week ago, the attitude of producers continues of such a nature that offerings are not freely made in the belief that a higher level will prevail in the future. Very little business for delivery beyond 80 days is being taken.

Antimony.—Wholesale lots for early delivery are unchanged at 4.20c., New York, duty paid, with the market quiet.

Aluminum.—Wholesale lots of virgin metal, 98 to 99 per cent pure, for early delivery continue to be quoted by the leading interest at 19c. to 49.10c., f.o.b. plant, depending on the quantity, while the same grade from foreign sources is quoted by importers at 17c. to 18c., New York, duty paid.

Old Metals.—The tendency of the market seems upward and business is more active. Dealers' selling prices are as follows:

	Cents Per lb.
Copper, heavy and crucible.....	12.50
Copper, heavy and wire.....	11.50
Copper, light and bottoms.....	9.50
Heavy machine composition.....	9.50
Brass, heavy.....	7.25
Brass, light.....	6.75
No. 1 red brass or composition turnings.....	8.00
No. 1 yellow red brass turnings.....	6.25
Lead, heavy.....	4.25
Lead, tea.....	3.25
Zinc.....	3.00

Chicago

MARCH 14.—Copper and zinc have advanced slightly in a dull market, principally because of firmness on the part of producers. Tin has declined in sympathy with another reaction in the London market and antimony has receded with the delivery of several cargoes at New York docks. Old metal prices remain unchanged. We quote in carload lots: Lake copper, 13.25c. to 13.50c.; tin, 30.50c.; lead, 4.50c.; spelter, 4.75c.; antimony, 6c., in less than carload lots. On old metals we quote: Copper wire, crucible shapes and copper clips, 9.50c.; copper bottoms, 7.50c.; red brass, 7.50c.; yellow brass, 6c.; lead pipe, 3.25c.; zinc, 2c.; pewter, No. 1, 22c.; tin foil, 23c.; block tin, 25c.; all buying prices for less than carload lots.

St. Louis

MARCH 14.—Reports from the tri-state field of Kansas, Missouri and Oklahoma tell of improved business conditions and a larger production of lead and zinc. The Eagle Pilcher Lead Co. has resumed full operations at Joplin, Mo., by adding 75 men to its force, bringing it up to 600. We quote lead at 4.40c., car lots, and slab zinc at 4.65c. On old material we quote: Light brass, 3.50c.; heavy red brass, 7c.; light copper, 7c.; heavy yellow brass, 4c.; heavy copper and copper wire, 7.50c.; pewter, 15c.; tin foil, 16c.; tea lead, 2c.; aluminum, 9c.

Cutting Tests for High-Speed Tool Bits

During the past month the Bureau of Standards of the Department of Commerce completed 60 more tests of ½-in. high-speed steel tool bits. The bits were of several grades of high-speed steel which had been subjected to various heat treatments. The steel used was the same for each test, the percentage of the various elements being as follows: Carbon, 0.62; chromium, 3.5; tungsten, 15.5, and vanadium, 1.6 per cent. The results, in pounds of metal cut away, are given in the accompanying table.

Results of Cutting Tests for High-Speed Tool Bits			
Preheating (20 Min.) Deg. Fahr.	Hardening (5 Min.) Deg. Fahr.	Quenched in	Metal Cut Per Tool (4 Tools Tested) Lb.
1400	2417	Oil	9.1
1500	2417	Oil	10.1
1600	2417	Oil	5.1
1600	2417	Water	5.1

Testing conditions were the same in all cases. The results obtained when using water as the quenching medium are about the same as when using oil for this particular case.

PERSONAL,

E. G. Rippel, who has been sales manager of the Buffalo Foundry & Machine Co. since its organization, has resigned that position and withdrawn from the company with a view to absents himself from business for some time. It is more than 21 years since Mr. Rippel organized the Buffalo Foundry Co., the expansion of which into the present company was a noteworthy development. C. W. Pearson, assistant treasurer of the Buffalo Foundry & Machine Co., succeeds Mr. Rippel as sales manager.

The Ohio Locomotive Crane Co., Bucyrus, Ohio, formerly represented in the New York district by J. N. Kinney, 30 Church Street, New York, has appointed Scott B. Lilly, formerly associated with J. N. Kinney, its representative with office at 30 Church Street.

E. M. Griffiths the founder of Burton Griffiths & Co., Ltd., of London, England, has resigned his position as managing director and chairman of that business and has also retired from the board of the Birmingham Small Arms Co., Ltd., so that he is no longer associated with the control of either company. His city address is now 30-32 Ludgate Hill, London, E. C.

Benjamin Graves, milling machine engineer Brown & Sharpe Mfg. Co., Providence, R. I., last week delivered an address on the construction and use of milling machines at the March meeting of the Engineering Club, Greenfield Tap & Die Corporation, Greenfield, Mass.

J. B. Bartholemew, structural steel sales agent, Bethlehem Steel Co., Boston, has accepted a position with the W. B. Kilgoire Co., Chicago. A. D. Dickson is acting structural steel sales agent, Bethlehem Steel Co., Boston.

G. R. Demming, of the Demming Co., Salem, Ohio, was elected president of the Salem Manufacturers' Association at the recent annual meeting, and H. M. Silver of the Silver Mfg. Co., was elected vice-president.

H. W. Gledhill, formerly Philadelphia district manager and special representative of the marine and terminal department of the Shepard Electric Crane & Hoist Co., Montour Falls, N. Y., has been appointed eastern sales manager in the New York office. The eastern district territory now includes Delaware and eastern Pennsylvania, formerly in the Philadelphia district and New Jersey, New York and the New England states.

Charles S. Vought, formerly vice-president and European representative of American Steel Export Co., who has recently returned from a trip around the world, has joined the sales force of the New York office of the Donner Steel Co. Mr. Vought for many years was connected with the Cambria Steel Co., Johnstown, Pa., where he received his early training in the steel business.

R. O. Gill, formerly production manager of the Packard Motor Car Co., Detroit, has been promoted to be factory manager.

Charles Rogers, formerly superintendent of the Michigan Gray Iron Castings Co., Detroit, has become a superintendent for the Monroe Steel Castings Co., Monroe, Mich.

J. R. Camm has been appointed assistant to C. J. Sturgeon, manager of the Cleveland office of Hearnsey & Liecker Co., Milwaukee, and will cover the southern portion of Ohio, with residence at Dayton. Mr. Camm is a brother of J. A. Camm, sales manager of Hearnsey & Liecker, and has been connected with the company's Milwaukee office for the past two years.

At the recent yearly meeting of the Lumen Bearing Co., of Buffalo and Youngstown, L. S. Jones, general manager, was elected to the board of directors, succeeding H. P. Parrock, who has severed his connection with the interest. The board and its officers are: W. H. Barr, president and treasurer; C. H. Bierbaum, vice-

president; N. K. B. Patch, secretary, and L. S. Jones, general manager, all of Buffalo; Kester Barr, Lucius B. McKelvey, Thomas Parrock, B. G. Parker and J. Fearnley Bonnell, all of Youngstown. Kester Barr is manager of the Youngstown plant of the company, which is now operating about 20 per cent.

J. G. Hoffman, Wheeling, W. Va., has been elected president of the Buckeye Aluminum Co., Wooster, Ohio, to fill the vacancy caused by the recent death of George W. Blake, who was both president and treasurer. Robert Blake, who has been secretary, was elected secretary, treasurer and general manager. W. R. Curry of Wooster, Ohio, was elected first vice-president and J. L. Ellis, of Wheeling, second vice-president. Oscar H. Foss has been appointed sales manager.

Alfred Herbert, Ltd., British machine tool builder, has closed its New York office at 50 Church Street and the American representative in charge, E. D. Mitchell, will return to England on April 19. The Vandyck-Churchill Co., 149 Broadway, New York, has been appointed sales agent in this country for the Alfred Herbert turret lathes and chucks.

Controversy as to Molders' Wages in Boston

Definite action is anticipated this week in the controversy between the foundry owners in Boston and vicinity and the molders' union, over wages. The foundry owners' original agreement with the molders' union expired Feb. 15, but was extended another month at the ruling wage because at that time the question of a new wage scale was not settled.

The molders are receiving 75c. an hour, with a working schedule based on an eight-hour day, 48 hours per week. The employers have offered the men 70c. an hour on the same basis of hours, the agreement to run until Aug. 15, next, and refuse to recede from their position. The local molders' union has voted against acceptance of this wage schedule, but has failed to sanction a strike. There the matter rests.

About five years ago, a disagreement over wages and hours arose between employer and employee, and there was a strike which lasted about a fortnight. At that time, the foundries were busier than they are today. To-day few foundries in Boston and the vicinity are operating a full week, and it is largely because of this fact that the union members are against accepting a reduction in wages. They demand the present wage scale be continued until Aug. 15.

Coke Production Maintained

UNIONTOWN, PA., March 13. — Coke production is being maintained in the Connellsville region, as is the output of by-product coal, especially in the southern Klondike plants of the H. C. Frick Coke Co. The present situation in the coke market apparently is unaffected by the threatened strike in the union coal fields. Production during the past week probably will show an increase of around 7000 tons. A few additional ovens were added to the active list during the week. Highest coke quotations as the week closed were \$3.25 to \$3.60 for furnace coke and \$4 and \$4.50 for foundry coke.

The coal market is presenting an unusual situation as March wears on. Apparently the consumers have discounted the strike, for the market in the Connellsville bituminous region this week has been decidedly softer. Observers believe that consumers have pretty ample reserve stocks and are depending, should the emergency develop, upon non-union fields to meet the present demands of the industry. There will be no change in wage schedules in the Connellsville region this quarter.

The Board of Water Supply, Twenty-second Floor, Municipal Building, Park Row and Centre Street, New York, is taking bids until 11 a. m., March 2, for a quantity of steel castings, gate valves and steel pipe appurtenances for use on the Catskill Aqueduct, as per plans and specifications on file (Contract 212). Benjamin F. Einbigler is secretary of the board.

OBITUARY

COL. JOHN SARGEANT, 59, of Bellevue, Ky., president the Domhoff & Joyce Co., Cincinnati, whose death March 4 in a Buffalo hospital was announced in THE

COL. JOHN SARGEANT

IRON AGE of March 9, had been under a physician's care for several months. Colonel Sargeant was born May 10, 1862, at the village of Wass, Northern Yorkshire, England. He came to the United States at the age of 17, and located at Cincinnati, where he secured a position with the claims department of the Southern Railroad in 1879. In 1889 he left the railroad and became associated with the Matthew Addy Co., pig iron merchant. He continued with that company until 1896, when he organized the Domhoff & Joyce Co., then a small selling concern dealing in pig iron and steel. Through his efforts this concern has grown steadily and rapidly. Mr. Sargeant was president and treasurer of the Domhoff-Joyce Co., also president of the South Dayton Railway Co., director of the Campbell County Bank, Bellevue, and financially interested in a number of other business enterprises. He was looked upon throughout the country as an authority in the iron and steel business. He was a member of the Cincinnati Business Men's Club, Cincinnati Chamber of Commerce and Cuvier Press Club, also a member of the Southern Club of Birmingham, Ala., and Mountain City Club, Chattanooga, Tenn. He was a leader in Republican politics in Campbell County and the State of Kentucky, and was a close personal friend of United States Senator Richard P. Ernst and Governor Edwin P. Morrow of Kentucky. When Governor Morrow assumed office, one of his first official acts was to appoint Mr. Sargeant a colonel upon his staff. He was very philanthropic and no interest of charity ever sought assistance without obtaining liberal response. He is survived by his wife, one daughter and two sons, Chas. A. Sargeant, vice-president and treasurer of the Domhoff & Joyce Co., and Harry Sargeant, also a director of the same company.

Harry Firmstone

HARRY FIRMSTONE died in Philadelphia on March 10 in his seventy-fourth year. He was born near the York Road in the northern suburbs of Philadelphia. He was educated at the Polytechnic Institute, which stood on what is now the southwest corner of Market and West Penn Square, the site of the Third National Bank. Mr. Firmstone's father and grandfather came to the United States from England about 1834 and went directly to Scioto County, Ohio, under an engagement to build a hot blast stove in connection with a charcoal furnace that was being operated in that county. In 1836 William Firmstone, Harry Firmstone's father, built a hot blast stove for the Vesuvius furnace in Lawrence County, Ohio. In 1837 he blew in a furnace at Phoenixville, Pa., for Reeves, Buck & Co. In 1835 he was successful in making good gray forge iron at the Mary Ann furnace in Huntingdon County, Pa., using coke made from Broadtop coal, and in 1839 he made pig iron with coke in Clearfield County. Soon after this he became associated with the Pardees and the Fells and located at Glendon, near Easton. Harry Firmstone and Frank Firmstone were associated with their father, as young men, in the operation of the Glendon and the Andover furnaces. Along about 1867 these interests came into possession of a large tract of ore land and a charcoal furnace in Virginia, and they developed what was

afterwards known for a great many years as the Longdale property at Longdale, Va. These same interests were also the owners of the Cranberry mine in North Carolina, and for many years operated the charcoal furnace at Cranberry, N. C., and were interested in the operation of the Johnson City furnace, Johnson City, Tenn., which still uses the Cranberry low phosphorus ore. In 1912 the Longdale Iron Co. started to liquidate, selling all their various properties, except the home property at Longdale, Allegheny County, Va. Harry Firmstone had made his home for many years at this place and so he made a proposition to his associates that he buy this property for a home, and they agreeing to this, he purchased it, and has been living there ever since.

"There is probably no family more deeply interested and more responsible for the birth and progress of the pig iron industry in America than the Firmstone family," said a prominent pig iron merchant of Philadelphia. "They were pioneers in many of the great changes and improvements in the business, and, at the same time, they were good business men, and successful operators. The companies with which they were connected and for whose management they were responsible always made money, and no man who has lived in the iron business was more scrupulous than Harry Firmstone in living up to his contracts and agreements. Many times when there was a question in Virginia in regard to a contract it was decided to leave it to Harry Firmstone, even if he were one of the parties at interest."

WILLIAM C. SKINNER, chairman board of directors Colt Patent Firearms Co., Hartford, Conn., died in that city March 8. Mr. Skinner was a native of Malone, N. Y., where he was born in 1855. He became an official of the Hartford arms company in 1889, was made vice-president and a director in 1901, and president in 1909.

JAMES E. GREENSMITH, president Boston Scale & Machine Co., Boston, died March 8. He was born in Burton-on-Trent, England, where he was educated as a mechanical engineer. His early business experience was in India, whence he came to this country to take charge of the Pond Machine Tool Co., which at that time was preparing for a new factory in Plainfield, N. J. He supervised the construction and equipment of this plant, as well as the design and development of a new type heavy gun turning and boring lathe later installed at the Watervliet arsenal. Mr. Greensmith's next position was with the Portland Co., Portland, Me., as superintendent, where he remained a short time, going then to the Mason Machine Works, Taunton, Mass., where he was superintendent for many years. For the past six years he has been the president and general manager of the Boston Scale & Machine Co. He was an early member of the A. S. M. E.; also the Engineers' Club of Boston.

JOHN HASSALL, president of John Hassall, Inc., Brooklyn, nail manufacturer, died at his home on March 12. He was 82 years of age and a veteran of the Civil War. Mr. Hassall is credited with having built the first wire nail machine, in 1851. It was in use in his plant for 52 years and is now on display in the industrial museum of the American Steel & Wire Co. at Worcester.

The Dickson Construction & Repair Co., Youngstown, Ohio, has taken over maintenance-of-way work on the entire system of the Western Maryland Railway, with headquarters at Baltimore. The company is handling the work on a contract basis and has largely retained the old force of laborers, but at reduced wages. J. B. Dickson, formerly a general manager of the Erie railroad, heads the construction company, which likewise has charge of maintenance-of-way work on the Ohio Region of the Erie Railroad.

The H & G Die Head Works of the Eastern Machine Screw Corporation are working 10 hours a day, five days a week, and January and February this year have shown decided improvement.

BOOK REVIEWS

Wealth and Income of the American People. By Walter Renton Ingalls, director of the American Bureau of Metal Statistics, formerly editor of *Engineering and Mining Journal*. Cloth; pp. xiv + 321, 5½ x 8½; G. H. Merlin & Co., York, Pa. Price, \$4.

The poor rewards received by prophets are well known. When the prophecy comes true, it appears as if it had been easy to make the prophecy. The value of the work Mr. Ingalls has done is likely to be similarly underrated. While he presents a great amount of valuable fresh information, his chief work is the dispelling of illusions and the reader accompanies him with such confidence that when it is all over the fact that the illusions did exist is apt to be slighted.

The title does not suggest the real scope of the work. Statements of the wealth and income of the American people are made not as an end, but as a basis for determining what occurred during the war and during the period of extravagance afterward and for forecasting what we are going to be forced to do.

Recently the National Bureau of Economic Research made a careful study and compiled statistics of the income of the people of the United States in each of the years 1909 to 1919 inclusive. The bureau refrains from drawing conclusions from the statistics it gathers. Part of Mr. Ingalls' work is to interpret the findings, but the book is much more than a mere interpretation of these findings, for Mr. Ingalls first makes a careful study of the wealth of the people. The fact is perhaps commonly known that in certain non-census years the Bureau of the Census has presented a statement of what has been called the "wealth" of the United States, but few, probably, know what the figures have been or have any clear conception of what they represent. The latest was for the year 1912, and would therefore be useless for a study of economic changes wrought by the war even if trustworthy, which Mr. Ingalls doubts.

An inventory of the national wealth is obviously very difficult. Mr. Ingalls attempts such an inventory for the two years 1916 and 1920 for comparative purposes, and displays such aptness in guessing the probable error in each item considered and such knowledge of the details as to make even this part of the work of no little interest to the average reader.

Of course the majority of men realize that they entertained illusions as to the economic effects of the war, and they rather pride themselves on having lately seen the light, but Mr. Ingalls' conclusions would indicate that the illusions were greater than have been commonly admitted, hence there has remained much misconception to be dispelled.

The estimates of the internal wealth of the United States are \$268,000,000,000 at the end of 1916 and \$272,000,000,000 at the end of 1920, with a probability that the figure for 1920 is overstated, so that it is doubtful whether there was even the trifling increase indicated. The wealth in each case is, of course, measured in 1913 dollars, there being nothing else conceivably possible as a standard. It is a fallacy that the United States profited during this period. It may have profited during the war prior to its own entrance, but the profits are represented chiefly in debts due to the country, the eventual payment of which is more or less doubtful. One of the fallacies prevalent at the time at least is that the high prices obtained for goods in 1915 and 1916 contained correspondingly large profits, the fact being that much of the excess price was simply payment of the capital necessary to be employed in creating productive facilities, the usefulness of which would afterward disappear.

Mr. Ingalls undertakes to show that the increase in production during the war was greatly overrated, that not enough allowance was made for the increase in prices, so that the physical increase was almost negligible. Thus he deduces that the quantity of raw material produced per capita was about 11.5 tons in 1913, 11.9

tons in 1917 and 11.7 tons in 1918 and 1920, while in every other year since 1913 it was either less or at least no greater than in 1913. Then it is added: "Nor is there any good evidence of the exercise of increased man-power in manufacturing, carrying and trading, but rather are the indications the other way. If there had been no war, the probability is that the American people would have proceeded along the even tenor of their way, adding annually to the national wealth by accounts varying a little according to whether it were a good or a bad year, but in general accumulating at a rate a little in excess of the rate of increase in population."

The fallacy that the war has produced or procured a much higher standard of living is one we know has not been dispelled from the minds of many people. Mr. Ingalls quotes an interview given on as late a date as Aug. 21, 1921, by Samuel Gompers: "Certainly we are going to fight to our utmost the reduction of wages. . . . The workman needs some of the worthwhile things of life, and we are going to fight to see that he gets more than a bare existence." Plausible budgets in support of an income of \$2,000 to \$2,500 for the family have been presented, but the income of the American people does not find the money.

The Great War did not so increase efficiency in production and distribution that the losses of the war would be outweighed and the people as a whole would benefit out of the net result. The war was not only destructive but also it was, broadly speaking, sterile. There was no lasting uplift in the minds of the people. On the contrary, there was deterioration in morale, and also in morals. Of invention in military machinery and methods there was much; in industrial machinery and methods there was some, but on the whole it was disappointing.

This cursory review of Mr. Ingalls' book merely gives a few illustrations of the method of treatment of the theme that runs throughout. As to the corporations and the war, the author says: "The prevalent idea has been, and still is, that the corporations of the United States waxed greatly during the war. They are regarded as comprising the quintessence of profiteering. Taxation has been directed especially toward them. Let us therefore try to ascertain what are the facts." Then with nine pages of analysis he finds "the surpluses were economically fictitious" and "the misconception about this is a part of the tragedy of Wall Street."

The findings of the National Bureau of Economic Research, as to incomes, have been published. What Mr. Ingalls does not analyze the figures, but it is not inappropriate to mention an interesting point in the bureau's findings, that of the total income in 1909, 68.7 per cent went for wages and salaries and 31.3 per cent for management and property. To and including 1914 the percentage for wages and salaries increased, while in the next two years there was a sharp drop, because prices and profits advanced more quickly than wages, the proportion becoming 66.7 per cent in 1916. Then the proportion increased, so that in 1918 it was 77.3 per cent for wages and salaries and 22.7 per cent for management and property. There the bureau's division ends. For 1919 Mr. Ingalls estimates 80 per cent and 20 per cent respectively. He believes there must be a reversion to 75 per cent or 70 per cent, or perhaps less in the proportion for labor and a retraction in the scale of living.

The above gives but hints of Mr. Ingalls' various conclusions. The book should be read by those who wish information and are willing that new lines of thought be suggested to them. The style is lucid throughout.

NEW BOOKS RECEIVED

Gieseler-Handbuch.—Compiled by the German Society of the Iron Foundry Industry. Pages 264, 6½ x 9½ in.; Illustrations, 34. Published by R. Oldenbourg, Gluckstrasse 8, Munich, Germany. Price, 300 marks.

Engineers License Laws.—Compiled by the American Association of Engineers, 63 East Adams Street, Chicago. Pages 136, 8½ x 6 in., paper covers. Price, 50 cents.

IRON AND INDUSTRIAL SHARES

Investment Buying Appears When Steel Shares Are Offered for Sale

Increased mill activity and higher prices for mill products so far have had little appreciable influence on steel company share values. Such securities have ruled firm the past week, however, due to the appearance of good investment buying whenever shares were offered for sale. The offering in this country of a large issue of a French steel producers' securities in banking circles is admitted as an act of confidence in the domestic industry. Most of the anticipated adverse 1921 reports have been issued by our steel corporations, and investors and bankers feel we have entered a period when slow yet steady expansion will be in order. Better buying of farm machinery already reflects higher prices for grains and cotton, and of railroad equipment increasing transportation revenue. On the strength of such buying, there has been more inquiry for shares of those corporations supplying these things.

The range of prices on active iron and industrial stocks from Monday of last week to Monday of this week was as follows:

Allis-Chal., com.. 45 - 47½	Int. Har., pf.... 108½-109
Allis-Chal., pf.... 91 - 92	Inland Steel 49 - 49½
Am. B.S. & F., cm. 57 - 61	Lucka. Steel 46 - 48½

Int. Har., com.... 90½ - 92½	

Industrial Finances

Preliminary statement of General Motors Corporation, for the year ended Dec. 31, 1921, shows that, after providing for depreciation, inventory adjustments, etc., and setting up a reserve of \$14,000,000 to cover anticipated losses not yet ascertainable, there was a deficit of \$38,680,770. This compares with net income of \$37,750,375 in 1920, which, after deduction of preferred and debenture dividends, was equivalent to \$1.58 a share earned on the common stock. Deficit, after dividends for 1921, was \$65,459,056, against a surplus of \$14,236,660 in the preceding year. Profit and loss surplus at the close of last year totaled \$55,814,160, compared with \$121,273,217 on Dec. 31, 1920.

The Taylor-Wharton Iron & Steel Co. for 1921 reports a deficit of \$1,148,827, after charges for interest and depreciation, comparing with a surplus of \$392,045 in the previous year.

New York Air Brake Co.'s report for the year ended Dec. 31, 1921, shows net loss, after charges and taxes, of \$458,699. This compares with net profits of \$751,860, equivalent to \$7.51 a share in the preceding year, earned on the \$10,000,000 capital stock in the preceding year.

Earnings of American Steel Foundries from operations last year, after deducting manufacturing, selling and administration expenses, were \$1,428,187.61. Adding miscellaneous income of \$325,885.47 and deducting for depreciation \$512,784.55 and an aggregate of \$566,329.48 for interest charges, for earnings of subsidiary company appertaining to minority stockholdings and for excess profits and income taxes, leaves a balance of net profits for the year of \$875,009.05. Cash dividends of 7 per cent on the preferred stock and \$3 a share on the common stock were declared during the year; the statement shows that the common dividend of \$1,833,090 was paid largely out of surplus. The unappropriated surplus now stands at \$8,971,083.03. The appropriated surplus is \$3,314,143.50.

The National Lead Co. is one of the few concerns able to report satisfactory earnings for last year. Its net earnings for 1921 after deducting all expenses, reserves, etc., amounted to \$3,481,512. Dividends deducted from these earnings

amounted to \$2,945,056. The surplus to Dec. 31, 1921, was \$20,880,874.

The report of the Worthington Pump & Machinery Corporation for the year ended Dec. 31, 1921, shows net income of \$1,810,949 after interest, depreciation and federal taxes, but before inventory losses. A charge of \$1,999,579 was made for inventory adjustments, making net loss for the year of \$188,630. In 1920 the company reported net income after interest, depreciation and federal taxes of \$2,030,923, equivalent after allowing for annual dividend requirements on Class A and Class B preferred stock, to \$7.85 a share, earned on the \$12,992,149 common stock.

The annual report of the National Acme Co., Cleveland, for the year 1921 shows net sales of \$3,879,072, as compared with \$15,758,921 in 1920. The operating loss for 1921 was \$920,987 and total losses, including \$2,315,137 as adjustments on inventories, were \$3,727,498. Deducting inventory adjustments, depreciation and taxes, the direct operating loss was \$462,500. The size of the inventory loss is explained by the statement that Treasury Department rulings prevented full inventory readjustments during 1920, only \$855,000 being written off during that year. The surplus Dec. 31, 1921, was \$1,536,775.

The Electric Controller & Mfg. Co., Cleveland, in its annual report for 1921 shows an operating loss for the year of \$240,719. After paying dividends and retiring a portion of the preferred stock the surplus was decreased \$441,101. Inventories have been reduced more than \$200,000 and the current assets are \$954,128, against current liabilities of \$113,340.

After all charges, depreciation and federal taxes, the Yale & Towne Mfg. Co., holds, etc., showed net profits last year of \$1,269,214, equivalent to \$25.39 a share on its \$4,998,774 stock. In 1920 the profits were \$2,324,470, or \$46.51 a share. On Dec. 31 last the profit and loss surplus stood at \$11,780,131, as against \$11,465,795 at the close of 1920.

The Northway Motors Corporation, 1 Beacon Street, Boston, manufacturer of motor trucks, is perfecting plans for a merger with a number of allied companies, with a note issue of \$400,000 to carry out the details of the amalgamation. Arrangements for the manufacture of 1500 motor trucks during the present year, recently announced, will be changed to a lower production schedule.

Harry J. Lewis and L. C. Bandy have been appointed receivers for the Pittsburgh Steel Tube Co., with a plant at Beaver, Pa.

Directors of the Westinghouse Air Brake Co., Wilmerding, Pa., at a meeting held March 9, reduced the common stock dividend from \$7 annually to \$4, declaring a quarterly dividend of \$1 per share, payable April 29 to stockholders of record March 31, as against \$1.75 quarterly, the rate from 1918 to 1921, inclusive. Part of the dividend disbursements in 1921 were from the surplus. The annual report of the company for 1921 shows net profits of \$1,412,490 and a surplus of \$12,931,100.

The Superior Steel Corporation, Pittsburgh, in its report for 1921, shows a net operating loss for the year after expenses and depreciation charges of \$273,395, as compared with a net profit in 1920 of \$1,022,820. After deducting sinking fund and dividend requirements in 1921, there was a deficit of \$1,115,373, against a surplus of \$205,547 in 1920.

Penn Seaboard Steel Deficit

The 1921 report of the Penn Seaboard Steel Corporation shows a deficit after expenses, tax, interest, etc., of \$749,945. This compares with a deficit of \$768,247 in 1920.

The income account compares as follows:

	1921	1920
Loss after expenses.....	\$207,188	*\$379,366
Interest, sinking fund, etc....	541,857	388,881
Deficit	749,045	768,247

*After expenses, adjustment of inventory, and Federal tax.

The profit and loss account shows surplus on Jan. 1, 1921, of \$4,915,251. Proceeds from additional shares issued for purchase of Rockaway Rolling Mills, Titusville Porch Company, etc., were \$1,660,228, making a total of \$6,575,479. Deducting deficit of \$749,045 in 1921, adjustment and extraordinary charges of \$847,434, and dividends on Tacony Steel preferred stock of \$18,832, the surplus as of Dec. 31, 1921, amounted to \$4,960,168.

The Rendall Steel Products Co., Real Estate Trust Building, Philadelphia, has been appointed sole United States agent for a term of years of Mellowes & Co., Ltd., Sheffield, and is distributing that firm's catalog descriptive of lead sheathed skylight bars.

Machinery Markets and News of the Works

NO DEFINITE TREND TO MARKET

Machine-Tool Sales and Inquiries in Small Volume with No Improvement

Better Operation of Industrial Plants Brings Hope, However, That Betterment Will Come Soon

Indications are still lacking of any definite trend toward improvement in machine-tool business. During the past week in some markets, notably New York and Chicago, there has been extreme dullness. In New York it is noted that even inquiries have fallen off.

The most hopeful sign of prospective increase in machine-tool buying is the gradually increasing operation of metalworking plants. The interest of machine shops in new equipment has been manifested by the fairly large number of inquiries issued since the first of the year, but buyers continue hesitant about placing orders.

A number of important projects which involve substantial purchases of machine-shop equipment are pending, but action has been repeatedly deferred.

New York

New York, March 14.

No improvement in machine-tool business in this market has developed in the past week, in fact many sellers report that the situation has turned quieter. There are fewer inquiries, while orders are very few and usually for single machines. A large dealer handling both new and second hand machines reports that sales are about equally divided between new and used tools.

The New York Central Railroad has placed an order for its lines West for a 90-in. driving wheel lathe.

The auction sale of the machine-tool equipment of the Owen Magnetic Motor Car Co., Wilkes-Barre, Pa., March 7, 8 and 9, developed prices and disclosed a demand that was highly pleasing to the machine-tool trade. The sale was attended by many dealers, but a large part of the machines sold were purchased by buyers who not only paid good prices but also paid extra for loading for shipment. Including both large and small tools, the prices obtained were something better than 50 per cent of to-day's market. All of the equipment was high-class. Some of the prices obtained follow:

- One 42 x 42 in. x 12 ft. Cincinnati planer, \$3,600.
- One 42 x 42 in. x 12 ft. Cincinnati planer with two heads, \$2,050.
- One 36 in. Bullard turret lathe, \$3,250.
- One 14 x 72 in. Norton grinder, \$1,550.
- One No. 4 Cincinnati vertical milling machine, \$1,600.
- One No. 4 Cincinnati vertical milling machine, \$1,300.
- One No. 3 Hendey cone-driven milling machine, \$1,532.
- One No. 2 Brown & Sharpe plain milling machine, \$560.
- One No. 2 Brown & Sharpe plain milling machine, \$750.
- One No. 0 Giddings & Lewis horizontal boring machine, \$2,000.
- One 22-48 x 12 ft. Putnam drop lathe, \$1,100.

Herbert Crapster, 1 Madison Avenue, New York, dealer in railroad equipment, reports the sale to Worcester, Mass., of three 6-ton gasoline locomotives for sewer work.

The crane market is quiet, few sales and new inquiries being reported the past week. Makers of chain blocks and similar hand power equipment, generally sold out of stock, report a tendency on the part of dealers to cut the market prices to unloaded stocks. Of pending business, only the order of the American Car & Foundry Co. for two 10-ton, 70-ft. and 90-ft. span overhead traveling cranes has been placed. It is reported to have been awarded to the Pawling

Orders are expected soon, however, for about 20 tools and 20 cranes for extensions to the Whitaker-Glessner steel plants, and the West Leechburg Steel Co. is expected to buy a 16-in. continuous hot strip mill and auxiliary equipment within a week or two.

About \$100,000 worth of mail trucks, platform trucks, mail conveying machinery and other equipment has been purchased for the new Union Station in Chicago.

The Western Clock Co., La Salle, Ill., has purchased about 20 automatic screw machines. The H. H. Franklin Mfg. Co., Syracuse, N. Y., has bought several lathes.

Railroad buying is in small volume. The New York Central has bought a 90-in. driving wheel lathe and the Clinchfield Railroad is reported to have bought several tools. The Rutland Railroad's tool requirements total about \$40,000 and those of the Central of Vermont about \$25,000, but official approval of these lists, it is understood, has not yet been given. The Bangor & Aroostook Railroad is in the market for four small tools. The Santa Fe has added a few tools to its outstanding inquiries.

A considerable improvement in the demand for locomotive cranes is an indication of expansion of general construction work.

& Harnischfeger Co. Among recent export sales was a 5-ton Reading hand power crane sold by Arthur Appleton, 29 Broadway, New York, to the New Sabinas Co., Cloete, Coahuila, Mexico.

The Ward Baking Co., Southern Boulevard and St. Marys Avenue, New York, will equip its machine shop with lathes, drills, grinders and other tools. Purchases will be made at an early date.

Officials of the Standard Oil Co. of New Jersey, 26 Broadway, New York, are perfecting plans for the formation of the Standard Oil Co. of Argentina, a subsidiary company, for the operation of oil wells and refineries in the Argentine Republic. About 25,000 acres in the Neuquen field, Argentina, have been acquired and operations will commence at an early date.

The Staten Island Rapid Transit Co., St. George, S. I., operated by the Baltimore & Ohio Railroad Co., Charles Janaway, vice-president in charge, Baltimore, has surveys and plans in progress for the electrification of its entire line, with initial installation to include the division between St. George and Tottenville. The work will comprise power houses, distributing system, car equipment, etc. T. A. Davis is electrical engineer of the Baltimore & Ohio system.

The Advance Boiler Co., Poughkeepsie, N. Y., has awarded a contract to the H. K. Ferguson Co., Euclid Avenue, Cleveland, for a one-story foundry, 100 x 300 ft., brick and steel, to cost about \$100,000, including equipment.

Hugh L. Cooper & Co., 101 Park Avenue, New York, consulting engineers, have tendered a proposal to the International Joint Commission, Toronto, for the construction of a series of hydroelectric generating plants on the St. Lawrence River, with dam and main power station near Morrisburg, Ont. The initial installation will comprise 400,000 hp. capacity, and is estimated to cost in excess of \$50,000,000. The project will be carried out by private capital, under the direction of the Cooper company and authority as granted by the commission. The entire development totals 1,000,000 hp., with investment of about \$150,000,000.

William R. Noe & Sons, 43 East Tenth Street, New York, manufacturers of portable and other electric lamps and fixtures, have purchased property at Willoughby Avenue and Raymond Street, totaling about 10,000 sq. ft., for a three-story, reinforced concrete factory, plans for which are being drawn.

The Cox Klemin Aircraft Corporation, College Point, L. I., manufacturer of airplanes and parts, will install new equip-

ment in its machine shop, including rivet punches, shears and bench tools.

The National Enameling & Stamping Co., 411 Fifth Avenue, New York, is arranging for financing, either by bond or note issues, to an amount of \$15,000,000, the majority of the proceeds to be used for plant extensions and improvements.

The Remington Arms & Ammunition Co., 25 Broadway, New York, will devote a portion of its plant at Ilion, N. Y., to the manufacture of a new cash register and parts, and it is proposed to have the initial machines ready for marketing at an early date. Branch offices will be established in a number of cities.

The Light Car Corporation, 401 West Fourteenth Street, New York, has leased property at 171 Christopher Street for the establishment of a new automobile plant. The site is improved with a two and two and one-half story building, 45 x 95 ft.

The Police Department, 240 Centre Street, New York, will use a portion of a fund of \$1,000,000 for the erection of an automobile service building and general machine repair works. A site for the structure has been selected under the Williamsburg bridge. Police Commissioner Enright is in charge.

The Long Island Lighting Co., 50 Church Street, New York, is arranging a fund of about \$1,000,000 for extensions and improvements in its electric power plant and system. A new 10,000-hp. generator and auxiliary electrical equipment will be installed at the power house at once.

The Board of Estimate, Municipal Building, New York, has granted an appropriation of \$600,000 to the Borough of Queens, Long Island City, for the construction of a new incinerator plant and bulkheads, to include electrical apparatus, conveying and material-handling equipment, etc. The Borough engineer is in charge.

A power plant, 67 x 165 ft., with radial brick stack 175 ft. high, will be erected by the Clark Thread Co., 260 Ogden Street, Newark, N. J., at its new bleaching plant at Bloomfield, N. J. Work will commence at once. The installation will comprise two 500-hp. boilers, one 500 kw. generator, and auxiliary equipment. The entire plant will cost \$200,000, exclusive of site.

The Board of Freeholders, Court House, Newark, has commissioned Guilbert & Betelle, architects, 546 Broad Street, to prepare preliminary plans for a three-story, brick and steel vocational school, 36 x 184 ft., with two wings each 40 x 120 ft., to be erected at Bloomfield Avenue and Franklin Street, Bloomfield, N. J., estimated to cost \$500,000. It will include machine shops, foundry, electrical department, etc.

The Inter-State Safety Appliance Co., Moorestown, N. J., will install new equipment for stamped metal production at its plant.

A vocational department will be installed in the new high school to be erected by the Board of Education, Millville, N. J., estimated to cost \$250,000. N. Corson is secretary.

Alfred Hofman & Co., Union, N. J., recently organized, will take over the plant and business at 150-52 Hudson Avenue, heretofore operated in the name of Alfred Hofman. They will manufacture special machinery and parts, including equipment for the production of electric lamps. Alfred Hofman is president, and Victor Anderson, vice-president.

Electric motors and other electrical and mechanical equipment will be installed in the new plant to be erected by the Paterson Industrial Development Co., 5 Cbit Street, Paterson, N. J., and occupied under a 20-year lease by the Periodical Press, 80 Lafayette Street, New York. It will cost about \$400,000, including machinery.

Export Opportunity

J. R. Smallacombe, First Avenue, Joslin, South Australia, desires catalogs and information regarding a small plant for the manufacture of aluminum sauce pans and other aluminum utensils.

Chicago

CHICAGO, March 13.

Evidences of a definite trend in the machine tool business are still lacking. Some local machinery houses report a slight gain in orders, while others find the situation as dull as ever. That there are signs of a slow recovery of industrial activity, however, is rather generally agreed and it is only a question of time when the market will feel the effects of this betterment in the general situation.

The local tractor plant of the International Harvester Co., which resumed operations only a few weeks ago after a long period of idleness, is now running at close to 75 per cent. Other shops, notably those making railroad supplies, are steadily getting back on a better operating basis.

Prominent among recent orders booked in this district is one placed by the Western Clock Co., La Salle, Ill., for 24 automatic screw machines. A local manufacturer has placed

an order for one 4-ft. radial drill, one 20-in. upright drill, one 14-in. x 6-ft. engine lathe and a sensitive drill. The Santa Fe has sent out the following additional inquiries: One heavy duty 24-in. crank shaper; one heavy duty-type gap engine lathe with a swing of 18 in. overbed, 36 in. through gap with bed 14 ft. long; one 54-in. boring mill with two heads; two 18-in. x 8-ft. heavy duty lathes; one 4-spindle combined turning and threading machine for straight and radial stays, and one 2-in. heavy duty-type bolt cutter. The inquiry of the Universal Portland Cement Co., referred to last week, calls for the following machines for delivery at Huntington, Ind.:

- One 60-in. x 26-ft. heavy-duty engine lathe.
- One 84-in. vertical boring mill.
- One type "J" Gisholt turret lathe with 28-in. swing and 7½-in. spindle bore.
- One four-head quick return planer with bed 42 in. wide and 12 ft. in length.
- One 24-in. x 15-ft. engine lathe.
- One No. 1 horizontal spindle milling machine with table 14 in. x 8 ft.
- One cold cut circular saw to cut material up to 12 in. in diameter inclusive.
- One 1000-lb. single frame steam hammer.

The only new price change reported is the reduction of 20 per cent on pipe machines by the Williams Tool Co., Erie, Pa.

The Red Oak Bridge & Iron Works, Red Oak, Iowa, is in the market for a second-hand steel derrick with an 80-ft. mast and 100-ft. boom to be guyed with 6½-in. galvanized wire ropes; capacity 16 tons. Must be complete with slinging attachments and operated by electric motor.

The Hanna Engineering Works, Chicago, has received an order from the Wyatt Metal & Roller Co., Dallas, Tex., for a 126-in. reach, 18-24-in. gap, 80-ton riveter, and an order from Imperial Oil, Ltd., Sarnia, Ont., for a 102-in. reach, 15-18-in. gap, 70-ton riveter.

The Boyle Ice Co., 847 Larrabee Street, Chicago, has let contract for a two-story ice manufacturing plant at 542 Linden Avenue, Evanston, Ill., to cost \$40,000.

The National Phonograph Co., 824 Albert Street, Chicago, has leased a three-story factory containing 50,000 sq. ft. of floor space, at 2837-47 North Ashland Avenue, for 10 years. The lessor sold \$15,000 worth of wood-working machinery and equipment to the lessee.

J. Huether, manufacturer of store fixtures, 1315 West Twenty-first Place, Chicago, has let contracts for a one-story factory, 123 x 124 ft., at 4511-21 Broadway, to cost \$20,000.

The Holton-Seelye Co., realtor and builder, 140 South Dearborn Street, Chicago, has let contract for a one-story factory, 50 x 150 ft., at 6100-8 Ravenswood Avenue, to manufacture electric irons, and to cost \$10,000.

Ernest J. Kruetgen & Co., engraver, 626 Federal Street, Chicago, will build a two-story plant, 50 x 100 ft., at 913-21 North Fairfield Avenue, to cost \$35,000.

The James T. Iggoe Co., printer, 117 West Harrison Street, Chicago, has purchased the northwest corner of Van Buren and Jefferson streets, 100 x 125 ft., and will erect a ten-story printing plant to cost \$450,000.

A fire in the shop of the Passenger Elevator Safety Lock Co., 119 North Washington Street, Peoria, Ill., recently did damage to the extent of \$15,000, of which \$10,000 represented damage to machinery.

The Cotta Transmission Corporation, Rockford, Ill., recently incorporated, has taken over the business of the Cotta Transmission Co., manufacturer of Cotta transmissions, and will continue to produce the same line of constant mesh transmissions for trucks, tractors, buses and gasoline locomotives. No increase in plant space or equipment is contemplated at present.

Work is rapidly progressing on the renovation of the former Flak-Jencks foundry building at Aurora, Ill., recently purchased by the Diversey Foundry Co., Chicago. It is expected that the plant will be ready to resume operations in a short time.

The Jones Road Machinery Co., Galva, Ill., has been re-organized, the new corporation having taken over the entire stock and equipment of the old company. Under the terms of the transaction Charles Jones, the inventor of the Jones road machinery, will receive a royalty on each machine manufactured, besides the original purchase price. The new company has \$50,000 capital stock and the officers are: President, George Jones; vice-president, E. H. Fielder; treasurer, H. A. Smith; secretary, Arthur H. Johnson.

The Village Board, Leigh, Neb., contemplates the purchase of a 100-hp. oil engine for the municipal electric light and power plant.

The South Chicago Radio Electric Co. has been formed for the manufacture and installation of wireless telephone

apparatus. Headquarters are at Peulecke's Garage, 9237 Houston Street, Chicago. Walter Peulecke is business manager and construction engineer.

A power house, electrical and mechanical equipment, and other machinery will be installed in the three-story plant, 60 x 140 ft., to be erected by the Mid-West Box Co., 111 West Washington Street, Chicago. J. Matteson, Ill., estimated to cost about \$300,000. Harvey C. Miller, 112 West Adams Street, Chicago, is architect. K. I. Herman is in charge.

The Gopher Machinery Co., New Prague, Minn., has plans under way for a one-story factory, 80 x 100 ft., to cost about \$50,000. It will form the first unit of a plant. J. C. Niemeyer, 613 Endicott Building, St. Paul, Minn., is engineer.

The Common Council, Eagle Grove, Iowa, has tentative plans under consideration for the erection of a municipal light and power house.

The Hurley Machine Co., West Twenty-second Street and South Fifty-fourth Street, Cicero, Chicago, manufacturer of electrically operated washing and ironing machines, has acquired the plant and business of the Superior Machine Co., De Kalb, Ill., manufacturer of similar equipment. The new owner will maintain operations at the Superior works as heretofore and no immediate change will be made.

The International Harvester Co., 606 South Michigan Avenue, Chicago, will take bids at once, through Day & Zimmerman, 608 Chestnut Street, Philadelphia, for its new plant on West Wayne Street, Fort Wayne, Ind., for the manufacture of automobile and tractor equipment, and machinery. The work has been held in abeyance for several months, and is estimated to cost about \$500,000.

The Common Council, Granite Falls, Minn., is considering plans for a municipal electric power plant, with improvements in present station. L. M. Marcuson is city clerk in charge.

Architects Michaelson & Rognstad, 3815 West Congress Street, Chicago, are preparing plans for a one-story foundry and machine shop, the owner's name and location to be announced later.

The Western Instrument Co., Chicago, recently organized to manufacture electric precision equipment, has leased property at 1001 Washington Boulevard, totaling about 8,000 sq. ft. for its new plant. A department will be operated for brass finishing and plating. Julius Severus is vice-president and general manager.

The Northwestern Iron Works, Devils Lake, N. D., is considering the erection of a two-story and basement addition. Plans will be prepared in the near future. Samuel A. Pfahn is president.

A vocational department will be installed in the two-story and basement high school to be erected at Preston, Minn., estimated to cost \$150,000. Tolz, King & Day, Inc., 1410 Pioneer Building, St. Paul, Minn., are architects.

Buffalo

BUFFALO, March 13.

The Richardson & Boynton Co., 260 Fifth Avenue, New York, manufacturer of stoves, furnaces, etc., with plant at Dover, N. J., is completing arrangements for the purchase of the property and buildings and equipment of the W. A. Case & Son Mfg. Co., Kensington Avenue, Buffalo, manufacturer of similar products. It will be used for a branch plant, transferring certain branches of manufacture from the Dover works to the new location.

The Board of Education, Buffalo, has adopted a resolution requesting the City Council for an immediate appropriation of \$3,500,000 for the erection of seven trade and vocational schools to cost \$500,000 each, including equipment. Plans will be prepared at once.

Fire, March 5, destroyed the annex to the erecting shops of the Pennsylvania Railroad Co., Olean, N. Y., with loss estimated at about \$100,000, including pipe shops, airbrake shops, paint shops and other structures. The buildings were erected as an extension to the main locomotive shops during the war, and it is undecided whether or not they will be rebuilt. The principal erecting shop, damaged by the fire, will be repaired at once.

The Vacuum Oil Co., 61 Broadway, New York, operating refineries at Rochester and Olean, N. Y., has awarded contract to the White Construction Co., Inc., 95 Madison Avenue, New York, for an addition to its Olean plant, with power house, to cost about \$1,000,000, including equipment.

The Acme Pattern & Machine Co., 1553 Niagara Street, Buffalo, has leased a portion of the plant of the Thorpe Co., Courtright Street, Bridgeburg, Ont., for the establishment of a branch works. Possession will be taken at once.

A vocational department will be installed in the two-story high school, 130 x 130 ft., to be erected at Williamsville, N. Y., estimated to cost about \$175,000.

Edwin J. and John H. Wolf, operating Wolf's Garage, 378 East Delavan Avenue, Buffalo, will install an automobile repair department.

The New York State Gas and Electric Corporation, Ithaca, N. Y., has arranged for a bond issue of \$700,000, the proceeds to be used in part for extensions and improvements in electric power plant and system. S. J. Magee is president.

A vocational department will be installed in the three-story high school, 128 x 215 ft., to be erected at Hornell, N. Y., estimated to cost \$350,000. Plans are being drawn by Tooker & Marsh, 101 Park Avenue, New York, architects and engineers.

The G. A. Aber Mfg. Co., Watertown, N. Y., will install equipment for the manufacture of automobile motors and parts.

The Mutual Ice Co., Erie, Pa., has plans under way for the erection of a new one-story ice-manufacturing plant, estimated to cost about \$65,000. A. C. Bishop & Co., 426 Guardian Building, Cleveland, are architects and engineers.

Cleveland

CLEVELAND, March 13.

Orders and inquiries for machine tools continue to gain, and if the present volume of business holds up March sales will show a fair increase over January and February. Orders are still mostly for single machines, but some buying is being done in lots of two or three tools. Sales are confined for the most part to small and medium size machines, and the business is well scattered among various metal-working industries. Some orders are being placed by automobile parts manufacturers, but very little business has come from automobile plants. The placing of some railroad business has been deferred because of the possibility of a coal strike.

The demand for locomotive cranes has increased considerably, orders coming from various sources particularly from contractors and cement companies. A few export orders are also coming out. The city of Cleveland has placed an order for an 18-ton Orton & Steinbrenner locomotive crane and is in the market for a second crane. The Brown Hoisting Machinery Co. has increased its plant operations, largely for locomotive cranes, from 32 to 44 hr. per week. There is also a better volume of orders coming out for hand operated travelling cranes.

The Erie Railroad has leased several of its large car and locomotive shops to the Meadville Machinery Co., which took over the operation of the shops March 1. They include those at Hammond and Huntington, Ind., Marion, Gallon, Dayton and Cleveland, Ohio, and Elmira, N. Y., as well as other shops. The Meadville Machinery Co. was recently incorporated and its officers include William Schlafke, president, and W. C. Cotton, secretary and treasurer.

The Dover Tank & Plate Co., Dover, Ohio, has been incorporated with a capital stock of \$24,000 and has taken over the plant of the Acme Boiler Works, Dover. It will specialize in the manufacture of electric welded tanks.

The Lisbon Agricultural Lime Co., Lima, Ohio, has been incorporated with a capital stock of \$50,000 and will operate the plant of the Lisbon Lime Co., which will be enlarged and new equipment installed.

The Chastee Automatic Headlight Control Co., Conneaut, Ohio, has been incorporated with a capital stock of \$50,000 and will make automatic automobile headlight controls. It is stated that a factory will be erected. W. J. Chastee is president.

New England

BOSTON, March 13.

Sales of individual used machine tools in this district the past week in the aggregate were larger than a week ago. The market, however, is far from active. Competition for business from used tool dealers and among manufacturers is bringing out some low prices from the latter, although few if any changes are being made in list quotations. Sales the past week include one No. 164 Toledo press and one No. 84 Bliss reducing press to a South Boston manufacturer of silverware; one No. 40E used Perkins press to a Boston manufacturer of leather buttons; one 6 x 6 x 1/4-in. double angle shear to the Lamson Co., Lowell, Mass., conveyors; and a new 20-in. brass working lathe to the Boston & Albany Railroad.

Inquiries have increased, mostly for single used tools, however. The Bangor & Arcoostook Railroad is in the market for four new small tools. The Rutland Railroad's list calls for the expenditure of about \$45,000, and includes a wheel press, shaper and some smaller tools and pumps. This list has not had the official O. K., however, nor has the Central Vermont Railroad's, which involves about \$25,000 worth of

machine tools. A Laconia, N. H., maker of textile mill equipment has bought practically everything on its list excepting a fairly large lathe and shaper, negotiations on these still being in progress. The United Fruit Co., Boston, wants a 14-in. lathe for the Tropico Radio Telegraph Co. The United Lace & Braid Co., Auburn, R. I., is equipping a complete machine shop for the manufacture of its own machinery.

Small tools and machine tool parts continue in good demand, prices on most of which are firmer. The local market on Critchley reamers, however, is now 35 per cent discount, heretofore it was 25 per cent.

The American Sanitary Products Co., Stamford, Conn., organized more than a year ago, will begin at once the erection of a 40 x 60 ft. addition.

The Board of Commissioners, Wakefield, Mass., is considering plans for extensions and improvements in the municipal electric lighting plant to cost about \$50,000.

The Central Maine Power Co., Augusta, Me., has arranged for a bond issue of \$810,000, a portion of the proceeds to be used for extensions and improvements in its hydroelectric generating plants and system. Harvey D. Eaton is president.

Barker & Barker, 86 Page Street, Providence, R. I., manufacturing jewelers, have awarded contract to Mahoney & Tucker, 72 Weybosset Street, for a new factory, 10 x 100 ft. Edgar R. Barker is head.

A vocational department will be installed in the two-story high school to be erected at Laconia, N. H., 125 x 164 ft., and estimated to cost \$400,000. Bids will be asked early in April by P. S. Avery, 99 Chauncy Street, Boston, architect.

The Cambridge Electric Light Co., Cambridge, Mass., has filed plans for the erection of a two-story power house at Western Avenue and Blackstone Street to cost \$160,000.

The Board of Water Commissioners, New Britain, Conn., will install a new Diesel engine and auxiliary operating equipment at the Polkville pumping station.

A vocational department will be installed in the new high school to be erected at Petersboro, N. H., plans for which are being drawn by John P. Kingston & Son, 507 Main Street, Worcester, Mass., architects.

Reeds & Thorpe, 60 Prospect Street, Hartford, Conn., engineers, have started work on the new power house to be erected at the plant of the Handel Co., manufacturer of lamps and fixtures, East Main Street, Meriden, Conn.

The Magna Automobile Co., Division Street, Holyoke, Mass., is planning to build a two-story garage, sales and service station to cost about \$50,000.

The town of Millinocket, Me., plans a vocational department in the new \$400,000 high school to be erected. Harry S. Coombs, 11 Lisbon Street, Lewiston, is the architect.

Morris Spirt, 129 Willow Street, Waterbury, Conn., is having plans prepared by C. Jerome Bailey, architect, 65 Bank Street, for a one-story 50 x 110-ft. garage and service station.

Philadelphia

PHILADELPHIA, March 13.

The Philadelphia Steam Heating Co., Juniper and Cherry streets, Philadelphia, heating and equipment engineer, has awarded contract to George H. Evans, 105 North Fourteenth Street, for a two-story and basement factory, 24 x 51 ft., at 3316-20 Lancaster Avenue.

A power plant will be constructed by Albert M. Greenfield & Co., Fifteenth and Chestnut streets, Philadelphia, on property recently acquired at Fifteenth and Ionic streets, for service for a new eighteen-story office building to be erected on adjoining site. The entire project will cost, \$4,000,000.

A vocational department will be installed in the high school to be erected at Jenkintown, Pa., estimated to cost about \$170,000.

The Bureau of Yards and Docks, Navy Department, Washington, will make extensions and improvements in the power plant at the Philadelphia Navy Yard to cost \$240,000.

The United States Radiator Co., Detroit, has leased the three-story building at the corner of Twenty-fourth and Vine streets, Philadelphia, totaling about 27,000 sq. ft., for a factory branch.

The General Processing Co., Trenton Avenue and Willard Street, Philadelphia, will install new conveying machinery, shafting, pulleys and other transmission equipment, at its textile mill.

Electric motors, power apparatus and other mechanical equipment will be installed in the first unit of the new four-story building to be erected by the Public Ledger Co., Independence Square, Philadelphia, at Seventh and Sansom streets, estimated to cost \$2,000,000.

C. Kohn, Morris Building, Philadelphia, will soon com-

mence the erection of a two-story plant at Glenwood Avenue and Oxford Street, 125 x 300 ft., for the manufacture of boilers, radiators and other heating equipment. It is estimated to cost \$80,000.

Vocational equipment will be installed in the new junior and senior high schools to be erected by the Board of Education, Keystone Building, Philadelphia, in different parts of the city, plans for three of which have been prepared, estimated to cost \$800,000, \$200,000 and \$150,000, respectively.

The Trenton Emblem Co., 120 Hamilton Avenue, Trenton, N. J., has filed plans for a one-story foundry.

Subject to final approval by the Court, the Waterbury Clock Co., Waterbury, Conn., has acquired the entire property and business of Robert H. Ingersoll & Brother, manufacturers of watches, bankrupt, for \$1,500,000. The sale includes the plant at Trenton, N. J., with rated capacity of 8000 watches a week, and the factory at Waterbury, with output of 11,000 watches weekly. Both plants will be continued by the purchasing company, and operations will be increased at the Trenton works, now running on a curtailed schedule.

The State Highway Department, Broad Street Bank Building, Trenton, N. J., R. J. Wasser, State engineer, will break ground at once for the erection of a one-story automobile service and repair works, 106 x 400 ft., at Fernwood, N. J., to cost \$95,000.

The Pennsylvania Edison Co., Easton, Pa., has arranged for a preferred stock issue of \$1,350,000, about \$800,000 of which will be used for a new generating plant, and other improvements and extensions. The company is a subsidiary of the General Gas & Electric Co., and operated by W. S. Barstow & Co., 50 Pine Street, New York.

The Board of Works, Altoona, Pa., is having plans prepared for a one-story and basement municipal automobile service and repair works, for city cars and trucks. Bids will be asked early in April. H. G. Huckle is city manager.

Pittsburgh

PITTSBURGH, March 13

Actual business in machinery and equipment in this district still is moderate, but in almost all lines a good inquiry exists. There is an inquiry for four grinders for export and the trade is expecting action before long on the tools which will be wanted for the new rod and wire plant of the Wheeling Steel Corporation at Portsmouth, Ohio. The West Leachburg Steel Co., which is to install a 16-in. continuous rod strip mill with auxiliary equipment is expected to close this week. The U. S. Electrical Tool Co. reports the sale of two grinders to a Pennsylvania oil company.

The market for cranes still is more active in the prospective than in the actual. The Coshort Iron Co., Monongahela City, Pa., has taken bids on four cranes, including one 10-ton, one 5-ton and two 2-ton capacity, and is expected to place the order soon. The Standard Plate Glass Co., Butler, Pa., recently closed for a 5-ton, 57-ft. overhead Shaw crane. Much interest centers in the 20 cranes inquired for by the Wheeling Steel Corporation for its Steubenville, Ohio, and Beech Bottom, W. Va., plants awards, of which are likely in the near future.

The Wheeling Machine Products Co., Wheeling, W. Va., is in the market for one 250 or 300-hp. direct-connected steam generator unit, including boiler.

The Galena Signal Oil Co., Franklin, Pa., has purchased about four acres at Richmond, Cal., as a site for the construction of a new refinery, estimated to cost about \$500,000 with machinery. Charles A. Miller, superintendent of the refinery at Franklin, will be in charge of construction.

The Harbison-Walker Refractories Co., Farmers' Bank Building, Pittsburgh, has tentative plans under consideration for a new plant at Elgart, Iowa.

The American Window Glass Co., Kane, Pa., is dismantling its plant at Smethport, Pa., preparatory to the installation of new machinery of improved type. It is proposed to have the work completed to permit operation in the fall.

A vocational department will be installed in the central high school to be erected by the Red Stone Township Board of Education, Republic, Pa., estimated to cost about \$200,000. J. H. Harmon, 632 Fayette Title & Trust Building, Uniontown, Pa., is architect.

Klenck Brothers, Warren, Pa., operating an automobile service works, will install a complete machine repair works.

The Gilmore Coal Co., Oliver Building, Pittsburgh, will build a one-story power plant at its properties near Venice, Pa., to cost about \$50,000.

The Interstate Glass Co., Bradford, Pa., has completed plans for extensions and improvements in its plant at Clarks-

burg, W. Va., to cost about \$75,000, including equipment. H. J. Waters is president and general manager.

The Dayton Construction Co., P. O. Box 870, Elkins, W. Va., is planning to purchase air compressors, cable guard and other equipment.

The Electric Power Equipment Corporation, 215 Tenth Street, Huntington, W. Va., recently organized, will establish a plant to manufacture wireless equipment and other electrical apparatus. E. C. Broskie is treasurer and general manager.

The American Coal Co., Bluefield, W. Va., will build a new steel tippie at its properties, with capacity of about 400 tons per hour. E. J. McQuall is general manager.

The Slab Fork Coal Co., Slab Fork, W. Va., is planning for the construction of a new steel tippie. It recently increased its capital to \$500,000 for expansion. H. G. Caperton, Jr., is manager.

The West Virginia Pulp & Paper Co., 200 Fifth Avenue, New York, is considering rebuilding the portion of its plant at Cass, W. Va., recently destroyed by fire with loss estimated at \$200,000, including machinery.

The Common Council, Athens, W. Va., has plans under way for an electrically operated pumping plant for the waterworks department. C. E. Collins, Drexel Building, Philadelphia, is engineer.

The Board of Water Commissioners, Fairmont, W. Va., will build an electrically operated pumping plant in connection with new filtration works, estimated to cost about \$150,000. Fuller & McClintock, 170 Broadway, New York, are consulting engineers.

The E. E. White Coal Co., Glen White, W. Va., is perfecting plans for a new steel tippie.

The Ashland Coal & Coke Co., Ashland, W. Va., is planning to rebuild its tippie, recently partially destroyed by fire with loss estimated at \$50,000, with hoisting and other machinery.

Indiana

INDIANAPOLIS, March 13.

The Monroe Automobile Co., Indianapolis, recently organized, will take over the plant and business of the William Small Co., 33 West Eleventh Street, heretofore manufacturing passenger cars under the Monroe name. The new owner will make a number of improvements, and proposes to develop capacity production. William Small, head of the acquired company, will be sales manager for the new organization.

The Standard Oil Co., Davidson and Lord streets, Indianapolis, will build a new two-story works, 40 x 200 ft., at Twenty-ninth and Schurman streets, to cost about \$100,000. A portion of the structure will be equipped as an automobile service and repair department for company trucks.

A vocational department will be installed in the new junior high school to be erected at Columbus, Ind., for which bonds for \$125,000 have just been voted.

The Interstate Public Service Co., Indianapolis, is perfecting plans for a new electric power plant on the Tippecanoe River, near Norway, Ind. The construction of the dam will be commenced at once. The entire plant, with equipment, will cost about \$1,225,000 and will be the first of a number of such plants to be established in this vicinity. Edward C. Burch, Monticello, Ind., is manager for the company in this section.

The Indiana Oil Refining Co., Columbus, Ind., is arranging to proceed with the erection of its new refinery, now about one-half completed, work upon which has been held in abeyance for several months. About \$100,000 will be expended to bring the plant to completion. The machinery installation will commence some time in April. Louis J. Scheldt is president.

Clayton Cooper and associates, Elwood, Ind., are organizing a company to take over and operate the plant of the Elwood Foundry Co., bankrupt. The building and other property have been acquired recently from William O. Maines, trustee in bankruptcy. The new company will manufacture metal traffic signs and kindred products, as well as general iron castings.

The Northern Indiana Gas & Electric Co., South Bend, Ind., is negotiating for the purchase of the plant and property of the Lafayette Service Co., Lafayette, Ind., now in receivership. Upon acquisition, the new owner will make a number of improvements in line extensions, and connect with its general system.

The Board of Sanitary Commissioners, City Hall, Indianapolis, will receive bids until March 30, for power plant equipment for use in connection with a sewage disposal plant, including: Three 400-hp. watertube boilers, with superheaters, soot blowers and auxiliary apparatus; three chain

grate stokers, with capacity 150 per cent of rating, including operating mechanism; three steam turbine blowers, each with capacity of 16,000 cu. ft. per min.; two steam-turbo electric generators, each 500 kw., provided with exciters; five surface condensers, each with about 750 sq. ft. of cooling surface, provided with air and condensate pumps; one electric switchboard, six or more panels, with instruments. Charles H. Hurd, 1405 Merchants' Bank Building, is consulting engineer. Jay A. Craven is president of the Board.

Cincinnati

CINCINNATI, March 13.

Local manufacturers report that while there is still a lack of machine tool orders, the situation is showing signs of improvement, with more inquiries for single machines coming from widely scattered points. Most of the orders placed during the week were for single machines. The Sewell Valley Railroad has purchased one or two tools against its recently revived list and the Cincinnati Railroad has also taken several tools, including a large planer. The H. H. Franklin Mfg. Co. is reported to have placed orders for several lathes, an Eastern manufacturer booking the business. A local manufacturer is figuring on a fairly large order and expects to close the business within the next week or two.

No new railroad lists have been issued, although a large Western railroad is expected to be in the market shortly for a number of machine tools. Action on the Whitaker-Glessner list of 20 tools and 20 cranes is looked for within the next ten days. A recent order placed with a Columbus manufacturer calls for \$100,000 worth of equipment for the new Union station at Chicago, consisting principally of mail trucks, platform trucks, mail moving machinery, etc.

The William Kohl Co., 1034 Hulbert Street, Cincinnati, paper box manufacturer, has awarded contract for a five-story fireproof building, 50 x 100 ft., to cost approximately \$50,000, to the Ferro-Concrete Construction Co.

The plant and equipment of the Knox Tire & Rubber Co., Mt. Vernon, Ohio, has been purchased by stockholders of the company at Middletown, Ohio, for \$175,000. Middletown capitalists were represented by F. D. Litsch. No announcement has been made as to the intentions of the new owners with regard to the operation of the plant.

The plant of the Licking Window Glass Co., Utica, Ohio, was damaged by fire on March 5 to the extent of \$150,000. Harry McCanh, president, states that it will be rebuilt.

Baltimore

BALTIMORE, March 13.

The property of the Globe Shipbuilding & Dry Dock Co., recently adjudged bankrupt, Curtis Bay, Baltimore, has been purchased by Henry W. Williams and a number of creditors for \$1,050,000. The company will be reorganized, new capital secured, and the plant placed in operation.

The United States Radiator Corporation, Detroit, will improve the three-story building at 1162 Scott Street, Baltimore, recently leased for a factory branch. Arthur E. Thain, 2116 Mt. Holly Street, is local manager.

A one-story power house will be erected by the J. L. Gilbert & Brother Lumber Co., Eastern and East Falls avenues, Baltimore, at its new mill, on property recently acquired. An automobile service and repair plant will also be constructed.

The Board of Street Commissioners, Hagerstown, Md., is negotiating with the City Council for a new municipal electric power plant, replacing the present station.

The Empire Sherardizing Co., Baltimore, is establishing a new local plant for metal treatment and will begin operations at an early date.

Fire, March 5, destroyed a portion of the power plant of the North State Power Co., Wendell, N. C., with loss estimated at about \$22,000. It will be rebuilt.

The Industrial Department of the Chamber of Commerce, Newberry, S. C., is arranging for the establishment of a local plant to manufacture iron, brass, bronze and other metal products.

Cecil C. Davis, Seventh Street, Bristol, Va., is planning to rebuild his automobile machine shop, recently destroyed by fire with loss estimated at about \$17,000.

The Carolina Power Co., Raleigh, N. C., recently organized by officials of the Carolina Power & Light Co., as a subsidiary, has plans under way for the construction of a dam on the Pee Dee River, near Babin, N. C., and hydroelectric generating plant, with capacity of about 35,000 hp. A transmission system will be built to connect with the lines of the parent organization. The entire project is estimated to cost close to \$2,000,000. Charles M. Johnson is president of both companies.

The Summerville Cotton Mills, Summerville, Ga., John D. Taylor, president, have preliminary plans under way for a hydroelectric generating plant on the Chattahoochee River.

The City Council, Danville, Va., is planning for the construction of an electrically operated pumping plant, with capacity of 5,000,000 gal. in 12 hr. at the municipal water-works.

A vocational department will be installed in the two-story and basement high school to be erected at Suffolk, Va., 60 x 150 ft., to cost \$100,000. Charles M. Robinson, Times-Dispatch Building, Richmond, Va., is architect.

Fire, March 8, destroyed the engine house, water tank tower and other mechanical departments at the plant of the Crozet Cider Co., Charlottesville, Va. The structures will be rebuilt.

The Macon Ice Co., Macon, Ga., has plans under way for a new one-story ice-manufacturing plant on Wall Street.

The Hanson Motor Car Co., Atlanta, Ga., manufacturer of automobiles, is planning for an addition to increase the output from 20 to about 50 complete cars per day. It recently acquired the plant of the American Motors Export Co., Jacksonville, Fla., as a branch. The two organizations will be merged under the Hanson company name.

Hackney Brothers, Wilson, N. C., operating an automobile works, are planning to rebuild the two-story structure destroyed by fire, Feb. 22, with loss estimated at about \$110,000, including equipment and stock.

The Gulf States

BIRMINGHAM, March 13.

The Eureka Foundry Co., Gadsden, Ala., has plans under way for the construction of a new foundry to manufacture iron and other metal castings. Evan Owen is president.

Fire, March 3, destroyed a portion of the machine shop of the Hooten-Phillips Co., Sulphur Springs, Tex., with loss estimated at close to \$25,000.

The Citizens Light & Power Co., New Orleans, recently organized with a capital of \$2,000,000, is completing plans for a new electric power plant at Carrollton, La.

Fire, Feb. 28, destroyed a portion of the plant of the New Boston Cotton Oil Co., New Boston, Tex., with loss estimated at \$100,000, including machinery.

S. F. Bowser & Co., Fort Wayne, Ind., manufacturers of gasoline pumps, tankage devices, etc., have leased a building at Dallas, Tex., for a Southern branch. It will concentrate on the production of gasoline filling equipment for garage service.

The Leeds Mfg. Co., Leeds, Ala., recently organized, has plans under way for the erection of a new ice-manufacturing plant. Frank R. Hurst heads the company.

The City Council, Dothan, Ala., is taking bids for electric power equipment for a new unit at the municipal lighting plant, comprising a 750-kw. generator set, with exciter, boilers, stokers and other equipment. R. W. Lisenby is city clerk; B. R. Plicher is consulting engineer.

The Darco Co., Marshall, Tex., will build an electric power house at its new manufacturing plant, now in course of erection and estimated to cost in excess of \$250,000.

A vocational department will be installed in the new high school to be erected at Greenville, Tex., bonds for which in an amount of about \$100,000, have been voted.

The Worsham Brothers Co., Lamar Avenue, Houston, Tex., will soon commence the erection of a three-story automobile service and repair works, 65 x 113 ft., estimated to cost \$110,000. A complete machine shop, paint shop and other departments will be installed. R. D. Steele, Houston, is architect.

The City Commission, St. Petersburg, Fla., is perfecting plans for a municipal electric power plant.

An electrically-operated pumping plant will be constructed by the Birmingham Waterworks Co., Birmingham, Ala., in connection with extensions and improvements in its system, estimated to cost about \$500,000. The company has increased its capital to \$3,029,700.

The Common Council, Brownwood, Tex., has perfected plans for the erection of a municipal electric light and power plant at the waterworks station, and work will commence at an early date.

Butler Brothers, Eastland, Tex., will soon commence the erection of a new gasoline producing plant and oil works, estimated to cost about \$300,000, including machinery. It has acquired a portion of the Johnson tract, about 3 miles from the city for the works. The company will also establish a number of subsidiary plants in neighboring districts, with entire project estimated to cost \$1,500,000, inclusive of machinery.

The Orange Ice, Light & Water Co., Orange, Tex., is planning for the erection of additions to its ice-manufacturing plants, estimated to cost about \$50,000.

A vocational department will be installed in the new high school to be constructed at San Antonio, Tex., plans for which will be prepared by M. L. Waller, 511 Brady Building, San Antonio.

Fire, March 5, destroyed a portion of the plant of the Wichita Mill & Elevator Co., Wichita Falls, Tex., including steel elevator bins, conveying equipment, etc., with loss estimated at about \$50,000.

A vocational department will be installed in the new high school to be erected at Gadsden, Ala., estimated to cost in excess of \$150,000.

The Common Council, Elton, Tex., has plans under way for a municipal electric light and power plant.

The Common Council, Fernandina, Fla., has called a special election on April 4 to vote bonds for \$150,000, for extensions and improvements in its electric power and ice-manufacturing plants.

The Central South

ST. LOUIS, March 13.

The Western Supply Co., 424 Boulder Street, Tulsa, Okla., will build a new one-story and basement forge shop, 50 x 60 ft., at 405-7 North Cheyenne Street.

The Jefferson City Light, Heat & Power Co., Jefferson City, Mo., has plans in progress for an addition to its electric power plant and for other improvements and extensions in the system, to cost about \$85,000. H. S. Kilby is general superintendent.

The Common Council, St. Charles, Mo., has called a special election to vote bonds for \$175,000 for the construction of a municipal electric light and power plant. Benham & Mullergren, 512 Gimbel Building, Kansas City, Mo., consulting engineers, will prepare plans.

Fire, March 6, destroyed a portion of the plant of the Brinly-Hardy Co., 334 East Main Street, Louisville, manufacturer of agricultural implements and equipment, with loss estimated at about \$150,000, including machinery.

The Hackney Iron & Steel Co., Enid, Okla., recently organized, is arranging for the operation of a local plant to manufacture iron and steel products for oil well and other service. The initial works will be about 40 x 60 ft. D. R. Hackney is president and manager.

The Memphis Fender & Enamel Works, 52 South Fourth Street, Memphis, Tenn., recently organized, has leased a one-story building, 25 x 175 ft., for the establishment of a plant to manufacture automobile fenders and other sheet metal products, with repair department. F. H. May is president and general manager.

The Caruthersville & Kennett Light & Power Co., Kennett, Mo., is planning for extensions in its electric power plant and equipment, to cost about \$100,000. A new transmission line will also be built.

The Miners Ice & Fuel Co., 318 Main Street, Joplin, Mo., is planning for a two-story ice-manufacturing plant at Kentucky Avenue and Tenth Street.

The Indianola Refining Co., Okmulgee, Okla., operating a local oil refinery, and similar plant at East St. Louis, Ill., has arranged for a note issue of \$900,000, a portion of the proceeds to be used for extensions and improvements. Elmer E. Schock is president.

A vocational department will be installed in the three-story and basement high school, 125 x 207 ft., to be erected at Oklahoma City, Okla., estimated to cost about \$250,000. Parker & Rittenberry, Oklahoma City, are architects.

The Nashville Pulp & Paper Corporation, Nashville, Tenn., is planning for the construction of a new power house. R. J. Cullen is president and general manager.

A vocational department will be installed in the three-story and basement high school to be erected at Liberal, Kan., estimated to cost \$175,000. Lorentz, Schmidt & Co., 121 North Market Street, Wichita, Kan., architects, are preparing preliminary plans.

The Chase Mfg. Co., 3216 Morgan Street, St. Louis, manufacturer of steam vulcanizing equipment, has awarded a contract to August Stollman, St. Louis, for a new one-story factory, 50 x 100 ft. J. L. Chase is president.

A vocational department will be installed in the high school to be erected by the Board of Education, Owensboro, Ky., estimated to cost about \$225,000. A. F. Hussander, 25 North Dearborn Street, Chicago, is architect.

The Standard Crate & Filler Co., Jefferson City, Mo., has awarded a contract to the Fruin-Colnon Construction Co., St. Louis, for a one-story addition, 100 x 200 ft., estimated to

cost about \$55,000. A list of machinery for installation is being arranged. A. W. Happy is president.

The Choctaw Brick & Gas Co., Kennedy Building, Fort Smith, Ark., has acquired a building at Mansfield, Ark., and will establish a plant to manufacture brick, tile and kindred products. Allen Kennedy is secretary.

The Cumberland Power Co., Cumberland, Tenn., is planning for extensions and improvements in its power plant and system, estimated to cost about \$150,000. A new transmission line will be constructed. G. S. Numanaker, vice-president, is in charge.

The Common Council, Savannah, Tenn., is planning for a municipal hydroelectric power plant, and will commence the installation at an early date. A municipal ice-manufacturing plant will also be established. A. M. Patterson is chairman of the committee in charge.

A vocational department will be installed in the new high school to be erected at Hill City, Kan., estimated to cost about \$135,000. William H. Saylor & Co., 305 Mutual Building, Kansas City, Mo., are architects.

Milwaukee

MILWAUKEE, March 13.

While the machine tool trade so far has experienced only a slight resumption of activity, confidence is expressed that the improvement in the general metal-working situation must carry the tool industry upward in due time. In the milling machine trade a feature of the past week has been a relatively brisk inquiry from automotive shops in Detroit, Cleveland and Indianapolis. Sales in this period were somewhat larger than before, but were confined to purchases of one or two tools. Large lots are still absent even in the inquiries being put out for miscellaneous requirements.

The Excel Mfg. Co., 3402 South Pierce Street, Milwaukee, manufacturer of interior woodwork, millwork, cabinets, billiard tables and store and office fixtures and furniture, will start work April 1 on the erection of a two-story brick addition, 40 x 120 ft., which will require some additional machinery, motors, etc. L. C. Neumann is secretary and treasurer.

The Six Wheel Truck Co., Fox Lake, Wis., which for several months has been negotiating with business men's associations for a permanent location, has decided to retain its establishment in Fox Lake and will begin work after April 15 on a one-story brick and concrete factory, 50 x 110 ft., estimated to cost \$50,000 with equipment. For the past four years a small experimental shop has been maintained for the development of a heavy duty motor truck with dual sets of rear wheels, designed by F. N. Pettegrew, president of the concern.

John A. Luke, Burlington, Wis., will build a \$45,000 public garage and service shop, 66 x 133 ft. part two stories and basement. The architect is Martin F. White, 908 Trust Building, Milwaukee.

The Board of Education, West Allis, Wis., will take bids until March 25 for an addition to the high school, to be equipped exclusively for vocational training purposes. The estimated cost is \$120,000. The architects are Robert A. Messner & Brother, 221 Grand Avenue, Milwaukee.

The Ever-Bilt Auto Appliance Co., Milwaukee, has been incorporated with a capital stock of \$15,000 to manufacture mechanical specialties and appliances. Arrangements are being made for a shop. The incorporators are C. M. Modney, Edward Guetzkow and A. C. Carlson, 1655 Tenth Street, Milwaukee.

The DePere, Wis., Board of Education has accepted the bid of the Hub City Construction Co., Stoughton, Wis., to build the new high and vocational training school at a price of \$93,950. Contracts for heating, ventilating, etc., will bring the cost up to \$165,000. Manual training equipment will be bought later. The architects are Foeller, Schober & Stephenson, Green Bay, Wis.

The Blum Brothers Box Co., Marshfield, Wis., has let the general contract for designing and erecting a brick and steel addition, 10 x 120 ft. and a wing, 56 x 80 ft., to the Krasin Construction Co. local. Inquiry is being made for wood-working, veneer cutting, nailing and motor equipment.

The Common Council, Kaukauna, Wis., has approved a bond issue of \$175,000 for a new junior high and manual training institute. Parkinson & Dockendorff, architects, La Crosse, Wis., are revising original plans to come within the appropriation. Bids will be taken shortly after April 1.

The Northern Tool & Machinery Co., 736 Winnebago, Street, Milwaukee, is increasing its force and expects later to add some new equipment and take more space to accommodate the growing demand for tools, dies, jigs, fixtures and welding work. It was established two years ago at 946

Bremen Street and moved to the present quarters last fall. John Umanaki and Leonard Kaszolka are the owners.

The Fahrenkrug & Voissem Electric Co., Oshkosh, Wis., has been incorporated with \$15,000 to manufacture and repair electrical equipment, etc. The principals are Alois Voissem, Menasha, Wis., and George H. Fahrenkrug, Oshkosh.

M. Tullgren & Sons, architect, 425 East Water Street, Milwaukee, are preparing plans for a \$200,000 general storage and service garage, 102 x 150 ft., five stories and basement, to be erected by a local syndicate at Fifth and Wells streets. Work will start some time in April.

The Merrill, Wis., Board of Education will close bids April 4 for the construction of a vocational training annex to the present high school, and a new graded school building, the whole to cost about \$200,000. Harry R. Allen is secretary of the board.

Detroit

DETROIT, March 13.

The Mason Motor Truck Co., organized last December, has secured the former plant of the Young Spring Co. in Flint, Mich., which will give 35,000 sq. ft. of floor space. Full production is planned by July 1. The company is headed by A. C. Mason, formerly with the Cadillac and Buick companies and later with the General Motors Corporation as consulting engineer.

The Benton Harbor Auto Machine Shop, Benton Harbor, Mich., will soon begin the manufacture of a line of automobile accessories, including an oil gage and a patent wheel rim remover.

The Corodum Sand Brick Co., Pontiac, Mich., will start work on a new plant as soon as weather permits.

The Pere Marquette Railway has entered into a contract with the Kellogg-Grice Co., Chicago, whereby the latter company took over operation of the shops at Tonia, Mich., on March 1.

The Stafford Roller Bearing Co., Lawton, Mich., will soon start construction work on a new factory, one story, 40 x 60 ft.

The Kirsch Mfg. Co., Kalamazoo, Mich., will build a new three-story factory, 180 x 200 ft., to cost about \$100,000.

The Reiber-Kels Co., Adrian, Mich., manufacturer of deflector spotlights and kindred equipment, has been reorganized, and has plans under consideration for improvements and extensive production. Walter G. White is president and general manager.

The Kirkland Brothers Machine Co., Detroit, recently organized with a capital of \$250,000, is arranging for a local works to manufacture special machines for cylinder grinding work, and a line of small tools. Thomas H. Kirkland, 31 Elm Street, Springfield, Mass., heads the company.

The Saginaw Products Co., Saginaw, Mich., manufacturer of automobile equipment, will install new equipment in its machine shop. F. W. Mowbray is superintendent in charge.

Motors, transmission, and other equipment will be installed in the addition to be erected by the Kalamazoo Paper Box Co., Kalamazoo, Mich., estimated to cost about \$175,000. Robert E. Staebler is secretary-treasurer and general manager.

A one-story power plant will be erected by the Cadillac Lumber & Chemical Co., Cadillac, Mich., at its new plant at Sault Ste. Marie, Mich., for which a site has recently been acquired.

The Pacific Coast

SAN FRANCISCO, March 7.

The California Car Co., Alexander Building, San Francisco, will soon commence the erection of a new plant at Martinez, Cal., for the manufacture of automobiles, estimated to cost in excess of \$75,000. C. R. Manspert, 496 Twelfth Street, Oakland, Cal., is architect.

The Board of Trustees, University of California, Berkeley, Cal., will build a new power plant at the institution. William C. Hays, First National Bank Building, San Francisco, is architect.

The Los Angeles Gas & Electric Co., 645 South Hill Street, Los Angeles, has plans under way for a one-story compressor plant, 12 x 145 ft., estimated to cost about \$60,000.

The Regan Forge & Engineering Co., Regan Street, Los Angeles Harbor, Los Angeles, has awarded a contract to the Austin Co., 702 Pacific Electric Building, for a new one-story machine shop, 80 x 200 ft.

The City Commission, Sacramento, Cal., is planning for the erection of a hydroelectric power plant on the South Fork of the American River, in the vicinity of Saylor Flat. Albert Glivan, city engineer, is in charge.

The Concrete Lumber Co., Los Angeles, recently organized with a capital of \$1,000,000, has acquired about four acres on the San Fernando Boulevard for a new plant to manufacture concrete building products. The company is headed by George A. Mesick and Henry W. Schlueter.

A two-story cold storage and refrigerating plant addition will be erected by the Christopher Ice Cream Co., Los Angeles, estimated to cost about \$30,000, exclusive of machinery. Richard D. King, Los Angeles, is architect.

The Kersey Pattern Works, 702 Date Street, Los Angeles, manufacturer of metal and wood patterns, and other foundry and machine shop equipment, is having plans prepared for a one-story factory, 50 x 120 ft., on Santa Fe Avenue. Herbert A. Hamm and Glen E. Smith, 412 Central Building, Pasadena, Cal., are associated architects.

A vocational building will be constructed at the group of high school buildings by the Santa Barbara High School District, Santa Barbara, Cal., estimated to cost about \$500,000. W. H. Weeks, 369 Pine Street, San Francisco, is the architect.

The Santa Fe Railway Co., Kerckhoff Building, Los Angeles, has authorized an expenditure of \$204,000 for extensions to its shops at San Bernardino, Cal., in addition to the new machine shop now in course of construction and which will cost about \$300,000, with machinery. Plans for the other structures are being prepared, to include a power house.

The Union Oil Co. of California, Mills Building, San Francisco, is perfecting plans for the erection of its new oil distributing plant at Hoquiam, Wash. It is estimated to cost about \$200,000, including machinery.

The Bourne Gold Mining Co., Bourne, Ore., has secured permission to use waters from Cracker and Little Cracker creeks, and will erect a hydroelectric generating plant.

The Albina Electric Co., Mississippi Avenue and Shaver Street, Portland, Ore., manufacturer of electrical specialties, is planning for enlargements. W. D. Williams is head.

The Wonder Electric Mfg. Co., Chamber of Commerce Building, Portland, Ore., will operate a plant at York and Twenty-fourth streets for the manufacture of electrical products and appliances. Property has been acquired. John W. Henry is president.

Canada

Toronto, March 13.

The demand for machine tools is showing steady improvement. Users who have been contemplating entering the market for some time are buying two or three machines and it is the general opinion that business is making good progress. The construction of industrial plants and additions is also more pronounced and dealers are looking forward to a larger buying movement in the early future. The automobile and car repair industries continue to furnish the greater part of the demand for equipment, although some dealers point out that wood-working concerns and the general industrial trades are buying more freely than in the past. Small tools continue to move freely with consumers buying for future use as well as for immediate requirements.

The Pease Foundry Co., 118 King Street East, Toronto, will rebuild its machine shop at Brampton, Ont., recently destroyed by fire, and is expected to enter the market in the early future for equipment.

The City Council, Edmonton, Alta., has authorized the expenditure of \$115,000 for power plant extensions and improvements.

The mill owned by the Canadian Lumber & Timber Co., Vancouver, B. C., recently destroyed by fire with a loss of \$110,000, will be rebuilt immediately.

The cartridge factory of the Dominion Arsenal, Quebec, Que., was damaged by fire about a week ago, and a second fire caused further damage to the main plant on March 10.

The machine shop of the Home Logging Co., Courtney, B. C., was destroyed by fire with a loss to building and equipment of approximately \$75,000.

Birmingham Motors, Ltd., Peterborough, Ont., recently incorporated, has acquired the Canadian rights for the manufacture of the Birmingham car now being manufactured at Falconer, N. Y. The Home plant at Peterborough, has been taken over by the company and manufacturing operations will be started in the early future. It is not the intention of the company to purchase any machinery or equipment at present.

The Canadian Aluminum & Brass Co., is opening a branch in Windsor, Ont., in a part of the plant occupied by the Dominion Motor Castings Co. It is affiliated with the General Aluminum & Brass Co., Detroit, and J. P. Carrille, president, states that manufacturing operations will commence about the end of March.

Rebuilding of furnaces and additions to the plant of Pilkington Brothers, Thorold, Ont., are responsible for a temporary shutdown of the plant, according to J. E. Harrison,

general manager. Mr. Harrison further stated that he was looking forward to a revival of business in the building trades which would control to an extent the speed with which the alterations would be accomplished.

The Canadian Electric Castings, Ltd., is building a two-story foundry, 50 x 250 ft., on the former site of the foundry of the Canadian Electro Foundries at Orillia, Ont., destroyed by fire some time ago. It will specialize in steel castings, including grinding balls for the mining and concrete industries and is expected to be ready for operation by the middle of April. Equipment will include two electric, three phase Heroult furnaces having a daily capacity of 18 tons.

Electro-Castings, Ltd., Collingwood, Ont., which is erecting a foundry, expects to have it in operation before the end of April. W. T. Stephens, manager, is supervising the installation of a two-ton electric furnace of his own design with a capacity of 12 heats in 24 hr. Production in general and special lines will be in gray iron, hard iron and semi-steel.

Sharon Steel Hoop Co. Report

According to the annual report for 1921 of President Severn P. Ker, the Sharon Steel Hoop Co., Sharon, Pa., sustained a total loss last year of \$2,711,674.86. The income account shows the following items:

Gross loss for operations after repairs of	
\$600,367	\$375,827.59
Idle plant expense	911,285.90
	\$1,487,113.49
Miscella	114,234.25
Net loss	\$1,372,879.24
Add:	
Depreciation	\$376,968.23
Interest	570,711.81
Inventory write-off	391,114.58
	\$1,338,795.62
Total loss for 1921	\$2,711,674.86
Deduct surplus 1-1, 1921	1,013,390.34
Deficit	\$1,698,284.52

The company's gross assets are given as \$25,314,502, including property account of \$14,459,389.67. Its balance sheet shows current assets of \$4,135,007, including \$2,610,134 in inventories and \$275,972.61 cash. Its current liabilities are \$2,673,727.11, leaving a working capital of \$1,561,280.39. Its statement carries an item of good will to the amount of \$3,844,727.91.

Gross sales in 1921 were \$5,274,942 on 93,383 tons of semi-finished and finished steel products.

During the year the company was obliged to sell \$5,000,000 of a \$10,000,000 bond issue. After this issue of 8 per cent first mortgage bonds, there is outstanding \$13,317,300 of stock. The company has established a reserve of \$4,152,510.69 and has set up a fund of \$62,314 for contingencies.

Electric Steel & Forge Co. Plans

The Electric Steel & Forge Co., Cleveland, has announced new financing plans to meet present financial needs. It is proposed that the company be reorganized under a new name, probably the Mid-West Steel Co., with a capital stock of 7500 shares of 8 per cent preferred stock, par \$100, and 39,000 of no par common stock. The new preferred stock will be entitled to dividends from Jan. 1, 1923, and will be redeemable at \$110. It is estimated that \$150,000 is needed at the present time and it is stated that the directors have already subscribed to \$75,000 of the new preferred stock, or one-half of the amount required. The exchange of stock is to be made on the basis of one share of preferred for one share of new common and one share of old common for one-half share of new common. The company's obligations amount to \$640,000 distributed as follows: merchandise creditors, \$85,000; banks, \$70,000; mortgages, \$450,000; taxes, \$35,000.

Subject to the successful consummation of this financing plan, creditors are asked to agree to a three-year extension upon payment of 10 per cent to merchandise creditors and 25 per cent to banks, while mortgage holders are asked to agree to an extension until December, 1923. The company states that many creditors and stockholders have already agreed to the plan.

Joseph S. Webster, New Haven, Conn., has organized a sales force to be known as Joseph S. Webster & Co., to represent the Kingsford Foundry & Machine Works, Oswego, N. Y., in the New England states for the Kingsford-Webster water tube boiler. Offices will be established in New Haven, Providence and Boston.

Current Metal Prices

On Small Lots, Delivered from Merchants' Stocks, New York City

The following quotations are made by New York City warehouses.

As there are many consumers whose requirements are not sufficiently heavy to warrant their placing orders with manufacturers for shipment in carload lots from mills, these prices are given for their convenience.

Iron and Soft Steel Bars and Shapes

Bars:	Per Lb.
Refined bars, base price.....	2.53c.
Swedish bars, base price.....	10.00c.

Polishing of Metals an Art in Itself*

Lack of Standards Attributed to Lack of Appreciation of
What the Problem Means—Major Importance
of the Lowly Glue Pot

BY SIDNEY G. KOON

WITH the start of the nickel plating industry, about 1876, began the real need for giving metals a polished or refracting finish which would take from them the crude, rough appearance left by the preliminary processes and develop their inherent beauty. From small beginnings, the business of polishing and highly finishing metals has grown in a cumulative manner, and has lately received a considerable impulse from the disinclina-

far superior to that left by the lathe or planer tool, it must be regarded merely as a stepping stone or preliminary operation to the real finishing or polishing processes.

Polishing may be regarded primarily as flexible grinding, in that it is accomplished by means of emery or other abrasive held by glue on the periphery of a flexible wheel, made usually of cloth or leather. Buffing, on the other hand, while done

Polishing Two Brass Door Knobs on One Specially Shaped Canvas Wheel. The knobs revolve while being finished

Special Faced 16 In Compress Canvas Polishing Wheel of Hard Density, Used in Finishing Scissor Handles. The sketch shows how the emery heading fits the wheel contour

tion of buyers to purchase materials which lack such a finish.

Manufacturers, feeling this condition of affairs through the inability of their sales departments to maintain an adequate volume of sales, have not been slow to learn the cause, and to look about for means of giving their products a satisfactory luster. Where they have succeeded in this effort, they have been able in many cases, during the prevailing depression, to hold their customers and add new ones, and to preserve a better proportion of their sales than have their less fortunate neighbors.

This element of sales resistance is centered ultimately very largely in women, who want everything in the household bright and shiny. This attitude applied not only to kitchen utensils, but to door-knobs and other house hardware and a multitude of other things which formerly were left dull. The finely polished nickel-plated electric iron, as compared with the rough black flat iron of a generation ago, is a familiar example.

Grinding with a solid wheel of emery or other abrasive has been used for a long time as a shaping or finishing operation. While this leaves a finish

with tripoli-rouge, lime or other abrasive powder, and producing the most highly finished product possible, does not have the abrasive firmly attached to the wheel. In buffing the abrasive is applied during the process by means of a "cake," using wax or grease as a body or bond, and held to the wheel, whence it is transferred to the part being treated. It is thus rubbed in by the application of the buffing wheel.

There has long been much confusion in connection with these treatments; many people call them indiscriminately by either name. Hence, it is perhaps not strange, in view of the recent development of the processes, and the utter lack of general information about them, that encyclopedias, even those devoted primarily to mechanical subjects, do not clear up the matter. The paucity of written information in this field is extreme. There is no book dealing adequately with it, nor are there many magazine or other technical articles which cover it, except in fragmentary form.

An idea of the importance of polishing operations to the metal working industry may be obtained when it is realized that about 85 per cent of the cost of making pocket knives is represented in the finishing operations. This leaves only 15 per cent for the material, the forging, grinding and other

*Prepared from an interview with Bradford H. Divine, Assistant Divine Brothers Co., Eliza, N. Y.

ONE man calls it "buffing"; another says it is "polishing"; still a third refers to "flexible grinding." Confusion of terms implies lack of standards. Lack of standards connotes—in many plants—lack of interest. And lack of interest is the forerunner to loss of profits. When five-sixths of the entire production cost of a pocket knife is incurred in the finishing operation, up-to-date management realizes that that finishing operation deserves the most expert attention and painstaking skill which money can buy. It demands equipment properly fitted, in all its details, to the particular operation to be done on that particular job.

processes. Due doubtless to a lack of realization of its importance, the polishing operation of the usual metal working plant has been neglected to such an extent that this has been characterized as the one department of modern plants which is not run in accordance with modern engineering methods.

The beginning of the importance of polishing was simultaneous with the advent of the nickel-plated bicycle, which was followed almost immediately by nickel-plated faucets and other plumbing fixtures. From this starting point, the process has passed to a myriad of uses, until to-day a very large proportion of metal parts for final use have to be polished. It may seem a far cry from the small blade of a pocket knife to a locomotive bell,

Special Compress Polishing Wheel for Finishing Simultaneously Two Parallel Surfaces on a Lathe Guide. The two other inclined parallel surfaces may likewise be finished simultaneously with this same wheel, merely by changing the setup. Note that the wheel consists of annular rings, held in place by special clamps and bolts.

but both are now treated largely in the same manner, under modern methods.

Solid grinding does not produce a truly finished surface except in some forms of high precision work. Even then, the rigidity of the abrasive wheel is likely to produce scratches on the surface. Carborundum crystals are prone to dig in. These troubles are avoided when flexible grinding is used,

because of the smooth running of the wheel and because the mere property of flexibility in the wheel prevents the resistance to its passage across the part being finished from becoming sufficient to cause scratches.

Engineers, who have given this subject of polishing practically a lifetime study, hold positively that the entire proposition of abrasive metal-finishing processes, from whatever angle considered, gets back eventually to the character and quality of the glue used in tying the abrasive to the wheel, and to the method and care by which the glue is applied to the wheel.

It is perfectly obvious that the glue must hold the abrasive particles tightly in position, for it is

Special Angles for Use in Construction of Rheostats Are Polished on Two Wheels, One Following the Other. Both are special 14-in. diameter compress leather wheels. The roughing wheel, of medium density, has three grooves; the finishing wheel, medium hard, has but two. This is on the theory that the abrasive on the rougher operation will wear away more quickly; hence the wheels were designed for an equal amount of service before redressing.

quite impossible to do a satisfactory polishing or flexible grinding job if particles of glue and emery fly from the rapidly revolving wheel onto the floor. And the resultant of the wheel and its peripheral velocity must give a hardness sufficient to cut the metal, or the cost will be increased, a satisfactory production volume not reached and the desired finish or luster not obtained. At the same time, the glue has to be flexible enough to bend slightly,

Two Wheels with Plain Contour Polish Simultaneously the Edges of the Handle Stem of the Scissor Blade, the Blade Being Held in a Suitable Jig. The third wheel, shown in a different plane, is used to polish the edge of the handle, as indicated by the dotted line A.

otherwise the wheel ceases to be flexible and the process approaches that of solid grinding. These two functions of the glue, seemingly almost diametrically opposed, can readily be obtained in a glue manufactured especially for this purpose in accordance with standard formulas. They are almost certain, however, not to be obtained from the general-purpose glues on the market.

Grinding, polishing and buffing are all alike in the fact that they are all performed with wheels. Beyond that point, they differ materially and each in itself has differences due to the character of

the work to be done. For instance, coarse grinding is used for removing scale and humps from the surface of the metal. Medium grinding carries the process one step further and reduces the surface to a certain degree of smoothness. Fine grinding is used for precision work and for leaving a perfectly smooth surface for the following operations. There is no definite dividing line between these three designations of coarse, medium and fine, for there are many grades of fineness of abrasive wheels from the coarsest to the finest.

Similarly, polishing may be classified about in the same way as grinding, into coarse, medium and fine, the coarse and medium being similar in the results desired to the coarse and medium grinding. Fine polishing, sometimes called "glazing," grease polishing, etc., is used to prepare on non-ferrous metals a surface which will later be buffed or plated.

Shaped Compress Canvas Wheel, 12 In. in Diameter and of Medium Hard Density, Used in Finishing Gear Box Handles. The handle rotates at a speed different from that of the polishing wheel

The final and finish polishing, when applied to bare steel, is often called buffing.

Buffing may also be divided into three groups, coarse buffing consisting in cutting down non-ferrous metals, this operation being done often direct on the casting as it comes out of the sand. Fine or medium buffing follows the rougher process and produces a smoother finish, which may later be carried further. The final or finest buffing process, known as coloring, is used to produce high light

To Get Up Into the Goose-Neck Section of a Hoe Blade, an Acute Angle Is Needed on the Edge of the Wheel. This is a special compress composition wheel

refracting surfaces on either bare metal or plated ware.

Polishing is governed first by the character of the metal being treated. A second governing point, and furnishing a sub-division within each class of metal, is the type of article to be polished. The third governing factor is the contour of that article, which governs not only the density of the wheel but the shape of its face. The fourth and final governing characteristic is the finish which it is desired to obtain upon the metal part.

The character of the abrasive to be used depends upon the amount of metal to be removed, resolved into the number of processes necessary, as well as the character of the finish to be laid on the metal. The size of the abrasive depends on the character

WHEN the sales manager finds a competitor cutting into his customers with goods of a superior finish, then is the importance of proper polishing driven home with compelling force. This is purely an executive problem. The engineering and production elements have all been reduced to standards—but not in every shop. Where finishing technique and methods are still left to Tom, in one shop, to Dick and Harry in the others—there is the place for the expert in polishing to advise with the management and show how dollars may be saved, and others earned, through modern methods untrammelled by precedent and inertia.

or fibrous nature of the material being polished, and on the fineness of the surface desired. Whether natural or artificial abrasive is used depends upon the amount of cut required and whether or not the process is designed for a reduction of the metal. Artificial abrasives are used almost wholly in the cutting process, while the softer natural abrasives, with a certain admixture of dirt which it is difficult to remove from them, but which seems to help

Rough and Dry Finishing on Five Surfaces Simultaneously by Means of Special Sectional Compress Polishing Wheel Designed for This Particular Job

lubricate the process, are used for producing a finish on the surface.

Wheel speed is controlled by the same conditions, and is a matter of greater importance than is generally understood. The limit of operating speeds is controlled by the melting or softening point of the glue used, which action in turn is produced through excessive friction between the wheel and the metal, and through the crushing or glazing of

the abrasive particles. But there is no occasion, in general, to approach this limit. Far lower speeds are called for in many instances than are commonly used and, in these cases, the high speed of usual operation will not produce the finish desired.

Upon the surface to be covered depends the diameter of the wheel. Its speed depends upon the

Because of the Nature of Soft Copper, Which Would Tend to Clog a Polishing Wheel Rotating in the Same Plane as the Engraving Roll, This Concave-Faced Compress Canvas Wheel, with 2-in. Cushion and Extra Soft Density, Has Been Mounted at a Right Angle to the Work. The wheel is 16 in. in diameter, with 4-in. face; the copper roll 16 in. in diameter and 31 in. long

desired results for the several processes necessary to the completed article. The density of the wheel is governed by the shape of the article. The shape of the wheel, that is, whether the face is flat or formed, depends upon the contour of the surface to be polished. Our illustrations show a number of wheels designed for certain specific contours and fitted to those only.

A typical example of the sort of problem to be met in connection with polishing of metals may be drawn from the experience of a prominent optical company, which required a highly polished surface, absolutely true in a plane, for the comparison of lenses. Attempts were made to get this surface

Two Polishing Operations Performed Simultaneously on a Knife Blade by Special Medium Density Compress Leather Wheels 14 In. in Diameter. One wheel has shaped contour; the other, while plain in contour, is undercut to clear the heel of the knife blade

by the usual planing, followed by polishing with a very fine wheel, while the piece was held by clamps upon a planer. Invariably, however, it was found upon removing the piece from the planer that a certain amount of distortion had been set up, by the combined action of the restraining clamps and the heat of the process produced by the passage of the polishing wheel over the surface. Consequently, the familiar rainbows appeared when the plate was used.

In search of better methods of handling the operation, the engineers avoided the use of clamps by holding the piece in place on the planer bed by means of hot pitch, and polishing after the pitch had set. Still the rainbows appeared when a lens

was tested. This was due to the fact that the heating of the metal by the action of the wheel produced a local, though minute, heating of the pitch, and so caused the almost microscopic distortion of the metal.

A solution to this problem would be to bring both sides of the metal plate to as nearly as possible a uniform and plane surface, the two being parallel to each other, and then polishing one surface with a polishing wheel while the plate was held by the other surface magnetically on the planer bed. The polishing under this condition can be done with great nicety, care being taken so that the amount of heat previously experienced is considerably diminished. This illustration gives a clear indication as to the character of accuracy required in some polishing operations and as to how this accuracy may be obtained.

In another instance, a firm manufacturing tin foil equivalent to about 1/3000 in. thick only. The final rolling process was done by a roll 7 in. in diameter and 17 in. long, made of hardened steel and highly polished. It was found, however, that

Method of Polishing Hardened Steel Rolls Used in the Manufacture of Tin Foil

after a few days' work the roll began to give streaks, or tiny scratches, in the surface of the tin foil, which was a condition unacceptable to purchasers. Consequently these rolls had to be changed frequently and redressed before again being used. This redressing was done by a skilled operator, who smoothed the rolls by means of abrasive on a leather surface mounted on a block of wood, and applied by hand to the roll. The operation took him three weeks and, while it resulted in a smooth surface, produced an exorbitant upkeep cost.

This problem is being met by a flexible grinding equipment, shown in one illustration, where a polishing wheel 12 in. in diameter, and with a face of 1 1/2 in., runs back and forth on a lathe carriage while rotating at high speed against the surface of the rotating hardened steel roll. The use of a proper abrasive on this wheel produces the surface desired, while the continuous rotation of the steel roll, on a fixed axis, insures its perfectly cylindrical form after the conclusion of the operation. It is estimated that by this means a roll may be redressed within 30 minutes, instead of requiring three weeks.

Frequently it is necessary, in connection with polishing operations, to go back into the previous history of the manufacture of the article to be polished, and make some change in the manufacturing process so that conditions prejudicial to polishing may be avoided. This study of preliminary processes frequently results in a change in the shape of the piece, so that the polishing may more easily be done. Sometimes this results in the use of a larger amount of metal in the piece, which, of course, is rarely favored by the manufacturer. When it is made clear, however, that the use of an

additional dollar's worth of metal may save ten dollars in the finishing process, the desirability of the change becomes apparent.

These pages contain a number of sketches show-

To Get into the Angle of a Bicycle Handle Bar Post a Wheel with Beveled Contour Is Necessary. This one is 14 in. in diameter, with 3-in. cushion of compress canvas and soft density

ing typical polishing processes applied to a great variety of products, all the way from surgical scissors and pocket knives to lathe beds and other heavy pieces. Each one is a problem in itself and each one has to be separately studied. As an illustration of this, mention may be made of skate blanks turned out by a Massachusetts concern. They were cut out by dies from thin plates or sheets of steel. It happened that the manufacturer blanked the blade for the heel risers with one side of the sheet uppermost, while the toe riser was cut with the other side uppermost. The result was a piece so warped that it could not be held on a magnetic chuck, either for removing the burr, by grinding, or for polishing. The remedy was obvious.

The foregoing illustrations may serve to bring clearly to the attention of the executive end of a manufacturing concern the fact that the possibilities of accomplishments, both mechanical and financial, in polishing departments, are fully as large as

Polishing Pipes or Tubes Which Are Fed Across the Face of the Polishing Wheel by the Feed Roll Held Askew

any other department in the factory. The actual polishing processes themselves have been reduced to such absolute standard formulas that they are simple of introduction and execution. The basis of these processes, however, is a general knowledge of all other processes preceding polishing, in order to bring the work through to the polishing or finishing department in such condition that it can be properly operated upon and proper results secured.

It will appeal to the reader, no doubt, that a man who may have spent a lifetime in a plant as a polisher has not had the proper education, experience or training to permit him to do other than simply sit at his polishing wheel and polish a piece of metal.

Planning the work requires the best kind of technical training and manufacturing experience. A man, to be a competent executive in charge of a finishing department, should have a thorough knowledge not only of metallurgy, including the effect of various processes, such as heat treating, upon metals, but also of forging, casting, drawing, stamping, spinning, etc. He should have a comprehensive knowledge of the design of metal parts, having in mind the ability of the operator to reach every portion of the article with a polishing or flexible grinding wheel of the size, shape and character necessary to produce the desired finish.

Much could be said on the question of cost of operating finishing departments. It is true that, especially in buffing, the whole plan is so fundamentally loose to-day that enormous wastages, all of which are part of the cost, are present and foolishly so, simply because the proposition in the plant has not been standardized. It is, indeed, difficult to find two concerns, even in the same line of manufacturing, using the same process; and often they are operating at widely different costs. In connection with this, much of the work previously executed, undoubtedly by hand, is now being handled on automatic and semi-automatic machines, with the obvious advantage of decreased cost and increased speed of production.

Shaped wheels are coming rapidly into use, following along the principles of milling machine practice—for what is polishing, except another phase of metal production expressed so clearly in milling operations? Likewise, polishing is taking the place of lathe and planer operations, and, more generally speaking, flexible polishing and grinding are being substituted for other tooling operations at great reduction of cost, and are at the same time producing satisfactory finishes.

Progress in Molding Sand Investigation

The American Foundrymen's Association committee on molding sand research has been formulating instructions to be sent various State surveys as to methods to be followed in their investigations. The sub-committee on standard tests will report in due time on standard methods which will make possible a comparison of sands of one State with those of another. The committee desires information concerning investigations which have been carried on in foundries and laboratories in the testing of molding sand and the reclamation of old sand. The American Steel Foundries, Sivyer Steel Casting Co., Buckeye Steel Casting Co. and Ohio Brass Co. have already offered to contribute the results of tests made in their foundries. Three representatives of the American Society for Testing Materials have been appointed to represent that organization on the A. F. A. committee. They are G. K. Burgess, Bureau of Standards; G. H. Clamer, Ajax Metal Co., and Dr. Richard Moldenke, Watchung, N. J. The secretary of the committee, R. E. Kennedy, 909 W. California Street, Urbana, Ill., would like to be notified of any investigations that are being carried on by foundry companies or individuals.

The Pendergast Fence Co., Ltd., Sarnia, Ont., has begun operations in the manufacture of wire fencing. The plant is equipped with new modern machinery. The president is Maurice De Pendergast; vice-president, Archibald Weir; secretary, Judith M. Pendergast, and treasurer, Harvey Unsworth. Maurice De Pendergast started the manufacture of wire fencing in Sarnia in 1903 and the business gradually developed, but has been out of business for a few years preceding the organizing of the new company. He is also president and principal owner of the Pendergast Fence Co., Inc., with head office and a plant at Stillwater, Minn.

ELECTRIC STEAM GENERATOR

An Apparatus to Take the Place of Fuel-Fired Boilers

AN electric steam generator, utilizing the principle of heating produced by resistance to flow of electric current through water, has been placed on the market by the Electric Furnace Construction Co., Philadelphia. It is called the Electro steam generator.

Steam is generated at any specified pressure by means of high tension alternating current led directly

An Electric Steam Generator of 20,000 Kw., 6600 Volts, 3-Phase, Installed by Shawinigan Water & Power Co.

through electrodes of special design into the water to be evaporated. A vertical tank is used, constructed according to approved boiler practice. The whole apparatus occupies, it is emphasized, only a fraction of the space required for fuel-fired boilers and the cost of installation is much less.

The amount of steam generated, the pressure and amount of electric power used are governed by the height of water in the vertical tank. This is controlled and regulated by standard valves, thus to render the whole operation practically automatic.

Any water that is suitable for the ordinary boiler is satisfactory and it is not regarded as necessary to install water softening apparatus. Either condensate or raw water can be used or a mixture of the two. No part of the electric steam generator is exposed to a higher temperature than that of the steam and the only part subject to wear is the electrodes.

The most important application of this steam generator will be found in industries located within the range of hydroelectric power plants, where use may be made of surplus energy or water running to waste. Due to the inability of ordinary power consumers to operate 24 hr. per day, the load factor at most power plants runs from 60 to 80 per cent. Complete use may be made of this off-peak load, which is not now used, by the installation of such steam generators, and the load

factor of the power station can be considerably improved. The generators are found to operate with 98 per cent thermal efficiency and unity power factor. The generator can be paralleled in with existing coal or oil-fired boilers and operated on the off-peak loads, when cheap power can be had.

One large installation operates only on Saturday night and Sunday, and the resultant saving in coal, it is stated, paid for the whole cost in one season.

The chief advantages claimed are that the initial and operating costs are much lower than on fuel-fired boilers, the space occupied is much less, minimum expenses involved for buildings, and smokestacks, storage for oil or coal, fuel or ash-handling equipment, mechanical stoking devices and water softeners are not needed. Renewals, repairs, cleaning and shutdowns are reduced to a minimum as the highest temperature is that of the steam.

A number of large generators have been in successful operation for some months and already over 100,000 kw. of generators, representing 10,000 boiler horsepower, according to Frank Hodson, president Electric Furnace Construction Co., are running or being installed of the type described.

Wherever fuel is expensive and power can be had at cheap rates, the electric steam generator is regarded as the economical unit. This condition applies particularly to industries like paper, pulp and chemical, lumber, textiles, etc. Many companies purchasing power contract for blocks of electric power at a fixed rate per horsepower year. Yet few of these use this continuously, it is pointed out, and during idle periods the energy which they pay for can be converted into steam for heating or industrial purposes.

Air Reduction Sales Co. and Davis-Bournonville Co. Merge

The Air Reduction Sales Co., Canadian Pacific Building, New York, and the Davis-Bournonville Co., Jersey City, N. J., have consolidated. Plans which have been under way for several weeks were ratified at a meeting of the stockholders on March 17. New officers of the consolidated company have not yet been elected, nor have complete arrangements been made regarding the physical merging of the plants of the combined companies.

The Air Reduction Sales Co. was incorporated in 1915, acquiring its processes for the production of gases from liquid air largely from the L'Air Liquide Societe of France, and it owns exclusively the rights to these processes for the United States and Mexico. In addition to plants scattered at various industrial centers throughout the country for the manufacture of oxygen and acetylene, the company also markets the entire output of a plant in Baltimore, Md., operated and owned jointly with the U. S. Industrial Chemical Co., for the manufacture of calorene by a process developed by the two companies. It has a plant at Jersey City for the manufacture of cutting and welding torches, and a plant in Chicago for the manufacture of acetylene tanks. It has warehouses in 35 cities of the United States.

The Davis-Bournonville Co., which has a plant at Jersey City, is a pioneer in the development of oxy-acetylene apparatus and equipment, its products including the "Oxygraph," the "Radiograph," tube welding equipment and other special devices which will be combined with the "Aircro" line of the Air Reduction Sales Co.

At the annual meeting of the Engineering Advertisers' Association, held at the Great Northern Hotel, Chicago, March 14, the following officers were elected for the coming year: President, Julius Holl, assistant to president and advertising manager Link-Belt Co., Chicago; vice-president, J. B. Patterson, district manager P. H. & F. M. Roots Co. at Chicago; secretary, H. N. Baum, advertising manager Celite Products Co., Chicago.

Fluorspar in Open-Hearth Practice

Effective Agent in Removing Sulphur from the Steel— Action on the Slag and Furnace Lining—Some Old Ideas Altered

FLUORSPAR has been used in the basic open-hearth process for many years, but very little is known as to the reasons for the effects it brings about. It has been found useful in helping to lower the sulphur in open-hearth heats, and in this connection a paper by S. Schleicher in *Stahl und Eisen*, March 17, 1921, is of great interest, as it deals entirely with this question of desulphurization and the use of fluorspar.

In Table 1 are shown the results with nine heats made from material very low in manganese and high in sulphur, and in the working of which no fluorspar was used. The last column shows the sulphur distribution coefficient and is obtained by dividing the sulphur content in the slag by that in the steel. In other words, it shows the ratio of the sulphur in the slag to that in the steel.

Table 1—Sulphur Contents of Heats Made without Fluorspar

Analysis of Metal					
Carbon, Per Cent	Manganese, Per Cent	Phosphorus, Per Cent	Sulphur, Per Cent	Sulphur in Slag, Per Cent	Distribution Coefficient
0.12	0.56	0.04	0.06	0.14	2.33
0.12	0.47	0.03	0.08	0.27	3.37
0.12	0.56	0.07	0.08	0.19	2.37
0.11	0.53	0.05	0.09	0.34	3.77
0.08	0.58	0.04	0.09	0.35	3.90
0.11	0.53	0.06	0.08	0.20	2.50
0.10	0.44	0.04	0.08	0.36	3.25
0.16	0.50	0.03	0.09	0.32	3.50
0.09	0.44	0.04	0.09	0.30	3.33

The distribution coefficient of these nine heats averages 3.15. Table 2 shows what a different result is produced when fluorspar is used and gives the analysis of nine 30-ton heats, as before, using the same lime charge but with addition of 400 kg. (882 lb.) of fluorspar.

Table 2—Sulphur Contents of Heats Made with Fluorspar

Analysis of Metal					
Carbon, Per Cent	Manganese, Per Cent	Phosphorus, Per Cent	Sulphur, Per Cent	Sulphur in Slag, Per Cent	Distribution Coefficient
0.10	0.38	0.02	0.05	0.32	6.4
0.13	0.47	0.03	0.05	0.32	6.4
0.08	0.32	0.02	0.04	0.30	7.5
0.17	0.50	0.05	0.06	0.38	6.3
0.15	0.47	0.02	0.04	0.26	6.5
0.13	0.44	0.06	0.05	0.30	6.0
0.12	0.53	0.04	0.03	0.20	6.6
0.12	0.41	0.02	0.05	0.33	6.6
0.12	0.47	0.03	0.06	0.36	6.0

The coefficient of these nine heats is considerably increased and averages 6.5. The steel of the first nine heats averages 0.08 per cent sulphur, which is above the allowable limit of 0.06 per cent, while with the last nine heats it is about 0.05 per cent. The addition of fluorspar brings about a noticeable increase in the distribution coefficient and a decrease in the sulphur in the steel.

The next matter to be investigated is the action of the fluorspar in the slag. After its addition the slag becomes very fluid. If the outgoing gases are conducted through water the well known jelly-like precipitate of silica is formed which is always produced when silicon fluoride is passed through water. The fluorspar has therefore reacted with the silica of the slag, silicon fluoride being given off as a fume, and lime formed according to the equation:

As silicon fluoride is formed, the calcium fluoride or fluorspar contents of the slag must decrease. This is shown by the following results, the first sample being taken immediately after solution of the fluorspar; that is, 10 min. after addition, and the other samples

at 10-min. intervals. The exact results of sulphur determinations in the steel, and calcium fluoride in the slag, were as follows:

Sulphur, per cent	0.110	0.076	0.074	0.070	0.063	0.056	0.053
Calcium fluoride, per cent	6.03	4.10	3.40	2.27	2.09	2.21	2.00

This shows that the decrease in calcium fluoride only goes on to about 2 per cent, the samples taken during the last 30 min. agreeing within allowable errors of analysis.

Seven finishing slags from seven heats in which fluorspar was used were then examined. The results were:

Calcium Fluoride, Per Cent	Fluorine, Per Cent
2.58	1.26
2.40	1.17
2.44	1.19
2.30	1.12
2.16	1.05
2.48	1.20
2.06	1.00

Here, also, with sufficiently long working, the calcium fluoride contents of the slag are reduced to 2.0 to 2.5 per cent, and then remain practically constant. Whether the fluorine is all present as calcium fluoride, or in some other form, was not determined, but the assumption was made that it was calcium fluoride.

Up to now it has also been assumed that desulphurization, when fluorspar is used, was brought about by the slag being made more basic and yet remaining fluid enough to permit a good reaction. The following results will show that desulphurization cannot be laid to this cause. The finishing slags of two similar heats, one made without fluorspar additions and the other with fluorspar, are given in Table 3.

Table 3—Open-Hearth Slags with and without Fluorspar

Without Spar				With Spar			
Slag, Per Cent	Steel, Per Cent	Slag, Per Cent	Steel, Per Cent	Slag, Per Cent	Steel, Per Cent	Slag, Per Cent	Steel, Per Cent
SiO ₂ 15.20	C 0.16	SiO ₂ 19.63	C 0.12	SiO ₂ 19.63	C 0.12	SiO ₂ 19.63	C 0.12
Fe ₂ O ₃ 3.57	Mn 0.50	Fe ₂ O ₃ 2.86	Mn 0.41	Fe ₂ O ₃ 2.86	Mn 0.41	Fe ₂ O ₃ 2.86	Mn 0.41
FeO 8.14	P 0.03	FeO 11.57	P 0.03	FeO 11.57	P 0.03	FeO 11.57	P 0.03
Al ₂ O ₃ 2.14	S 0.09	Al ₂ O ₃ 3.36	S 0.06	Al ₂ O ₃ 3.36	S 0.06	Al ₂ O ₃ 3.36	S 0.06
MnO 5.41		MnO 5.63		MnO 5.63		MnO 5.63	
P ₂ O ₅ 4.76		P ₂ O ₅ 2.62		P ₂ O ₅ 2.62		P ₂ O ₅ 2.62	
CaO 46.50		CaO 45.98		CaO 45.98		CaO 45.98	
MgO 12.97		MgO 4.55		MgO 4.55		MgO 4.55	
S 0.32	S. Coeff. 3.50	S 0.44	S. Coeff. 7.3	S 0.44	S. Coeff. 7.3	S 0.44	S. Coeff. 7.3
CaF ₂ ...		CaF ₂ 2.26		CaF ₂ 2.26		CaF ₂ 2.26	

The basicity of the two slags expressed as the ratio of the oxygen of the bases to that of the acids is 1.67 in the first case, 1.30 in the second, and yet the distribution coefficient in the first case is 3.50 and in the second 7.3.

In order to obtain conclusive information, the following experiment was carried out: A 60-ton heat was taken, and while working down 2000 kg. (4409 lb.) of spiegeleisen was added. In a half hour the manganese was worked out and the bath was in such condition that about a half hour's work with the finishing slag was needed. An addition of 900 kg. (1984 lb.) of fluorspar was made, the spar containing 95 per cent calcium fluoride. Samples of metal and slag were taken, as shown in Table 4. Especially striking is the fact that the silica does not decrease but increases, notwithstanding the calcium fluoride reacts with the silica as shown by the thick white smoke from the chimney after each addition.

To investigate the matter further, samples were taken from another heat giving results as follows:

Test	Time	Silica, Per Cent
1	10:28	17.23
2	10:30	17.35
3	10:33	17.35
4	10:37	16.18
5	10:43	17.08
	11:13	17.70

This heat also shows that the silica drops during the first seven minutes but then again increases. The slag takes up silica which must come from the furnace lin-

ing, and it must be mentioned that there is marked destruction of that part of the hearth and walls coming in contact with the slag. Through the fluorspar addition the slag has not become more basic. The sulphur in the bath (Table 4) is lowered from 0.081 per cent to 0.064 per cent and then 0.060 per cent. In the slag, however, the sulphur is not increased but decreases, and to a greater extent than is accounted for by the dilution of the slag with the spar addition. The same results were shown by another heat as given below:

Time	Sulphur in Steel, Per Cent	Sulphur in Slag, Per Cent
10:55	0.081	0.333
11:06	800 kg. (1764 lb.)	Spar addition
11:20	0.060	0.165
11:46	n. d.	0.182
12:12	0.042	0.220
12:13	Tapped	

A careful balance of the sulphur in the heat given in Table 4 shows that 18.39 kg. (4054 lb.) were volatilized. A test was carried out several times of taking outgoing gas from the furnace between the port and the air regenerator, through a water-cooled pipe, and bubbling through potash solution. The average

was 0.064 per cent in the steel and only 0.09 per cent in the slag. Careful calculation showed that 10.8 kg. (23.8 lb.) sulphur had volatilized. The finished metal showed 0.06 per cent sulphur, so the slag had absorbed sulphur again from the metal.

With soft heats, also, it has been found that there might be re-sulphurization but only when spar was added suddenly, in large amounts, to the finishing slag. In these cases there was always such a drop in the sulphur contents of the slag that the total of sulphur in metal and slag was decreased and sulphur was volatilized. In one case, of a 44-ton heat, after the addition of 700 kg. (1543 lb.) of spar there was an increase in the bath from 0.076 to 0.097 per cent, while the sulphur in the slag dropped from 0.385 to 0.016 per cent. Calculation also showed that 18.6 (41 lb.) of sulphur was volatilized. It is evident that such a slag is in good condition to take up sulphur from the bath.

For desulphurization, therefore, it is necessary that, after the fluorspar addition, the heat remain sufficiently long in the furnace. The fear that too early addition of fluorspar is harmful is therefore not true.

Table 4—Test with Fluorspar Addition*

*Data in percentages.

showed 0.22 gr. sulphur per cubic meter, and theoretically there should be 0.213 from the producer gas. Similar tests were made after the addition of fluorspar, but this method did not show an increase in the sulphur contents of the gas. This shows the sulphur is not in the form of SO₂, but there is the possibility of a fluoride being present, such as, for example, SF₆. There is a possibility that such a compound would be precipitated by the low temperature of the water-cooled tube, so the gas was sucked hot through a porcelain tube, and it was found that more sulphur was absorbed. The gas contained 1.966 gr. per cubic meter, and as 0.22 gr. came from the producer gas, the remainder or 1.766 gr. was volatilized from the slag. The amount taken for the test was 10 liters and the time was the seven minutes immediately following the fluorspar addition.

The test showed, therefore, that the influence of fluorspar addition to an open-hearth slag regarding the lowering of the sulphur is that in some form or other the sulphur is volatilized, and the slag is therefore in condition to take up more sulphur from the bath. The last mentioned tests show this clearly, the sulphur contents in the final slag being approximately the same as before the fluorspar addition, although previous to this it decreased. The sulphur in the bath dropped from 0.081 to 0.042 per cent. Where the slag is to be used for fertilizer, and it is necessary the phosphate be soluble in citric acid, fluorspar should not be used.

Next comes an abstract of the paper by J. Fohs in THE IRON AGE, May 27, 1909, p. 1692, with the conclusions of which Mr. Schleicher is not in agreement, as they are contradicted by the results of the tests previously described.

Under certain conditions, notwithstanding fluorspar additions, it is possible to get re-sulphurization of the bath, when there is a very rapid removal of carbon. An example of a 40-ton heat may be mentioned. The heat was very high in carbon and with a very thick slag. Ten minutes after the addition of about 10 per cent fluorspar to the slag, the metal after a good deal of foaming was soft. The sulphur before the spar addition was 0.048 per cent in the steel and 0.34 per cent in the slag. Ten minutes after the addition it

Experience proves that spar can be added with the lime, and it can at least be added while the lime is in lumps in the slag without danger that there will not be plenty of time to take care of possible re-sulphurization. Experience also shows that heats handled with spar are always very low in phosphorus.

The writer draws the following conclusions: If fluorspar is added to an open-hearth slag, it is only decomposed and reduced to a certain limit, namely, from 2.0 to 2.5 per cent calcium fluoride content. Silica is first removed from the slag as silicon fluoride, but this silica is replaced by silica from the furnace lining. Fluorspar is desulphurizing in its action in that sulphur is volatilized from the slag in some form and the slag therefore can take up more sulphur from the bath.

There was an interesting discussion of this paper which was read before the steel works committee of the German Iron and Steel Institute. One speaker mentioned the great danger of using fluorspar because of the deterioration of the furnace walls and port ends. The first result of the spar additions is to give greater fluidity to the slag, greatly increasing its capability for reaction. The whole melting practice is thereby favorably influenced and it may be assumed that the increased removal of sulphur is due to this cause. Mr. Schleicher disputed rapid deterioration of the furnace ends or walls when fluorspar was used, but admitted that the hearth suffered and the dolomite consumption was increased.

Another speaker mentioned that fluorspar burst into fine particles when added to the furnace because of its water of crystallization, and had a very harmful effect on the roof, walls and ends, and on this account was only to be used in the most urgent cases. In reply to another speaker, Mr. Schleicher said numerous cases had proved that, after spar additions, the sulphur in the slag first dropped considerably, and that the sum of the sulphur in slag and metal showed a loss in total sulphur, and also a re-sulphurization of the metal in the bath. In regard to the destructive effects of fluorspar, it had not been found that the port ends and roof suffered, but the ladle linings were very rapidly eaten away. It should not be used unless needed, but there were cases where it provided a means for reducing the sulphur in high sulphur heats.—G. A. W.

Rack-Cutting Attachment for Heavy Miller

A new rack-cutting attachment designed especially for the heavy-duty miller has been brought out by the Rockford Milling Machine Co., Rockford, Ill. Rigidity is a feature emphasized by the makers.

As shown in the illustration, the attachment is clamped securely to the face of the column, further support being given by the overhanging arm support immediately above the attachment spindle, at which point the greatest strain is received. This strain is said to be entirely overcome by the method of clamping to the overhanging arm. The drive is by a shank held in the main spindle by the tang and drawback. A wide face hardened spur gear on the shank drives a spur gear keyed to the double-lead worm, the latter being

The Attachment Is Clamped to the Face of the Column, as Shown. Further support is given by the overhanging arm

of alloy steel, supported at both ends and provided with two ball end-thrust bearings. The worm drives a heavy bronze worm wheel of coarse pitch which has keyed to it, one on either side, two spur gears of wide face and with staggered teeth. These spur gears drive two gears that are cut solid on the attachment spindle, one very close to the front, the other to the rear bearing. The wide face gears with staggered teeth are intended to assure smooth drive.

The attachment spindle is of special alloy steel and runs in bronze taper bearings which are provided with means for taking up wear through the adjustment of a single nut. The solid shaft on which the two spur gears and worm wheel are mounted extend through the attachment to serve as an over-arm support for the cutter arbor. The worm wheel and spur gears on the shaft, as well as the gears on the spindle shaft, run in a bath of oil, an oil cup at the side of the attachment serving as an oil line.

The rack-indexing attachment used in connection with the rack-cutting attachment is fastened to the T-slot in the left-hand end of the table and consists of a bracket which carries an indexing and locking disk with change gears. It provides for cutting racks and making settings without relying on the usual dial for this purpose. The various gear combinations permit racks of different pitches to be indexed by making either a half turn, a complete turn or two complete turns of the locking disk. Eighteen change gears provide for the cutting of the following diametral pitches: 3 to 6, by half pitches; all pitches from 7 to 16; and all even pitches from 18 to 32. Circular pitches from 1 to 1/16 in., varying by sixteenths of an inch. The rack vise used has jaws 30 in. long and opens 5 1/2 in.

The rack cutting attachment will be made also for the No. 1 1/2 machine.

The Keith Car Works, Sagamore, Mass., have resumed operations after a shutdown of three weeks.

National Metal Trades Association to Meet in New York, April 19 and 20

The 24th annual convention of the National Metal Trades Association will be held at the Hotel Astor, New York, on Wednesday and Thursday, April 19 and 20. On the Monday preceding, the executive committee will be in session and the 23 local branch secretaries will hold their semi-annual meeting. On Monday night, the Administrative Council and the local branch presidents and secretaries will meet at dinner. On Tuesday, the administrative council will hold its semi-annual meeting and the local branch secretaries will continue their sessions and at noon the administrative council, local branch presidents and secretaries will meet at luncheon. The annual dinner of the Alumni Association, consisting of the organization's past officers, comes on Tuesday evening.

The convention will open on Wednesday morning with a short business meeting, followed by a program of unusual interest. Able speakers have been secured to discuss business, financial and labor questions. The association, after a careful survey of apprenticeship training, covering a period of more than two years, has prepared a thorough-going plan of apprenticeship training, which will be submitted to the members at the convention.

Angle Fixture with Perforated Plate

A universal angle fixture with the plate perforated as shown in the illustration, for insertion of patent clamps, has been placed on the market by E. L. Krag & Co., 50 West Randolph Street, Chicago. The perforations and clamps are intended to facilitate fastening and adjusting the work, the fixture as a whole being designed to permit easy and economical angle set ups on milling machines, surface grinders and drill presses.

The plate swings a full 180 deg., or 90 deg. on each side from a horizontal position, and revolves a full 360 deg. on the base. Surfaces of the plate are ground true and square with each other. Both dials at the joints are graduated in degrees and the plate hinged

The Perforation of the Plate Is for Insertion of Patent Clamps, as Shown

on a 3/4-in. stud which is threaded at one end and is used to clamp the plate in the desired position. The faces of the large flanges on the plate engaging the faces of the bosses on the yoke lugs afford the necessary friction required to hold the plate fast. The yoke casting revolves on a 1 1/4-in. pilot which fits into the center of the base, the yoke being fastened by two 1/2-in. bolts which ride in a circular T-slot in the base. All working surfaces are finished true and flat to assure perfect clamping. The three clamping nuts are of the same size, requiring but one wrench for all adjustments.

The base is 8 1/2 in. long and 6 1/2 in. wide. The height over all is 6 1/2 in. and dimensions of the plate 3 1/2 in. by 4 1/2 in. The weight is 25 lb.

Electric Runabout Crane Truck

An electric runabout crane truck of the type shown in the illustration has been recently developed in England, the truck being manufactured by Messrs. Ransomes, Sims & Jeffries Ltd., Ipswich, and the crane mechanism by Messrs. Ransomes & Rapier Ltd., also of Ipswich.

In this design the turntable usually employed to

Full View of Runabout Electric Crane Is Shown Above. In the left hand sketch the wheels are adjusted for swinging the load, the other showing position of wheels for traveling

enable the crane to swivel independently of the chassis frame has been dispensed with, the crane being rigidly fixed to the chassis. The vehicle is constructed to turn on its own axis or run forwards or backwards in a path of any curvature.

The crane being a fixture on the chassis, the jib is always in the same position relatively to it and there is no variation of the stability factor as the load is swung, resulting in a lighter weight of crane truck. The pressure on the road remains constant for all positions of the crane and is kept within low limits by its distribution between four wheels.

Each driving wheel is driven by an electric motor supplied by a battery carried on the truck. The steering wheels can be rotated in either direction to positions at right angles to the running positions, as shown in the illustration. Just before reaching this extreme position one of the running motors is automatically reversed so that the truck then rotates about its own axis.

Congress has approved an item of \$158,000 in the deficiency bill to be used in carrying into effect the Lampert Act reorganizing the Patent Office personnel and revising salaries there.

New Form of Lock-Nut

In a lock nut of a type frequently employed, with six serrations, the nut may be locked in position within one-sixth of a turn, or, with two pin-holes at right angles, to within one-twelfth of a turn. *Comptes Rendus* describes a locking arrangement with finer precision of adjustment, devised by A. Rateau, which is suitable for special cases or for large sizes of nuts. It consists of a washer A with a pentagonal center and six projections B. One axis of the pentagon is displaced 3 deg. from one axis of the equi-spaced projections. The pentagonal center is an exact fit upon a pentagon at the extremity of the bolt, and the projections fit into serrations in the nut, with an allowance

Hexagon-Pentagon Form of Lock-Nut

of 3 deg. play. The washer is kept in place by a pin C passing through the hole D in the bolt.

There are five possible positions of 12 deg. interval of the pentagon for each one-sixth rotation of the nut, and, by turning over the nut, another five positions 6 deg. from the previous. Thus, with a play of 6 deg., it would always be possible to place the washer in position. With a play of only 3 deg., the maximum tightening or loosening of the nut is $1\frac{1}{2}$ deg. or $1/240$ turn. If necessary, this precision could be increased by choosing, for the design, larger contiguous numbers than 5 and 6.

Novel Rolling-Mill Belt Drive

In a German wire factory a remarkable drive of approximately 1000 hp. for a continuous wire-rolling train has been running continuously for a period of over 10 years. Half the output of the engine is transmitted by spur-wheel gears to the roughing train with seven consecutive housings, while the remaining half of the output goes to the finishing train, to which it is transmitted by means of eight belt pulleys, four jockey pulleys, and four superimposed leather belts, all driven from the flywheel as shown in the illustration.

In view of the strong deflections and the high speed

Eight Mills Run from One Pulley

of the superimposed belts (98 ft. per sec.), the attempt at first sight appeared risky. The shocks and strains occurring in the working of the train are neutralized by the jockey pulleys being spring-loaded. The belt widths, are, successively, 40 in., 28 in., 26 in. and 24 in. According to *Engineering Progress*, the drive has given entire satisfaction.

The Erie Electrical Equipment Co., Johnstown, Pa., after considering various propositions to move from that city, has decided to remain there. At a special meeting of the directors, S. R. Burd was appointed sales manager, succeeding H. A. Selah, who retains his stock in the company and is still a member of the board of directors. Mr. Burd has been a resident of Johnstown for seven years and has been connected with the engineering department of the H. S. Kerbaugh Co. The officers of the company are: President, J. L. Hershberger; treasurer, J. F. Kress; vice-president, M. D. Bearer; secretary, Charles C. Kress.

Trade Aspects of Non-Ferrous Metals

The Manufacturer's Point of View Brought Out at Institute of Metals—British Specification Problems— Training Men for Management

(Special Correspondence)

LONDON, March 10.—The annual general meeting of the Institute of Metals, which concluded yesterday, was notable for the frank exposition of the manufacturer's viewpoint by the new president, Leonard Sumner. Among the papers submitted for discussion it was generally conceded that the one of outstanding merit and practical utility was Doctor Bengough's summary of the research work on the corrosion of condenser tubes, which he has been conducting, with the aid of various collaborators, for the past ten years, under the auspices of the corrosion committee of the institute. Doctor Moore and Mr. Beckinsale also contributed a valuable paper recounting their further investigations on season cracking, with special reference to condenser tubes.

The other papers were all of a high standard of merit, although in one instance the author appears to have made a rash attempt, for which he was politely but firmly reproved, to evolve a rather startling general theory from the results of a very special and restricted investigation. He is not the only sinner in this respect, however. The shoemaker thinks there is nothing like leather. Doctor Rosenhain thinks there is nothing like amorphous cement, Professor Thompson considers there is nothing like surface tension, while Professor Carpenter believes there is nothing like experimental data. No doubt, in a multitude of counsels metallurgical wisdom ultimately will be found.

Manufacturers More Coöperative

Beginning with a reference to the prestige of the institute, President Sumner said in his address that the *Journal* holds a very high place in the world's metallurgical literature. The membership increased in 1921 from 1298 to 1410. Student members, who numbered but 6 in 1916, are to-day no fewer than 116. Slightly over 13 years ago the institute began with 300 members. Much has been done to break down the old feeling of antagonism and mistrust that prevailed among manufacturers. The speaker said:

During the war every manufacturer desired to do all he could for his country in its hour of need, and one and all both gave and received information. Exchange of visits to works took place, processes and methods of manufacture were shown, and that interchange of ideas, so much desired, freely took place. I am happy to state that this same spirit still prevails to a very large degree to-day. Before the war I think I had been through only one works that was in competition with my own. Since then I, or a representative of my firm, have been shown "really" round the works of all our principal competitors, and we have also had the pleasure of showing our competitors through our works and exchanging notes and ideas with them. We therefore may feel happy that this particular object for which the institute was founded has been largely realized.

Other subjects discussed in the address were specification and the scarcity of men with talent for works management. On these questions the views of the speaker are indicated in the extracts given below:

Unusual Specifications

Some years ago Sir Gerard Muntz complained that manufacturers had to work to some arbitrary specifications, and that we had some weird and strange tasks to perform, whereby the user got something which might be unsuited for the purpose required. He went on to hope that in due course the influence of the Institute of Metals would be such that the issuing of these weird specifications would soon become a thing of the past. I cannot do better than quote the words he then used:

The chief matter is that the general knowledge of the non-ferrous metals is simply appalling by its absence; it leaves

the greater scope for the work of the Institute of Metals; there is much to learn, much already known which can be taught, better taught by such a body as the institute than by any individual, or even by any university or school of metallurgy, because it would come with more weight from an institute embracing so many different classes of thought than from anywhere else.

I venture to think that to-day the manufacturer does get many less of these weird specifications to which he is requested to work. The user has gained knowledge, and if he does now make a specification to which he asks the manufacturer to work, there is usually some reason for that particular specification. Then there are other users who may have little or no knowledge of non-ferrous metallurgy. These users generally make no specification, but leave it to the manufacturer to supply what he thinks most suitable. If the material supplied is unsatisfactory, then the onus falls on the maker. Whatever the attitude taken by the user the position is unsatisfactory for both user and manufacturer. What would be ideal would be that the user should consult with the manufacturer; the user should explain his views to the maker; the maker should give his views; and that both parties should be so well acquainted with the properties of various alloys that between them a suitable alloy should be produced to meet the user's needs.

Generally speaking, however, that branch of industry with which I am connected has usually to work to specifications which have been drawn up by responsible bodies, such as the Admiralty, War Office, or the British Engineering Standards Association. These specifications have been put into force after consultation with the manufacturer. . . . The policy of allowing a certain amount of freedom to the manufacturer has, I maintain, been a good one, and I trust that it will be continued in the future as far as possible. Particularly in these difficult times, it is vitally important for the commercial prosperity of the industry that the manufacturer should have a large variety and range of raw material to draw upon. His choice should be as little circumscribed as possible.

Responsibilities of Metal Merchants

There is another body of men whom I would like to see more actively interested in the work of the institute. I refer to the metal merchants and brokers. The manufacturer is many times offered a material containing, say, 98½ per cent copper. The manufacturer asks what does the other 1½ per cent represent. The merchant cannot tell him, and he neither knows nor cares, so long as he can sell. Or, it may be, he offers a spelter containing 98½ per cent zinc, and if he is asked what are the cadmium contents, the dealer says he does not know, and perhaps asks, "What is cadmium?" There are members of this institute who are metal merchants, and I have no doubt that since joining they have been much impressed by the necessity for the manufacturer to know everything about the metal that he is offered, if he is to produce satisfactorily the product that is demanded by the user. In consequence, these metal merchants do take a great deal more care in obtaining information as to the metal they are offering, and are now much more frequently in a position to give full information than they were some years ago.

Makers have in the past (and are doing so still to-day, although perhaps in a lesser degree) pushed their wares under a fancy name or names. The alloy or metal may be, and often is, quite an ordinary alloy, but it will be dubbed, say, Smith's bronze or Jones's metal. The traveler goes out and preaches the virtues and the merits of, say, Jones's metal, and he prates

loudly of what this metal will do, and he is cautious enough, if he is properly posted, not to say what it will not do. The traveler is more often than not glib of tongue; he knows a little metallurgy, but very little; he gives results of tests of the metal which very likely are not applicable to the use to which the user wants to put the metal. . . .

I am bold enough to assert that the time is coming when no Jones's metal or Smith's bronze will be accepted by the user unless the manufacturer is prepared to lay his cards on the table and say at once what his alloy consists of. The alloy may be called any name one likes, but its constituents should be stated, and the maker should be prepared to stand by or fall with the metal he puts on the market. I have noticed that in recent times the tool steel makers, where they are still advertising their goods under their different trade names, are giving a complete analysis of the different grades of steel which they offer for varying purposes. This is an example which might with advantage be copied by the manufacturers of the non-ferrous metals, and, in the case of the more enlightened firms in the non-ferrous trade, is being put into practice.

Training for Management

Some four years ago, Professor Carpenter, in his presidential address, emphatically laid it down that students who were expecting to occupy technical positions in works must have been afforded opportunities to have works practice in conjunction with their educational training. I am thoroughly in agreement with this view.

Professor Carpenter gave us the three types of students that the training developed. First, there is the type of man whose bent is originality, whose bent is research, who wishes to improve the product or find a new and improved product. To that man the task of seeing that the daily out-turn of tons of material of the same type was up to standard would be most irksome. His *métier* is research, seeking for something new, and in his sphere in a works he is most valuable. A second type of student is the man who is not bent on research work, but who takes a keen interest in works practice, who is interested in existing methods and processes, and brings about improvements and gets the best out of the men. He is keen not only on the quality of the product of his mill, but on the output of the mill—a most valuable type of man for a commercial manufacturing firm to have. In one sense he is much more valuable to a manufacturer than a man of the first type. This man is a producer, and helps to find the ways and means for carrying on the business, while the first type of man may be considered a bit of a luxury. Still, the first type must be employed, because, after a period of some years, he may produce, from his labors, knowledge and skill, something which may revolutionize not only one's ideas but works practice. The third type of man, as illustrated by Professor Carpenter, is the man who is afraid of taking responsibilities of his own, but is an accurate and faithful worker under some one else's guidance and direction. Occasionally this type of man blossoms out and displays some independence and originality, but it is not often.

Equipment for Management Rare

Of these three types of men, one would think that the second type would be the man who would rise to the position of works manager or managing director. The research worker would not have the inclination or the adaptability to attend to the mass of detail and routine work that falls to the lot of a works manager, and the analyst in all probability has not got the ability. And so it is to the second type of man that we look for the man to promote to the managership. And yet, what do we who are in charge of commercial undertakings in the non-ferrous industry find? It is one of the greatest difficulties we have, to find a man suitable for these positions. A fellow competitor was telling me only a short time ago that he could get trained metallurgists, chemists, engineers in plenty, but that he could not find the right man for the managership. Why should this be so? The man in charge of a mill who is keen on his product and his output,

and can get the very best out of the workers under him, should be simply invaluable, but is in my experience failing in appreciation of the fact that organization, detail and discipline are essential to the successful running of a commercial undertaking. For instance, the bringing together of figures for the cost clerk may be distasteful and irksome to him, and he probably resents the cost clerk, perhaps questioning some of the figures that he has sent up to the office. He would seem to fail altogether to appreciate the necessity for accuracy; and accurate costing is of the greatest importance in a factory. He fails perhaps to work with other departmental heads. He may be running his mill on A's order, and word comes to stop production on this order and turn on to B's order. This upsets his arrangement, and he resents it. He does as he is requested, but unwillingly and grudgingly. Why should this man be lacking in these essentials for works management?

Is it a fault of his training? I do not express an opinion, but I would like our professors and teachers to ponder over the fact and ask themselves why it is that the students they have trained so carefully and with so much pains do not rise, generally speaking, to take those higher positions on the non-ferrous manufactures to which it would seem their training would eminently fit them. I am not sure that in the training in this country we do not specialize a little too much, and that the training should not be broader and more varied. Sometimes, too, I am inclined to think that our teachers are prone to be too much interested in the brilliant student to the possible neglect of the student who is not so clever. They seem to overlook the fact that industry requires many sound and able men and but a few brilliant men.

Efficiency of Labor in Germany

Reports from the German statistical office, relating to the daily output per worker in coal mines, show a steady falling off, together with a steady increase in the number of men employed in the mines, and a loss in mine production. The figures are drawn from three districts—Ruhr, Upper Silesia and Sarre. They show the number of workers employed in the average month of 1913, in each month of 1920, and in each of the first 8 months of 1921, together with the daily output per worker under each of those dates. The general results are tabulated below:

	Average Month		
	1913	1920	1921
<i>Ruhr District</i>			
Workers employed	390,600	496,600	542,800
Daily output, kilograms per man	972	582	569
<i>Upper Silesia</i>			
Workers employed	123,300	173,100	176,700
Daily output, kilograms per man	1,177	616	520
<i>Sarre District</i>			
Workers employed	46,700	71,200	74,800
Daily output, kilograms per man	868	479	499

It will be found from the above tabulation that the daily output in 1913 averaged 380,000 (metric) tons for the Ruhr district, this figure decreasing to 289,000 tons in 1920, and going up to 309,000 tons in 1921. In Upper Silesia the average output in 1913 was 145,000 tons per day; in 1920, 107,000 tons per day; and in 1921, only 92,000 tons per day. Part of this latter drop was due to the political troubles last May. Similar figures for the Sarre district show an output in 1913 of 40,500 tons; in 1920 of 34,100 tons; and in 1921 of 37,300 tons per day.

Canadian Iron and Steel Output in January

The year end decline in the Canadian production of pig iron was carried into the new year, states the Dominion Bureau of Statistics, Ottawa, and the output of pig iron dropped still lower in January to a new level of 32,184 gross tons, all made in blast furnaces, as compared with 39,917 tons in the month of December. The production of steel ingots and castings during January declined almost 10,000 tons from the quantity produced in December. The actual output was 33,011 tons of ingots and castings, comprising 31,163 tons of steel ingots and 1848 tons of steel castings.

STORING OF STEEL BARS

System Used by Machine-Tool Builder—Colors Denote Brand—Special Racks to Facilitate Handling

In standardizing the identification and storage of steel bars to conform to the efficient manufacturing system developed for their new plant, Gould & Eberhardt, Newark, N. J., have devised a system and equipment that has unique features. Construction of special racks was necessary because of the lack of standard equipment on the market that would meet the particular situation. The system developed has facilitated the handling of the steel, eliminating loss of time and the chance of error in locating the piece desired.

In the manufacture of shapers and automatic gear-cutting machinery many different kinds and sizes of steel bars, round, square, hexagon and rectangular, are used. In the method devised plain colors and combinations of colors are used to mark the steel, each color or combination serving to identify the metallurgical contents or the particular make. The identification colors are painted on the ends of the bars as they are received in the shipping department. To assist the raw-material clerk in selecting the proper steel, a conspicuous identification board, shown in the accompanying illustration, is hung above each rack. On this board are listed the names of the different kinds of steel used by the company, with a 2-in. disk as shown, painted in the corresponding color opposite each name. The board has a white background which shows the various colors to the best advantage. The various steels with their corresponding colors as listed on the board are:

30/45 Machine	Red
Hy-Speed Tool	Blue
Crescent	Yellow
10/15 Machine	Green
Cold Rolled	White
O.C.N.S.	Halves of green and red
Simplex	Green with white stripe
Tap	Halves of green and white

Racks Permit of Easy Handling

The storage racks are shown in the illustration. Each rack is built up of five duplicate steel frames, spaced 4 ft. apart and braced to form a rigid rack 16 ft. long. The individual section has a base consisting of an 8-in. I-beam, 8 ft. long, with six heavy 2 by 2 in. angles, 7 ft. high equally spaced and forming uprights to divide the section into five tiers. These tiers are in turn subdivided by 1/4-in. rods which extend from top to bottom, making ten tiers available in each rack. The cross pieces or shelves on which the steel bars lie are heavy 2 by 2 in. angles, spaced about 20 in. above each other at the bottom but diminishing in this distance until at the top, where the very small rods are stored, the distance between the shelves is only 6 in.

The top piece of each section is a heavy 2 by 3 in. angle, which makes a rigid top brace to complete the frame of the section, and also permits the storage of extra-large diameter short bars on top of the rack.

The five sections are spaced and held together to form the completed framework of the rack by 2 by 2 in. heavy angle stringers extending the full length of the rack at the top and bottom of each side. Further longitudinal bracing is provided by 1/4 by 2 1/2 in. flat bars crossed between and bolted to the top and bottom of the sections. An extra angle at the top on each side and extending the length of the rack prevents pieces from rolling off. Further precaution is taken by using timbers with half-round notches cut in them along the front on top of the rack, permitting short round pieces to be set in place.

The most convenient way to place the steel in the rack would seem to be to have all of the same kind in one tier, with the largest and heaviest pieces on the bottom shelf and the varying sizes in regular order, according to their dimension, with the smallest at the top. This order, however, has been reversed wherever possible. In some cases the square, hexagon, or rectangular shaped bars, which are generally smaller in size, are placed on the bottom shelves, and the very heavy bars on the top in order that they may be easily handled by the overhead traveling crane.

To facilitate the placing and finding of the various

The Storage Racks Are Shown Above. In some cases the heavier bars are placed at top to facilitate handling by overhead crane. The identification board is shown below

kinds and sizes of steels in their proper location, each rack is given a section number. Each tier in the rack is also lettered and each shelf numbered, making it a

simple matter to give instructions for the proper location of each bar as it is received, besides facilitating the keeping of stock records and taking inventory.

New Etching Medium for Chromium and Tungsten Steels

Special Solution for Detecting the Presence of Carbides—
Valuable as Applied to High-Speed Steels

A NEW etching medium, to be used in developing the microstructure of tungsten and chromium steels, is discussed by Dr. K. Daevies in the issue of *Stahl und Eisen*, Sept. 8, 1921. It was developed for steels containing carbides that were not attacked by the usual sodium picrate etching. The best solution has proved to be:

- 20 grams potassium ferrieyanide
- 10 grams sodium hydrate
- 100 grams water

Such a solution was suggested by the two Japanese workers, K. Honda and T. Murakami, but further work was necessary to test and develop it. The solution given above slowly decomposes in the cold, and fairly quickly when heated, giving ferrocyanides. The microsections are polished and etched in either the cold or boiling solution for 15 to 20 seconds. Results are shown in the following table:

No	Composition—			Etching Results	
	Carbon, Per Cent	Chromium, Per Cent	Tungsten, Per Cent	Cold	Boiling
1	2.18	9.8		Eutectic colored.	Similar to cold solution, but stronger (more darkly colored).
	1.94			Eutectic colored.	Similar to cold solution, but stronger (more darkly colored).
3	1.23	0.54		No effect.	Crystal junctions light brown.
4	0.80	5.0		Excess eutectic colored.	Similar to cold solution, but stronger.
5	0.54	5.25		Traces of eutectic were colored.	Similar to cold solution, but stronger.
6	0.40	8.16		Traces of eutectic were colored.	Similar to cold solution, but stronger.
7	0.21	11.50		Isolated carbide particles at the crystal junctions colored.	Similar to cold solution, but stronger.
8	1.46	1.10		No effect.	Excess cementite blue, pearlite cementite weak yellow.
9	1.00	1.37		No effect.	Excess cementite blue, pearlite cementite weak yellow.
10	1.25		0.8	No effect.	Cementite of the pearlite yellow to blue.
11	1.15		1.2	No effect.	Cementite of the pearlite yellow to blue.
12	0.80	4.10	12.2	Small and large carbide particles were colored.	Similar to cold solution, but stronger.
13	0.70	4.00	19.0	Small and large carbide particles were colored.	Similar to cold solution, but stronger.

A Chromium Steel Containing 9.80 Per Cent Chromium and 2.18 Per Cent Carbon Etched Cold with the New Solution

The appearance of sample No. 1 etched with the cold solution is shown in the illustration. Only the carbide in the eutectic of all steels with free eutectic is colored yellow to blue. Also with alloys that are just

For high-speed tool steels, which considerably exceed the limit, this method of examination is of value in determining whether the eutectic is properly broken up by forging and distributed properly through the metal. It can be used hot for showing the secondary cementite and pearlite of all tungsten steels, and as it only attacks the carbide of the pearlite it perhaps gives clearer, sharper structures than normal acid etching, which shows the difference in height between carbide and ferrite. It may be mentioned that very long etching with hot solution slightly colors the pearlite of ordinary carbon steels, probably due to decomposition of the solution.

The new solution, therefore, can be used cold for identifying the carbide of the eutectic of chromium steels, thereby showing whether excess eutectic is present, which is to be avoided in construction steels. It is also suitable for developing the structure of high-speed tool steels, and, as mentioned before, can be used for tungsten steels.—G. B. W.

A sentence in the article on page 766 of THE IRON AGE of March 16, reviewing the book, "Wealth and Income of the American People," was made meaningless by a typographical error. The second sentence in the paragraph next to last should read: "What Mr. Ingalls does is to analyze the figures," etc.

Development of Continuous Rolling Mills

Fundamental Conditions Affecting Design—Application to Specific Products and Specific Problems —Co-relation of Units

BY JOHN W. SHEPARDSON*

CONTINUOUS rolling is the most scientific method of forming metal so far discovered. It is for this reason alone that out of the round 30,000,000 tons of present-day annual production of hot-rolled steel in the United States, at least 30 per cent is roughed or finished in continuous mills. It is true that the con-

cal use, few people realize that it began its existence in the same period in which other types of mills were taking form. The decade between 1856 and 1866 saw the inception and establishment of several distinct types of mills now in use.

In the same decade—in 1862—George Bedson of

Fig. 1. Continuous Wire-Rod Mill at Works of Richard Johnson & Nephew, Manchester, England, with One Vertical Loop

struction and operation of continuous mills involve many difficult problems, and require greater experience than with other types of mills; nevertheless, the continuous process of rolling is being rapidly extended, particularly in this country, to many new lines of product, thus ever increasing the proportion of the total tonnages rolled on continuous mills. Changed labor conditions in other countries, as the result of the war, make necessary the use of improved labor-saving machinery, and many continuous mills are now being laid down in Europe.

For the mechanical treatment of steel some process better than rolling may be discovered; but, so long as rolls are employed, there seems to be no prospect of

Manchester, England, built and operated the first continuous rod mill. Fig. 1 shows the second mill built by Bedson, in 1868. It is still running and doing good work. The first mill laid down in the United States was made from the same patterns. It must be observed that the mill consists of alternate horizontal and vertical rolls. As first built, it was straight continuous from end to end. In 1896 it was divided into two parts.

Though the credit of building the first continuous mill belongs to England, it was in the United States that Charles Hill Morgan of Worcester, Mass., took up the development of this type of mill, and in his life saw it reach a place of great importance, due to the American ingenuity of himself and his associates. It was quite

Fig. 2. Blooming Mill and Continuous Billet and Sheet-Bar Mill, the Roughing Mill Being for Future Installation

equalling the continuous mill in the following important and fundamental features:

The practicability of finishing very long lengths, limited only by the ability to handle the finished product.

The possibility of uniform heat treatment from end to end of a bar of any length, due to uniform time and exposure from furnace to finishing pass.

Low power consumption, due to rolls of small diameter.

Low fuel requirements for heating, because of rapid rolling and short exposure.

Freedom to use the maximum size of roll neck, due to two-high construction.

As the continuous mill is commonly thought of as being the last type to be conceived and put into practi-

natural that the New World, with its younger steel industry, should have taken up this advanced method of rolling. American capital was willing to provide special mills for the development of standardized products, and so gave the continuous mill the necessary impetus in its early life to reach the high place which it has held by demonstrated merit.

Continuous Billet Mills

A discussion of continuous billet mills naturally involves a discussion of the use of small billets, which these mills have made available at low cost. Before continuous billet mills became an integral part of blooming mills, the 4 x 4-in. billet held the field. This billet established itself so firmly because it was the smallest size the ordinary blooming mill could roll and maintain any semblance of output. When smaller initial sections were needed to satisfy the requirements of small mills, they were secured by special means.

*Engineer, Morgan Construction Co., Worcester, Mass. The paper was read before the Engineers' Society of Western Pennsylvania.

The development of continuous and other finishing mills to take small billets came simultaneously with the necessity of giving relief to the blooming mill, which, as a link in the production chain, was becoming severely taxed. It was, therefore, quite natural that, when the design of the continuous billet mill was undertaken, the following were the major aims:

To secure, direct from the ingot heat, as small a billet as was adaptable to subsequent use in finishing mills.

To start the continuous billet-rolling process from a section enough larger than a 4 x 4-in. to afford the desired relief for the blooming mill.

To roll the product of a whole ingot in one undivided length, and thus reduce to a minimum the losses in crops and shorts.

Minimum Billet Section

In the interests of both the continuous billet mills and the mills which use the billets, a standard length

with the extent to which the blooming mill is taxed by the steel making capacity back of it.

When a small beginning is being made, and the blooming mill is not taxed, a continuous billet mill of six stands can be employed, in which case the entering section is from 16 to 20 sq. in. In such cases, provision is usually made for the interposition of additional continuous roll stands between the blooming mill and the billet mill, for later tonnage development. Even in this case, the problem of dividing the work between the blooming mill and the billet mill is not clear cut. Quite frequently, an investment in an excess of soaking-pits proves attractive in order that the blooming mill may run single turn, while the steel-making plant is running 24 hrs. To maintain a high rate of output during its own operating time under these conditions, the blooming mill should be relieved of all extra passes by the installation of a 10-stand billet mill divided into two parts, and receiving a bloom section of about 42 sq. in. Such a combination, quite apart from its value in hav-

Fig. 3. Blooming Mill and Continuous Billet and Sheet-Bar Mill (One Roughing and Two Finishing)

is necessary. The practice of using 4 x 4-in. billets of every imaginable length, cut specially for each order, increases discards and throws an entirely unnecessary burden on the operating force in the mill and stock yard. The 1.75-in. billet is in the main the minimum commercial section, and has firmly established itself as a standard for a multiplicity of uses. It represents 100 elongations from the usual ingot cross-section. A No. 5 wire rod represents in turn 100 elongations from the 1.75-in. billet, which makes 1.75 in. a logical size at which reheating should be done. The 30-ft. 1.75-in. billet makes a rod bundle of 300 lb., a suitable and popular weight in American wire mills. Furthermore, 30-ft. lengths fit conveniently into railroad cars and can be easily loaded and unloaded in heavy lifts.

In the development of passes for the production of 1.75-in. billets, it was obviously necessary to bear in mind that not in all cases would the 1.75-in. billet be

ing sufficient capacity in a single turn to keep step with the plant, will also have ample capacity for promptly clearing congestion due to bunched heats.

Eight passes, corresponding to an entering section of 25 to 30 sq. in., are used very rarely in a permanent layout, and the conditions must indeed be very special to justify this rolling program. In such an instance, the eight passes are arranged in straight continuity without interruption. The point beyond which it does not seem advisable to extend pure continuous billet rolling is about 64 sq. in. of entering section. The billet mill for such a size should consist of two parts, each having six passes.

Rolling of Product of a Whole Ingot in One Length

The usual present-day ingot weighs about 7000 lb. The rolling of a whole ingot of this weight into 700 ft. of 1.75-in. billets is entirely beyond the limitations

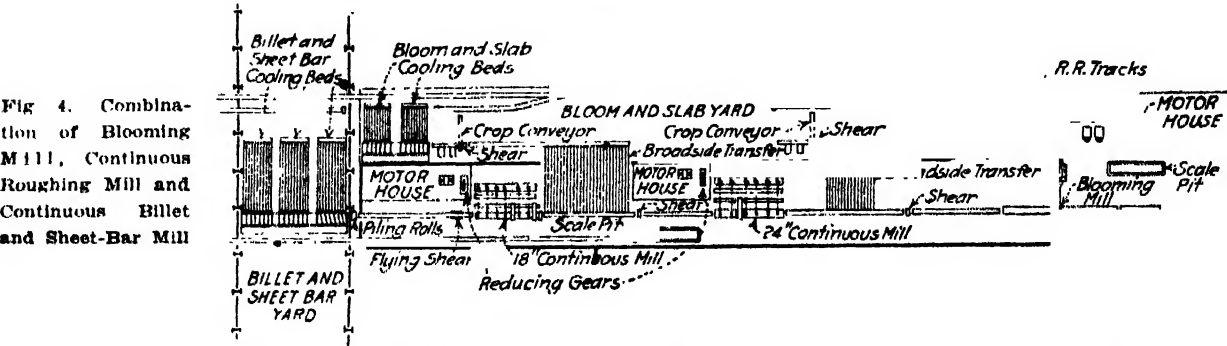

Fig. 4. Combination of Blooming Mill, Continuous Roughing Mill and Continuous Billet and Sheet-Bar Mill

the most advantageous section for subsequent rolling. As a consequence, suitable larger sizes were chosen and incorporated in one set of continuous rolls. Furthermore, provision was made to obtain 1.5-in. billets for purposes, where special conditions call for a similar initial section.

The Section Entering the Continuous Billet Mill

The size of the section entering the continuous billet mill depends upon local conditions, and varies directly

of any other than a continuous mill coupled with a flying shear. The invention of the flying shear by Victor E. Edwards has removed practically all limitations of initial ingot weight, and has given to the steel industry a piece of equipment which unquestionably has done more than any other machine to maintain yields at a high figure. It has also made the combined blooming and continuous billet mill realizable, and has given these mills their present-day tonnage making ability.

If one were entirely to disregard the low operating

cost of the continuous system as compared with any other rolling scheme, the high yield, the direct outcome of rolling long lengths, alone would be found to justify the continuous billet mill.

Continuous Sheet-Bar Mills

Sheet bar, like billets, is an intermediate product rolled direct from the ingot heat in continuous mills.

Fig. 5. Blooming Mill, Billet Mill and Sheet-Bar Mill Arranged for Special Conditions of Flexibility

Until recently sheet bar was used almost exclusively in 8-in. widths, but present day practice is properly extending the range of widths up to 12 and 14 in. in the heavier foot weights. This results in economies at the sheet mills.

Since practically the same considerations govern the design of continuous sheet-bar mills and of billet mills, the two mills are frequently combined, and one or the other product is produced by changing the rolls. Roll-speeds in such mills are governed, not by the sheet bar, but by the billet passes.

The demand for width variation in sheet bar has led to a departure from the tongue-and-groove method, which was used generally when sheet bar was confined to an 8-in. width. The combination of cylindrical rolls with vertical edging rolls now affords a maximum of

each plant, due to local requirements and conditions, proximity of other mills, available track service, etc. Nevertheless, such a mill properly laid down will realize certain minimum essentials:

The blooming mill must be provided with an independent outlet for its product through a bloom shear or slab shear to a bloom yard.

The continuous mill must be divided into two sepa-

rate mills, and the distance separating them must be greater than the greatest length that the first mill will ever deliver, in order to afford a maximum of freedom in rolling, and also to permit diverting the product at this point through a shear into a yard.

The first mill, being necessarily of heavy construction, preferably 24-in. nominal diameter, must have in its rolls all the working and dummy passes to produce the range of sections its program embraces. Roll changing in such a mill is too much of a burden to be assumed except in occasional emergency, forced by breakage of rolls. All of these passes must be arranged in definite lines and must be fully equipped with guides, so that a bloom can be directed into any line by a switch in front of this mill.

The second mill must have a pass design which will

Fig. 6. Continuous Mills. Together with Furnaces for Reheating Slabs

flexibility, and produces sheet bar accurate in width, with clean edges, and of very uniform foot weight. One of the edging mills is located in front of the first pair of rolls of a six-stand sheet-bar mill. Its function is to perform the major part of the width reduction and to crack the scale, leaving a slight reduction for the second edging mill, located immediately following the second pair of horizontal rolls. This second edging pass is merely to iron out the inequalities and to dress the edges, as at this stage the ratio of the width to the thickness is great, and heavy side reduction is impossible.

Arrangement of Units for Blooming Mill, Billet Mill and Sheet-Bar Mill

The arrangement of the various units composing a blooming mill, billet mill, and sheet-bar mill differs in

render available all the desired small billet sections in a single set of rolls. In cases where both billets and sheet bar are produced, the mill must also have a set of sheet-bar rolls, which latter should preferably have their own set of housings, in order that the change from billets to sheet bar, and vice versa, may be made as expeditiously as possible. With a double equipment of housings, the rolls for billets can properly be longer than the short, stiff rolls that are required for accurate sheet-bar rolling.

In Fig. 2 to 6 are shown several plans of mill combinations for blooming, billet, and sheet-bar mills which satisfy these essential conditions. Each lay-out shows some particular feature of general arrangement which would be difficult to describe without the aid of illustrations.

With the arrangement of blooming mill and contin-

uous billet and sheet-bar mill shown in Fig. 2, blooms and slabs rolled by the blooming mill can be diverted by a broadside transfer through a heavy shear into a bloom yard. In this installation, the billet and sheet-bar mill is direct connected to an electric motor; and this motor is placed under the crane in the main building, but in a separate motor room, while the control and switchboard are in a lean-to. Provision is made, as shown in dotted lines, for the future installation of a continuous roughing mill, and a broadside transfer for carrying out heavier billets through the building columns into the bloom yard, for which purpose a girder

Fig. 7 Arrangement of Passes for Billets and Sheet Bar

of sufficient length has already been provided in the building.

Fig. 3 shows a blooming mill and a continuous billet and sheet-bar mill in which the bevel-gear, transmission and electric motors are in a lean-to of the main building, thus permitting the broadside transfers for blooms and for the product of the first continuous mill to be kept inside of the main building. Provision is made for the installation of a second 18-in. mill with a flying shear and cooling beds. When this is installed, one mill will be permanently for sheet bar, while the other will always make billets. The roughing mill over-feeds the 18-in. mill sufficiently to support both of them. An edging mill of heavy construction is provided in the continuous roughing mill, to afford flexibility in rolling a multiplicity of slab widths.

Fig. 4 shows a combination of a blooming mill, 24-in. continuous roughing mill, and 18-in. continuous sheet-bar and billet mill, in which high-speed motors drive the continuous mills through reducing gears. In this mill, a shear is introduced approximately midway in the connecting table between the two continuous mills, to part the billet so that it can be diverted into the adjoining yard over a narrow broadside transfer. When steel is not so diverted it is passed on to the 18-in. mill in a single length. This arrangement has the advantage of leaving the working side of the mill entirely unobstructed, and of requiring a girder of only moderate length to pass the broadside transfer into the billet yard.

Fig. 5 shows an arrangement of blooming mill and billet and sheet-bar mills for special conditions. In addition to the features previously emphasized, an inspection and chipping building runs parallel to the main

building of the mill. Two furnaces, capable of taking 30-ft. billets after they have been chipped, deliver them heated to the 18-in. billet mill. This provision is made to care for alloy steel, where it is advisable to remove surface imperfections before the steel is reduced to minimum section.

Skelp, when too wide for the continuous skelp mill and too narrow for the universal plate mill, can properly be rolled on continuous mills, provided the temperature can be maintained to secure the skelp thicknesses. Fig. 6 shows continuous furnaces for reheating slabs from 8 to 16 in. wide for rolling into skelp.

Fig. 7 shows a typical arrangement of billet and sheet-bar passes. The sheet-bar reductions are made on plain cylindrical rolls, with the width controlled by vertical edging rolls.

(To be continued)

New Small Tools and Gages

A micrometer depth gage, inspector's micrometer caliper gage, dial sheet gage and a less expensive combination square than its standard No. 11, are among the new tools recently placed on the market by the L. S. Starrett Co., Athol, Mass.

The micrometer depth gage has a 1-in. movement of the screw and is equipped with three measuring rods, 0 to 8 in., by thousandths of an inch. The inspector's caliper gage is for accurate measurement of the walls of hollow cylindrical forms and the dial sheet gage is for sheet metal, paper, etc., pressure on a thumb button permitting insertion of the sheet between the two contacts. With release of the pressure the thickness is indicated on the dial. Thicknesses up to 0.150 in. in thousandths can be measured.

The new combination square is for carpenters and others not requiring the finer graduations and combines a marking gage, rule, square, miter, depth and height gage, level and plumb. A beveled-edge square known as the No. 55 is also offered. A double steel square having a 4-in. sliding block is similar to the Company's No. 14 square, but has a larger beam. An 18 in. vernier height gage with heavy base is also offered and is made with graduations in English, metric and both English and metric measures.

Standard end-measuring rods with rubber handles and with flat ends which are hardened, ground and lapped parallel, and a useful tool consisting of four small rules $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$ and 1 in. long, respectively, have been added to the line. A holder is provided into which the rules may be set at a convenient angle for easy reading. They are for accurate measuring of small recesses, shoulders, etc. A bench block for use in driving pins in round or flat work has also been added. The blade is a 3-in. disk, $1\frac{1}{2}$ in. high and has nine holes from $\frac{1}{8}$ to $\frac{3}{8}$ in., and also a V-groove for holding round work. A thickness gage for use in adjustment of automobile motor tappets and the gaging of slots, contains six leaves from 0.0015 to 0.015 in. thick which fold into a metal case on a screw stud, removable for replacing any of the leaves.

Other additions to the line include a protractor and depth gage, a nickel-plated metal case for 1-in. micrometers, a T-handle tap wrench; tape hooks for attachment to $\frac{1}{4}$ -in. or $\frac{3}{8}$ -in. steel tape and plumb bobs for attachment to steel tapes used for gaging oil or other liquids in tanks.

New High Record

The blast furnace of Weirton Steel Co., Weirton, W. Va., on March 15, established a new high record for one day's production of pig iron from one furnace when it tapped 845.6 gross tons of pig iron. This is the second record made in a week by this furnace which on March 9, produced 826.1 gross tons, thus surpassing the former production mark previously held by No. 1 furnace, Pittsburgh Steel Co., Monessen, Pa. In the first 15 days of March the furnace of Weirton Steel Co. produced 11,105.3 gross tons, an average of 740.35 gross tons per day.

Safety Hoist Hook

A hoist hook of the type shown in the illustration, intended to provide safer operation than the open hook commonly used in foundries, machine shops, steel construction work, mines, oil fields and railroads, is being marketed by the Frank W. Trabold Co., 30 Church Street, New York. It is known as the Yankee safety hook and made in five sizes, from 1 to 25 ton capacity.

It cannot be placed securely in the sling chain unless the hook is placed in a locked position, and cannot be released from the sling until the load is safely

The Hook Cannot Straighten Out or Unlock While Under Tension

landed in the position intended. It is to be noted that the hook cannot straighten out nor unlock while under tension and also cannot catch on any projection that it may hit in mid-air.

The component members are the hook, latch, shank and swivel. The swivel feature is for easy landing but the hook is also made without this member, for standard equipment. The hook is also furnished with straight shank for attachment to standard blocks or hoisting equipment. An elongated hole in the main-hook member permits raising that member sufficiently to allow the notched portion of the hook to clear the notched portion of the latch member only when the load is landed.

The body parts are drop forged from a high grade carbon steel, and Monel metal pivotal pins are incorporated, being non-corrosive and assuring high resistance to shearing strain.

Lake Shipping Hampered by LaFollette Act

Attention has been called to the burdens that have been placed on the lake shipping industry by the La Follette seamen's act in a report issued during the past week by the board of directors of the Cleveland Chamber of Commerce, which sharply criticises various provisions of that act. The report urged either the repeal of four sections of the LaFollette act or that the act be amended so that vessels on the Great Lakes be exempted from complying with provisions of these sections. The report states that the act has necessitated a material increase in the size of crews and wages. Before the passage of the act, 25 men were sufficient to handle a bulk freighter, but a crew of 33 is now required, while Canadian vessels use a crew of only 27 and pay lower wages. The passage of the act has caused 75 lake freighters to be transferred to Canadian registry, and the Canadian lake fleet has increased 35 per cent while the American fleet has gained only 1 per cent.

It is pointed out that not a passenger boat has been built for American Great Lakes service since the passage of the act. On the contrary, some boat lines have either curtailed their service or whole routes have been abandoned. The provisions of the act found particu-

larly objectionable are those limiting the number of passengers allowed on a boat, fixing the minimum size of crews, the length of the working day in port and the minimum percentage of able seamen. The report states that the requirements of the act increased navigation costs and freight rates.

Rolled Zinc in 1921

The output of rolled zinc in the United States in 1921 fell off nearly one-half, as shown by reports made to the U. S. Geological Survey by producers. The notable feature of the year was the importation of large quantities of sheet zinc, for only a few tons had been imported each year since 1915. From April 1 to June 30, 1921, there was imported and entered for consumption 4245 tons of sheet zinc. In the first quarter also the imports were large, but during the last half of the year they were very small. At the close of the year the price of American sheets was less than that of the foreign. The output of rolled zinc in the United States was as follows in pounds:

	1920	1921
Sheet zinc not over 1 10 in. thick....	56,812,989	28,580,904
Boiler plate and sheets over 1 10 in. thick	3,950,489	2,545,755
Strip and ribbon zinc	45,701,062	29,673,527
Total rolled zinc....	106,467,530	60,800,186

Grinder with Self-Contained Dust Exhaust

A grinder equipped with a self-contained fan for removing the dust has been brought out recently by Forbes & Myers, Worcester. This method of exhaust is claimed to be as effective as any for single machines where dust may be conducted directly outside and less expensive than installing a separate motor and fans for a single grinder. It has not sufficient power,

Grinder with Self-Contained Dust Exhaust

however, to carry dust through long pipes with many turns and is not intended to take the place of large exhaust systems.

In the illustration one end of the grinder is shown with tool rest and the other end without, the machine being furnished with both ends either way. The motor is of the induction type fully inclosed, for single, two or three-phase alternating current, and of ½ and ¾ hp. Hess-Bright bearings are used, which are also fully inclosed. The centrifugal fans, located between the bearings and the grinding wheels, blow the dust directly back through the exhaust pipe.

Rejects All Ship Bids

WASHINGTON, March 20.—The Shipping Board today rejected all bids received for the 1490 Shipping Board vessels recently announced for sale. Chairman Lasker said bids were received for about 100 ships and "there was not a serious bid in the whole lot." He said he was convinced there was no market for ships at this time in the United States, and probably there would not be any market until Congress decided the subsidy question now before it in the form of a bill.

Reduced Production Cost A Prime Need

What Measures May Be Used to Forecast Business Trends— How Expectations So Far in 1922 Have Been Fully Met

BY NATHANIEL R. WHITNEY, PH.D.*

AS we advance farther into the year, it becomes increasingly evident that the predictions of those who asserted, toward the close of last year, that the corner had been turned and that business was definitely on the up-grade were well founded. Although the betterment which was predicted is now visible in many directions, it is still impossible for many business men to observe signs of this improvement in their own business. It is clear, however, that a real change for the better has occurred, although the improvement is not evenly distributed.

After all, it requires a comparatively small change in the volume of business to convert depression into prosperity—the difference between a period of depression and a period of prosperity being estimated at 10 to 15 per cent in volume. Considerable industrial activity occurs even in periods of depression. Many of the ordinary processes of life are carried on as usual and it is from the savings of persons engaged in these lines of activity, and from the purchases made by such consumers that the foundation is laid for each new upward movement.

Increased Savings Accounts in Depression Period

This is strikingly indicated by the fact that, even in periods of depression when unemployment exists on a large scale, the number of savings accounts and the volume of savings deposits in the banks reach new high levels. The explanation is simple; the employed bend every energy to increase their savings as a measure of protection against the possibility of unemployment which may come upon them as upon their fellows almost any day. Gradually, as savings are thus made available and interest rates decline, business men are encouraged to resume activity. But they begin timidly and cautiously, and it requires considerable time after the turn has occurred before the improvement in conditions becomes marked. No one can say just how long will be the period of recuperation or convalescence in which we now are, but it is satisfying to know that the situation is better than it has been and that unless something unforeseen occurs it will continue to improve throughout the year.

There is ample justification for optimism, but it should be a conservative and reasoned optimism, which, while feeling confident that conditions are getting better, does not fail to take account of some of the obstacles in the path. One of the facts that cannot be over-emphasized is that those entrepreneurs who first succeed, and succeed best, in reducing their costs of production will be the ones who will reap the first and greatest benefit in the new industrial day which is dawning. The general level of prices is likely to decline for some years to come; a few commodities

now very low will advance, but many more will decline greatly. Hence, success must lie in the direction of reduced costs of production. This does not necessarily call for reduction in wage rates, though in some industries reductions may be justified, but it does call for increased efficiency on the part of employees and managers. The search for increased efficiency and lower costs of production will undoubtedly result in new

methods of organizing the production and distribution of commodities and will lead to the adoption of labor-saving and other cost-saving devices on a large scale.

Since the reduction in costs is mainly obtained by the effective use of machinery, it is probable that the machine-tool making plants and industries associated with them will feel the effects

of the business revival earlier than some of them now anticipate. American industrial genius, which is proverbial, has always manifested itself by a willingness to scrap equipment, regardless of its condition, if something which will make possible more effective production is available. The existence, therefore, of considerable numbers of machines does not mean necessarily that the machine-making industry must face a long period of depression.

Nor, paradoxically, will the increased use of cost-saving machinery mean greater unemployment for labor. Such laborers as are displaced by the machinery introduced will be employed either in the machine-making industries or in other industries which are stimulated by the prosperity in these and allied lines. On the other hand, those laborers who remain in their original employment will turn out a much larger product than was possible before because of the use of machinery. This will make possible not only the maintenance of existing wage scales but even an increase above the present level. The prosperity of these workmen will lead to demands for all sorts of commodities and thus will stimulate production in other lines until the slack which at first results from the introduction of labor-saving machinery is entirely taken up. There will then be increased demand for labor of all kinds. The new prosperity, thus based upon the more effective use of the factors of production, will be more far reaching and more firmly established than any that has gone before.

Evidence Used to Determine Currents of Business

The evidence upon which an attempt to determine the currents of business is based must vary with the particular purpose one has in view. For example, if we seek knowledge of current business conditions, we consult certain data. If, however, we desire information, not so much of existing conditions as of future developments, we turn to other sources. Much confusion arises in connection with attempts to determine business movements because the observer fails to dis-

*Professor of finance, college of engineering and commerce, University of Cincinnati.

tinguish between the kinds of information which may be regarded as anticipatory and those which may be considered as reflecting current conditions.

The writer suggests the possibility of grouping the various kinds of information under three main heads: (1) Financial data; (2) industrial or production data; and (3) commercial or trading information. It is suggested also that the fundamental importance of these three groups is in general indicated by the order in which they have been named. That is to say, if it be desired to make an estimate of probable business developments, much more valuable guidance can be secured from the study of facts concerning financial conditions than from those facts brought together under the other two heads. The industrial and commercial data indicate the *present* condition of business rather than its *future* prospects, although they do throw some light on the latter.

The general purpose of assembling information under the head of financial conditions is to ascertain so far as is possible the present and prospective state of the capital supply with a consideration of the demand for such capital. Obviously there can be no improvement in the industrial or commercial situation unless the funds available for industry are being accumulated in a adequate amount. Hence the kind of information to be considered under this head is that which shows the tendency of the capital supply either to increase or decrease. Significant information on this point can be obtained by considering the following topics:

- (1) Trend of savings bank deposits
- (2) Trend of bond prices
- (3) The discount rate for high grade commercial paper
- (4) The liquidation of loans
- (5) The volume of Federal reserve notes outstanding
- (6) The Federal reserve ratio of reserve to note issues and liability to depositors
- (7) New issues of securities contemplated
- (8) Government finance—expenditures, taxation, funding

Determining Industrial and Commercial Conditions

Industrial or production data furnish evidence as to the condition of industry at the present time. Such information is valuable not only for the purpose of providing some way of estimating existing industrial conditions but also because a knowledge of *present* industrial conditions will enable us to foretell *coming* commercial or trade conditions. This must be evident since the power to buy and sell rests upon the production of goods. Goods must be produced before they can be bought and sold, and the purchasing power of consumers depends in the last analysis upon the volume of goods they have produced. Their money wages which they spend merely represent an approximately equivalent value of the goods they produce. Hence activity of a commercial nature, buying and selling, shipping and speculating, must be preceded by betterment of the industrial situation. A great deal of information may be obtained which is useful for determining present industrial conditions. The most suggestive may be assembled under the following heads:

- (1) The extent of unemployment
- (2) Wage difficulties
- (3) The volume of production in such lines as (a) agriculture, (b) iron and steel, (c) coal, (d) oil, (e) lumber, and (f) railroad equipment
- (4) The consumption of water and electric power

- (5) The number of business failures and the amount of liabilities

The information concerning commercial conditions may well be ascertained from a study of the following topics:

- (1) The trend of general prices and a comparison with each other of prices of various groups of commodities
- (2) The volume of retail trade
- (3) Bank clearings
- (4) Stock market operations
- (5) Car loadings; idle cars
- (6) Foreign trade—exports, imports, and balance of trade; tariffs, and their effects
- (7) Foreign exchange rates; the economic situation of foreign countries

The general reasoning involved is that there must be improvement in underlying financial conditions, especially those relating to the capital supply, before there can be any improvement in industrial conditions; that there must be improvement in industrial conditions before there can be any permanent improvement in commercial conditions; and that when commercial conditions improve as the result of the financial and industrial betterment, the increased volume of buying and selling will in turn further strengthen the financial situation. The process is repeated until failure to come up to increasing requirements causes a halt in one of these stages and paves the way for the impairment of all. In this article effort is made to set forth in general terms the evidence upon which it is now frequently asserted that business conditions are improving. In a subsequent article the statistical verification of this claim will be presented in accordance with the theory and plan just outlined.

Notable Increase in Savings Deposits

The evidence of improved financial conditions since the beginning of the year is found, first, in the increase in savings bank deposits. The index for the volume of savings in 30 representative savings banks in the New York Federal reserve district is well above that of any previous period. Although a slight decline occurred between Jan. 10 and Feb. 10—a result of the withdrawals normally following the crediting of interest as of Jan. 1—the volume of deposits is still noticeably higher than at any preceding period.

The same trend is indicated by the reports for postal savings. The past few months have shown a gradually smaller decline in the volume of deposits and during February this was turned into an increase in deposits over withdrawals for the first month since January, 1921. This information is compiled from all sections of the country and hence indicates the reality of the improvements which have been reported in industrial conditions.

The trend of bond prices similarly shows an increase in the amount of capital available for industrial and commercial enterprises. During the last week of January, the Treasury offered a series of notes for the purpose of refunding some of its short-dated debt. The notes were heavily oversubscribed, although they bore interest at 4% per cent as compared with 5½ per cent on a similar issue last September, and 5% per cent on such an issue in June, 1921. New securities offered by corporations have been in large volume and have been eagerly taken up at lower rates in what is described as a phenomenally strong bond market. The supply of funds for investment is growing so rapidly that there is a strong investment demand not only for

bonds but for such high-grade preferred stocks as United States Steel, and even for well established dividend paying common stocks, such as American Telephone & Telegraph.

Other Significant Aspects of the Financial Situation

There has been reduction in the volume of credit required for commercial purposes, and the rate prevailing for high-grade commercial paper varies in different sections of the country from $4\frac{1}{2}$ to 5 per cent. Liquidation is going on steadily if not rapidly. The greatest progress recently has been made in the agricultural districts where the improved prices for farm products have encouraged the marketing of such commodities. There is still a large volume of frozen credit both in the industrial and agricultural sections of the country. On this account it would be extremely ill-advised to adopt any such proposal for the payment of a bonus as is represented by the scheme to give the soldiers some form of collateral which they could presumably use as a basis for loans from the banks. The banks should not and cannot take the Government's place in paying such a bonus. The reserve position of the Federal reserve system continues very strong. The latest ratio of total reserves to deposits and Federal reserve note liabilities combined is reported as 75.6 per cent.

One of the important financial factors that is retarding business recovery is the uncertainty as to governmental policies in regard to taxation, expenditures and funding. With nearly six billion dollars of public debt falling due in the next year and a half, it is important that expenditures which are not absolutely essential be eliminated, and that this economy be supplemented by wise measures of taxation. Unfortunately the Administration, so far as its policies can be judged by Congressional attitude, has given the business man no confidence that these fiscal problems will be handled wisely. The President and the Secretary of the Treasury undoubtedly entertain much sounder notions in these matters than do the Republican majority in Congress; but the best that they can do seems to be to put difficulties in the way of the enactment of unsound measures by this majority. The result is that little is accomplished.

Doing Business with Canada Handicapped

A good example of the harm that can be done by legislation adopted for political effect without regard to economic principles can be seen in the effect of the so-called "emergency tariff" upon the trade between the United States and Canada. During 1921 the total imports from Canada fell over \$200,000,000 as compared with 1920, while our exports to Canada decreased about \$400,000,000. Allowing for the decline in the price level, there was a decline in our exports to Canada and our imports from her of approximately 45 per cent. So long as we refuse to admit Canadian products except under the imposition of a high tariff, we are reducing the purchasing power of Canadians and the possibility of exporting to them.

However, it is not only from the immediate financial point of view that this legislation is harmful. The interference with the trade between the two countries has produced in Canada a strong reaction in favor of British products. The United States was for some time Canada's leading customer, but now since we are forced to keep down our purchases from her, and since England has displaced us as her best customer, the Canadians are buying much more heavily from the United Kingdom than formerly. The general advice in Canada is: "Buy in Great Britain whenever possible anything that can't be produced in Canada." Because of the hostility engendered against the United States in a business way, the Canadian government is making

an effort to secure closer relations with British industry. A book has recently been issued entitled, "Canada as a Field for British Branch Industries," and is being widely circulated in Great Britain. Progress toward business recovery would be very much hastened if legislation in regard to the tariff, the bonus, taxation, and the funding of domestic and foreign loans were intelligently disposed of.

Improvement in Employment

Industrial conditions show an uncertain trend, with some industries still in a much depressed condition and others in a very satisfactory position. The volume of unemployment which has been extraordinarily large for the past ten months is being reduced. The employment service for the Department of Labor in Washington reports that employment has increased in all industries except textiles. The basic industries—food, iron, steel and metal products, railroad repair shops and automobile plants—all show substantial increases in number of employed.

Out of 65 cities considered, increases in the number of employed were reported in 44 cities. The New York State Industrial Commission reported on March 12 that there was an increase in the number of employees in practically all industries in New York State. Throughout the steel manufacturing districts in Ohio reports of increases in operation have been recently of almost daily occurrence. From the automobile manufacturing centers of Ohio come reports of increased demand for cars and increased operation of plants. This may be merely seasonal, but in any event it offers employment in a period when the demand for laborers would otherwise be at a low ebb. In the near future the agricultural demand will make itself felt and thus further reduce the volume of unemployment.

Other Factors Affecting the Industrial Situation

Wage difficulties and other labor problems are still hampering production in some lines. Notable among these is the strike of the textile workers which has brought the cotton manufacturing industry in New England almost to a standstill. The threat of a coal strike on the first of April is likewise acting as a depressing influence. The consumption of power in industrial establishments indicates an increase in the activity of such plants, although the volume of production in most lines is still below normal. Among the most gratifying proofs of improvement in the industrial situation is the increased production in the iron and steel and railroad equipment industries. As earnings and new financing permit, the railroads are certain to come into the market with large orders for equipment of all kinds. The advance in the prices of the shares of steel and equipment companies indicates that shrewd observers of business conditions are convinced that railroad buying on a large scale will not be long postponed.

Commercial failures which were very high throughout 1921 and through January and the early part of February this year have shown a tendency to diminish. If this tendency is maintained for the next month or two it may be assumed that most of the weak concerns have been squeezed out and that thereafter little fear need be felt that failures will be on a scale large enough seriously to retard business growth.

Commercial Conditions Not Yet Satisfactory

In considering information relating to commercial conditions the showing is less satisfactory. The downward trend of prices generally seems to have been halted temporarily. While this makes for immediate stabilization, it postpones the ultimate adjustment which must be made on a lower basis. Some commodities, which were too low in comparison with others,

notably farm products, have registered an advance. This has engendered a more optimistic feeling in the agricultural regions and has brought about an improvement in those industries which are immediately dependent on agricultural buying, such as the mail order houses and the manufacturers of agricultural implements and supplies.

The index numbers for prices of various groups of commodities as computed by the Department of Labor still show wide variations between the prices of the various groups. Lumber and building materials, house furnishings, fuel and lighting, and clothing are still far out of line. The fact that resistance to an inevitable price decline works to the disadvantage of an industry is shown by the unsatisfactory position of the furniture trade. The index number for housefurnishings advanced farther above normal than that of any other group of commodities, and it has been held more persistently at its high level. As a result it has been reported that the annual midwinter clearance sales of furniture are very disappointing, and that this decline in the volume of furniture sales was largely responsible for the total decline in sales registered by the department stores during January and February. The monthly business summary of the Philadelphia reserve bank for the first of March designates both the demand for furniture and the collections for furniture sold as poor. The reports on retail sales in department stores for January, 1922, indicate a falling off as compared with January, 1921, of about 8 per cent in value, although if allowance be made for price declines it is probable that there was a small increase in the number of individual transactions.

Sales of securities on the stock market show considerable strength and activity both in the number of shares sold and in the gradual advance in prices.

A favorable exhibit which throws light on current activity is found in the increase in car loadings. Although an increase would normally not occur until March, this year it began several weeks earlier. The weekly car loadings in February averaged 800,000 cars. This is about six weeks in advance of the normal rate of loadings. Freight is being moved not only in increasing quantity, but also under lower operating costs than a year ago.

Bank clearings, as might be expected, are considerably below normal, for while underlying conditions are showing constant improvement, actual every-day transactions are still very much retarded.

Not only domestic trade, but also foreign trade, is relatively inactive. There has been a decline in the value of both exports and imports, but the rate of decline has been greater in exports than in imports. An interesting feature of our export business is the tremendous increase in the exportation of corn. Before the war corn was relatively unpopular as an export commodity, but in the seven months ended January, 1922, more than 90,000,000 bu. were exported. This is more than six times the volume exported a year before. Evidently large new markets are being developed for this grain. This, of course, improves the farmers' situation very considerably.

Another favorable indication from the commercial point of view is found in the rise of foreign exchange rates. There has been a marked advance in the price of sterling, and along with this has come improvement in most of the other currencies. Such improvement in the rates of foreign exchange not only increases the potential purchasing power of our foreign customers and stimulates our export business, but it suggests betterment in the internal economic condition of these countries.

There are other developments among the European countries which support the evidence of the exchanges. There have been since the first of the year important

reductions in the bank discount rate; in Norway the rate has been reduced from 6½ to 6 per cent, in Sweden the reduction has been from 5½ to 5 per cent, and the Bank of England recently announced the reduction of its rate from 5 to 4½ per cent. This last is the lowest rate which has prevailed in England since the week before the war began. There has recently been an announcement by the Chancellor of the Exchequer that the government intends to restore an unrestricted market for gold at the earliest possible date. Further evidence of improvement in the English economic situation is found in the upward movement of gilt-edged securities on the London exchange which has attained something in the nature of a boom. Treasury bonds are now selling several points above their original issue price. Bank of England stock, which last year fell to 163½, has advanced to 200. All the prior lien stock of the railroads has risen substantially.

Conditions in France are reported as very much better, and progress in readjustment is even reported from Germany. All in all, while much unsettlement still exists in the foreign situation, and a long road must still be traveled before we can count on selling goods to Europe on anything like the old terms, it is safe to say that each month has brought some improvement.

All the evidence indicates that conservative optimism is justified. Conditions are noticeably better than they were at the close of 1921, and those producers who can get their costs of production down to a level which will allow them to sell their output at gradually lowering prices will undoubtedly be able to close their books for 1922 with a gratifying profit.

Waste Material Dealers Hold Meeting and Dinner

The annual meeting of the National Association of Waste Material Dealers, New York, was held March 15, at the Hotel Astor. Frank C. Overton, Castle, Gottheil & Overton, New York, was re-elected president; Harry R. De Groat, of Philadelphia, first vice-president; James Rosenberg of New York, second vice-president; Fred Mayer of St. Louis, third vice-president. Charles M. Haskins is secretary of the association.

At the ninth annual banquet in the evening, the Rev. Percy Stickney Grant, rector Church of the Ascension, New York, the Hon. Carroll L. Beedy, congressman from Maine, and Willard Scott, Brookline, Mass., spoke. Dr. Grant pointed out the great necessity for better education as a cure for industrial unrest. Mr. Beedy's subject was "The Money Puzzle." He quoted the statistics covering United States indebtedness, European indebtedness, interest costs on these debts, proportion of the world's gold supply held by the United States prior to the war and now and the average value of paper before and since the war. Maintenance of the gold standard, he said, is to-day dependent upon Britain and America.

Prizes Offered for Foundry Devices

In October, 1920, a gift of \$1,000 to the American Foundrymen's Association was made by the S. Obermayer Co., the interest on which is to be awarded for devices which will aid foundries in their work. The devices for this year, in the shape of models or drawings, will be on exhibition at the annual convention of the association in Rochester, N. Y., during the week of June 5.

The contest is limited to foremen or other workers in foundries or in other departments of plants operated in connection with foundries. Particulars of the contest will be furnished by the secretary of the association, 140 South Dearborn Street, Chicago. The jig or other equipment entered in the contest shall not be patentable, but shall be such a device as can be constructed in any foundry and used in the production of castings, or in core making, molding, pouring or handling operations.

SHIPPING BOARD EQUIPMENT

Increased Demand Believed to Reflect Improved Business Conditions

WASHINGTON, March 21.—While from a spectacular point of view wrecking of the more than 100 large buildings used as storehouses, offices, etc., at the Harriman, Pa., headquarters of the United States Shipping Board Emergency Fleet Corporation has aroused current interest, from an industrial point of view the interest is of another character. This relates to the various uses to which the material being disposed of at the yard by the Emergency Fleet Corporation is being put. Large quantities of equipment already have been sold, but there still remains considerable to be disposed of. According to an announcement by W. P. Willetts, manager of sales, material sales division of the Emergency Fleet Corporation, with headquarters at Harriman, the generators which have been sold are being used by manufacturers, and the air compressors are being sold to large general contractors and tunnel builders. He said that one of the features of the wrecking of the yard will be the tearing down of the wooden ship runways, and the large steel cranes and craneways which formed the 12 shipways.

The work of salvaging lumber has started and the purchaser of the steel craneways is organizing a force of men preparatory to salvaging the steel. Approximately \$450,000 worth of materials have been disposed of within the last three months and a force of 100 laborers is engaged in tearing up the railroad tracks, dismantling the cranes and skidding the machinery, preparatory to its shipment.

Although the largest structures have not as yet been sold, Mr. Willetts thinks that they will be disposed of in the near future.

The plate and angle shop, in which at one time the major portion of the local fabricating work on 40 steel ships was done, has been dismantled and the machines have been removed and made ready for distribution to various localities in the United States. Some of the most desirable machinery is still awaiting purchasers. The locomotive cranes, 50 and 60-ton portal pier cranes, and shipway cranes, are rapidly being dismantled for removal and sale.

Among other equipment still to be liquidated are 10 and 15-ton gantry cranes; air compressors, steam-driven, with a capacity of 1950 and 5715 cu. ft. per min.; 100-lb. air compressors; tool steel, including carloads of hand tools; rivets; hammers, drills, heaters; eight Erie city boilers with mechanical safeguards and coal-handling apparatus; welding and cutting machines; electric testing machines and service equipment.

Mr. Willetts says that business conditions have shown a decided improvement and that buyers from all sections of the country, representing nearly every phase of industry, are purchasing equipment.

Cost of Living Slightly Higher

Monthly figures of the Bureau of Labor Statistics show the wholesale prices of all commodities during February to be 51 per cent above the average for 1913, compared with 48 per cent in January and 49 per cent in both December and November. Three of the nine individual groups showed a rise in January compared to December, these being farm products, with 10 points; food, etc., with 4 points, and miscellaneous, 4 points. Metals and housefurnishings showed decreases of 2 and 1 points, respectively.

Metals and metal products, which now stand at 15 per cent above the 1913 average, are far lower than any other group listed. This item is now 11 points below farm products, and more than 20 points below any of the others. The highest item on the list still continues to be housefurnishing goods, which, together with building materials, are more than double their 1913 prices.

Our table shows the figures for the two most recent months and for February, 1921, and the peak in 1920. It shows also the amount of liquidation, be-

tween the 1920 peak prices and the present, of the excess of the peak prices over the average of 1913. Metals have been liquidated to a greater extent than any other group.

Index Numbers of Wholesale Prices, by Groups of Commodities
(1913 equals 100)

	1920 Peak	1921 Feb.	1922		Liqui- dation, Per Cent
			Jan.	Feb.	
Farm products	246	129	116	126	82.2
Food, etc.	287	150	134	138	79.7
Cloths and clothing....	356	198	183	183	67.6
Fuel and lighting.....	284	218	183	183	54.9
Metals and metal prod- ucts	195	146	117	115	84.2
Building materials	341	221	202	202	57.7
Chemicals and drugs...	222	178	159	159	51.6
House-furnishing goods.	371	277	214	213	58.8
Miscellaneous	247	180	146	150	66.0
All commodities	272	167	148	151	70.4

High-speed Wire Brush Cleaner

For cleaning metal surfaces the air-driven wire brush machine shown in the accompanying illustration, having an average free speed of 4200 r.p.m. at 90 lb. air pressure, has been added to the line of the Ingersoll-Rand Co., 11 Broadway, New York.

Among the uses for the machine may be mentioned the removal of paint, rust, dirt and scale from tanks, steel cars, structural and other steel. It may be also used for cleaning iron and steel castings. The wire brush, turning at the high speed, is said not only to clean faster but to be more durable in severe service than if revolving at only 2000 to 3000 r.p.m. As an ex-

High-Speed Wire Brush for Cleaning Metal Surfaces

ample of its performance it is claimed that on a six-weeks' test, the machine cleaned steel gondolas, each averaging 540 sq. ft. surface, in 3½ hr., and all-steel box cars, averaging 1400 sq. ft. surface each, in 7½ hr. It is further claimed that the brush removed not only all the rust but the old paint as well.

The machine is shown in the accompanying illustration. It is known as the Little David No. 601. The air motor is of the three-cylinder type used in the company's Little David portable grinder. Light weight has been attained by using an aluminum casing reinforced with cast-in steel brushings. The weight complete is 14 lb. and the length over all 17½ in. The diameter of the wire brush is 6 in.

Following announcement that the car repair work of the Western Maryland Railway, Baltimore, at the shops in Baltimore and Elkins, W. Va., had been abandoned and placed on contract, and also the announcement that the railroad's maintenance-of-way work had been placed in the hands of Dickson Construction & Repair Co., Youngstown, Ohio, the company has now announced that the shops at Hagerstown, Cumberland, Connellsville and Hanover have been placed under the control of the Youngstown company.

The National Carbon Co., 30 East Forty-second Street, New York, has issued an attractive booklet, "The Carbon Electrode," which gives data concerning the manufacture, use, handling, etc., of various kinds and sizes of electrodes for its different electric furnaces. The electrical phase arrangements of various types of furnaces are included in graphic form.

Iron and Steel Industries of Europe

Reports to the Government Show Much Irregularity, but Improvement in Some Countries, Particularly in England and Germany

WASHINGTON, March 21.—The iron and steel industries abroad show an irregular condition, according to reports received by the Department of Commerce. While, like the United States, none of them is operating on a normal basis, there are notable instances of improvement. These relate particularly to England and Germany.

Improvement in British iron and steel exports was pointed out in THE IRON AGE of last week. This is also a matter of comment this week in Commerce Reports. Using somewhat different lists of items than those covered by THE IRON AGE, based on Board of Trade figures, the Government publication says that British iron and steel exports in January amounted to 234,446 long tons, a gain over December, 1921, of 45,683 tons. British iron and steel imports in January totaled 85,223, as compared with 13,406 tons imported to the United States.

American manufacturers are showing considerable concern over the recovery of the British export market, as compared with progress made in the same direction by domestic producers. Exports of American iron and steel in January amounted to only 160,920 tons. The outstanding takings of British exports other than those of its dominions overseas, which represented by far the largest tonnage were: pig iron—Belgium and France, over 4500 tons each, and Italy, 10,800 tons; plates and black sheets under ½ in.—Japan, 2700 tons; galvanized, plain, and corrugated sheets—Argentina, 12,800 tons; Japan, 2100 tons, and the Dutch East Indies, 1400 tons; tin plates—Japan, 4300 tons; the Netherlands, 1900 tons; France, 1600 tons, and China (including Hongkong), 1200 tons; rails—Argentina, 4800 tons. Iron and steel imported into Great Britain in January totaled 85,223 tons, a decline of 28,453 tons from December's figure. Exports for the month exceeded imports by 149,223 tons.

The Industries of Germany

The iron and steel industries in Germany reported a brisk month in January, despite greatly increased transportation difficulties. Prices are soaring. No pig iron and steel production figures are published, as a matter of policy, but it is understood that the steel output in January slightly exceeded the estimated combined production of England, France and Belgium. The industry is in need of scrap metal, hitherto an important factor in its raw materials. Stocks of scrap are now low and unless supplies are obtained from Poland, there will be felt a serious pig iron shortage.

Coal prices were raised on March 1 by between 106 and 159 marks per ton, lignite briquettes by between 71 and 87 marks per ton; thus, the present minimum price of Ruhr pit coal is 600 marks per ton and of lignite briquettes, 200 marks per ton, including 20 per cent coal tax and 1.5 per cent turnover tax. The maximum prices of pig iron and steel effective for March are as follows:

Hematite pig iron.....	4,744 marks per metric ton
Ingots	5,320 marks per metric ton
Blooms	5,770 marks per metric ton
Sheet bars	6,086 marks per metric ton
Billets	5,945 marks per metric ton
Shapes	6,920 marks per metric ton
Hoops	7,750 marks per metric ton
Wire rods	7,515 marks per metric ton
Thin sheets	9,375 to 9,690 marks per metric ton
Medium sheets	8,910 marks per metric ton
Thick sheets	7,805 marks per metric ton

Slow Improvement in Belgium

The last quarter of 1921 in practically all lines of Belgian iron and steel marked a continuation of the slow general improvement which first appeared in August and September, according to a report to the

Department of Commerce by Acting Commercial Attache Cross. Between September and the end of December pig iron production increased 83 per cent, while the raw steel output practically doubled; the situation in rough castings is less favorable, with production figures stationary since July, 1921, in the neighborhood of 3300 tons monthly. Owing to some uncertainty felt as to the permanence of the revival, most plants have been slow to relight blast furnaces, with the result that only fourteen were in operation at the end of the year—five in Hainaut (Charleroi), four about Liege, and five scattering.

Despite this improvement, pig iron production in December was only 36 per cent of the 1913 monthly average and slightly under 80 per cent of the 1920 average.

Poor Business in Austria

Business was poor in most of the Austrian metal industries during the first half of 1921, but during the summer a more active demand began to make itself felt, and in the fall there was a real boom, according to a review of the year received by the Department of Commerce from Trade Commissioner Upson at Vienna. This was largely the result of the depreciation of the Austrian crown, but the fact that the competing German metal industry disposed of a large part of its goods at home and found a market for the rest in countries with a more stable currency also aided in the recovery of the Austrian indemnities. Czech competition has been excluded by the rise of the Czech crown.

Nevertheless, production still remains short of what it was in time of peace. Obstacles to a full capacity production are the diminished efficiency of the individual workmen and the eight-hour day. Efforts are therefore being made to induce the workmen to consent to longer hours. At the present time, all branches of the metal industry are doing a great deal of work for export, and with most of them it forms the greater part of their business. They are quite dependent on this export business, since they have to import a part of their raw materials and fuel and must pay for them in foreign currency at a high rate of exchange.

Depression in Sweden

At the meeting of the Swedish Iron Works Association, held during the last week of January, 1922, statistics of Sweden's output of iron and steel and its foreign trade therein for 1921 forwarded to the Department of Commerce by Commercial Attache Anderson at Copenhagen, show the extreme depression that has prevailed in this industry in Sweden during the past year. Production of pig iron in 1921 was 308,600, compared with a ten-year average of 642,700; of steel ingots, 219,100, compared with 601,400. On the whole, exports of iron and steel were only 29.3 per cent of the total for 1913, while imports, which amounted to 122,400 tons, as compared with 231,700 tons in 1913, were 52.3 per cent.

Conditions in Holland

The import trade in iron and steel in Holland during 1921 was unsatisfactory in nearly all lines, says Consul General George E. Anderson in a report to the Department of Commerce. The trade on the whole declined very materially from that of the years immediately preceding, and the decline told heavily against the United States. German competition has not been nearly so keen in most lines of imports into Holland as is generally supposed, but in iron and steel has been especially keen and effective.

The trade in general has declined as a result of depressed industrial conditions, particularly in the

shipbuilding and allied lines, which were the chief foundation for the very large trade in steel products during 1919 and 1920.

The well-established lead of German iron and steel makers in the Netherlands markets is made plain from official figures, but it was cut down somewhat during the latter part of 1921 when Dutch importers found they could not rely upon German deliveries and turned to the United States and other countries where they placed orders.

Better Times in Latin America

ERIE, Pa., March 21.—"A promising sun-rise glow of 'better times' is tinging the Latin American trade horizon. Most of the countries of this region have passed through the dark period of liquidation and are facing the 'breaking day' of business revival with renewed confidence," declared Dr. Julius Klein, director of the U. S. Bureau of Foreign and Domestic Commerce of the Department of Commerce, in a speech to-night before the Chamber of Commerce in this city.

Latin America will from now on present a steadily developing market for American products; significant evidence of its growing importance to us is found in the fact that our trade with that region to-day represents 18 per cent of our total trade with the world, against 13 per cent in the fiscal year 1913-14. Exports to Latin America from the United States during the calendar year 1921 amounted to over \$800,000,000, a gain of 165 per cent over the last normal pre-war year.

"This is certainly a striking example of the ability of America to hold its own," Dr. Klein declared, "especially in view of the fact that this increase has been achieved in the face of extremely unfavorable exchange rates, complicated by world-wide depression

and after fully two years have elapsed in which our old commercial rivals, the English, the German and the French manufacturers, have had time to enter into active competition against us. It means," the director asserted, "that in spite of a few noisy complaints our Latin American friends have learned to appreciate American quality and service, and that our business men have likewise learned that quality and service are the keys to commercial success the world over."

The importance of the Latin American markets in the eyes of official America is clearly indicated, said Dr. Klein, by the recent action of Congress in recommending a 70 per cent increase in the Commerce Department's appropriation for trade promotion work in that part of the world.

Referring to the subject of competition, the speaker dealt with the scare-head announcements of overwhelming German success in the markets of our Southern neighbors. He denied emphatically that Germany had even begun to reconquer these markets, much less drive American salesmen into the sea with prohibitively low price quotations. "Simple trade statistics answer this question to the satisfaction of most of our business men," the director said. "For the benefit of any skeptics on this point, the director declared that reports coming to the Department of Commerce indicate that our competitors are not only failing to dominate all of the business but that in some important lines of trade they have actually failed to make delivery on orders obtained. The strong German campaign which started in the Argentine, Brazil and Mexico, has suffered great checks through the inability of many German manufacturers to meet the promises of their salesmen as to deliveries and qualities, Dr. Klein added.

JURISDICTIONAL AWARDS

Action Taken By American Engineering Council —Features of Executive Board Meeting

The executive board of the American Engineering Council of the Federated American Engineering Societies met in Chicago, March 10. The committee on employment service reported a resolution "that the maintenance of an employment bureau by the council is not at this time advisable." After discussion, the council voted to discharge the committee and instructed the president to appoint a committee of five to consider the whole question and report to the board at its next meeting, which will be held at Pittsburgh in May.

The executive board received a report from Rudolph P. Miller, New York, its representative on the National Board of Jurisdictional Awards, stating that the United Brotherhood of Carpenters and Joiners of America has not been observing the decisions of the jurisdictional board and that the attitude of the carpenters was causing serious embarrassment to owners, architects, engineers, contractors and workmen in the building industry as well as being detrimental to the public interest. As a consequence of this report, the executive board adopted a resolution urging "that the members of the American Institute of Architects and of the F. A. E. S. insert in all specifications and contracts for building operations a stipulation that the decisions of the Jurisdictional Board shall be observed."

It was further resolved "that this resolution shall be enforced as expeditiously as possible, beginning with those localities in which the trouble appears to be the most acute and where action seems most urgent, and that all these signatories make special and united efforts toward securing general and complete compliance with all the decisions of the Jurisdictional Board." The resolution also recited "that as and when trouble in any locality is brought to the attention of any of the signatories such organization shall take the initiative in forming a general committee of representatives from all the signatories for the purpose of dealing with the situation in that locality."

One of the liveliest discussions of the meeting of the

executive board arose from a resolution presented by Philip N. Moore, St. Louis, "that the president of the F. A. E. S. be authorized to offer the Secretary of War the service of a committee of disinterested distinguished and skillful engineers, to be selected by a committee of its executive board, for the purpose of making a thorough investigation of the geological, engineering and manufacturing possibilities of the Muscle Shoals power project; this committee to serve without compensation, save for necessary expense." The resolution was voted down.

The Great Lakes-St. Lawrence Waterway project came before the board, which decided that at present it was undesirable to take any action.

The general question of international engineering federation was considered in many phases and provoked a discussion in which the constitutionality of a proposal to admit the Engineering Institute of Canada to membership in the Federation, if formal application should be made, was the subject of a lengthy debate. The board adopted a proposal put forward by E. S. Carman, Cleveland, for the appointment of a committee "to consider and report upon the affiliation of other engineering organizations than those within the United States with the F. A. E. S."

Secretary L. W. Wallace reported that the membership of the Associated Engineers of Spokane had so increased that the association was now entitled to a representative on the council, J. C. Ralston being the appointee. The Engineers Club of Columbus has appointed John R. Withrow as its representative upon the council.

A report from E. J. Prindle, chairman of the patents committee of the council, commended the publicity efforts of the Federation as a powerful factor in bringing about the success of the movement to reform conditions in the United States Patent Office.

The monthly statistical bulletin of the National Federation of Iron and Steel Manufacturers, Caxton House, Tothill Street, Westminster, London, S. W. 1, is now available for general circulation by subscription at 14s. per year. It contains iron and steel production and export data of the leading countries besides Great Britain.

Machine for Bending Tennis Racket Tubing

The bending of 7/16-in., 22-gage tubing to the shape required for metal tennis rackets is accomplished in two operations on the special machine developed for the purpose.

A straight tube is placed in the machine and bent around the form to the shape shown in Fig. 2. The bending is by means of two arms or cranks keyed to two vertical oscillating shafts which are driven through the worm gearing and a crank motion located underneath the table. The normal cycle of motions is bend, release and stop, the operator then removing the bent part and replacing with another tube.

After running through a lot of frames for the first operation, the bending tools are changed to those shown

Fig. 1, at Right, is a Full View of the Machine. Fig. 2, above, shows layout of bending tools for the first operation and the tube bent around the form which completes that operation

Fig. 3, Below, Shows Bending Tools Used in Second Operation. The frame is closed around the form, one leg passing under the clip, the other riding over the top, resulting in the finished shape as shown

in Fig. 3. It will be noted that the rollers on the end of the cranks are removed and links are connected to the studs midway in the crank arms. These links are attached at the opposite ends to another pair of swinging arms terminating in small rollers which engage the tube. The large rolls, mounted on the cranks in the previous operation, are used as locating stops in the second operation. They are positioned so that the partly bent frame is located by the rollers midway on the form in the center.

The second operation closes the frame around the form, one leg of the frame passing under the clip at the left while the other rides over the top, resulting in the finished shape shown in Fig. 3. It is necessary, of course, to bend the frame through a greater angle of curvature than actually needed in order to overcome the spring and to set the metal in shape.

The machine illustrated is being offered by the Davis-Bournonville Co., Jersey City, N. J. It is said to operate at the rate of 600 bends per hr., the drive shaft running at 300 r.p.m. When working to normal production the operator starts and stops the machine for each bend. When facility in handling the work has been acquired, however, and maximum output desired, the machine, it is said, can be operated without stopping to insert the tubes and remove the bent shapes, the production being in this manner raised to about 1000 bends per hr.

The H. H. Robertson Co., Pittsburgh and Ambridge, Pa., recently was presented the Rice safety award for a 100 per cent record in accident prevention during 1921. This company employed 124 men, working 250,000 hours last year, without a lost time accident.

Earnest Plea for Merchant Marine

WASHINGTON, March 21.—Pointing out that without American ships to carry American products to customers everywhere, trade of this country in time of emergency will again be at the mercy of foreign competitors and that at any moment domestic interests are liable to suffer disarrangement of internal economy and the piling up again of our surplus products along the highways and railroads and at the ports, as happened at the outbreak of the World War, Commissioner Meyer Lissner has issued a statement discussing legislation regarding merchant shipping. He makes a vigorous plea for the upbuilding of the American marine through legislation recommended by President Harding, which was based on a report of the Shipping Board Committee of experts, of which Mr. Lissner was chairman. Mr. Lissner is one of the Pacific Coast representatives on the board and in his statement he discusses in particular the effect of the proposed measures on Pacific Coast shipping and correlated industries.

Commissioner Lissner declares that the necessity for Government aid to merchant shipping arises out of the higher costs of ships under the American flag than under the flag of any of the other and principal maritime nations. This higher cost of American operation results largely from higher pay to American officers

and crew, higher subsistence costs, and higher fixed charges for interest, insurance and depreciation on "our admittedly higher ship values."

Welding Steel Ships

The success which has attended the building of a ship in which rivets were eliminated in favor of electric welding forecasts a radical change in steel structural methods, comments the London *Ironmonger*, March 4. In a paper on "Electric Welding Applied to Steel Construction, with Special Reference to Ships," recently read before the Institution of Mechanical Engineers, A. T. Wall recounted the successes achieved and difficulties encountered in the attempt to grapple with the many problems involved in the building of steel ships. The all-welded motor ship, Fullagar, the completion of which was largely due to the efforts of the late Sir George Carter, has demonstrated that an electrically welded ship can carry out successfully the work of a sea-going carrier. This ship has now been in service for 18 months, and has encountered heavy seas, even receiving a minor indent on her side, but the welding has not started.

RAIL FAILURES

Discussed by Railroad Engineers—Good Showing of 130-lb. Rails

The American Railway Engineering Association held its twenty-third annual convention at the Congress Hotel, Chicago, on March 14, 15 and 16. The total registration was 687 members and 172 guests, or a combined total of 859, as compared with an attendance of 815 last year. New members added during the year just closed totaled 129, bringing the entire membership up to 1960. Simultaneous with the convention an exhibition of railroad supplies and materials was held at the Coliseum, Chicago, under the auspices of the National Railway Appliances Association. There were 176 exhibits in the hall.

New officers of the engineering association for the ensuing year were elected as follows: President, J. L. Campbell, chief engineer, El Paso & Southwestern, El Paso, Texas; vice-president, G. J. Ray, chief engineer Delaware, Lackawanna & Western, Hoboken, N. J.; treasurer, George H. Bremner, consulting engineer, Chicago, and secretary, E. H. Fritch, Chicago.

The report of the committee on rails was read by G. J. Ray, chairman. Rail failure statistics included in this report showed a continuous decrease in failures from 1908 to 1914, when the low point was reached, and a gradual increase in failures from that time up to 1917. The "war-time" rollings and particularly the rails rolled in 1917 are not showing up so well, due probably to the unfavorable manufacturing conditions that prevailed when they were made and also to the lack of usual care in the track that the railroads were able to give them during that time. The statistics are as follows:

Year Rolled	Average Failures Per 100 Track Miles				
	—Years Service—				
	0	1	2	3	5
1908	398.1
1909	224.1	277.8
1910	124.0	152.7	198.5
1911	77.0	104.4	133.3
1912	28.9	32.1	49.3	78.9
1913	2.0	12.5	25.8	44.8	69.5
1914	1.2	8.2	19.8	32.9	50.9
1915	0.7	8.9	19.0	34.2	53.0
1916	1.6	11.8	29.2	47.7	70.6
1917	5.3	21.6	38.9	66.0
1918	1.6	8.9	27.6
1919	2.0	14.8
1920	3.9

A recommended schedule for the inspection of steel rails was submitted for inclusion in the association's manual. Under this recommended practice inspection will be taken care of by a chief rail inspector, three or more assistant inspectors, a number of checkers and a chemist. The duties of each are outlined.

Piped Rather Than Segregated Ingots for Rails

In the discussion, Chairman Ray stated that the committee had paid particular attention to mill practice at various mills during the past year and as a result of these studies thought it best to prepare a new specification or to revise the old rail specification with a view to eliminating segregated steel so far as possible. He stated that a segregated rail is a dangerous rail compared with a piped rail, or a rail which has a natural lamination in the center due to the cavity in the top of the ingot. The committee is of the opinion that most of the trouble is due to split-head rails which are caused by bad segregation. Therefore, the new specification is being gotten up with the idea of producing an ingot which will contain what is known as piped steel, rather than segregated steel. Not that the railroads are looking for piped steel, but rather they wish to get away from segregated steel and want to give the manufacturer an opportunity to do that.

In touching on the same subject, C. W. Gennet, Jr., Robert W. Hunt & Co., Chicago, stated that experience has demonstrated repeatedly that the most constant cause of criticism of rails is the incessant fault found with the action of A or top rails in the track. It is plain that, until the mills generally adopt some method of casting hot-top and big-end-up ingots, the liability

of obtaining piped and segregated unhomogeneous steel in the top rail is so great as to require the adoption of more positive methods for combatting the difficulties.

Rail Metal A for Tie Plates, Etc.

Testing the top rail of each ingot is one method for protecting against the shipment of inferior metal. In lieu of such testing methods it has now been deemed practicable to provide for the disposition of the A rail metal by agreeing to its use in the form of hot worked tie plates. In fact, a new rail manufacturer, who has just entered the field, has provided facilities for the disposition into other products, including tie plates, of what would ordinarily be the A or top rail metal. It is hoped, Mr. Gennet said, that early in the future more mills may see their way clear to adapt themselves to such manufacture.

Good Records of 130-lb. Rails

W. C. Cushing of the Pennsylvania System indicated how the adoption of heavier rail sections was affecting failure records. He stated that it has been estimated that the 130-lb. rail on the Pennsylvania System outlasts the 100-lb. section by two and a half times and is worth 23 per cent more in reduced maintenance on heavy curvature districts. It has also been established that failures of 130-lb. rail on the Pennsylvania System are many times fewer than those of the 100-lb. section, notwithstanding the fact that they are located where the traffic and alinement conditions are the severest.

Government and Industry Co-operate in Standardization

At the request of Secretary of Commerce Hoover the American Engineering Standards Committee has designated A. A. Stevenson, the retiring chairman of the committee, to act as a special representative to work with the department in the co-operation between the department's division of simplified practice and the engineering standards committee. The work of the division of simplified practice was organized in the latter part of 1921. More than a hundred national organizations are participating through representatives officially designated by them.

The American Engineering Standards Committee is maintained jointly by 29 national organizations, including five departments of the Federal Government, nine national engineering societies and 15 national industrial associations. There are now similar national industrial standardizing bodies in thirteen foreign countries, all but one of which were formed during or since the war. Of these the British and the German work is the most extensive, but active and important work is going forward in other countries.

Mr. Stevenson, who is a past president of the American Society for Testing Materials and has had a most extensive experience in standardization work, is vice-president in charge of manufacture, of the Standard Steel Works Co., which is a subsidiary of the Baldwin Locomotive Works.

Started on Open Shop Basis

The Wheeling Steel Corporation has succeeded in starting up some of its sheet mills at its Beach Bottom, W. Va., works on an open shop basis after a shut-down of about nine months. This company declined to renew its agreement with the Amalgamated Association of Iron, Steel and Tin Workers in June, 1921. Efforts made to keep the Beach Bottom mills in operation on an open shop basis were unsuccessful and, business being poor, it was decided to shut down the mills. Some trouble marked the resumption, but since the first night the situation has been quiet. At the Yorkville, Ohio, works of the company, where the company is operating on an open shop basis, eight of the 24 hot mills now are on.

The Lindstrom Tool Co., Bridgeport, Conn., recently employed 150 additional hands in its toy manufacturing department, and will shortly put on 100 more, owing to several large orders recently received.

BETTER PLANT OPERATIONS

Improved Bank and Labor Conditions in Youngstown—Production Increased Moderately

YOUNGSTOWN, March 21.—Improved sentiment is unquestionably spreading in this center among iron and steel executives and banking interests. Production is being accelerated in a moderate way. The Youngstown Sheet & Tube Co. has blown in "D" blast furnace in its East Youngstown group, giving it three active stacks out of six, and increasing the total number of operating furnaces in the Mahoning Valley to 13, of 26. Finishing mills are averaging 55 per cent, with units devoted to the lighter products on a larger scale. Heavy steel production is still restricted.

But for the coal strike threat, additional stacks would be blown in. The Struthers Furnace Co., Cleveland, operating a merchant furnace at Struthers, Mahoning county, is preparing to start production as soon as unsettlement arising from the coal situation disappears. Both the Republic Iron & Steel Co. and the Brier Hill Steel Co. will likely blow in additional furnaces when this situation is cleared up. The former has two furnaces pouring and the latter one.

The Newton Steel Co., operating an electrically-driven sheet plant consisting of eight stands of roughing mills and eight stands of finishing mills at New Falls, Trumbull county, is contemplating an addition of six mills. This company has been in exceptionally good operating position for the past six months, fully 90 per cent of its output consisting of deep drawn stock which has proven acceptable as automobile body material. Its capacity is occupied fully 45 days ahead. No decision has yet been reached, however, to proceed with the additional capacity, but if demand warrants and business conditions continue to improve, the units may be installed this year.

New Orders Being Received

Consumers are not yet placing future tonnages with any degree of freedom, but mills are able to operate on week-to-week business with assurance that new orders will replace those being rolled. An indication of the situation is found in the fact that a recent appraisal of unfilled tonnage of the Sharon Steel Hoop Co., Sharon, Pa., showed no orders in excess of 100 tons, in a total volume of 16,000 tons. An independent at Youngstown, with 28,000 tons of unfilled orders at the close of last week, reports most of the business is in small lots, for which prompt shipment is desired.

An encouraging feature of the local situation is the increase in commercial bank deposits, which gained \$1,581,441, to \$42,321,118, during the 10-week period from Dec. 31 to March 10. Another significant factor is the seeking of loans due to enlarged demands for working capital by interests which had largely liquidated their bank indebtedness at the close of the year. Withdrawals from savings accounts at this time are insignificant as compared with the demand last summer and fall.

Bank statements are regarded as very satisfactory in view of withdrawals before March 10 for industrial payrolls and the recent payments of income, real and personal property taxes. A combined banking institution with close connections with the major steel groups in the Valley, reports liquidation of loans during the past ten weeks aggregating \$1,500,000.

"One of the encouraging features of the current situation is that stocks of steel supplies in hands of consumers are largely exhausted," states an independent executive. "Buying is in small lots, but is sufficient in the aggregate to give producers a fair tonnage volume. A larger volume of buying from regular sources is to be expected in view of these conditions."

No More Shrinkage of Inventories

"Further loss due to shrinkage of inventories is unlikely in this district, as Valley plants have made generous allowances for such depreciation. The earning situation will likewise improve as schedules ex-

pand, thus proportionately reducing overhead costs per ton."

Another executive states: "Liquidation is ended for the time being and we are trending upward. A definite turn has undoubtedly been reached in the market. Problems remain to be solved, of course, but never at any time, even when business was considered good, was the steel industry wholly free from troublesome factors."

The A. M. Byers Co., Pittsburgh, is planning to suspend its Mattie blast-furnace at Girard, Ohio, during the next three weeks, owing to accumulation of iron. By that time its ore yard will have been cleaned up and the company is buying additional tonnage. It will continue to operate its puddle furnaces at Girard on piled iron.

Sheet & Tube Company Operations

The Youngstown Sheet & Tube Co. has seven pipe mills on the active list, almost double its recent operating rate, while the Republic Iron & Steel Co. has four pipe furnaces fired. Valley sheet mill capacity is occupied to the extent of about 60 per cent. The Trumbull Steel Co. is operating all departments of its Trumbull and Liberty plants virtually at normal on tin plate, sheets and strips. The Falcon Tin Plate Co. is operating its recently acquired Canton property at 75 per cent, as compared with a recent schedule averaging 60 per cent. Following a suspension of several weeks, the Mahoning Valley Steel Co. resumed this week at its Niles plant, with six mills scheduled to roll tonnages covered by mixed orders for black and galvanized sheets.

Three merchant bar mills are being operated by the Republic company, chiefly on light bar business. Secondary steel establishments, such as the Truscon Steel Co. and the General Fireproofing Co., are expanding operations to meet improved requirements for their products.

In the Shenango Valley employment conditions are appreciably improved, due to enlargement in operations at the plants of the Carnegie Steel Co. and the American Sheet & Tin Plate Co. The latter interest is operating 62 of 100 hot mills at its Farrell and New Castle works.

Sales executives in the two Valleys do not regard current buying activity as a "flash-in-the-pan" movement, but one backed by sustaining influences.

Stabilization of wire products prices has stimulated buying in this division and has been responsible for enlarging active capacity to 75 per cent in this district, as compared with a level of 50 per cent, which was maintained for some time previous. Wire nails spread from \$2.40 to \$2.50 per base keg, while plain wire is generally held at \$2.25.

The Barney & Berry Co., Springfield, Mass., skates, etc., a subsidiary of the Winchester Co., New Haven, Conn., is gradually increasing its output and by May is expected to reach its capacity of 1500 to 1800 pairs of skates per day. Its roller skate season is about to close. The manufacture of bicycles has been temporarily abandoned.

The Franklin Automobile Co., Syracuse, N. Y., manufacturer of the Franklin motor car, has requested data from the Chamber of Commerce of Youngstown, Ohio, regarding available industrial sites. The company is considering erection of an additional plant for production of a lower priced automobile.

Supt. A. L. Cromlish of the Farrell, Pa., plant of the Carnegie Steel Co., announces that orders have been received to operate eight additional open hearth furnaces. Bricklayers, structural steel workers and laborers have been called to work.

The Singer Mfg. Co., Bridgeport, Conn., is operating its plants on a five days per week basis, starting March 20. The company had a three days per week run for over a year. A fifteen per cent cut in wages also went into effect last Monday.

GERMAN SMELTING ENGINEERS

Annual Meeting Discusses Change from Bessemer to Open-Hearth Process, Exports and Armor Plate

(Special Correspondence)

At a recent meeting of the Society of German Smelting Works Engineers, held at Düsseldorf, the president, Dr. Vögler, in reviewing the trend of developments in the German iron and steel industry since the war, resented the charge by the Ministry of Traffic and Transportation as to the piling up of profits by the industry during the war. The injustice and inaccuracy of this charge were strikingly shown, according to Dr. Vögler, by the fact that foreign debts incurred by the industry one year after the conclusion of war were exceeding the aggregate share capital of the works.

More Open-Hearth Steel Being Made

In the course of his address, Dr. Vögler touched upon the change in iron and steel production since the war. Germany's pig iron production in 1913 amounted to 19,300,000 tons, of which total 12,900,000 tons was produced in the territories now forming the German nation. Of the 18,900,000 tons of steel produced before the war, approximately 56 per cent was basic Bessemer steel and 40 per cent open-hearth steel. The output of works located in what now constitutes German territory amounted to 15,300,000 tons, with the ratio of basic to open hearth steel output about 47 to 48, or both processes had an almost equal share in steel production.

During the war, however, and even more so during the post-bellum period, this ratio has undergone considerable change to the detriment of the basic process whose percentage of the total output had receded to 34 per cent in 1920, with open-hearth steel comprising 60 per cent. Compared with pre-war production output of basic steel had therefore not reached 30 per cent of the 1913 figure.

Continuing, Dr. Vögler pointed to the serious aspect of the economic side of this change, for owing to the decline in basic steel production Germany was no longer a large exporter of phosphates but had become a buyer in the world's phosphate markets to the disadvantage of domestic agricultural interests.

Steel Export Movement

Turning to the export business, Dr. Vögler* said that in view of the aforementioned figures, which clearly revealed the extent of decline in steel production, he could not understand all the talk about Germany flooding the world with iron and steel products. Exports amounted to about 6,500,000 tons in 1913 as compared with only 1,700,000 tons in 1920, and the best figures for 1921 were slightly above 150,000 tons per month. Exports had thus reached only 26 per cent of the pre-war figure—a fact which was giving ample food for reflection.

[NOTE.—Dr. Vögler is obviously juggling with figures, which is a comparatively easy matter in view of the elasticity of the term "iron and steel products." According to the German official statistics, exports "iron and iron alloys and wares thereof" (which, course, includes steel), amounted to 1,750,601 tons in 1920, while the respective figures for the period May to October are given as follows: May, 129,847 tons; June, 162,297 tons; July, 177,773 tons; August, 240,071 tons; September, 225,331 tons, and October, 246,115 tons. These figures do not include machinery, electrical supplies, and vehicles.]

German Armor Plate

Then Dr. Ehrensberger, the Krupp armor expert,* read a paper on the history of armor plate production in Germany. The author gave a detailed survey of the early history of the process and the different stages of development. Production of the English compound plate, which was introduced in 1880 by the Dillingen

Hüttenwerke, was taken up by Krupp's in 1890. Collaboration by the Krupp and Dillingen works resulted in the production of a soft nickel steel plate in 1892 which equalled in efficiency a wrought iron plate 16 per cent thicker. In the same year, Krupp's succeeded in turning out a plate made of half hard nickel steel whose quality was improved upon by hardening in oil and subsequent annealing.

The first gas-carburized and water-hardened armor plate was produced in 1893 and exhibited at the World's Exposition at Chicago. This nickel steel plate was substituted in 1894, however, by a nickel-chrome steel plate, the so-called Krupp plate, whose efficiency equalled that of a wrought iron plate three times the thickness and possessing an incomparable toughness. This plate, which has been introduced by all navies and is still in use to-day, is produced in the basic open-hearth furnace from nickel-chrome steel having a carbon content of 0.35 per cent, a nickel content of 4 per cent and a chrome content of 1.75 per cent.

William B. Pollock Co. Resumes

The William B. Pollock Co., important fabricating interest of Youngstown, Ohio, will commence operations April 1 on a 50 per cent basis, working off a variety of business. The company has received orders for iron and cinder ladles, boiler drums and miscellaneous equipment, in addition to a contract from the Delaware River Steel Co., Chester, Pa., to replace its blast furnace. On business now on the books, the Pollock company's capacity will be engaged at 50 per cent for fully four months, states a sales executive.

The contract with the Delaware River Steel Co. provides for replacement of its stack from the foundations up, with exception of the stoves. Fabrication will be done at the Youngstown plant of the Pollock company, and the material then shipped to the site at Chester, Pa., where it will be erected by the Pollock interest's organization. Plate stock for the furnace has been largely purchased.

When completed, the furnace will have a capacity of 350 tons. The Delaware River Steel Co. is a merchant iron interest, consuming foreign ores largely and producing foundry grades of iron for the eastern trade. A distinctive feature of the new installation will be two Mullen dry gas cleaners and washers.

Sweden's Steel Industry in 1921

The year 1921 was the worst on record in the Swedish iron and steel industry, as most of the works were idle for the greater part of the year. Of 133 blast furnaces only 22, of 201 Lancashire hearths only 37, and of 80 open-hearth furnaces only 15 were working at the end of the year, according to the London *Ironmonger*. The pig iron produced was 308,600 tons, equal to 42 per cent of the average output before the war, and the exports, which in 1913 were 502,000 tons, last year only reached 147,000 tons. The domestic consumption was insignificant, owing to foreign competition, in spite of reductions of from 35 to 50 per cent in the Swedish prices. The shipments of northern iron ore from Narvik were well maintained, but those from Lulea were practically stopped, owing to the chaos in the Upper Silesian industry. The principal takers of the Narvik ores were the German Westphalian and Rhine works, which during the great part of 1921 worked at high pressure and absorbed over 3,000,000 tons of ore.

Wilton R. Olds, George E. Ingraham and A. J. Littlejohn have purchased the interest of Charles H. Wood in the C. H. Wood Co., dealer in machinery, tools and factory supplies, Syracuse, N. Y. The three men were elected directors at a recent meeting. Mr. Olds was elected president and general manager; Mr. Littlejohn vice-president, and Mr. Ingraham secretary and treasurer. Mr. Olds has been vice-president and manager of the company for a number of years, and previous to that he was connected with the Burbans & Black Co., wholesale hardware dealer.

EUROPEAN FOUNDRY PRACTICE

New German Method to Desulphurize Cast Iron —Using Old Sand—Coke Gas Producers

Dr. Richard Moldenke was the guest at the March meeting of the New England Foundrymen's Association, held Wednesday, March 8, at the Exchange Club, Boston. The subject of his address was "Recent Developments in European Foundry Practice."

Most of the new developments, of which he talked, concerned those in Germany, and were the direct result of the war. Certain things were concealed during his inspection of various plants and processes and since then German interests have not been able to patent their processes in this country; consequently, Doctor Moldenke was frank to state he was not in a position to explain in detail some of the things he discussed.

For instance, the Germans had discovered a new process for desulphurizing cupola iron. The metal is run from the cupola into a ladle and the slag removed. The contents of a package, about the size of a cigarette box, are then thrown into the ladle, which the metal absorbs in about two and one-half minutes. The original sulphur content of the iron is reduced about one-half if the slag is removed. The contents of the

package are in powdered form. Doctor Moldenke said it might be potash, or possibly potash plus some ferro-alloy. Whatever it is, it is cheap, and affords a method of securing better castings in this country by the small foundry owner who cannot afford an electric furnace, or the expense of large percentage pig iron cupola charges, the two other methods of reducing sulphur.

In Doctor Moldenke's opinion the Germans have not progressed as far as we have with the electric furnace. Great progress has been made in Germany, however, in methods of handling molding sands. By regrounding, etc., they are able to use such sands many times and, in so doing, produce finer castings than they did before the war. He also touched on a new type of gas producer used in steel mills. This producer is practically a small blast furnace, 10 ft. high and 7 ft. in diameter. These producers are charged with coke and 2-lb. air pressure is supplied by centrifugal blowers. No steam is employed. Each charge produces, besides gas and slag, a small amount of 12 per cent manganese pig iron, which, it is claimed, pays for the cost of operation of the gas producer.

About 120 members of the association attended the meeting. E. H. Ballard, president, presided. He announced a committee has been appointed to prepare a question box to be brought up at future meetings, and that electric furnaces and non-ferrous metals will be the subjects at forthcoming meetings.

Better Co-ordination of Cost and Production Methods Advocated

That in the majority of factories the relation of cost accounting to production methods is not what it should be was an opinion expressed by Horace G. Crockett, supervising industrial engineer, Scovell, Wellington & Co., New York, at a meeting of the Society of Industrial Engineers, New York chapter, held in the Engineering Societies Building, March 14.

In Mr. Crockett's talk which was on the relation of cost accounting to production methods, he pointed out that in many factories where excellent production control is maintained the cost system utterly fails to reflect conditions. In other plants elaborate cost systems have been built up on an entirely wrong foundation of production methods. "On the one hand we have an excellent production system," he said, "but the management is without any good measuring device with which to determine what it actually accomplishes for them. In the other case we have a good cost system which balances beautifully and ties in with the general books, but tells little or nothing except the net profits at the end of the month."

One of the chief causes for this discord between cost and production in many factories is a lack of understanding or appreciation on the part of the various individuals of the other man's job, Mr. Crockett said. The production engineer is inclined to think that if he follows standards of time and quantity very closely, the dollars take care of themselves. Production managers have been inclined also to look upon cost accounting as a necessary evil, to be performed by a good clerk and that the whole aim and object of a cost system is to determine the cost of the article sold.

"We have come to realize," he said, "that that is not by any means the sole function of a cost accounting system. The title cost accounting in itself is somewhat misleading, and perhaps factory accounting would be better. The value of a cost system is in direct ratio to the information that it supplies, not only about the cost of products, but the cost of every activity of importance in the factory, and provided that information is presented in the way it can be used best by the men responsible for reducing costs, decreasing expenses and maintaining efficient control."

Topical questions discussed by Mr. Crockett included: How much do your foremen know about your costs—not only costs of product, but costs of operating their departments, subdivided according to the activities they control and measured according to proper standards? He pointed out that in many plants the foreman never sees cost or expense figures, although

he is the man who must see that standards are realized and results accomplished. In this connection he emphasized again the necessity of the cost accountant's giving consideration to the information that he should be supplying. "Many cost accountants seems to think that the factory is organized to supply them with certain figures, so that they can close their books at a certain time of the month," he said. "They do not realize that their most important function is the kind of information that they give back to the manufacturing executives."

Another topical question taken up was: Was your cost system built up from the factory or down from the office? It should be built up from the factory, he said.

Money or profit is the motive behind the manufacturing activity, he continued, and in the last analysis it is the figure that appears at the bottom of the profit and loss statement as the net profit from operations that tells the story. The executive controlling the business is interested in dollars and cents of profit and he is going to start investigations and enforce economies accordingly as the final net profit figure is favorable or otherwise. The production engineer must realize that while it is true that if you set proper standards of time and quantity you can measure your performance by the degree you approach those standards in time and quantity, and without the aid of dollars and cents, you must have that additional information if you are to know which particular product or operation needs attention.

L. B. Dorr, general auditor, Robt. H. Ingersoll & Brothers, New York, addressed the meeting on merchandise inventory control, explaining in detail the physical double-entry accounting operated by his company. Joseph Mayer, National Industrial Conference Board, and president of the New York chapter, presided.

The Carbon Limestone Co., Youngstown, Ohio, is now shipping flux-stone for blast furnaces in the Valleys at the rate of 35,000 tons a month. During the low point in the industrial depression, shipments had virtually ceased for a time owing to reduced blast furnace operation. In 1921 the company shipped 30,000 tons of agricultural limestone, but shipments are now at the annual rate of 50,000 tons.

F. E. Carnick and others have organized the Valley Steel Co. at Youngstown, Ohio, which will take over the business of Carnick Bros., dealers in scrap metals and iron and steel products. The old organization of Carnick Bros. remains with the new interest.

TRADE ORGANIZATIONS

Objects of Conference to Be Held April 12 with Secretary Hoover

WASHINGTON, March 21.—Representatives of national trade organizations will hold a conference in Washington on April 12 with Secretary of Commerce Hoover to discuss methods of co-operation between the Department of Commerce and associations concerning statistical information. In order to make another trip to Washington unnecessary, the National Association of Manufacturers has called a meeting to be held in Washington on April 11 of manufacturers and others interested in the subject of the production and use of industrial motion pictures as an aid to American industry. The association is co-operating with the department, with regard to both subjects and will supply him with a preliminary print of the results of its questionnaire directed to trade associations. This print will be made available to Secretary Hoover for use in connection with the meeting of April 12.

The purposes of the conference with representatives of trade associations have been announced by Secretary Hoover as follows:

Securing a list of trade associations that will furnish voluntarily to the Department of Commerce the classes of statistical information outlined in the correspondence between the Department of Commerce and the Department of Justice, published on Feb. 16.

Discussing and considering means and methods that may be best adapted for collecting and forwarding to the Secretary of Commerce, for dissemination, the classes of statistical information outlined in the correspondence referred to, including the forms of reports that will be most suitable, for associations that are willing to furnish such statistical information.

Discussion of the manner in which such reports of the statistical officer of the associations are to be filed with the Department of Commerce, and the manner and method of distributing the information to the members of the associations and to the public.

Tentative Program for Foundrymen's Convention.

A tentative program for the annual convention and exhibition of the American Foundrymen's Association in Rochester, N. Y., June 5 to 9, is announced as follows:

Monday, June 5

Morning: Opening of exhibits.
Afternoon: Joint general session of A. F. A. and Institute of Metals Division, A. I. M. E. Address of welcome, response, etc.

Tuesday, June 6

Morning: Gray iron session.
Afternoon: Steel and non-ferrous sessions.

Wednesday, June 7

Morning: Steel and non-ferrous sessions.
Afternoon: Industrial relations session.
Evening: Annual banquet.

Thursday, June 8

Morning: General session, molding sand symposium.
Afternoon: Special entertainment features.

Friday, June 9

Morning: Malleable session; final business session, 5 P. M., close of exhibits

Committee Chairmen of American Foundrymen

The chairmen of the important committees of the American Foundrymen's Association are announced as follows:

Papers: Robert M. Kennedy, 909 West California Street, Urbana, Ill.

Convention and Exhibits: W. R. Bean, Eastern Malleable Iron Co., Naugatuck, Conn.

Awards: G. H. Clamer, Ajax Metal Co., Philadelphia.

Promotion and Membership: Alfred E. Howell, Somerville Stove Works, Somerville, N. J.

Nominating: Benjamin D. Fuller, Defiance Paper Co., Niagara Falls, N. Y.

Foundry Costs: J. Roy Tanner, Pittsburgh Valve, Foundry & Construction Co., Pittsburgh.

Safety and Sanitation: Benjamin D. Fuller, Defiance Paper Co., Niagara Falls, N. Y.

Industrial Education and Training of Apprentices: C. B. Connelley, Department of Labor and Industry, Harrisburg, Pa.

Steel Foundry Standards: W. A. Janssen, American Steel Foundries, Chicago.

Standard Pattern Practice: Vaughan Reid, City Pattern Works, Detroit.

Advisory to U. S. Bureau of Standards: Richard Moldenke, Watchung, N. J.

April Meetings of Steel Electrical Engineers

Scheduled meetings in April for the Association of Iron and Steel Electrical Engineers include the following:

April 10, Cleveland, topic: "General Use and Abuse of Flexible Steel Ropes in Steel Mills."

April 15, Pittsburgh, topic: "Selective Switching, Including Overload and Reverse Relays and the Interconnecting of Large Power Plants."

April 18, Philadelphia, topic: "Wireless Telegraphy, Telephony and Radio Control."

April 22, Pittsburgh, topic: "Heating Furnaces."

Some time during the month an inspection trip will be made to Wheeling, W. Va.

COMING MEETINGS

April

National Federation of Construction Industries. April 3, 4 and 5. National conference, Drake Hotel, Chicago. Association headquarters, Drexel Building, Philadelphia.

National Metal Trades Association. April 19 and 20. Annual meeting, Hotel Astor, New York. Secretary, Louis W. Fischer, Peoples Gas Building, Chicago.

American Gear Manufacturers' Association. April 20, 21 and 22. Annual meeting, Hotel Lafayette, Buffalo. Secretary, F. D. Hamlin, 4401 Germantown Avenue, Philadelphia.

American Supply and Machinery Manufacturers' Association and Southern Supply & Machinery Dealers' Association. Joint Meeting, April 24 to 26, Birmingham. F. D. Mitchell, 233 Broadway, New York, is secretary of the American association and A. M. Smith, Smith-Courtney Co., Richmond, Va., is secretary of the Southern association.

National Machine Tool Builders' Association. April 25 and 26. Spring convention, Hotel Traymore, Atlantic City, N. J. General manager, E. F. DuBrul, 817 Provident Bank Building, Cincinnati.

Society of Industrial Engineers. April 26 to 28. Spring meeting, Hotel Statler, Detroit. George C. Dent, business manager, 327 S. La Salle Street, Chicago.

American Electrochemical Society. April 27 to 29. Spring meeting, Baltimore. Acting secretary, Dr. Colin G. Fink, 110 Park Avenue, New York.

May

Iron and Steel Institute. May 4 and 5. Annual Meeting. Quarters of Institution of Civil Engineers, London, England. Secretary, George C. Lloyd, 28 Victoria Street, S. W., London.

The National Supply and Machinery Dealers' Association. May 8, 9 and 10. Seventeenth annual convention, Marlborough-Blenheim Hotel, Atlantic City. Secretary, T. James Fernley, 505 Arch Street, Philadelphia.

American Society of Mechanical Engineers. May 8 to 10. Spring meeting, Atlanta, Ga. Secretary, Calvin W. Rice, 29 West Thirty-ninth Street, New York.

National Association of Manufacturers. May 8, 9 and 10. Annual Convention, Waldorf-Astoria Hotel, New York. General offices, 50 Church Street, New York.

National Foreign Trade Council. May 10 to 12. Convention Hall, Philadelphia. Secretary, O. K. Davis, 1 Hanover Square, New York.

National Sheet Metal Contractors' Association. May 15 to 19. Convention and exposition, Cadle Tabernacle, Indianapolis.

National Association of Purchasing Agents. May 15 to 20. Annual convention and exposition, Exposition Park, Rochester, N. Y. Secretary, H. R. Heydon, 19 Park Place, New York.

American Iron, Steel & Heavy Hardware Association. May 22 to 25. Annual meeting, Hotel Washington, Washington. Secretary, A. H. Chamberlain, Marbridge Building, New York.

American Society for Steel Treating. May 25 and 26. Sectional meeting, Pittsburgh. Secretary, W. H. Eisenman, 4600 Prospect Avenue, Cleveland.

Owned by the United Publishers Corporation, 243 West 39th Street, New York. H. M. Sweetland, *Treas.*, Charles G. Phillips, *Vice-Pres.*, A. C. Pearson, *Treas.*, F. J. Frank, *Secy.*

BRANCH OFFICES: Chicago: Old Building. Pittsburgh: Park Building. Boston: 410 Unity Building. Philadelphia: 1120 14-2 Widener Building. Cleveland: Guardian Building.

Detroit: 317 West Fort St. Cincinnati: Mercantile Library Bldg. Buffalo: Elliott Square Building. Washington: 816 Fifteenth St., N. W. San Francisco: 320 Market St. London, Eng.: 11 Haymarket, S.W.1.

Subscription Price: United States and Possessions, Mexico, Cuba, Shanghai, \$6.00; Canada, \$8.50; Foreign, \$12.00 per year. Single copy 50 cents.

Entered as second class matter, June 18, 1879, at the Post Office at New York, New York, under the Act of March 3, 1879.

The Lack of Invention

In the readjustment that has already been under way for a year and a half we are being faced with a number of unpleasant truths. The surpluses built up in years of apparently large profits are found to be partly fictitious. We cannot receive individually more of this world's goods in proportion to the service we render; in other words, the war did not automatically furnish us a higher standard of living. We cannot sell goods to nations that are unable in their turn to sell. There are various other unpleasant truths.

Some of these truths that are almost staring us out of countenance are closely associated with illusions that sprang up during the war. As to the "higher standard of living," for illustration. Before the war, no one would have been considered safely at large if he had proposed: "Let us have a great war, killing many people, and destroying a great deal of property, and wasting much time. Then each of us will be able to get more goods for the amount of work we do." Yet during the war just such a belief took shape. The unpleasant truth facing many people now is that this was an illusion.

Likewise during the war there sprang up a belief that after the war there would be a great period of construction throughout the world, and that this construction work would make everybody prosperous. That was an illusion. One misconception that fostered it was that prosperity results from construction, the truth being that construction results from prosperity. The prosperity is due to what may be called in a broad sense "savings." Using the words in the most general way, we save and invest the savings. In a narrow sense, a man saves money and then invests the money, but in the broadest sense a people can save, in money, in materials and in time and effort, and use the surplus created in the production of permanent facilities or wealth.

One of the ways in which mankind has saved in the past has been by invention. The cotton gin, the harvester, the sewing machine, the linotype, innumerable inventions, all resulted in the saving of time, and the time saved has been used in various ways; thus we have become better off, we have progressed or prospered.

Added to the unpleasant truths already gener-

ally recognized that we must now face is the fact that the past eight years have been particularly bare of inventions enabling us to save. There has been some progress, but not much. Three great new things that we have are the automobile, the cinema and the wireless. Each has effected a saving, but very little compared with the time and energy we spend on them. Each represents in a large degree a luxury or pastime. They do not help us to do things more expeditiously or more easily to an extent that enables us as a nation to save.

A good point about new inventions is that they effect so promptly an improvement in business. It is not necessary to wait until the savings they promise have accumulated, for business to improve. As soon as the merit of a new idea is recognized capital is invited, facilities for employing the invention are created and materials are bought. Relief is afforded from the condition of some industries being overbuilt. As a rule in all the past some things have been overbuilt while others have been underbuilt. There are overbuilt industries now, but with the usual supply of new inventions we should have also underbuilt industries, and thus the situation would be relieved. What we must and will do is to invent, bring out new things that will make a market for themselves.

While the value of iron and steel shares is not always an indication of business conditions at the time, the trend in securities is often significant. A compilation made in Great Britain shows that in the case of six iron and coal companies, nine iron, steel and engineering companies and 24 iron and steel companies, the average of market values of the 39 stocks at the peak on March 31, 1920, was 163.9 per cent of the par value. After that date the decline was steady, with one exception, until on Feb. 14, 1922, the market average was 79. In the case of the 24 iron and steel companies, the peak was 148 on March 31, 1920, and the low point on Feb. 14, this year, was 73.8. At the really critical period in the British steel industry, in the second quarter of last year, when operations had virtually ceased because of the coal strike, the percentage figure was 89.6 on June 30, 1921. Despite a marked revival in the industry up to the present time, par-

ticularly with January exports exceeding those of any other country, the stock market index is at the lowest point in over two years.

World Movement in Steel

Some striking changes are shown by an analysis of the iron and steel export statistics of the leading producing nations for 1921, which recently have been made complete. The figures for last year, compared with those for 1913 and 1920, are as follows in thousands of gross tons:

	1913	1920	1921
United Kingdom	4,969	3,251	1,700
United States	2,892	4,706	5,180
France	678	895	1,525
Belgium	1,546	892	904
Germany	*6,203	1,723	†1,607
Total	16,188	11,467	7,916

*Luxembourg included. †Eight months, May to December.

The first fact that stands out is that in 1921 the total movement of 7,916,000 tons was about 70 per cent of the exports in 1920, despite the world-wide depression. Compared with the iron and steel production in the same countries the difference is marked, because the 1921 pig iron and steel output was only 53 per cent and the steel output 56 per cent of the 1920 figures. The conclusion is that a liquidation in stocks took place last year which was world wide.

A second striking feature of these data is the pronounced rôle of France. Not only did that country exceed in 1921 its sales in 1920 but they easily surpassed the pre-war record in 1913 by nearly threefold. France is also the only country whose exports last year not only suffered no diminution as the year progressed but also exceeded the pre-war record. With the acquisition of German capacity, France has been compelled to find new outlets in foreign trade.

One important development is not shown in the above table, and that is that at the close of the year Germany was leading all other countries in iron and steel exports, with Great Britain, France, the United States and Belgium following in the order named—a marked reversal of the position obtaining early in the year.

The volume of international trade in steel last year was less than 49 per cent of what it was in the year before the war, and it is likely to be some years before these countries will equal or exceed combined exports of over 16,000,000 tons. Even in the boom of 1920, the total was far from reaching 1913 proportions. When world demand again approaches the pre-war scale the old alignment need not be expected, but whether the United States can improve on third position will depend on the right settlement of some questions of national policy in which the outcome is none too clear at this writing.

As was to be expected, the personnel of a Washington local organization aiming at establishing the metric system in this country is largely, if not wholly, made up of those who have no real stake in the change. The translator who has to convert metric units into those of the English system would like, of course, to be relieved of the job, but he has no machinery, jigs, fixtures or equipment to scrap. Pro-metric advocates try periodically to gain the

limelight but they find it hard to arouse sustained interest outside of industrial circles; and it is in the outside fields that they must get adherents, those who do not know the other side of the question. So long as these missionaries for the metric system remain with us, so long will it be necessary to maintain educational bureaus to controvert the plausible arguments addressed to the man who can sign his name to a petition with entire immunity from the heavy loss a metric law would visit upon industry.

Liquidation of Metal Prices

Since the peak was reached in April, 1920, the prices of metals and metal products, reported monthly by the Bureau of Labor Statistics, have fallen steadily, with three insignificant interruptions, from an index of 195 to 115. In other words, while these prices were 95 per cent above the 1913 average, two years ago, they are now only 15 per cent above that average and are, incidentally, much nearer to the 1913 figures than any other of the nine groups reported upon by the bureau. Only in July and August of 1920 and in October of 1921 was an advance recorded in this group above the previous month, these advances being respectively 1, 2 and 1 points.

No other group in the entire list can show in the same measure the steady decrease in price recorded by the metals group. All of the others have had their marked ups as well as downs, and the only ones which have been comparable with metals in their ratio of liquidation have shown substantial increases over low points reached last June. Thus, farm products stand now at 126 as compared with 116 in January and 113 last June and food products stand now at 138, as compared with 134 in January and 132 last June.

Much has been said, in Congress and out, of the plight of the farmer. His prices, after being considerably higher than those of metals, fell in October, 1920, for the first time below the metal figures. They kept consistently below the metal figures until last September, subsequently having been both above and below, due to fluctuations month by month. They are now 11 points higher than metals, while last June they were 19 points under metals. This shows a 30-point change between metals and farm products, the metals taking the lower prices.

In liquidation of prices from the 1920 peak, metals have lost 84.2 per cent of the excess of that peak over the 1913 average. Farm products, figured in a similar manner, have liquidated 82.2 per cent; food, 79.7 per cent. All commodities averaged show a liquidation of 70.4 per cent, but none of the separate groups, except the three mentioned, shows so much liquidation as 70 per cent.

It will be evident that the drop in metal prices has been brought about largely by the steady drop in pig iron and finished steel, as indicated week by week by THE IRON AGE composites, and partly by the drop in copper and other non-ferrous metals, which began long before steel started to drop, and in which prices have lately shown signs of stiffening. Steel and iron of course are the

dominant factors in the metal and metal products groups, hence the steady down grade of the index for that group is a reflection, largely, of the status of the iron and steel market.

The Bituminous Coal Strike

The small chance there may have been of the walkout at the bituminous coal mines being averted seems to have disappeared when representatives of District No. 5, United Mine Workers, failed to accept the proposal of the operators of the Pittsburgh district that a wage agreement conference be held last Monday. The United Mine Workers remains firm in its stand that it will not negotiate anything with the operators except a national agreement, while the operators are equally firm that they will enter into no negotiations looking toward a national agreement. In most districts, if not all, the operators are willing to negotiate with the men in their respective districts.

The desire of the United Mine Workers for a national agreement is a natural one, but as wage agreements are usually made a national agreement means a national scale. That is the case, for instance, with the scales of the Amalgamated Association, which prescribe wages for a sheet mill, tin mill or iron mill irrespective of its location. With carpenters, printers, and other workers having national organizations, scale agreements are made by local and not national conferences. The practice in determining bituminous coal wage scales has been unique, in that agreements have been reached between the United Mine Workers and a certain group of operators, viz., those in the so-called "central competitive field," Pennsylvania, Ohio, Indiana and Illinois. Scales for other districts were derived from this basic scale, the operators concerned having had no voice in determining the basic scale.

While the breaking up of the central competitive field, through the operators of Ohio and Pennsylvania last December refusing to continue the arrangement, has appeared to be the chief cause of the failure of the usual system to operate, the fact is that the operators of other districts are strongly opposed to the system. Some of them have expressed to Secretary of Labor Davis their opinion of the system in vigorous language.

The failure of the machinery to produce a conference is, however, really only an incident. If the four-State conference had been held, there would have been a disagreement. If scale rates could have been agreed upon, which is very doubtful, the parties certainly would have split on the check-off. The operators are absolutely opposed to continuance of the check-off, while the officials of the United Mine Workers cannot see a prosperous future for themselves without it.

The miners cannot view the check-off in exactly the same spirit as their officials, since the money involved in the check-off is money that the miners pay, while it is money the officials receive. Naturally that makes a difference.

The prospective suspension is different from many that have preceded it, in that the objective is plainly a reduction in the cost of coal to the consumer. In not a few suspensions in the past the outcome was an advance in the market price of

coal, whereby the operators became willing to grant the miners higher rates than seemed feasible before April 1.

The weekly reports of coal production indicate that the country is well stocked, for the increase in production since the beginning of the year has been much greater than would be accounted for by any conceivable increase in consumption. Production has risen to 11,058,000 tons in the week ended March 11, against an average in the closing weeks of the old year of scarcely more than 7,000,000 tons a week, when domestic requirements were heavier than of late. Rarely if ever has a prospective mining suspension been so well advertised long in advance. Separate evidence of the large stocks held by consumers is seen in the softening of coal prices within the past two or three weeks.

Demand from Japan was an important factor in American iron and steel exports during the war. The movement continued in 1919 and 1920 when the monthly averages of exports to Japan were 56,900 and 56,400 tons. Following the Japanese financial crash there was a marked falling off to only 25,600 tons per month in the first half of 1921, with an average for the last half of 31,500 tons per month. November and December last year showed a recovery to nearly the rate of 1920, exports in the two months being 52,900 tons and 56,400 tons respectively. In fact, apart from these shipments to Japan our total iron and steel exports in those months would have been only 70,000 tons and 73,600 tons, or on a parity with those of Belgium, which in 1921 were 75,300 tons per month.

CORRESPONDENCE

Mexican Trade Going to Europe

To the Editor: It is deplorable the way American manufacturers and exporters are letting Europe get away with Mexican business. It is quite true that some American firms are getting business from the Tampico-Tuxpam oil fields and also some business from mines. But the bulk of the machinery, hardware and iron and steel trade is now going to Europe. It is going to take a long time for Americans to get these customers back, if ever, and if any effort is going to be made toward this end, it will have to be put forth now without waiting on recognition.

I recently made a hurried business trip into northern Mexico and I found importers of German, English, Spanish and French goods of all kinds taking advantage of the situation, and while they work they are praying that our Government will continue to delay indefinitely extending recognition to the present Mexican Government.

The average representative of American manufacturers who visits Mexico gets his information mostly at foreign club sessions and directly from parties interested in keeping a status quo as far as America and Mexico are concerned. Unfortunately, these representatives do not always speak the language of the country and thus are handicapped further in their investigations. Another unfortunate feature is that some representatives of our own Government make reports that are quite as indiscriminating.

The bugaboo of long-time credits necessary to do business in Mexico is constantly held up before the American exporter. Few manufacturers and exporters, except those who have trusted representatives on the ground, realize that this much advertised handicap is being overcome by European firms whose bank bal-

ances (especially since the war) do not seem to justify extending long credits.

The ordinary way by which European companies overcome this handicap is to add enough to the price so that an attractive discount can be given on any paper accepted by the seller. Contrary to the usual belief, the money stringency in most parts of Mexico is no worse now than it is in the United States, and many times a Mexican firm will discount its own paper. Then, too, the banks in different localities do not hesitate to discount paper of merchants and others having good standing, especially at the attractive rates offered.

While the average American is in the dumps about losing European trade, he is overlooking a market right

at his door, and is letting his foreign competitor get firmly established in a market that rightfully belongs to the United States.

This is not an argument for recognition of Mexico, but is simply a statement of facts. If American business sits back and waits for formal recognition much longer, trade with Mexico will dwindle to a point that will include only those things that cannot be purchased in Europe. Our exports to Mexico, even during the ten years' revolution, have run large figures, as consular reports will show. Shall we sit down and calmly look on, without an effort to save what business we have down there?

CHARLES L. SMITH.

El Paso, Tex., March 15, 1922.

IMPROVEMENT IN PICKLING

New Compound Developed to Retard Acid Attack on Sound Metal

BY GEORGE W. EMLÉN, JR.*

ONE department of almost every steel plant that everyone avoids like the plague is the pickling house. Clouds of evil-smelling steam and poisonous gases make it an excellent place to stay away from. This probably accounts for the fact that there is less scientific knowledge of pickling problems than of those of other important departments of the steel industry. It is curious to contemplate that, in some of the most carefully supervised steel mills in this country, the pickling process is left more or less to haphazard and its operation often entrusted to the care of ignorant men, in a way that would be considered extremely slipshod in any other of the major operations.

This condition leads to more than one grave result. In the first place, the fact that workmen may be forced to breathe in an atmosphere that is heavy with acid-laden steam needs no comment. The presence of these acid fumes and steam works untold damage to hoists, cranes and other incidental metal work necessary to the pickling operation.

Economy in the use of acid is another feature that would seem to be strangely overlooked. It is a well-accepted theory in many steel plants that high temperatures speed up the pickling operation, but it is an absolute fact that the steam caused by such temperatures carries with it a considerable volume of free acid which not only does damage to surrounding objects, but is carried off and lost. Moreover, there are methods of greatly prolonging the potency of the pickling bath which we shall take up later. Too often the strength of the bath is guessed at after a considerable amount of metal has gone through, with the result that it frequently is considered exhausted when there may be a large proportion of effective acid still available. Sometimes the pickler judges of the bath's condition by feel, taste or appearance, any one of which may be misleading.

Acid Attack on Metal

Another troublesome but little understood condition is acid attack on the sound metal. The object of pickling, as we all know, is to remove oxide scale. This removal is brought about by acid attack on the metal itself and the evolution of hydrogen gas, brought about by acid-metal contact, causes the scale to flake off. Unfortunately, as the layer of scale is seldom evenly distributed on the steel, it follows that good, clean metal is subject to acid attack, while an adjacent portion is being cleaned. Blisters, brittleness, stains, after-sweating and other evils are the result of prolonged acid attack on metal, not to mention an actual loss of weight of the steel itself, which will run to impressive figures after many thousand tons have been pickled.

English and German steel makers have stolen a march on us when it comes to pickling. An organic compound known as "piclette" has been invented which, when added in minute proportions to the acid, seems to have the effect of practically eliminating the

evolution of hydrogen in the pickling bath. It follows that the acid breaks up with far less rapidity than usual, with the result that about 50 per cent more metal can be cleaned in a given bath. It seems that acid so treated with piclette removes the scale without attacking the underlying steel to anything like the usual degree. Hence there is a uniformly better surface on the steel after pickling; blisters, brittleness, after-sweating, etc., are done away with and there are practically no bad fumes given off from the bath.

Working Method

Naturally, no one need suppose that a small dose of piclette will immediately end all his pickling troubles. Like anything else, it has to be handled with intelligence and by following definite rules. The quality of the steel pickled has a good deal to do with the results obtained. In general, however, the following directions apply: It must be added to the raw acid before dilution in the proportion of 0.10 to 0.15 per cent—say about 3 lb. per ton of acid. The temperature of the bath must be kept at about 140 deg. Fahr. Piclette breaks up under higher temperatures, and slows up the action of the bath if a much lower temperature be employed. A fairly strong solution of acid with water is preferred and, where higher temperatures have been the practice, a stronger solution will compensate for any loss of speed caused by lowering the temperature, and the presence of piclette will still effect an economy.

Exhaustive experiments carried out by J. E. Stead, D.Sc., D.Met., F.R.S., etc., have proved the foregoing statements; and the wide use of piclette in England and on the Continent is a further indorsement of its success.

The figures given above are based on the use of 60-deg. Baumé sulphuric or 17-deg. hydrochloric acid, but piclette may, of course, be adapted to different acid strengths. In fact, the whole subject of pickling is one which deserves considerably more study than has been generally given to it, and if such research be accompanied by an intelligent investigation of the new compound, there should certainly be important advances made in our knowledge of the subject. Specific reports on the application of piclette should be available before long, as the compound has now been introduced into a number of steel mills in this country.

German Ferroalloy Prices Advance Sharply

The renewed weakness in the mark exchange has had a striking influence on values of ferroalloys in Germany, says the *Metal Bulletin*, London, March 10. The market had been quiet for some time, but the rise in foreign exchanges has brought in a brisk—and at times almost panicky—demand for all descriptions. Ferrosilicon, 45 per cent, has risen to 11,000m. per 1000 kilos, while 75 per cent registered a rapid advance to 20,000m. and over; buyers at about 24,000m. now appear to be unsuccessful in obtaining material. Meanwhile, 90 per cent alloy is not offered freely, not so much because a shortage exists, as in expectation of higher prices; the present value is nominal at 30,000m. Ferrochrome, which had been weak, has undergone a revival, present quotations being: Maximum 1 per cent carbon, 105m.; 2 per cent, 90m.; 2 to 4 per cent, 76m., and 4 to 6 per cent, 60m. per kilo.

*Manager Piclette Dept., Matthew Addy Co., Philadelphia.

MACHINERY CONSOLIDATION

Seven Machine Tool Companies and Other Interests Included in Merger Plans

A merger of a number of machine tool manufacturing companies, which has been under negotiation for some months, is likely to be consummated in the near future. Announcement may be made in the coming week of the completion of the new organization, as it is understood that only matters of detail remain to be arranged. Seven companies whose names have been commonly mentioned in connection with the consolidation are the Betts Machine Co., Rochester, N. Y.; the Colburn Machine Tool Co., Cleveland; the Newton Machine Tool Works, Philadelphia; the Modern Grinder Mfg. Co., Erie, Pa.; the Carlton Machine Tool Co., Cincinnati; the Lodge & Shipley Machine Tool Co., Cincinnati, and the Hilles & Jones Co., Wilmington, Del.

Though manufacturing a fairly complete line of machine tools for all purposes, the new company will be particularly strong in shop equipment for railroads.

The capitalization generally named in connection with the plans of the syndicate points to the inclusion in the new corporation of important companies outside of the seven named above.

Efforts to Prevent Coal Strike Not Exhausted

WASHINGTON, March 21.—Announcement was made this afternoon at the White House that the Government has not entirely ceased its efforts to prevent a strike of union bituminous coal miners on April 1. It is evident, however, that the Administration has only slight hope of bringing about a conference between operators and miners and of forestalling the strike. The little hope there was became even less with receipt of the report from New York that Philip Murray, international vice-president of the United Mine Workers of America, said the order for suspension of work in both the anthracite and bituminous union mines throughout the country would be issued later in the day. Federal court indictments which charged operators and union miners with conspiring to fix coal prices and damage non-union coal mines are held by operators as the reason for refusal to meet the miners.

President Lewis of the Mine Workers announced here yesterday that the policy to be followed by the bituminous miners when work is suspended on April 1 will be formulated at a conference to be held in Cleveland on Friday of the present week. The conference will be attended by 116 men who are members of the general policy committee of the miners' union, it was stated, and who will have full authority to conduct the affairs of the union during the strike.

Error Claimed by Attorneys for Federal Trade Commission

WASHINGTON, March 21.—Assignments of error constituting the basis of appeal in the Claire Furnace Co. cost reporting case were filed yesterday with the Supreme Court of the District of Columbia by Attorneys William T. Chantland and Jesse C. Adkins of the Federal Trade Commission. Efforts will be made to have briefs prepared at an early date in order to present the case before the Court of Appeals and possibly a decision before summer vacation begins.

Boston Molders' Strike

As a result of the failure of union molders and foundry owners of greater Boston to come to an agreement on a new wage schedule, the employees of eight or nine Greater Boston foundries failed to report for work on March 15 and, since then have remained out. The total number of men out on strike is approximately 175.

FAR EAST STILL ACTIVE

Rails and Bars Pending—South America Buys—Caucasian Manganese Ore Imported

NEW YORK, March 21.—The upward trend of Japanese buying continues strong, although it is still largely confined to government and private purchasing of rails, private buying of mild steel bars and some small black sheet business. With the approach of spring activity, there is a slight increase in inquiries for light gage black sheets, which, it is generally believed, will later approach a considerable volume. Government purchases for the railroads exhibit no tendency to decrease at present, but the recent stiffening of prices quoted on export rails will probably exert a deterrent effect upon continued placing of heavy tonnages with American mills. About 2000 tons of bridge material was recently placed by the Imperial Government through a large Japanese export house and there is another government tender, which closed March 20, in Tokio, calling for a small tonnage of mild steel square bars for making railroad spikes.

Among the railroad inquiries either pending or not yet reported awarded are 21 miles of 60-lb. rails for the Kongosa electric railroad, to be shipped c.i.f. Corea, and about 3000 tons of 75-lb. rails for the Tokaido Tetsudo K. K. Recent bar purchases have been small in proportion to the large number of inquiries of size that are in the market. One Japanese house has closed two orders, one of 555 tons, the other of 435 tons for $\frac{3}{4}$, $\frac{1}{2}$, $\frac{3}{8}$ and 1-in. steel bars and also about 800 tons of light gage black sheets.

There has been an active interest on the Pacific coast, particularly among lumber interests, in the purchase of Belgian and French rails. While a few have been bought, a number of the inquiries figured on during the past few months have not developed into orders. The recent report of a 25,000 ton purchase of Belgian rails by railroad interests on the Pacific coast can not be confirmed. A recent quotation, made on 60-lb. rails of Belgian origin, was \$40, c.i.f. San Francisco.

South American markets are improving, some activity being noted in black and galvanized sheets and No. 14 to No. 20 gage plain wire for redrawing cold. The present trade is largely confined to Argentine purchasers, although some business is reported from Rio de Janeiro, Brazil.

Increasing imports of manganese ores are indicated. One New York importer recently closed with an eastern furnace for 50,000 tons of 52 per cent manganese ore from the Caucasus to be shipped from Poti, Georgia. While the present market price of this ore delivered Atlantic port is probably not less than 25c. per unit, this contract is understood to have been made at 24½c. per unit. Only recently have shipments of this ore been possible and for some time it has been quoted above Brazilian manganese ore.

To Manufacture Doxford Diesel Engines at Chester

Arrangements have been made for the manufacture in this country of internal combustion engines of the opposed piston type. William Doxford & Sons, Ltd., Sunderland, England, have arranged with the Sun Shipbuilding Co., Chester, Pa., for uniting the interests of the American Junkers patents with the Doxford patents, which have been the basis of the developments forming the Doxford opposed piston two cycle engine, built by the British firm.

The Sun Shipbuilding Co. has secured the license for America and its possessions of the Junkers patents. An immediate start is to be made at the Chester works on the construction of a four-cylinder, 3000-h.p. single screw installation, being a duplicate of the Doxford manufacture, two of which engines are already at sea in the motor ships Yngaren and Dominion Miller.

The Standard Steel & Bearings, Inc., Plainville, Conn., has increased its working forces slightly because of better business.

Lowest Rate in Corporation's History

Average for Year 1921 Was 47.5 Per Cent of Capacity, as
Shown by Annual Report—Heavy Cost of Transportation an Important Factor in Causing Deficit

THE twentieth annual report of the United States Steel Corporation for the year ended Dec. 31, 1921 is notable for the brevity of the comments of Chairman Gary upon the remarkable reversal of conditions in 1921 as compared with 1920. His general remarks were as follows:

"The marked decrease in the demand for iron and steel products which developed in the midsummer of

operations and the exercise of rigid economies. A number of elements in the cost of producing steel show little, if any, recession from wartime figures, notably that of railroad transportation, which on basis of existing rate conditions averages in the case of the subsidiary companies upwards of 40 per cent of the total cost of producing steel. At the close of the year the prices prevailing for some products were below the

Less, appropriated from surplus net income on account of expenditures made on authorized appropriations for additional property and construction	30,000,000.00	— 30,000,000.00
Balance	†\$14,017,784.81	\$29,059,425.64	— \$43,077,210.45

*Balance of earnings after making allowances for estimated amount of Federal income and excess profits taxes
†Deficit provided from undivided surplus.

1920, continued until the early fall of 1921, when there was some improvement. As stated in the annual report for last year, the subsidiary companies carried forward into 1921 a substantial tonnage of orders for steel products. This enabled them to operate at an average of somewhat over 70 per cent of capacity during the first quarter. The degree of operations dropped in succeeding months and reached the low point for the year in July, when the output was only about 29 per cent. The average production for the entire year in rolled and other finished products for sale was 47.5 per cent of capacity, the lowest ratio of production to capacity in any year since the organization of the Corporation. Concurrently with the decrease in demand for steel products there were marked declines in the prices obtained for nearly all classes of the same. These price reductions as a rule exceeded the decreases it was possible to effect in the cost of production through the reduction in unit prices of factors entering into cost of

cost of production. Since the beginning of 1922, and to the date of writing this report, the new orders received have been equal to about one-half the total capacity of the plants of the subsidiary companies."

Volume of Business

The volume of business done by all companies during the year, as represented by their combined gross sales and earnings, equaled the sum of \$986,749,719, as compared with a total of \$1,755,477,025 in the preceding year.

This amount represents the gross value of the commercial transactions conducted by the several subsidiary companies, and includes sales made between the subsidiary companies and the gross receipts of the transportation companies for services rendered both to subsidiary companies and to the public.

The earnings for the year resulting from the above gross business represent the combined profits accruing

to the several corporate interests on the respective sales and services rendered, each of which is in itself a complete commercial transaction.

Capital Expenditures

The expenditures made by the Corporation and the subsidiary companies during the year for the acquisition of additional property, new plants, extensions and improvements, including net stripping and development

Less, inventory reserve	60,710,255	95,000,000
Balance	\$241,504,369	\$258,363,497

year for safety work was \$1,061,685, compared with an outlay of \$1,420,456 in the preceding year. The average number of accidents of all kinds per 100 em-

ployees in 1921 showed a decrease of 19.6 per cent compared with the previous year. The previously established low record for serious and fatal accidents was maintained. In comparison with the record in 1906, this class of accidents per 100 employees in 1921 was 53.2 per cent less than in the former year.

Accident Relief—The disbursements made by the subsidiary companies during the year for work accidents (including accruals not yet actually payable under State compensation laws) was \$4,409,211, compared with an outlay of \$5,634,263 in 1920. Of the total disbursed in 1921, upwards of 90 per cent of the same was paid or is payable directly to the injured employees or their families.

Sanitation—The expenditures made during 1921, in providing modern sanitary facilities throughout the

WORKING ON THE TARIFF

Rates Tentatively Agreed Upon May Be Changed by Senate Committee

Washington, March 21—Differences of opinion as to rates of duties and the composition of the free list still remain to be worked out in connection with a number of items in the permanent tariff bill and in consequence it still is being considered by the Senate Committee on Finance. It is understood that even where many duties have been determined upon they have been named tentatively only while the administrative features that have been the subject of considerable discussion have been proposed but not definitely prepared.

Most of the steel schedule is said to have been closed

plants, mines and departments, for the health and comfort of the employees, totaled \$3,615,150, compared with an outlay of \$4,227,263 in the previous year. At the close of the year there were in and about the plants and works 1989 comfort stations with adequate toilet facilities, including 21,814 washing faucets and basins, 3741 showers and 144,003 lockers, also 3979 sanitary drinking fountains.

Housing and Welfare—In addition to the capital expenditures made during the year for additional housing facilities for employees and development of town sites in connection therewith, previously mentioned in this report, the subsidiary companies had at the close of 1921 advanced or loaned to employees the net sum of \$8,479,031 on contracts or mortgages, carrying interest at 5 per cent and payable in installments over a long period of years, to assist them in the construction or purchase of homes under the Corporation's home-owning plan. The efforts of the subsidiary companies in general welfare and educational work for their employees and their families have been consistently continued.

Pittsburgh Foundrymen's Association

Louis L. Vayda, Bacharach Industrial Instrument Co., Pittsburgh, was the speaker at the regular monthly meeting of the Pittsburgh Foundrymen's Association at the General Forbes Hotel last evening, giving an interesting talk on the blast meter, a product of his company for recording the velocity and volume of air passing through the intake into the combustion chamber of the cupola. The association was asked to indorse the standard pig iron contract which is being advocated by the National Association of Purchasing Agents, but deferred action pending the report by a committee which will study the contract and report at the April meeting of the association.

tentatively, with the hope that it may be permanently left as it is for reporting to the Senate, but there still are some products upon which the committee has not reached an agreement. The principal ones relate to manganese ore and ferromanganese, according to reports, and it is said the committee will vote on these items tomorrow.

Manganese ore had already been placed on the free list, according to a well-informed source, but protests are said to have followed the report that this had been done and to have had the effect of bringing the subject up again. The disposition of ferromanganese had not been decided upon even tentatively, it is said, but consideration has been given to the fixing of a duty of 1c. per pound on this ferroalloy, although steel makers are known to consider this duty entirely too high, and want it placed on the free list, or only a nominal duty fixed. The Fordney bill carries a duty of 1c. per pound of metallic manganese on manganese ore and a duty of 2 1/5c. per pound on ferromanganese when containing in excess of 1 per cent of carbon and 2 1/5c. per pound and 28 per cent ad valorem when containing less than 1 per cent of carbon.

Administrative Features

The administrative features are the source of a great deal of conflict of opinion, and as is well known, Chairman Fordney of the House Committee on Ways and Means has said that he would not accept any bill from the Senate that did not carry the American valuation plan. There are those on the Senate Committee on Finance who oppose this principle, but are ready to accept it in order to prevent an impasse with the House, if possible.

Accordingly, the Senate Committee has tentatively adopted the American valuation plan direct, together with a proposal to base duties on the American wholesale selling price.

Iron and Steel Markets

FURTHER IMPROVEMENT

Increased Buying of Steel and Larger Production

Stiffening in Prices of Heavy Products—New Construction Expanding

The improvement in the steel trade, both in demand and in rate of operation, has gone farther in the past week. The situation as to prices is stronger, though the 1.50c. basis on plates, structural shapes and bars, for which more large producers are holding, is not established thus far by important transactions. The week has seen the closing of considerable business on which lower quotations were out.

Reports of an expected announcement of the 1.50c. price by the Steel Corporation have not been borne out, price announcements from that source having been out of vogue for some time.

The percentage of active capacity for the entire industry is evidently close to 60. Current production of ingots in the Pittsburgh, Youngstown and Wheeling districts is put at 60 to 65 per cent of capacity.

The Carnegie Steel Co., which has reached a 65 per cent operation, is preparing to blow in six additional blast furnaces in the next 10 days, bringing the number up to 35 out of 59. The starting up of the company's Farrell, Pa., steel plant, which has been shut down nearly a year, leaves only three of its steel works idle, these being high cost plants.

Sentiment is divided as to the basis and the continuance of the present increased demand for steel. With almost no forward buying, the large call for quick delivery indicates the scant stocks of manufacturing consumers. But conditions in dependent industries still present many variations.

New construction, railroad and automobile activities figure more largely in the market. Detroit motor car works are busier. Ford requirements for April amount to 10,000 to 15,000 tons of bars, wire and sheets.

The nearness of the coal strike has made little impression on the finished steel market. Reserves of bituminous coal, at 60,000,000 tons, are estimated at eight weeks' supply and output of non-union mines has reached 60 per cent of total requirements in recent weeks.

Tie plates figure largely in railroad negotiations. Including 2500 tons for the Missouri Pacific, 5000 tons for the Northern Pacific and 2000 tons for the Illinois Central, the total is fully 12,000 tons. Some 343 passenger service cars have been inquired for, of which 250 are for the Pennsylvania, and 50 electric cars have been bought by the Southern Pacific.

A 5000-ton order for 16-lb. rails for Japan will be rolled at a western Pennsylvania mill.

Fabricated steel lettings of the week, taking in only the sizable bridge and building projects, exceed 40,000 tons, though for all of February, according to the records of the Bridge Builders

and Structural Society, the total was 78,700 tons. March promises to be the largest month in structural steel in over 20 months. To the pending list of structural business was added over 20,000 tons, and round lots of reinforcing bars are under inquiry.

Effective March 20, an advance of \$2 per ton was made by several Central Western producers of sheet bars and billets. Sheet mill operations have increased rather more rapidly than the supply of sheet bars.

The pig iron market is showing greater firmness in prices. This is due in part to uncertainty as to what effect the expected strike of coal miners will have on prices of coke, and in part to increased foundry melt. Buying in the East and the Central West has amounted to a considerable tonnage, made up to a large extent of moderate orders for early delivery. Eastern Pennsylvania and Buffalo furnaces have taken much of the new business, but furnaces along the lakes have also had their full share.

The first large contract for manganese ore from the Caucasus since the war involves the sale of 50,000 tons to an Eastern producer of ferromanganese. For 52 per cent ore the basis was 24½c. per unit.

At Chicago a situation has developed in which some sellers of heavy melting steel have paid higher prices, in covering short sales, than were paid by steel mills. The highest price paid by a mill there was \$12.75, whereas dealers have bought at as high as \$13.25.

Early announcement is looked for of an important consolidation in the machinery trade in which seven machine tool companies will be included with other large interests.

Pittsburgh

PITTSBURGH, March 21.

Further effect of the recent price stabilizing movement in steel products has been felt in the past week, which has been marked by a heavy volume of orders and a substantial increase in the activities of the plants in this and adjacent district. The Carnegie Steel Co. last week operated around 65 per cent of its capacity, one important unit having turned out full theoretic capacity production of ingots and this week's indications point to an even higher percentage. There has been substantial increase in the operations of the American Sheet & Tin Plate Co. and the other subsidiaries have at least maintained the recent rate. Valley steel makers have added both to steel works and finishing mill activities and there also has been some gain with the leading independents in the Wheeling district. Not much change has taken place in independent plant activities here in Pittsburgh, but the recent rate, which was high, is fully maintained. A conservative estimate of current production of ingots in the Pittsburgh, Youngstown and Wheeling districts is between 60 and 65 per cent of capacity.

There is still a considerable divergence of opinion as to whether the present activity is the beginning of a sustained buying movement or is merely a bulge. Some assert that this is the beginning of an active market, but others are not certain, pointing out the almost complete absence of forward buying and the fact that buyers still are refraining from building up stocks at current prices. On the other hand, the fact

	10-year pre-war average, 15.72

that all of the independent companies have swung into line at 1.40c. Pittsburgh for plates, shapes and bars, is taken to mean that these companies have built up a substantial back log at the old basis. Some support is lent the belief in a continued betterment in business by the fact that the Carnegie Steel Co. is actively making ready to put on six additional blast furnaces in the next week or so. These include one Isabella, one Dúquesne, one Carrie, one Ohio, and two Farrell, Pa., furnaces. These additions will bring the total number of active Carnegie furnaces to 35 out of a total of 59 and it is hardly conceivable that the company would take this step unless satisfied that good business is ahead. The starting up of the Farrell, Pa., works of this company, which has been down for about a year, will leave only three of its steel works idle, these being high-cost plants.

Although practically all makers of plates, shapes and bars now are holding to 1.50c., Pittsburgh, the great bulk of the tonnage which has been booked in the past week has been at the lower prices previously

quoted and only a very small and really unimportant part of the business has been entered at the new price. Sheet prices are firmly maintained and an advance of \$2 a ton just announced in sheet bars may possibly be followed by an advance in sheets. In the minor products, betterment in business has not been accompanied by any appreciable stiffening in prices. Indeed, it is commented upon that in the face of a higher market for hot-rolled bars, prices of cold-finished steel bars have actually weakened slightly.

The recently established price of \$18, Valley furnace, for basic iron has been strengthened by another sale of 1500 tons at that price.

Scrap dealers short of the steel works grades have been paying stiff prices in covering them, but there has been no advance in the prices offered by melters.

The close proximity of the coal strike is without effect upon the fuel market. It is estimated that present reserve stocks of bituminous coal throughout the country are fully 60,000,000 tons and on the basis of recent consumption this is sufficient to last about eight

weeks. The idea that a suspension of union mine operations will not have a serious effect is strengthened by the fact that non-union mines lately have shown ability to produce up to 5,000,000 tons a week.

Pig Iron.—The best demand continues to be for foundry iron of which we note one purchase for April shipment by a sanitary ware manufacturer of about 4000 tons of No. 2 and No. 2X. The plain No. 2 iron was bought at \$19, furnace, but makers seem to have waived the differential on No. 2X, most of which was also bought at \$19. There is a pretty steady demand for small tonnages of foundry iron from local foundries and if the sales are bunched with reservations which makers have made for regular customers, the business of the past few weeks would reach fairly heavy proportions. However, reservations cannot well be considered sales until the shipping instructions are received and this sort of business constitutes the greater part of the tonnage. We note another sale of basic iron at \$18, Valley furnace, this being of 1500 tons to a Pittsburgh district steel maker and more firmly establishes the market at \$18. There is very little interest in Bessemer iron, the largest inquiry being for 250 tons for the Pittsburgh plant of the American Steel Foundries. This grade of iron is still available at \$19, Johnstown, but Valley makers are holding to \$19.50, and claim to be making small sales at this figure.

We quote Valley furnace, the freight rate for delivery to the Cleveland or Pittsburgh district being \$1.95 per gross ton

Puro	\$18.00
Bessemer	19.50
Gray, large	18.75
No. 2 foundry	19.00
No. 2 foundry	18.75
Malleable	19.00

Ferrolloys.—The attention of the trade is directed toward Washington because of the probability of early action on the tariff. It is understood that the schedules to be reported out by the Senate Finance Committee will show several downward revisions in the ferrolloys rates as compared with those originally proposed. Manganese ore, it is said, will be restored to the free list and a duty of \$5 per ton be set up on ferromanganese. This is in line with the demands of the steel makers and is likely to meet opposition from the manganese ore interests, who are said to have allied themselves with the magnesite producers in a combined effort to force favorable action on both products. The rates on ferrosilicon to be reported call for a reduction of 1/2c. per unit from the original rates on 8 to 20 per cent to 2c.; of 3/4c. in 20 to 60 per cent to 2c. and of 1/5c. in 60 to 80 per cent to 3c. Market conditions here show little change. Two Middle Western steel makers recently were buyers of ferromanganese, one taking 800 tons at the full price and the other 1000 tons. The latter sale, however, was not clear cut, having been fastened on to an old contract carrying a much higher price than now prevails. The price remains at \$62.50 Atlantic seaboard for American and English 80 per cent material, but there are intimations of an early advance to \$65 on domestic material, it being claimed that on to-day's costs the latter price is justified. The Lackawanna Steel Co. inquiry for 1200 tons is reported to be still open. Spiegeleisen prices are weaker, 19 to 21 per cent being quoted at \$27.50 to \$30 furnace, according to the size of the order and 16 to 19 per cent from \$26.50 to \$29. We note a sale of 14 to 19 per cent material at \$24.25 furnace, to a central Ohio steel maker, the delivered price being about \$31. This was a cleanup sale by the maker. Interest in 50 per cent ferrosilicon is small. This material still is available at \$55 delivered this and nearby districts.

We quote 78 to 82 per cent ferromanganese, \$62.50 c.i.f. Atlantic seaboard for domestic and English. Average 20 per cent spiegeleisen, \$27.50 to \$30 furnace; 16 to 19 per cent, \$26.50 to \$29 furnace; 50 per cent ferrosilicon, domestic, \$55 to \$60 furnace, freight allowed. Bessemer ferrosilicon is quoted f.o.b. Jackson and New Straitsville, Ohio, furnaces as follows: 10 per cent, \$36.50; 11 per cent, \$39.80; 12 per cent, \$43.10; 13 per cent, \$47.10; 14 per cent, \$52.10; silvery iron, 6 per cent, \$25; 7 per cent, \$26; 8 per cent, \$27.50; 9 per cent, \$29.50; 10 per cent, \$31.50; 11 per cent, \$34; 12 per cent, \$36.50. The present freight rate from Jackson to New Straitsville, Ohio, into the Pittsburgh district is \$4.06 per gross ton.

Billets, Sheet Bars and Slabs.—Effective yesterday, several of the larger producers announced a horizontal advance of \$2 per ton. Sheet bars and small billets

now are quoted at \$31, Pittsburgh and Youngstown, and slabs and large billets at \$30. On forging billets, the Carnegie Steel Co., for some time, has been quoting \$35 and its new price accordingly is \$37. The independent quotation, which has been \$32, goes to \$34. These prices have not yet found much basis in sales and for the present must be regarded as maximum rather than minimum prices. Most recent business in sheet bars has been at \$29, Pittsburgh or Youngstown, with freight equalized to destination. It is reported that a fair sized tonnage of small billets recently was sold at \$28, Youngstown, and small tonnages of large billets have changed hands at \$28, Pittsburgh. Sheet mill operations have increased a little more rapidly than the production of sheet bars, and several makers are short of bars. Preparations for a resumption at the Farrell, Pa., works of the Carnegie Steel Co. are dictated largely by the sheet bar requirements of Shenango Valley plants of the American Sheet & Tin Plate Co., which hitherto have been drawing supplies from Pittsburgh district plants. The change in the source of supplies will mean a considerable saving in freight charges of the American Sheet & Tin Plate Co.

We quote 4 x 4-in. soft Bessemer and open-hearth billets at \$28 to \$30; 2 x 2-in. billets, \$29 to \$31; Bessemer and open-hearth sheet bars, \$29 to \$31; slabs, \$28 to \$30; forging billets, ordinary carbons, \$32 to \$37, all f.o.b. Youngstown or

Wire Rods.—Reports of business at less than \$36, Pittsburgh, do not find verification among makers in this district, all of whom insist that \$36 is the minimum quotation and that they are refusing business at less. Although a fair tonnage is being moved, all makers say there is room for much improvement. Prices given on page 831.

Steel Skelp.—The attempt to put steel pipe skelp to 1.50c. is not meeting with much success. There has not been much tangible improvement in tubular goods prices and buyers regard 1.40c. as about as high as they should go. There has not been enough business passing, unless inter-company business among the Steel Corporation subsidiaries be included, to really establish the market.

Wire Products.—There is a fairly good run of orders for early delivery, but still an almost complete lack of advance buying. Quoted prices are firmly adhered to by all makers and there are no intimations of an immediate change, but buyers are not yet convinced that this is the time to build up their stocks beyond a point indicated by the demands upon them. Mill operations are on a fairly high rate in this and nearby districts, the average being between 60 to 65 per cent of capacity, taking in rod mill and finishing mill capacity. There is some evidence of stocking by manufacturers.

We quote wire nails at \$2.40 base per keg, Pittsburgh, and bright basic and Bessemer wire at \$2.25 base per 100 lb., Pittsburgh.

Iron and Steel Pipe.—Demand for merchant pipe in both steel and wrought iron is steady and fairly satisfactory in the aggregate, but large individual purchases are conspicuously lacking, buyers showing a marked inclination against anticipating their needs. Jobbers' stocks are reported to be low but this does not forecast a pinch in the supply later, because makers generally are not committed very far ahead, and most of them are producing somewhat more tonnage than is called for on current orders. The price situation is steadier, due to less anxiety for business. Most of the large line pipe inquiries which were before the trade recently were closed. The largest open inquiry now up is that of the Southern Carbon Co. for 98 miles of 12-in. pipe for a gas line from Monroe to Alexandria, La. Card discounts are given on page 831.

Sheets.—Orders calling for early delivery are numerous and reach a very satisfactory total and moreover are coming from all but one or two of the consuming industries. Bookings by the American Sheet & Tin Plate Co. actually are in excess of its capacity and its schedule for this week calls for the operation of 85 per cent of its sheet mills, as compared with 75 per cent, the recent average. Independent companies also are getting more business, as is evident from the fact that about 65 per cent of the sheet mills of the country are in operation. The one unfavorable feature of the business from the standpoint of manufacturers is that buyers still evince little or no interest

in their future requirements, and that the great bulk of current orders calls for early delivery. Stocks in second hands are admittedly small but buyers do not appear to be convinced that this is the time to stock up. There continues to be remarkably firm adherence to the regular quotations of 3c. base for black, and 4c. base for galvanized, while 2.25c. base for blue annealed is much better established by sales than it was early in the year. Prices are given on page 831.

Tin Plate.—New business is of rather unimportant proportions, although some have noted improvement in this direction in the past week or so, but specifications against contracts continue to pour in freely and there is still a very dull engagement of independent capacity. The American Sheet & Tin Plate Co., which has been lagging behind independents in the matter of plant operations, is among those which have had an increase in new business and this week will operate more than 70 per cent of its tin mills, as against its recent average of around 65 per cent. Some of the smaller units which have not much of a backlog are reported to be shading prices occasionally, but as a general rule, \$4.60 per base box, Pittsburgh, is minimum on production tin plate.

We quote standard production coke tin plate, \$4.60 per base box f.o.b. Pittsburgh for carload lots.

Cold-Finished Steel Bars and Shafting.—One of the anomalies of the situation is that in the face of a firmer market in hot-rolled bars, prices of cold-finished bars have grown slightly weaker. Hitherto, makers of the latter have been endeavoring to hold the market on a basis of 1.90c. Pittsburgh, but have admitted that concessions were being made occasionally. Now, however, the market has definitely settled to a minimum of 1.80c. as a quotation and even less than that has been done in the Cleveland district, where a fair-sized tonnage recently was taken at about 1.75c. Makers quite generally report business as better, but those who buy their hot-rolled bars complain that there is no profit at current prices. Ground shafting is unchanged at 2.25c. base, mill, for carload lots.

Boiler Tubes.—Business gradually is improving, but evidently all makers are not sharing alike and competition is sharp enough to keep prices low and easy. It is reported that some 2-in. 11-gage seamless tubes recently were sold at a lower price than iron tubes of like dimensions. Card discounts are given on page 831.

Rivets.—Business unquestionably is better now than it has been before in several months, but the improvement does not extend to prices, which generally are favorable to buyers. Leading makers are quoting heavy rivets at \$2.10 to \$2.20 base per 100-lb., Pittsburgh, and are booking a fair number of contracts at these prices. It is admitted, however, that these prices are not minimums on current business, some bolt makers having gone as low as \$1.90 to secure orders for early delivery, evidently with an idea of helping plant operations. Prices and discounts given on page 831.

Fluorspar.—Producers generally are quoting \$16, f.o.b. mines, for washed gravel fluorspar, 80 per cent calcium fluoride and not over 6 per cent silica, but a steel works interest which recently inquired for 200 tons of 85 per cent reports having had a quotation of \$14.75. The freight from Illinois and Kentucky mines to Pittsburgh is \$6 per ton.

Iron and Steel Bars.—An eastern producer has notified the local office not to accept any more steel bar business at less than 1.50c. This action put all the independent companies on a base of 1.50c., Pittsburgh, but so far only small sales have been made at this price, the great bulk of the booking having been entered against protective quotations of less. Evidently the Carnegie Steel Co. is heavily booked on steel bars because the two largest bar making units have been running practically full for the past week. New business in reinforcing bars made from new billets, carrying a price of less than 1.50c., is not easily placed and these bars, rolled from old rails, are firmly held at 1.40c. We note no change in iron bars.

We quote steel bars rolled from billets at 1.40c. to 1.50c.; reinforcing bars, rolled from billets, 1.40c. to 1.50c. base; reinforcing bars, rolled from old rails, 1.30c. to 1.40c.; refined iron bars, 3c. to 3.10c. in carloads, f.o.b. mill, Pittsburgh.

Structural Material.—Fabricating shops in this district are not especially well engaged and demands for plain material from them are extremely light. The only important structural awards announced here are 500 tons of steel for bridges for the Nashville, Chattanooga & St. Louis Railroad taken by the American Bridge Co., and 1400 tons taken by the McClintic-Marshall Co. for the new club house of the Indianapolis Athletic Club. The common asking price on structural beams now is 1.50c., but most of the recent bookings have been at \$1 to \$3 per ton less and it is understood that protection still is out at low quotations against much tonnage. Prices are given on page 831.

Plates.—Some tonnage carrying less than to-day's price has been driven in by the recent advance, but the new quotation as yet has not found much basis in sales. There are intimations that some of the Valley car builders are figuring on substantial inquiries and that orders will be placed in the near future.

We quote sheared plates, 1/4 in. and heavier, tank quality, at 1.40c. to 1.50c. f.o.b. Pittsburgh.

Hoops and Bands.—The effort still is being made to restore 1.90c., Pittsburgh, as the price on both hoops and bands, and some business is being taken in hoops at that figure. Business generally is better than it was recently, but the improvement as yet has not embraced prices. The quotable range on hoops, based on sales, still is 1.80c. to 1.90c. and on bands from 1.75c. to 1.90c.

Coke and Coal.—There is no special change in the coke market. Spot tonnages of furnace grade still are moving at from \$3.25 to \$3.50 per net ton oven, with spot foundry coke \$1 per ton higher. The fact that the coal market has not developed more strength makes it impossible for coke producers to put up prices and while the general asking price on furnace grade is \$3.50, sales at that figure are few and usually for brands of high reputation. The foundries seem to have fortified themselves against a shortage in the event of a strike by the union coal miners and purchases for stock are not as large and urgent as they were recently. Mine run steam coal is quotable at \$2 to \$2.25 for union coal and \$1.50 to \$1.75 for non-union for spot shipment. Mine run by-product coal takes a range of from \$1.65 to \$2, while mine run gas coal is quoted at \$2.15 for non-union and \$2.40 for union coal.

Old Material.—High prices still are being paid for steel works grades by dealers short against sales, but melters are slow to follow advances thus established, and the market, based on what is being paid by consumers, is not quotably higher than it was a week ago. Heavy melting steel has been sold at \$16 and even \$16.25 delivered Pittsburgh district plants, but those to whom the material is being shipped deny having paid more than \$15.50 and their current offering price is \$15. Possibly if some of the mills were in the market for round tonnages, they would not be able to buy at less than \$16, but the trouble is that they are out of the market, and furthermore are strongly against paying any advance.

We quote for delivery to consumers' mills in the Pittsburgh and other districts taking the Pittsburgh freight rate, as follows:

Heavy melting steel, Steubenville, Follansbee, Brackenridge, Monessen, Midland and Pittsburgh.....	\$15.00 to \$15.50
No. 1 cast, cupola size.....	15.75 to 16.25
Re-rolling mills, Newark and Cambridge, Ohio; Cumberland, Md.; Huntington, W. Va., and Franklin, Pa.....	15.00 to 15.50
Compressed sheet steel.....	13.00 to 13.50
Bundled sheets, slides and ends.....	12.00 to 12.50
Railroad knuckles and couplers.....	15.50 to 16.00
Railroad coil and leaf springs.....	15.50 to 16.00
Low phosphorus standard bloom and billet ends.....	17.50 to 18.00
Low phosphorus plates and other grades.....	17.00 to 17.50
Railroad malleable.....	13.50 to 14.00
Iron car axles.....	23.00 to 24.00
Locomotive axles, steel.....	21.00 to 22.00
Steel car axles.....	15.50 to 16.00
Cast iron wheels.....	15.50 to 16.00
Roller steel wheels.....	15.50 to 16.00
Machine shop turnings.....	10.50 to 11.00
Sheet bar crop ends.....	15.00 to 16.00
Heavy steel axle turnings.....	12.50 to 13.00
Short shoveling turnings.....	12.00 to 12.50
Heavy breakable cast.....	15.00 to 15.50
Stove plate.....	12.50 to 13.00
Cast iron borings.....	12.00 to 12.50
No. 1 railroad wrought.....	12.50 to 13.00

Chicago

CHICAGO, March 21.

The steel market shows increasing strength. The leading interest has just closed the biggest week's sales in nearly a year, and its operations have again advanced to a higher plane, its present steel output being 69 per cent of ingot capacity. The Inland Steel Co. continues to operate at 60 per cent. Prompt delivery is no longer so readily obtainable on plates, shapes and bars and the prices of these commodities are now definitely at a minimum of 1.60c., Chicago.

Structural business is considerably more active and railroad purchases of track supplies and other materials are liberal. For a new ore dock at Superior, Wis., requiring nearly 12,000 tons of fabricated steel, the Great Northern has already bought the reinforcing bars, amounting to 1400 tons, from a Buffalo mill. By arranging to use its own boats to ship the material, the mill was able to name a delivered price which Chicago producers were unable to meet. It is reported that a quotation of 1.45c. delivered was named, but confirmation is lacking. In all of the current market activity there is little indication that the motive for buying is precautionary. It is known that the mills and furnaces are well supplied with fuel and that unless the railroads are crippled, deliveries of steel and iron are not likely to be interrupted. Even in the coke market the threatened coal strike has frightened few buyers into making large purchases.

Pig Iron.—While buying is lacking in spectacular features, the aggregate of current purchases is substantial and the leading merchant reports that shipments from furnaces are steadily increasing. Prominent among current inquiries may be mentioned 1000 tons of foundry wanted by the Crane Co., Chicago, 500 tons of foundry asked for by the Arcade Mfg. Co., Freeport, Ill., and 2100 tons of Southern foundry desired for April to September delivery by the Rundle Mfg. Co., Milwaukee. A north Chicago foundry has bought 700 tons of foundry at the ruling local furnace price and a local sanitary manufacturing company has placed 500 tons of foundry with the Southern furnace making water and rail shipments. A Kalamazoo melter is reported to have closed for 500 tons of foundry at \$14.75, base Birmingham, or 25c. under the ruling price of furnaces shipping all rail. A local company is inquiring for several hundred tons of low phosphorus and standard Bessemer for delivery at an Eastern plant. The recent reduction in the price of charcoal iron gives that iron an advantage of about \$1 a ton delivered in the Twin Cities over Chicago coke iron, and puts it in a competitive position with coke iron at Muskegon and other Michigan cities. It is reported that one result of the reduction was the placing of an order for 20,000 tons of charcoal by a large railroad car and carwheel manufacturer.

Quotations on Northern foundry, high phosphorus malleable and basic irons are f.o.b. local furnace and do not include a switching charge averaging 70c. per ton. Other prices are for iron delivered at consumers' yards, or when so indicated, f.o.b. furnace other than local.

Lake Superior charcoal, averaging sil. 1.50, delivered at Chicago.....	\$26.00
Northern coke, No. 1, sil. 2.25 to 2.75	20.50
Northern coke, foundry, No. 2, sil. 1.75 to 2.25.....	20.00
Northern high phos.....	20.00
Southern foundry, sil. 1.75 to 2.25.....	\$20.77 to 21.67
Malleable, not over 2.25 sil.....	20.00
Basic.....	20.00
Low phos., Valley furnace, sil. 1 to 2 per cent copper free.....	30.00
Silvery, sil. 8 per cent.....	32.82

Ferroalloys.—The market presents no new developments.

We quote 78 to 82 per cent ferromanganese, \$70.00, delivered; 50 per cent ferroallicon, \$56 to \$57.50, delivered; spiegelisen, 16 to 18 per cent, \$40.10, delivered.

Railroad Equipment.—The Chicago, Milwaukee & St. Paul is expected to close for 1000 box cars to-day or to-morrow. The Northwestern has added 300 ballast cars and 50 10,000-gal. tank cars to its previous inquiry, making a total of 3100 cars. The Chicago & Eastern Illinois is inquiring for five Pacific type loco-

motives. The Pennsylvania is in the market for 250 passenger service cars.

Cast Iron Pipe.—Milwaukee has awarded 1350 tons of four to 16-in. to the Clamorgan Pipe & Foundry Co., Lynchburg, Va., at \$42.20, delivered or the equivalent of \$32.47, Birmingham. It has also let 145 tons of special castings to the American Cast Iron Pipe Co. at \$85 a ton. The same city will take bids March 29 on 5620 tons of 54-in. and 150 tons of specials and 1130 tons of 36-in and 80 tons of specials. James B. Clow & Sons were the successful bidders on 1500 tons for Toledo and 300 tons for Elyria, Ohio. Pending business includes:

Lima, Ohio, 2000 tons, 4 to 20-in., March 21.
Duluth, Minn., 1000 tons, 4 to 12-in., March 24.
Kewaunee, Ill., 17,260 ft. of 6-in., April 3.
Park Ridge, Ill., 530 tons, let to contractor.

We quote per net ton, f.o.b. Chicago, as follows: Water pipe, 4-in., \$46.10 to \$47.10; 6-in. and above, \$42.10 to \$43.10; class A and gas pipe, \$3 extra.

Bars.—The fact that all of the bar mills of the Illinois and Inland Steel companies are running double turn and no buyer now entering the market can be sure of delivery earlier than four to six weeks indicates the improved position of mild steel bars. Buying during the past week has been brisker than for over a year and it is evident that orders are not merely for replenishment purposes but in some cases cover anticipated seasonal requirements. Business is coming from widely distributed sources, farm implement makers alone being notable for their lack of buying. Even the implement industry, however, is in a more optimistic mood and is making some purchases here and there to round out existing stocks of material. Mill prices on soft steel bars have stiffened and are now not lower than 1.60c., Chicago. In the reinforcing field, business is growing more active as the building season draws near. The Corrugated Bar Co. will furnish 300 tons for the Morrell Packing Co., Ottumwa, Iowa. The Concrete Steel Co. has the contract for 300 tons for the Admiral Hotel, Chicago. Pending business includes the Bankers' Life and Central Life insurance buildings, Des Moines, Iowa, 500 tons each; the Chicago, Burlington & Quincy Freight House, Chicago, 800 tons; a theatre at Fort Wayne, Ind., 250 tons; the Illinois Central Railroad, Chicago, 150 tons; and a sewage disposal plant, Lima, Ohio, 100 tons. Warehouse prices on deformed steel bars range from 1.75c. to 2c., Chicago. Bar iron has been generally advanced to 1.60c., Chicago, and a fair tonnage has been placed at that price. While mill bookings are not yet all that might be desired, the tendency seems to be towards gradual improvement. Hard steel bar prices remain unchanged, with buying somewhat better.

Mill prices are: Mild steel bars, 1.60c., Chicago; common bar iron, 1.60c., Chicago; rail carbon, 1.50c., mill or Chicago.

Jobbers quote 2.28c. for steel bars out of warehouse. The warehouse quotation on cold-rolled steel bars and shafting is 3.40c. for rounds and 3.90c. for flats, squares and hexagons. Jobbers quote hard and medium deformed steel bars at 1.90c. base. Deformed bars, 1.75c. to 2c. Hoops, 3.13c. Bands, 2.88c.

Sheets.—Prices are firm and business is increasing. The resistance of buyers is commencing to disappear as prices of plates, shapes and bars grow firmer and the restoration of the normal differentials between those products and sheets seems less remote.

Mill quotations are 3c. for No. 28 black, 2.35c. for No. 10 blue annealed and 4c. for No. 28 galvanized, all being Pittsburgh prices, subject to a freight rate to Chicago of 28c. per 100 lb.

Jobbers quote: Chicago delivery out of stock, No. 10 blue annealed, 3.38c.; No. 28 black, 4.16c.; No. 28 galvanized, 5.15c.

Wire Products.—Jobbers are buying nails and wire oftener and more liberally, although even yet a hesitancy to lay in stocks is evident. Prices are firm, however, and that caution may soon give way to a general endeavor to cover ahead at present levels is predicted in some quarters. Wire rods are also stiffening, the soft spots in the market noted a week ago having disappeared and a minimum of \$28, Pittsburgh,

being the present ruling price. For mill prices, see finished iron and steel f.o.b. Pittsburgh, page 831.

We quote warehouse prices f.o.b. Chicago: No. 9 and heavier black annealed wire, \$2.85 per 100 lb.; No. 9 and heavier bright basic wire, \$3 per 100 lb.; common wire nails, \$3 per 100 lb.; cement coated nails, \$2.50 per keg.

Rails and Track Supplies.—There is no abatement in the demand for track materials. The Northern Pacific is in the market for 5,000 tons of tie plates and is also expected to buy spikes and bolts. The Illinois Central is inquiring for 2000 tons of tie plates. While prices of bolts and spikes are still weak, tie plates appear to be strengthening with \$35 per net ton more generally named as a minimum quotation. New rail business is light, but specifications against contracts are coming in at a satisfactory rate.

Standard Bessemer and open hearth rails, \$40; light rails rolled from new steel, 1.50c. to 1.60c., f.o.b. makers' mills.

Standard railroad spikes, 2c. to 2.10c., Pittsburgh; track bolts with square nuts, 3.05c. to 3.10c., Pittsburgh; tie plates, steel and iron, 1.65c. to 1.75c., f.o.b. mill; angle bars, 2.40c., f.o.b. mill.

Bolts and Nuts.—Business is steadily, though slowly, improving, and prices are tending to stiffen, particularly in quotations on second quarter business. There is a more general tendency to adhere to the discounts on page 831. Quoting f.o.b. works on the products manufactured in the West and f.o.b. Pittsburgh, on commodities made largely in the East. Reports from the automobile industry are more encouraging every week, several manufacturers now being on a 100 per cent operating basis while others average between 70 and 75 per cent.

Jobbers quote structural rivets, 3c.; boiler rivets, 3.10c.; machine bolts up to $\frac{1}{2}$ x 4 in., 60, 10 and 10 per cent off; larger sizes, 60 to 10 off; carriage bolts up to $\frac{1}{2}$ x 6 in., 60 and 10 off; larger sizes, 55 and 5 off; hot pressed nuts, square and hexagon tapped, \$3.75 off; blank nuts, \$4 off; coach or lag screws, gimlet points, square heads, 65 and 5 per cent off. Quantity extras are unchanged.

Plates.—One of the best indications of the growing strength of the market was the placing of liberal orders for plates, shapes and bars by the jobbing interests. The warehouses have a reputation for buying at the bottom on the eve of an advance and in the opinion of many keen observers they did not err in their judgment on this occasion. Certain it is that the immediate effect of this concentration of buying has been to bring the prices of all producers up to a minimum of 1.60c., Chicago, on these products. Specifications for plates continue to be received from car builders in steady volume and orders from all sources are more numerous.

The mill quotation is 1.60c. Chicago. Jobbers quote 2.38c. for plates out of stock.

Warehouse Prices.—The reductions in plates, shapes and bars announced by local jobbers last week were particularly interesting because they constituted a recognition of the abandonment of the Pittsburgh base. This fact is clearly brought to light through the adoption of increased extras for 3/16-in. plates, 84-in. and 96-in. wide, sizes not rolled in the Chicago district. These extras have been advanced to 45c. for 84-in. and 75c. for 96-in. plate, the advances being necessary to cover the freight from the Pittsburgh district.

Structural Material.—Interest is centered in the Great Northern ore dock at Superior, requiring 11,850 tons, as was noted in THE IRON AGE a week ago. The same railroad is in the market for 750 tons of structural steel for bridge reinforcement. While these inquiries are conspicuous because of the large tonnage involved, the market in general shows healthy improvement, both lettings and inquiries being on the increase. Mill bookings are steadily accumulating, so that plain material is no longer readily available for prompt delivery and unless the sizes desired happen to fit in with current rolling schedules, shipment earlier than four to six weeks cannot be counted on. At the same time plain material prices have stiffened and are now quoted at a minimum of 1.60c., Chicago. Recent fabricating lettings include:

Chicago, Rock Island & Pacific Railway, bridge over Sylvan Slough, Rock Island, Ill., 1662 tons, to Fort Pitt Bridge Co.

Biltmore Hotel, Los Angeles, Cal., 5250 tons, to Llewellyn Iron Works.

Standard Oil Co., storage tank, Muskegon, Mich., 268 tons, to American Bridge Co.

University of Iowa, addition to grandstands, Iowa City, 445 tons, to American Bridge Co.

Indiana & Michigan Electric Co., power house addition, South Bend, Ind., 208 tons, to Elkhart Bridge & Iron Co.

Bridge over East Cadron Creek, Conway, Ark., 114 tons, to Midland Bridge Co.

Majestic Theatre, Houston, Tex., 1000 tons, to Virginia Bridge & Iron Co.

United Verde Copper Co., smelter and mill building, Arizona, 2200 tons, to Kansas City Structural Steel Co.

Furniture Exhibit Building, Chicago, 900 tons, to Duffin Iron Works.

Rhineland Paper Co., finishing room, Rhineland, Wis., 100 tons, to Worden Allen Co.

Milwaukee Electric Railway & Light Co., addition Kinnickinnic Avenue Garage and Service Station, 100 tons, to Worden Allen Co.

Pending business includes:

Guaranty Building, Indianapolis, 600 tons, bids in.

Randolph Hotel, Chicago, 6000 tons.

Masonic Temple, Aurora, Ill., 300 tons, bids in.

Federal Reserve Bank, Minneapolis, superstructure, 900 tons, bids to be asked soon.

Bridge over Panana River, Nenana, Alaska, 2883 tons.

The mill quotation on plain material is 1.60c., Chicago. Jobbers quote 2.38c. for plain material out of warehouse.

Old Material.—The steady improvement in finished steel business, together with recent heavy purchases of scrap by local steel mills, has materially strengthened the old material market. Speculative buying by dealers in anticipation of further advances is again becoming a feature of the local trade. In a number of instances sellers have paid higher prices for material than consumers have paid. In some cases they were forced to do so because they were caught short, but on the whole a bullish atmosphere pervades the market and dealers are showing a tendency to bid prices up in competition with each other. The highest price for heavy melting thus far reported as having been paid by a mill is \$12.75, delivered, yet dealers have bought at as high as \$13.25. While consumers are growing more cautious as dealers' asking prices advance, some moderate consumptive purchases of certain grades have been made at higher prices. This is notably true of some iron mill grades and to a lesser extent of cast and malleable grades. At the moment the future course of the market is uncertain. Whether, as the dealers expect, consumers will continue to pay advancing prices, or whether the market will be stimulated to a point where a reaction will occur, remains to be seen. Railroad lists include the Chicago and Alton, 600 tons; the Rock Island, 3000 tons, and the Chicago Great Western, 560.

We quote delivery in consumers' yards, Chicago and vicinity, all freight and transfer charges paid, as follows:

Per Gross Ton		
Iron rails	\$17.00 to \$17.50
Relaying rails	20.00 to 25.00
Cast iron car wheels	17.00 to 17.50
Rolled or forged steel car wheels	14.50 to 15.00
Steel rails, rerolling	13.75 to 14.00
Steel rails, less than 3 ft.	13.75 to 14.00
Heavy melting steel	12.50 to 12.75
Frogs, switches and guards cut apart	12.50 to 12.75
Shoveling steel	11.75 to 12.25
Low phos., heavy melting steel	14.50 to 15.00
Drop forge flashings	8.50 to 9.00
Hydraulic compressed sheet	8.50 to 9.00
Axle turnings	8.50 to 9.00

Per Net Ton		
Iron angles and splice bars	15.00 to 15.50
Steel angle bars	12.25 to 12.50
Iron arch bars and transoms	16.50 to 17.00
Iron car axles	20.00 to 20.50
Steel car axles	13.75 to 14.25
No. 1 busheling	9.50 to 10.00
No. 2 busheling	6.25 to 6.75
Cut forge	11.50 to 11.75
Pipes and flues	8.00 to 8.50
No. 1 railroad wrought	11.75 to 12.00
No. 2 railroad wrought	11.50 to 11.75
Steel knuckles and couplers	13.00 to 13.50
Coil springs	12.50 to 13.75
No. 1 machinery cast	14.25 to 14.75
No. 1 railroad cast	13.50 to 14.00
Low phos. punchings	11.50 to 12.00
Locomotive tires, smooth	11.00 to 11.50
Machine shop turnings	5.75 to 6.25
Cast borings	7.25 to 7.75
Stove plate	13.00 to 13.50
Grate bars	11.50 to 12.00
Brake shoes	11.50 to 12.00
Railroad malleable	12.50 to 13.00
Agricultural malleable	12.50 to 13.00

Philadelphia

PHILADELPHIA, March 21.

All branches of the iron and steel industry show improvement both as regards volume of business and prices. A conspicuous feature of the week is the betterment in steel plant operations. The Cambria works of the Midvale Steel & Ordnance Co. at Johnstown, Pa., is now on a 75 per cent schedule. The Bethlehem Steel Co. plants are doing practically as well. The Pencoyd works of the American Bridge Co. is operating at 50 per cent or better. Most of the smaller independent mills in the East are turning out about one-third of their normal output.

In steel prices the market has improved to the extent that 1.40c., Pittsburgh, now clearly appears to be the bottom on plates, shapes and bars, the only exception being that some business was booked in the past week at lower prices on which commitments had been made prior to the price advance. The leading interest is understood to be quoting its regular trade 1.40c., Pittsburgh, on plates, shapes and bars, but has quoted 1.50c. on some inquiries. One independent mill is offering concrete reinforcing bars made from new steel at 1.40c., Pittsburgh, but otherwise all of the independents seem to be adhering firmly to 1.50c. on all three products.

Pig iron is firmer and some furnaces are considering an advance of 50c. a ton, which would make No. 2 plain iron \$20.50, furnace. The scrap market is also considerably firmer.

The coal strike set for April 1 is not seriously affecting the market as yet, for the reason that large consumers have plenty of coal in stock for at least 60 to 90 days' operation. The railroads are also well supplied. An indication of the calm with which the situation is being met industrially is the softening in the price of bituminous coal and the falling off in demand. Large soft coal users have offered only \$2.30 a ton this week, which is declared to be less than the cost of mining.

Pig Iron.—A much improved tone exists in the pig iron market. Eastern Pennsylvania furnaces have booked substantial tonnages within the past 10 days, mostly in the New York and New England districts, and are not concerned about further selling until the coke situation becomes clarified. Furnace coke is strong at \$3.50, Connellsville, and because of this high price some of the Eastern furnaces have not contracted for second quarter. If the coal strike should develop further strength in coke prices, it is possible that at least two or three furnaces in this district will go out of blast rather than attempt to operate under higher cost conditions. It is stated that it is now costing eastern Pennsylvania furnaces from \$19.50 to \$23 a ton to make foundry iron. After many weeks of inactivity in basic iron, prospects for business appear more encouraging. One sale of 1000 tons has been made and a Harrisburg steel plant is in the market for 3000 tons or more. Two other steel companies are expected to need iron shortly. Since the last sale, which was at \$19, furnace, the views of sellers have changed, and it appears unlikely that basic iron could now be bought below \$19.50 to \$20, furnace. The inquiry for foundry iron continues fairly good. A radiator company which buys in New York is inquiring for 3000 tons for second quarter and a plumbing goods manufacturer at Trenton, N. J., wants 1500 tons for delivery beginning May 15. Another inquiry of a confidential character calls for 2000 tons. There are numerous small inquiries forming a substantial aggregate.

The following quotations are, with the exception of those on low phosphorus iron, for delivery at Philadelphia, and include freight rates varying from 84 cents to \$1.54 per gross ton:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.	\$20.74 to \$20.84
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.24 to 21.34
Virginia No. 2 plain, 1.75 to 2.25 sil.	26.24 to 26.74
Virginia No. 2X, 2.25 to 2.75 sil.	27.24 to 27.74
Basic delivery eastern Pa.	20.50 to 21.00
Gray forge	20.50 to 21.00
Malleable	22.50 to 24.00
Standard low phos. (f.o.b. furnace)	30.00
Copper bearing low phos. (f.o.b. furnace)	28.00

Ferrous alloys.—There is no change in the ferroman-

ganese situation except that increased activity at steel plants has resulted in a slightly better demand, but orders are confined to small lots. Domestic and imported alloy are quoted uniformly at \$62.50, Atlantic seaboard.

Rails.—The Chesapeake & Ohio Railroad distribution of rails for 1922 delivery has been announced as follows: Inland Steel Co., 9000 tons; Illinois Steel Co., 7000 tons; Bethlehem Steel Co., 1000 tons. For its subsidiary road, the Hocking Valley, the Chesapeake & Ohio placed 3000 tons with the Lackawanna Steel Co. The Cambria works at Johnstown, Pa., will roll 5000 tons of 16-lb. rails for shipment to Japan. Inquiries for lots of 500 to 1000 tons of rails from street railroad companies have been received within the past week.

Semi-Finished Steel.—Open hearth rerolling billets at \$28 and forging billets at \$32, Pittsburgh, are still obtainable, though small lots are sometimes sold \$1 a ton higher. Sheet bars have been sold for shipment to an Eastern mill at \$29, Youngstown.

Plates.—Eastern mills are quoting uniformly on the basis of 1.50c., Pittsburgh, for sheared and universal plates, and the only quotations below that figure appear to come from the leading interest, which quotes 1.40c. to its regular trade. While much of the business closed within the past week has brought only about 1.35c., Pittsburgh, sales have been made only where protection had been given prior to the recent advance. Orders for small lots have been booked at 1.50c., but in no case has the quantity exceeded 200 tons, so far as reported. Bids on 2000 to 4000 70-ton steel freight cars for the Norfolk & Western Railroad will be opened this week. More locomotive work is in prospect. The Baltimore & Ohio and the Southern Railway are reported to be inquiring for a few engines each. We quote plates at 1.40c. to 1.50c. base, Pittsburgh.

Structural Material.—Small orders for plain material have been booked at 1.50c., Pittsburgh, by independent mills, but shapes are still obtainable at 1.40c. A good deal of structural work is being figured on. Two apartment houses will require about 1000 to 1200 tons each. A new terminal and ferry slips for the Philadelphia & Reading Railroad at Camden, costing \$2,500,000, will require considerable steel, though actual tonnages have not been specified. Port development work at Norfolk, Va., including piers and a grain elevator, will also bring steel inquiries into the market shortly. The American Bridge Co. was low bidder on the first section of the new Public Ledger Building, requiring 1200 tons. We quote plain material at 1.40c. to 1.50c., Pittsburgh.

Old Material.—The Bethlehem Steel Co. is buying steel scrap, paying \$13.50 delivered Bethlehem and \$14 at Steelton. The Cambria Steel Co., which has been a consistent buyer for two or three weeks, paying up to \$14.25 delivered for steel scrap, dropped out of the market late last week, causing a momentary sagging in prices, but the demands of the Bethlehem Steel Co. this week brought increased strength. Turnings are in demand and scarce. We quote for delivery at consuming points in this district as follows:

We quote for delivery at consuming points in this district as follows:

No. 1 heavy melting steel	\$13.50 to \$14.00
Scrap rails	13.50 to 14.00
Steel rails, rerolling	15.00 to 15.50
No. 1 low phos., heavy 0.04 and under	18.00 to 19.00
Cast iron car wheels	16.00 to 16.50
No. 1 railroad wrought	15.50 to 16.00
No. 1 yard wrought	13.50 to 14.00
No. 1 forge fire	10.00 to 10.50
Bundled sheets (for steel works)	10.00 to 10.50
No. 1 busheling	12.50 to 13.00
No. 2 busheling	10.00 to 11.00
Turnings (short shoveling grade for blast furnace use)	11.00 to 11.25
Mixed borings and turnings (for blast furnace use)	11.00 to 11.25
Machine-shop turnings (for rolling mill and steel works use)	12.00 to 12.50
Heavy axle turnings (or equivalent)	12.00 to 12.50
Cast borings (for steel works and rolling mills)	12.00 to 12.50
Cast borings (for chemical plants)	15.00 to 16.00
No. 1 cast	17.25 to 17.75
Railroad grate bars	14.50 to 15.00
Stove plate (for steel plant use)	14.00 to 14.50
Railroad malleable	13.00 to 13.50
Wrought iron and soft steel pipes and tubes (new specifications)	12.00 to 12.50
Shafting	12.00 to 12.50

New York

NEW YORK, March 21.

Pig Iron.—The purchase of 5000 tons by a cast iron pipe interest, referred to in these columns last week, has been confirmed and other sales foot up from 5000 to 6000 tons, mostly foundry grades for early delivery, but including one lot of 500 tons of malleable, which was sold at \$18, Buffalo. Pending inquiries include one from Trenton, N. J., for 1500 tons, delivery over three months beginning May 15, equally divided among No. 1, No. 2X and No. 2 plain. Several other inquiries ranging from 1000 to 2000 tons are pending, but nearly all the new orders and inquiries are for small tonnages. Buyers are showing more interest and the general condition in the market is more satisfactory than it has been recently.

We quote delivered in the New York district as follows, having added to furnace prices \$2.52 freight from eastern Pennsylvania, \$5.46 from Buffalo and \$6.16 from Virginia:

East. Pa. No. 1 fdy., sil.	2.75 to 3.25	\$22.52 to \$23.02
East. Pa. No. 2X fdy., sil.	2.25 to 2.75	22.02 to 22.52
East. Pa. No. 2 fdy., sil.	1.75 to 2.25	21.52 to 22.02
Buffalo, sil.	1.75 to 2.25	23.46 to 23.71
No. 2 Virginia, sil.	1.75 to 2.25	28.16

Ferroalloys.—The market for ferromanganese is moderately active and sales of from 1500 to 2000 tons are reported to have been made with all selling agencies participating. There are still fair quantities before the market which have not been placed and there is more interest than in some weeks. In the spiegeleisen market there have been sales of carload lots at prevailing prices and there have appeared tentative inquiries for large amounts which have not yet developed into orders. In manganese ore there is a little more inquiry, but no business is reported and quotations are nominally unchanged. The 50 per cent ferrosilicon market is fairly active, due largely to the increased production of steel, and a fair business has been done both for early delivery and on contract at prevailing quotations. There is also more interest in ferrochromium and moderate sales have been made. Quotations follow:

Ferroalloys

Ferromanganese, domestic, seaboard, per ton	\$62.50
Ferromanganese, British, seaboard, per ton	\$62.50
Spiegeleisen, 16 to 19 per cent, furnace, per ton	\$29.00
Spiegeleisen, 20 per cent, furnace, per ton	\$30.00
Ferrosilicon, 50 per cent, delivered, per ton	\$55.00 to \$60.00
Ferrotungsten, per lb. of contained metal	.40c. to .50c.
Ferrochromium, domestic, 6 to 8 per cent carbon, 60 to 70 per cent Cr., per lb. Cr., delivered	13c. to 14c.
Ferrovanadium, per lb. of contained vanadium	\$4.00

Ores

Manganese ore, foreign, per unit, seaboard	.25c. to .26c.
Tungsten ore, per unit, in 60 per cent concentrates	\$2.00 up
Chrome ore, 40 to 45 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard	\$18.00 to \$20.00
Chrome ore, 45 to 50 per cent Cr ₂ O ₃ , crude, per net ton, Atlantic seaboard	\$19.00 to \$21.00
Molybdenum ore, 85 per cent concentrates, per lb. of MoS ₃ , New York	45c.

Finished Iron and Steel.—Fresh developments in the local steel market have been few since independent steel company advances took their prices on plates, shapes and bars to 1.50c., Pittsburgh. So far as can be learned practically all of them are adhering to this quotation, but the leading interest is said still to be accepting orders for the heavy products at 1.40c., Pittsburgh. Most of the business closed within the past week has been at prices ranging from 1.35c. to 1.40c., Pittsburgh, the lower price having been accepted where protection had been given prior to the advance. Small orders are being booked at 1.50c., but nothing larger than a carload is reported at this figure. Some companies which are quoting 1.50c. on soft steel bars will accept 1.40c. on bars for concrete reinforcing. Export prices are slightly firmer, but are not within several dollars a ton of the minimum domestic prices. Plates, shapes and bars have been sold for export within the week at 1.35c., Pittsburgh, or less. In competition with foreign mills, it is stated that it is necessary for American mills to go as low as 1.30c., Pittsburgh, on some business to be in the running. Low prices are still heard on tin plate, both for domestic and export trade. The domestic price is nominally \$4.60 per 100 lb. base box, Pittsburgh, but occasional reports of a \$4.50 price are still heard. Wire products and sheets continue fairly firm. In view of the present price situation

interest attaches to the public opening of bids on 3000 tons of bars, shapes and plates and additional lots of track supplies by the New York Central Railroad on Wednesday of this week. The Newport News Dry Dock & Shipbuilding Co. is reported to have placed 700 tons of plates and a few hundred tons of shapes through its New York office for the reconditioning of the steamship Leviathan. A current export inquiry is for 22,000 boxes of tin plate for the Nippon Oil Co. of Japan. Welsh mills, it is stated here, are able to undersell American mills on a c. i. f. basis if the recent advance in the export tin plate price is maintained, and it becomes a question whether buyers in the Far East are willing to pay a slight premium for American plate. The Sinclair Consolidated Oil Corporation has placed 12 oil tanks, requiring 3100 tons of steel, with the Graver Corporation, Chicago. This lot is an addition to the 10 bought from the Chicago Bridge & Iron Works, reported two weeks ago. Structural projects continue in fairly good volume. Some of the new inquiries follow:

Lehigh Valley Railroad, 400 tons, for eight bridges.
Building for the Talbot Mills, Billerica, Mass., 800 tons.
Store for the Edward Malley Co., New Haven, Conn., 750 tons.
Bridge for the Seaboard Air Line, 250 tons
Buildings for the Mount Hope Finishing Co., North Dighton, Mass., 300 tons.
Department store at Scranton, Pa., 1000 tons.
Chemistry laboratory for Tufts College, Somerville, Mass., 500 tons.
Municipal gas plant at Albany, N. Y., 900 tons.

Jobs which have been awarded include the following:

Apartment house in Philadelphia, 1900 tons, to American Bridge Co.
Home Insurance Building, New York, 750 tons, to Hedden Iron Construction Co.
Bridges and repair work for Delaware, Lackawanna & Western Railroad, 1800 tons, to American Bridge Co.
Building for the Abbott Worsted Co., Forge Village, Mass., 200 tons, to American Bridge Co.
Twelve story loft, Madison Avenue and Forty-eighth Street, 4300 tons, to Post & McCord.
Piershed for Lehigh Valley Railroad, Greenville, N. J., 1800 tons, reported let to Bethlehem Steel Bridge Corporation.
Knights of Columbus building at Bayonne, N. J., 200 tons, to Fagan Iron Works.
Building for Conley T'n Foll Co. at Glendale, Long Island, 400 tons, to McClintic-Marshall Co.
Cane sugar plant at Miami, Fla., 700 tons, to McClintic-Marshall Co.
Chamber of Commerce building, Newark, 1700 tons, to Hay Foundry & Iron Works.
Loft building on Seventh Avenue, New York, 500 tons, to A. E. Norton Co.
Temple University building, Philadelphia, 400 tons, to American Bridge Co.
Summer Building, Boston, 800 tons, to New England Structural Co.
Warehouse, Boston, 3500 tons, to McClintic-Marshall Co.

Directors of the New York Central Railroad met last week and adjourned without a decision being announced regarding the letting of the proposed bridge at Castleton, N. Y., across the Hudson River. The Chesapeake & Ohio is in the market for 63 passenger and express cars.

We quote for mill shipments, New York, as follows: Soft steel bars, 1.78c.; plates, 1.78c.; structural shapes, 1.78c. to 1.88c.; bar iron, 1.73c. to 1.88c. On export shipments the freight rate is 28.5c. per 100 lb. and the domestic rate is 38c.

Cast-Iron Pipe.—The tone of the market is extremely optimistic. Buying by private water and gas companies continues large and municipal tenders appear from time to time. The Department of Water Supply, Gas and Electricity, New York, closed March 22 on a contract which involves about 1100 tons of cast iron pipe, ranging through a number of sizes from 8 in. to 32 in. One cast-iron pipe manufacturer reports 85 per cent operation and more pits going than prior to the war. We quote per net ton, f.o.b. New York, as follows: 6-in. and larger, \$47.30; 4-in. and 5-in., \$52.30; 3-in., \$62.30, with \$4 additional for Class A and gas pipe.

Warehouse Business.—Although lower prices prevail in other markets, warehouses in this district have not announced any change in quotations. Current

prices are weak, however, and there is a distinct tendency to shade them whenever good business presents itself. Structural material is fairly active and there is some sheet buying. Brass and copper warehouses report activity and a general stiffening in prices. No change in the situation among dealers in wrought iron and steel pipe is reported. We quote prices on page 846.

High-Speed Steel.—The market is unchanged at about 75c. to 85c. per lb. for 18 per cent tungsten high-speed steel, with special brands of some companies still quoted up to as high as \$1.05 per lb.

Coke.—The market continues fairly active. Prices on beehive grades range from \$4.50 to \$4.75 with \$4.50 more frequently prevailing. It is becoming more difficult to obtain prompt delivery, but there is no excitement about the expected strike of coal miners. By-product coke is still quoted at \$8.59, delivered to points on the Pennsylvania, Erie and Lackawanna railroads, and \$9.15 to points on the Central of New Jersey.

Old Material.—The upward trend in the market continues. No. 1 heavy melting steel is firm at \$9 to \$9.50 per ton, buying price New York, although it is reported that \$16.25 per ton has been done on sales in the Pittsburgh district. Some brokers in this market claim to be willing to offer up to \$10 per ton for heavy melting steel. Wrought iron track shows an advance this week of \$1 per ton, now being quotable at \$9.50 to \$10. Iron and steel pipe, not under 2 ft. long is also 50c. per ton higher, bringing from \$8.25 to \$8.75 per ton. A fair quotation on mixed borings and turnings is \$6 to \$6.50 per ton.

Buying prices per gross ton, New York, follow:		
Heavy melting steel, yard	\$9.00 to	\$9.50
Steel rails, short lengths, or equivalent	9.50 to	10.00
Revolving mills	9.25 to	9.75
Relaying rails, nominal	27.00 to	28.00
Steel car axles	10.00 to	10.50
Iron car axles	17.50 to	18.50
No. 1 railroad wrought	9.50 to	10.00
Wrought iron track	9.50 to	10.00
Forge fire	6.50 to	6.00
No. 1 yard wrought, long	9.50 to	10.00
Cast borings (clean)	7.00 to	7.50
Machine-shop turnings	5.75 to	6.25
Mixed borings and turnings	6.00 to	6.50
Iron and steel pipe (1 in diam. not under 2 ft. long)	8.25 to	8.75
Stove plate	10.50 to	11.00
Locomotive grate bars	10.00 to	10.50
Malleable cast (railroad)	8.50 to	9.00
Cast-iron car wheels	10.50 to	11.00

Prices which dealers in New York and Brooklyn are quoting to local foundries, per gross ton, follow:

No. 1 machinery cast	\$17.00 to	\$17.50
No. 1 heavy cast (columns, building materials, etc.), cupola size	16.00 to	16.50
No. 1 heavy cast, not cupola size	15.00 to	15.50
No. 2 cast (radiators, cast boilers, etc.)	10.50 to	11.00

Cleveland

CLEVELAND, March 21.

Iron Ore.—While some consumers are showing an interest in iron ore prices for this year, ore shippers do not expect that the season's prices will be named before May 1. Ore men look for a little demand for small lots of ore for shipment when the season of navigation opens, but it is probable that such sales will be made subject to whatever prices are named later. The general improvement in the iron and steel industry is encouraging to ore shippers. Taking into consideration the large stocks of ore on hand at docks and in furnace yards, the season's movement is not expected to exceed 35,000,000 tons. No developments have occurred locally in the freight rate situation since the railroads notified the shippers that a 20 per cent reduction on rates from Lake Erie ports to interior furnaces would be placed in effect April 17. Shippers feel confident that the Interstate Commerce Commission will refuse the request of Buffalo interests that a proposed rate be suspended. The announcement of a reduction in rail rates has had no effect on dock shipments, as very little ore is moving from docks, furnaces taking only what ore they are actually in need of.

We quote delivered lower lake ports: Old range Bessemer, 55 per cent iron, \$6.45; Old range non-Bessemer, 51½ per cent iron, \$5.70; Mesabi Bessemer, 55 per cent iron, \$6.20; Mesabi non-Bessemer, 51½ per cent iron, \$5.55.

Pig Iron.—Sales of foundry iron show an increase, but there are weak spots in the market which have resulted in some price concessions, although most sellers are adhering to recent quotations. A local producer has taken some foundry iron at \$18.50 for Cleveland delivery and this price is evidently being shaded about 50c. a ton for shipment to some points. One sale of 1000 tons is reported at \$18.50 for delivery to a nearby point. A local producer is quoting foundry iron on the basis of \$19, Valley furnace, for shipment to points where the Valley has the freight advantage. Several lots have been sold for shipment from Cleveland to the Pittsburgh district, but it is stated that on this business the Cleveland producer did not absorb all the freight differential, which would have brought the price down to approximately \$18 a furnace. Sales during the week included several 1000 ton lots to Ohio consumers. A Cleveland foundry purchased 1000 tons and several 500-ton lot sales were made to local consumers. One lake furnace reports sales aggregating 8000 tons during the week, mostly at \$19. These include 1000 tons of foundry iron taken by a Michigan manufacturer of motor castings, 600 tons of malleable iron by an Indiana foundry and 400 tons of malleable by an Ohio foundry. While the bulk of the sales are for early shipment, some contracts have been placed for the second quarter. Only one or two inquiries have developed for more extended deliveries and buyers and sellers generally are not disposed to enter into contracts for delivery beyond July 1. Sales and shipments show a marked gain over February. One interest operating four of eight furnaces is now shipping more iron than it is making. The demand for low phosphorus iron in small lots has improved but prices are easier.

Quotations below are f.o.b. local furnaces for Northern foundry iron, not including a 56c. switching charge. Other quotations are delivered Cleveland, being based on a \$1.96 freight rate from Valley points, a \$3.36 rate from Jackson and a \$6.67 rate from Birmingham:

Basic	\$19.96
Northern No. 2 fdy., sil. 1.75 to 2.25	\$18.50 to 19.50
Southern fdy., sil. 1.75 to 2.25	22.17
Ohio silvery, sil. 8 per cent	30.86
Standard low phos., Valley furnace	30.00 to 31.00

Finished Material.—The stimulating effect on buying that was caused by the stiffening of prices continued during the week. Mills booked a good volume of business from jobbers, bolt and nut manufacturers, automobile manufacturers and other consumers. Orders came from manufacturers of automobile springs for 700 tons of spring steel. Orders show that buyers are not being stampeded by the possibility of higher prices into placing large tonnages for stock, but are buying rather conservatively. While a few sales are reported at the 1.50c. price, 1.40c. is still the going market price and the bulk of the business was taken at that price. Independent mills before they advanced prices gave protection to many of their customers at the old price and considerable of the business placed during the week was the closing of the contracts covered by these protections. However, some inquiries came out from consumers who had not secured protection. The leading interest which is still quoting steel bars, plates and structural material at 1.40c. for current orders have taken some contracts at 1.50c., but will make shipments against these contracts at 1.40c. as long as that remains its market price. With these contracts it will not have lower priced steel on its books, should it decide to mark its prices up. Reeves Brothers, Alliance, Ohio, have taken oil tanks for the Magnolia Petroleum Co. requiring 1300 tons of plates which have been placed with a Johnstown, Pa., mill, which has also taken 500 tons of structural material for the Kresge Building, Cleveland. In structural lines, the Detroit Medical Building, Detroit, requiring 1260 tons, has been placed with the Russell Wheel & Foundry Co., Detroit, and the East High School, Columbus, Ohio, requiring 200 tons, has been taken by the Massillon Bridge & Structural Co. Bids have been taken for the Genesee Building, Buffalo, requiring 2800 tons and for a bank at Brownsville, Pa., requiring 500 tons, and an inquiry is out for a Physics Building for the University of Michigan requiring 200 tons.

Hoops and Bands.—The demand for hoops and bands has become more active, but prices are irregular.

Quotations of 1.85c. for hoops and 1.75c. for bands are appearing, but one Valley mill is now asking 2c. for hoops and 1.85c. for bands.

Sheets.—The demand for sheets continues fair. While prices are generally firm, there are reports of shading on galvanized sheets. Weakness is also reported in warehouse prices on galvanized sheets, quotations of 4.25c. appearing or about the present delivered cost to the jobbers. This \$10 a ton concession is evidently being made to reduce stock.

Warehouse Business.—Cleveland warehouses have reduced prices \$3 per ton on steel bars, plates and structural material and on hoops and bands and \$5 a ton on cold-rolled steel. These reductions are due to competition in the Central Western territory and to the naming of lower warehouse prices in Chicago and Detroit. Warehouse orders show some gain.

Jobbers quote steel bars, 2.21c.; plates and structural shapes, 2.46c.; No. 9 galvanized wire, 3c.; No. 9 annealed wire, 2.50c.; No. 28 black sheets, 3.75c.; No. 28 galvanized sheets, 4.75c.; No. 10 blue annealed sheets, 3.06c. to 3.10c.; hoops and bands, 2.56c.; cold-rolled rounds, 3.25c.; flats, squares and hexagons, 3.75c.

High Speed Steel.—German made high speed tool steel is being offered in this market at 55c. to 58c. per pound for steel running about 14 per cent tungsten, but no sales of the imported steel are reported. The market continues very irregular. Prices on domestic 18 per cent tungsten high speed steel range from 65c. to 80c. per lb. with some of the leading manufacturers holding to a minimum price of 70c.

Bolts, Nuts and Rivets.—The improvement in the demand for bolts and nuts continues and some makers report that they booked more business during the first half of March than during all of February. One maker has taken some contracts for the second quarter, but manufacturers are not inclined to get loaded up with orders for that delivery at current prices. Regular discounts appear to be holding better than they have recently. Rivet sales have improved. Prices are steady at 2.10c. for structural and 2.20c. for boiler rivets, but there are occasional reports of shading of these prices.

Old Material.—Prices on many grades have advanced and the market is firm. There was very little buying by the mills during the week, the only local activity on the part of a consumer being the purchase of a few lots of machine shop turnings. Heavy melting steel is quoted at \$15.50 to \$16 for Valley delivery. Dealers have forced prices up on this grade to a higher point than mills are willing to pay. For Valley shipment dealers are offering up to \$15.75 for heavy melting steel, \$13 for compressed steel, \$12 for borings and turnings and \$12.50 for flashings. For delivery to a Cleveland consumer they are offering \$13.50 for heavy melting steel and \$10 for turnings.

We quote per gross ton, f.o.b. Cleveland, as follows:

Heavy melting steel.....	\$13.00 to \$13.25
Steel rails, under 3 ft.....	13.25 to 13.75
Steel rails, rerolling.....	15.00 to 16.00
Iron rails.....	13.00 to 14.00
Iron car axles.....	18.00 to 19.00
Low phosphorus melting.....	14.00 to 14.25
Cast borings.....	9.50 to 9.75
Machine shop turnings.....	9.50 to 9.60
Mixed borings and short turnings.....	9.50 to 9.60
Compressed steel.....	10.25 to 10.50
Railroad wrought.....	13.00 to 13.75
Railroad malleable.....	13.00 to 13.50
Light bundled sheet stampings.....	8.50 to 9.00
Steel axle turnings.....	11.00 to 11.50
No. 1 cast.....	15.00 to 16.00
No. 1 bushing.....	9.50 to 9.75
Drop forge flashings, over 10 in.....	10.25 to 10.75
Drop forge flashings, under 10 in.....	10.50 to 11.00
Railroad grate bars.....	13.00 to 13.25
Stove plate.....	13.25 to 13.50
Pipes and flues.....	10.00 to 11.00

Ore Rate Hearing Resumed

The hearing on upper lake ore rates which was adjourned some two or three months ago was resumed at the Great Northern Hotel, Chicago, on March 21, with Examiner Howard Hosmer of the Interstate Commerce Commission presiding. The morning session was taken up with rebuttal by Robert Hula, Steel & Tube Co. of America, and representatives of the Midvale Steel & Ordnance Co. and M. A. Hanna & Co., of exhibits entered in the previous hearing by the Chicago & Northwestern.

Cincinnati

CINCINNATI, March 21.

Pig Iron.—The market was fairly active during the week, most of the sales being, however, for small tonnages for immediately delivery. The largest sale reported was one of 6000 tons of Southern iron taken by a sanitary ware manufacturer. This interest is expected to close on another 3000 tons during the week, the whole tonnage being for delivery during the second quarter. A Columbus melter bought 300 tons of Northern iron, and a nearby melter 200 tons. Several sales of Southern iron are also reported, one being for 200 tons. A number of fair-sized inquiries are current. The Rundle Mfg. Co. is inquiring for 2500 tons of Southern iron, and the Ross-Meehan Co. has not closed on its inquiry for 1000 tons of malleable. The Westinghouse company is inquiring for 3000 tons of foundry iron, and a Michigan melter is in the market for 400 tons of Bessemer. Several other inquiries for 100-ton lots are also current. Prices show no change, although reports are current that Southern irons are inclined to advance. A very encouraging feature of the market is seen in the report of the Ohio State Foundrymen's Association for the month of February. The melt showed 50 per cent increase over January, having jumped from 22 to 33 per cent of normal.

Based on freight rates of \$4.50 from Birmingham and \$2.52 from Ironton, we quote f.o.b. Cincinnati:

Southern coke, sil. 1.75 to 2.25 (base).....	\$19.50 to \$20.00
Southern coke, sil. 2.25 to 2.75 (No. 2 soft).....	20.00 to 20.50
Ohio silvery, 8 per cent sil.....	30.02
Southern Ohio coke, sil. 1.75 to 2.25 (No. 2).....	21.02 to 21.52
Basic, Northern.....	21.02
Malleable.....	21.52 to 22.02

Finished Material.—The effect of the recent advance in prices made by practically all of the independent mills can hardly be gaged as yet. The immediate result of the advances, however, was to bring in a fair amount of business that had been quoted on, but during the past week the number of orders booked was rather light, the buyers, no doubt, hesitating to commit themselves until the price situation becomes more clear. A number of carload orders were placed at the advanced prices, but on the whole business during the week was light. An inquiry for 800 tons of reinforcing bars is the largest one reported and it is said that some hesitancy is being shown by mills in quoting on this business, as the delivery extends over the next few months. Prospects of a coal strike, with possible interruption to mill operations, is also being taken into account by mills when booking business and there appears to be a hesitancy on their part to quote for extended deliveries. The sheet market during the week was reported to be fairly active, but tin plate manufacturers, while booking some fair-sized orders, state that the market may well be regarded as spotty. Most of the orders placed are for immediate delivery, and there is not much tendency on the part of buyers to book as far ahead as is generally the case at this season of the year. In wire products, business has been fairly good, one order calling for 3000 kegs of nails. An inquiry for 800 kegs during the week, which it was thought would bring out a lower price than \$2.40 Pittsburgh, is reported to have been placed on this basis. One of the most encouraging features in the local situation was the appearance of several carload orders for cold-rolled steel. The city of Dayton, Ohio, has purchased 200 tons of cast iron pipe and fittings, the order going to the United States Cast Iron Pipe & Foundry Co. The only award of consequence in the structural field was one of 500 tons of bridge work made by the Nashville, Chattanooga & St. Louis Railway to the American Bridge Co. Bids will close on March 27 for the 22-story Snowden building at Memphis, Tenn. On the same date bids will close for the new dormitory building at the University of Cincinnati. Estimates will be received until March 29 for a five-story office building for the First National Bank at Richmond, Ind. Bids are also being taken on section 6 of the rapid transit loop in Cincinnati. This section is to cost approximately \$400,000 and a fair tonnage of reinforcing bars will be required. Plans have been

approved for two new school buildings in Cincinnati involving an expenditure of \$650,000 and a new high school for Evansville, Ind., will likely be up shortly. The city of Cincinnati will start at once preparing plans for the new Eighth Street viaduct, which will cost approximately \$1,500,000.

Plant Operations.—The American Rolling Mill Co. will continue to operate both plants at Middletown to capacity and it is expected that three sheet mills at the Ashland plant will be in operation toward the end of the week. This company is now operating 35 of its 50 sheet mills. The Andrews Steel Co. at Newport, Ky., will commence making steel this week, three open-hearth furnaces being on. The Newport Rolling Mill Co. will put on two additional sheet mills, giving it a total of 10, and it is expected that a slightly increased operation at the plant of the Whitaker-Glessner Co. at Portsmouth will also be made.

Warehouse Business.—Local jobbers report a considerable improvement during the week. Structural steel and reinforcing bars continue to be active, and there is also a slight increase noted in the demand for wire products. Prices are firm and unchanged.

Iron and steel bars, 2 7/8 in. base; hoops and bands, 3.35c. base; shapes and plates, 2.85c. base; reinforcing bars, 2.82 1/2c. base; cold rolled rounds, 1 1/2 in. and larger, 3.50c. base; under 1 1/2 in. and flats, squares and hexagons, 4c.; No. 10 blue annealed sheets, 3.60c.; No. 28 black sheets, 4.25c.; No. 28 galvanized sheets, 5.25c.; wire nails, \$2.75 per keg base; No. 9 annealed wire, \$2.60 per 100 lb.

Coke.—The coke market still shows fair activity, and some contracting is still going on for the year's requirements. Connellsville furnace coke is quoted at \$3.50, and foundry at \$4.50 to \$5. Quotations from New River and Wise County districts are unchanged.

Old Material.—The local scrap market continues inactive, but Western markets are showing more life. Inquiries from the smaller centers for special grades are also increasing in number, and altogether the tone of the market is much improved. It is reported that a steel company operating in the Cincinnati district had closed for 10,000 tons of scrap. The report in this paragraph several weeks ago indicated that the purchase was much smaller. Prices are unchanged, but firm.

We quote dealers' buying prices f.o.b. cars:

Per Gross Ton	
Bundled sheets	\$4.50 to \$5.00
Iron rails	11.50 to 12.00
Relaying rails, 50 lb. and up	24.50 to 25.00
Rerolling steel rails	10.00 to 10.50
Heavy melting steel	9.50 to 10.00
Steel rails for melting	9.50 to 10.00
Car wheels	12.00 to 12.50

Per Net Ton	
No. 1 railroad wrought	9.00 to 9.50
Cast borings	4.00 to 4.50
Steel turnings	3.00 to 3.50
Railroad cast	12.00 to 12.50
No. 1 machinery	14.00 to 14.50
Burnt scrap	7.50 to 8.00
Iron axles	16.00 to 16.50
Locomotive tires (smooth inside)	9.00 to 9.50
Pipes and flues	3.50 to 4.00

Boston

BOSTON, March 21.

Pig Iron.—Although individual orders in most cases are small, a more diversified buying movement of pig iron is reported this week than noted before in months. Sales aggregate 6500 tons, largely Buffalo iron, and include 1000 tons of silicon 2.75 to 3.25 to a Massachusetts maker of textile machinery, and another 1000 tons made up of three different grades from two furnaces to another Massachusetts textile interest. Both melters recently purchased round tonnages. Other sales range in size from car lots to 500 tons, practically all of them for second quarter delivery. As far as known, no furnace is quoting for delivery beyond July. Practically no No. 2 plain iron is selling. Sales of Buffalo iron this week are reported at \$18 for No. 2X and No. 1X, and in some instances at \$18.25 for No. 1X, but \$17.75 furnace was done by one Worcester, Mass., machinery maker. Eastern Pennsylvania is still available at \$19 furnace, although most furnaces are on a \$20 furnace base and asking differentials. One eastern Pennsylvania furnace this week made a few sales of No. 2X at \$20 furnace. A few sales of Alabama iron

for mixture purposes are reported in this territory at delivered prices \$3 to \$4 above Northern irons. The inactivity of Virginia furnaces eliminates such irons from this market. Small sales of charcoal iron were made this week at \$22.50 furnace.

We quote delivered at common New England points as follows, having added to furnace prices \$4.06 freight from eastern Pennsylvania, \$5.46 from Buffalo, \$6.58 from Virginia and \$10.66 from Alabama:

East. Penn., sil. 2.25 to 2.75	\$23.06 to \$24.56
East. Penn., sil. 1.75 to 2.25	23.06 to 24.06
Buffalo, sil. 2.25 to 2.75	23.46 to 23.96
Buffalo, sil. 1.75 to 2.25	23.46 to 23.96
Virginia, sil. 2.25 to 2.75	29.58
Virginia, sil. 1.75 to 2.25	29.08
Alabama, sil. 2.25 to 2.75	26.16 to 26.66
Alabama, sil. 1.75 to 2.25	25.66 to 26.16

Cast Iron Pipe.—The city of Boston has awarded 1850 tons, 6 to 36-in. pipe, to the United States Cast Iron Pipe & Foundry Co., and the town of Wellesley, Mass., 210 tons, 6, 8 and 10-in. pipe to the Warren Foundry & Machine Co. These two sales represent the largest placed in this territory during the past 10 days. Business otherwise has been confined largely to car lots. Prospects for future business are bright, especially from municipal sources, but amounts on which bids will be asked are rather indefinite at this time. Prices on cast iron pipe are reported as strong, but unchanged, as follows: Per net ton, f.o.b. Boston and district, in car load lots, 3-in., \$66.70; 4-in., \$56.70; 6-in., \$50.70; 10-in. and larger, \$49.70, with \$4 differentials on class A and gas pipe.

Coke.—The movement of by-product foundry coke from New England ovens to foundries continues heavy, but the force of incoming business apparently has spent itself, a majority of melters having sufficient fuel on hand to meet their requirements for some time. The leading coke producer in this territory, the New England Coal & Coke Co. has an adequate reserve stock of bituminous to supply its needs for some weeks after April 1. The by-product coke market is firm on a basis of \$10.15 delivered where the local freight does not exceed \$3.40.

Old Material.—The local market is sentimentally firmer, although quiet. Dealers in this territory say the outlook for Pittsburgh district mill buying within the near future is encouraging. Some speculation among dealers in anticipation of mill buying is noted, but such business is restricted by a lack of material. Heavy melting steel and wrought pipe quotations made here this week show a slight advance. Turnings and mixed borings and turnings are in demand and 50c. to 75c. higher. Ordinary cast iron borings, on the other hand, are about \$1 lower due to the withdrawal of Massachusetts buyers from the market. Chemical borings continue in demand at previously quoted prices. Small sales of railroad malleable at \$14 delivered Massachusetts are reported. Business in machinery cast is confined to an occasional car-lot at around \$17.50 delivered.

The following prices are for gross ton lots delivered consuming points:

No. 1 machinery	\$17.00 to \$17.50
No. 2 machinery	15.00 to 15.50
Stove plate	14.50 to 15.00
Railroad malleable	13.00 to 13.50

The following prices are offered per gross ton lots f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	\$9.00 to \$9.50
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	9.50 to 10.00
Wrought pipe (1 in. in diam. over 2 ft. long)	7.25 to 7.75
Machine shop turnings	2.50 to 3.00
Cast iron borings, rolling mill	2.50 to 3.00
Cast iron borings, chemical	2.50 to 3.00
Blast furnace borings and turnings	5.50 to 6.00
Forged scrap and bundled skeleton	4.50 to 5.00
Street car axles	11.50 to 12.00
Shafting	12.00 to 12.50
Car wheels	11.00 to 11.50
Rerolling rails	9.50 to 10.00

Basing Point Hearing at Chicago

A Chicago hearing on the Pittsburgh basing point practice was opened before the Federal Trade Commission on March 20. Among the witnesses who appeared on the first day were George E. Lasker, Lasker Iron Works, Chicago; Eugene H. Heller, president Hill Pump Valve Co., Chicago, and H. E. White, traffic expert, Western Association of Rolled Steel Consumers.

St. Louis

St. Louis, March 21.

Pig Iron.—The principal sale of the week was that of 2500 tons of low phosphorus, off in sulphur iron, made by a local producer to a St. Louis melter. The situation continues steadily to improve, the demand being better and purchasers being eager to get deliveries of orders placed. The stove foundries report that salesmen are sending in a greater volume of business than was expected, and one plant here placed a repeat order for 300 tons of Southern iron. Local job foundries also report an increasing volume of business. A Southern maker reports that more interest is being shown in the water and rail price from Sheffield, equal to \$19.44, St. Louis, made several weeks ago, and several 300-ton orders were placed during the week, in addition to a number of smaller requirements. Other Southern makers are quoting \$15 to \$15.50, but the Sheffield concern is believed to be getting the bulk of the business because of the lower rate. The market for Northern iron is firm at \$20, Chicago, with the local makers meeting that figure. A Quincy, Ill., stove manufacturer is in the market for 1000 tons for second quarter delivery. A Missouri melter wants 350 tons over six months' delivery. Negotiations are on with a southern Illinois melter for 500 tons, and a Kansas melter wants from 300 to 500 tons.

We quote delivered consumers' yards, St. Louis, as follows, having added to furnace prices \$2.80 freight from Chicago and \$5.74 from Birmingham:

Northern foundry, sil. 1.75 to 2.25	\$22.80
Northern malleable, sil. 1.75 to 2.25	22.80
Basic	22.80
Southern foundry, all rail, sil. 1.75 to 2.25	\$20.74 to 21.21
Southern foundry, water and rail, sil. 1.75 to 2.25, f.o.b. St. Louis	19.44

Finished Iron and Steel.—The center of interest in these lines lies with the railroads. The Missouri Pacific Railroad, which is the heaviest purchaser of material of any of the railroads centering here, is in the market for 500,000 tie plates; the Mobile & Ohio wants 20,000 tie plates; the Wabash has an inquiry out for 500 tons of tie plates, and the Terminal Railway wants 40 to 50 tons of angle bars. The Missouri, Kansas & Texas Railway's requirements of 200,000 tie plates went to the Railway Supply Co. The work of double tracking and grade revision to be done by the St. Louis & San Francisco, already announced in THE IRON AGE, will begin April 1. A total of 21½ miles will be double tracked. The requirements for 90-lb. rails and all track fastenings will be handled by the United States Steel Corporation under a contract of several years' standing and which has several years to run. The Missouri, Kansas & Texas is in the market for 30 72½-foot passenger coaches. The St. Louis Car Co. got the contract for 50 steel electric passenger cars from the Southern Pacific Railway of San Francisco, the contract for the motors going to the Westinghouse Manufacturing Co., Pittsburgh. The estimated cost of the cars is \$800,000. The biggest sale of structural steel of the week was that of 600 tons to the Stupp Brothers Bridge & Iron Co. by the Jones & Laughlin Steel Co. for all-barge shipment. An arrangement made with an Eastern fabricator for the purchase of 450 tons of structural steel for the Majestic Theater and Office Building, Dallas, has been cancelled and bids are to be asked on this as well as for 100 tons of bars.

For stock out of warehouse we quote: Soft steel bars, 2.37½¢ per lb.; iron bars, 2.37½¢; structural shapes, 2.47½¢; tank plates, 2.47½¢; No. 10 blue annealed sheets, 3.47½¢; No. 28 black sheets, cold rolled, one pass, 4.15¢; cold drawn rounds, shafting and screw stock, 3.50¢; structural rivets, \$3.09½ per 100 lb.; boiler rivets, \$3.19½; tank rivets, 7/16-in. and smaller, 65 and 5 per cent off list; machine bolts, large, 60-10 per cent; small, 60, 70 and 10 per cent; carriage bolts, large, 55-5 per cent; small, 60 and 10 per cent; lag screws, 65-5 per cent; hot pressed nuts, square or hexagon blank, \$4; and tapped, \$3.75 off list.

Coke.—The coke market is improving right along, a condition applying to all grades. Buying is heavier, and there is an insistent demand by purchasers for immediate shipment. The market has advanced, and some Connellsville producers are quoting from \$4.75 to \$5.25.

Old Material.—The market maintains a fairly firm undertone, although some dealers appear to be weakening, because of fear they have carried the market too far, as consumers refuse to pay by about \$1 a ton the

prices paid by the dealers on railroad lists recently closed. There appears to be a heavy short interest among the dealers, as some of them are eager to cover the bought material which they can only dispose of at a loss. The larger consumers contend they are paying the limit and cannot make steel at a profit by buying old material at the advances asked by dealers, as they must either use the cheaper grades or remain out of the market until the present flurry has subsided. Relaying rails are active, and several large inquiries are out for the heavier sections. Light section relayers, however, are not in demand.

We quote dealers' prices f.o.b. consumers' works, St. Louis industrial district and dealers' yards, as follows:

Per Gross Ton	
Old iron rails	\$14.00 to \$14.50
Steel rails, rerolling	12.50 to 13.00
Steel rails, less than 3 ft.	12.50 to 13.00
Relaying rails, standard section	23.00 to 23.00
Cast iron car wheels	15.00 to 15.50
No. 1 heavy railroad melting steel	10.50 to 11.00
No. 1 heavy shovelling steel	10.00 to 10.50
Ordinary shovelling steel	10.00 to 10.50
Progs, switches and guards, cut apart	10.50 to 11.00
Ordinary bundle sheet	4.50 to 5.00
Cast steel bolsters	11.00 to 11.50
Per Net Ton	
Heavy axle and tire turnings	6.50 to 7.00
Iron angle bars	13.00 to 13.50
Steel angle bars	11.00 to 11.50
Iron car axles	18.00 to 18.50
Steel car axles	13.00 to 13.50
Wrought iron arch bars	15.50 to 16.00
No. 1 railroad wrought	9.50 to 10.00
No. 2 railroad wrought	9.00 to 9.50
Railroad springs	12.00 to 12.50
Steel couplers and knuckles	11.50 to 12.00
Locomotive tires, 42 in. and over, smooth inside	10.00 to 10.50
No. 1 dealers' forge	0 to 9.00
Cast iron borings	5.50 to 6.00
No. 1 busheling	8.50 to 9.00
No. 1 boilers cut in sheets and rings	6.00 to 6.50
No. 1 railroad cast	13.50 to 14.00
Stove plate and light cast	12.50 to 13.00
Railroad malleable	10.50 to 11.00
Agricultural malleable	10.50 to 11.00
Pipes and flues	7.50 to 8.00
Heavy railroad sheet and tank	6.00 to 6.50
Light railroad sheet	3.50 to 4.00
Railroad gate bars	10.50 to 11.00
Machine shop turnings	3.00 to 3.50
Country mixed iron	6.50 to 7.00
Uncut railroad mixed	9.50 to 10.00
Horseshoes	9.50 to 10.00
Railroad brake shoes	10.50 to 11.00

Birmingham

BIRMINGHAM, ALA., March 21.

Pig Iron.—At the close of the week the Birmingham iron market was buoyant except as to price. The base remained at \$15 to \$15.50. Makers expect price to harden following the brisk business done and being done. One maker sold 3000 tons to Belleville, Ohio, stove works, one plant taking 1600 tons. San Francisco took 500 tons at \$15.50 and wants more. A Michigan melter took 750 tons. Sales have been scattered throughout the South, Middle West and Northwest. Woodward Iron Co. blew in its banked furnace and now has three active. One maker has sold March make and 10,000 tons additional for March delivery, has sold capacity for April and 60 per cent of capacity for May. Another maker with no iron on yards has booked April and May to 80 per cent of capacity and two interests have made some third quarter bookings where customers insisted on connecting them with second quarter orders. Several lots of Sheffield iron on the base of \$16 Sheffield were taken by St. Louis melters. Some Eastern business is being figured on and there was a competitive bid on a lot for Pennsylvania. One maker figures putting in another blast furnace soon to care for large bookings and this will probably be done. Active stacks in Alabama now include eight on basic, seven on merchant iron and two on charcoal iron. Small sales of charcoal iron were made the past week. A sanitary manufacturing company with plant at Louisville took 1000 tons of foundry. Consumers are showing a decided interest in forward delivery and there is general conviction that prices have reached the bottom.

We quote per gross ton f.o.b. Birmingham district furnaces as follows:

Foundry, silicon 1.75 to 2.25	\$15.00 to \$15.50
Basic	14.00 to 14.50
Charcoal, warm blast	32.00

Finishing Mills.—In order to have more iron for steel mill purposes, the Tennessee Company blew in

No. 2 stack at Bessemer Monday. It now has seven furnaces on basic iron and is operating the open-hearth plant with nine furnaces on full turn with rail mill on turn of 10,000 tons. Other mills are operating at good capacity as evidenced by increase in blast furnace and open hearth operations. The American Steel & Wire Co. and Gulf States Steel Co. are around 60 per cent of capacity with steady influx of new business.

Cast Iron Pipe.—The American Cast Iron Pipe Co. booked 3000 tons for Seattle and the McWane Iron Pipe Co. booked additional tonnage of its handlength high pressure pipe for Honolulu. Pressure pipe is strong at \$33 base. Sanitary pipe brokers began coming into the market again last of week.

Coal and Coke.—Birmingham district operators have tentative arrangements to supply certain concerns dependent on competitive field in case the strike necessitates that supply. Alabama is so completely non-union that no strike worthy the name can occur here. Coke is strong at \$5. Monterey, Mex., is figuring on a large tonnage.

• **Old Material.**—Cast scrap is active owing to demand on part of pipe shop and steel scrap is beginning to show some strength. Dealers are not yet inclined to raise prices. Yards are short on stocks and buying what is offered.

We quote per gross ton f.o.b. Birmingham district yards as follows:

Steel rails	\$11.00 to \$12.00
No. 1 steel	10.00 to 11.00
No. 1 cast	14.00 to 15.00
Car wheels	13.00 to 14.00
Tramcar wheels	12.00 to 13.00
No. 1 wrought	12.00 to 13.00
Stove plate	11.00 to 12.00
Cast iron borings	6.00 to 7.00
Machine shop turnings	6.00 to 7.00

Buffalo

BUFFALO, March 21.

Pig Iron.—Buying is more general and from a continually widening circle. The price situation shows no change and \$18 is the usual quotation irrespective of silicon. A number of carload sales at \$18.50 have been made and one furnace has sold some tonnages of this character at \$18.75. The largest inquiries now engaging local furnaces are one for 2000 tons and one for 1600 tons. The Donner Steel Co. has two furnaces blowing on foundry iron. The total placement for the week does not exceed 5000 tons.

We quote f.o.b. per gross ton Buffalo as follows:

No. 1 foundry, 2.75 to 3.25 sil.	\$18.50 to \$19.00
No. 2X foundry, 2.25 to 2.75 sil.	18.50 to 19.00
No. 2 plain, 1.75 to 2.25 sil.	18.00 to 18.50
Basic	18.00 to 18.25
Malleable	18.00 to 18.50
Lake Superior charcoal	26.14

Finished Iron and Steel.—The greater buying activity which was apparent a week ago continues and is felt in finished lines such as wire products more than in bars, shapes or plates. Strengthening of wire prices has served to stimulate buying and the 1.50c. price on bars, shapes and plates is more generally observed. Automobile activity has helped the leading wire maker and the enlarged Ford program for the month of March has greatly stimulated operation at this mill. Outside Buffalo, price shading on sheets is reported, but the Buffalo market is firm at \$3c. Release of shipping instructions on some very old contracts has also encouraged sellers. Improvement in demand for cold rolled material is a new development and pipe business has also come in in greater quantity. These improvements are mostly from small buyers. An inquiry for 500 tons of reinforced bars for a Canadian interest is engaging two local makers. The general contract for a new high school at Niagara Falls which will require 500 tons of shapes has been awarded but the steel order has not been placed.

We quote warehouse prices f.o.b. Buffalo as follows: Structural shapes, 2.65c.; plates, 2.55c.; plates, No. 3 gage, 3.35c.; soft steel bars and shapes, 3.55c.; hoops and bands, 3.15c.; blue annealed sheets, No. 10, 3.40c.; galvanized steel sheets, No. 28, 3.35c.; black sheets, No. 28, 4.35c.; cold-rolled strip steel, 5.90c.; cold-rolled round shafting, 3.40c.

Coke.—So many foundries have ordered ahead that the leading seller is virtually out of the market. Prices are stronger, heating coke now being quoted at \$3.50 and best grades of foundry from \$4.50 to \$5.50.

Old Material.—A number of sales of heavy melting steel at \$14 have been made. Considerable negotiating is going on between dealers in possession of stocks of steel, with the dealers who settled with the bar maker for \$21 on an old contract, an account of which was published in THE IRON AGE last week. Demand for borings from Eastern points has been brisk and greater activity in hydraulic compressed and No. 1 machinery cast is also evident.

We quote dealers' asking prices per gross ton f.o.b. Buffalo as follows:

Heavy melting steel	\$13.50 to \$14.00
Low phos., 0.04 and under	13.50 to 17.00
No. 1 railroad wrought	15.00 to 16.00
Car wheels	15.00 to 17.50
Machine shop turnings	8.00 to 9.00
Cast iron borings	9.50 to 10.00
Heavy axle turnings	12.00 to 12.50
Grate bars	12.00 to 13.00
No. 1 busheling	10.00 to 11.00
Stove plate	14.00 to 15.00
Bundled sheet stampings	8.00 to 9.00
No. 1 machinery cast	17.00 to 18.00
Hydraulic compressed	10.50 to 11.50
Railroad malleable	13.00 to 14.00

British Iron and Steel Market

(By Cable)

LONDON, ENGLAND, March 21.

Engineering and shipbuilding labor disputes continue. The Government has refused intervention.

German steel works are endeavoring to purchase their supplies direct from the mine owners.

Continental material is quiet. French foundry pig iron is held at £5 5s. to £5 10s. (\$23 to \$24.09) f.o.b. Luxemburg and Belgian foundry pig iron is quoted at £5 to £5 5s. (\$21.90 to \$23) f.o.b. Cleveland foundry hematite is competing on the Continent.

Belgian, French and Luxemburg merchant bars are obtainable at £8 to £8 10s. (1.56 to 1.66c. per lb.) f.o.b., for May and June delivery. Belgian angles are held at £10 7½s. (2.03c. per lb.) c.i.f. Japan.

Luxemburg structural beams are quoted at £7 10s. to £7 15s. (1.47 to 1.51c. per lb.) f.o.b., for April and May shipments. French beams are held at £8 (1.56c. per lb.) f.o.b., for April and May delivery. Belgian beams are quoted at £7 12½s. to £7 15s. (1.49 to 1.51c. per lb.) f.o.b., for April and May shipment. Belgian 3/16-in. plates are held at £8 12½s. to £9 (1.69 to 1.76c. per lb.) f.o.b., for May and June delivery.

French wire rods are quoted at £9 5s. (\$40.51) f.o.b., for June shipment. Belgian billets are held at £6 10s. (\$28.47) f.o.b., for April delivery. Belgian sheet bars are quoted at £6 12½s. to £6 15s. (\$29.02 to \$29.56) f.o.b., for April shipment.

We quote per gross ton, except where otherwise stated, f.o.b. maker's works, with American equivalent figured at \$4.38 per £1, as follows:

Durham coke, delivered	£1 9s.	\$6.35
Cleveland No. 1 foundry	4 15	20.80
Cleveland No. 3 foundry	4 10	19.71
Cleveland No. 4 foundry	4 7½	19.16
Cleveland No. 4 forge	4 10	19.71
Cleveland basic	4 10	19.71
Hematite	7 0*	30.66*
East Coast mixed	5 0	21.90 to \$22.45
East Coast hematite	4 17½ to 5 0	21.35 to 21.90
Ferromanganese	15 0 to 14 10*	65.70 & 63.51*
Rails, 60 lb. and up	8 0	35.04 to 41.61
Billets	7 0	30.66 to 32.38
Sheet and tin plate bars	7 0	30.66 to 32.38
Welsh	7 0 to 7 7½	30.66 to 32.38
Tin plates, base box	0 18½ to 0 19½	4.11 to 4.27
C. per lb.		
Ship plates	9 5	1.81 to 2.05
Boiler plates	12 10	2.44 to 2.74
Tees	9 10	1.86 to 2.15
Channels	8 15	1.71 to 2.00
Beams	8 10	1.66 to 1.95
Round bars, ½ to 3 in.	10 10	2.05
Galvanized sheets, 24 g.	16 0	3.13 to 4.13
Black sheets	12 10	2.44 to 2.49
Steel hoops	12 0	2.35 & 2.39*
Cold rolled steel strip, 20 g.	23 10	4.59

*Export price.

Prices Finished Iron and Steel, f.o.b. Pittsburgh

Freight Rates

Freight rates from Pittsburgh on finished iron and steel products, in carload lots, to points named, per 100 lb., are as follows:

Philadelphia, domestic...	\$0.36	Kansas City	\$0.815
Philadelphia, export...	0.285	Kansas City (pipe)...	0.77
Baltimore, domestic...	0.35	St. Paul	0.665
Baltimore, export...	0.255	Omaha	0.815
New York, domestic...	0.38	Omaha (pipe)	0.77
New York, export...	0.285	Denver	1.35
Boston, domestic...	0.405	Denver (wire products)...	1.415
Boston, export	0.285	Pacific Coast	1.665
Buffalo	0.295	Pacific Coast, ship plates...	1.335
Cleveland	0.24	Birmingham	0.765
Detroit	0.325	Jacksonville, all rail...	0.655
Cincinnati	0.325	Jacksonville, rail and water	0.46
Indianapolis	0.345	New Orleans	0.515
Chicago	0.38		
St. Louis	0.475		

The minimum carload to most of the foregoing points is 36,000 lb. To Denver the minimum loading is 40,000 lb., while to the Pacific Coast on all iron and steel products, except structural material, the minimum is 80,000 lb. On the latter item the rate applies to a minimum of 50,000 lb., and there is an extra charge of 9c. per 100 lb. on carloads of a minimum of 40,000 lb. On shipments of wrought iron and steel pipe to Kansas City, St. Paul, Omaha and Denver the minimum carload is 46,000 lb. On iron and steel items not noted above the rates vary somewhat and are given in detail in the regular railroad tariffs.

Rates from Atlantic Coast ports (i.e., New York, Philadelphia and Baltimore) to Pacific Coast ports of call on most steamship lines, via the Panama Canal, are as follows: Pig iron, 55c.; ship plates, 75c.; ingot and truck bars, structural steel, common wire products, including cut or wire nails, spikes and wire hoops, 75c.; sheets and tin plates, 60c. to 75c.; rods, wire rope, cable and strands, \$1. in diameter, netting and stretcher, 75c.; pipe, not over 18 in. diameter, 75c.; over 18 in. diameter, 25c. per in. or fraction thereof additional. All prices per 100 lb. in carload lots, minimum 40,000 lb.

Structural Material

I-beams, 3 to 15 in.; channels, 3 to 15 in.; angles, 3 to 6 in., on one or both legs, 1/4 in. thick and over, and zees, structural sizes, 1.40c. to 1.50c.

Sheared plates, 1/4 in. and heavier, tank quality, 1.40c. to 1.50c.

Wire Products

Wire nails, \$2.40 base per keg; galvanized, 1 in. and longer, including large-head barbed roofing nails, taking an advance over this price of \$1.25 and shorter than 1 in., \$1.75; bright Bessemer and basic wire \$2.25 per 100 lb.; annealed fence wire, Nos. 6 to 9, \$2.25; galvanized wire, \$2.75; galvanized barbed wire, \$3.05; galvanized fence staples, \$3.05; painted barbed wire, \$2.55; polished fence staples, \$2.55; cement-coated nails, per count keg, \$1.90; these prices being subject to the usual advances for the smaller trade, all f.o.b. Pittsburgh, freight added to point of delivery, terms 60 days, net, less 2 per cent off for cash in 10 days. Discounts on woven-wire fencing are 70 1/2 per cent off list for carload lots; 69 1/2 per cent for 1000-rod lots, and 68 1/2 per cent for small lots, f.o.b. Pittsburgh.

Bolts and Nuts

Machine bolts, small, rolled threads, 70, 10 and 10 per cent off list

Machine bolts, small, cut threads, 70 and 10 per cent off list

Machine bolts, larger and longer, 70 and 10 per cent off list

Carriage bolts, 1/2 in. x 6 in.

Smaller and shorter rolled threads, 70 and 10 per cent off list

Cut threads, 70 per cent off list

Longer and larger sizes, 70 per cent off list

Lag bolts, 70, 10 and 5 per cent off list

Plow bolts, Nos. 1, 2 and 3 heads, 60 and 10 per cent off list

Other style heads, 20 per cent extra

Machine bolts, c.p.c. and t. nuts, 1/2 in. x 4 in.

Smaller and shorter, 65, 10 and 5 per cent off list

Larger and longer sizes, 65 and 10 per cent off list

Hot pressed sq. or hex. blank nuts, \$5.50 off list

Hot pressed nuts, tapped, \$5.25 off list

C.p.c. and t. sq. or hex. blank nuts, \$5.25 off list

C.p.c. and t. sq. or hex. blank nuts, tapped, \$5.00 off list

Semi-finished hex. nuts:

1/4 in. to 9/16 in. inclusive, .80, 10, 10 and 10 per cent off list

Small sizes S. A. E., .80 and 10 per cent off list

1/2 in. to 1 in. inclusive, U. S. S. and S. A. E., 70, 10, 10 and 10 per cent off list

Stove bolts in packages, .80 and 3 tens and 5 per cent off list

Stove bolts in bulk, .80, 3 tens and 2 1/4 per cent off list

Tire bolts, 70, 10 and 5 per cent off list

Track bolts, carloads, 3c. base

Track bolts, less than carloads, 3.75c. to 3c. base

Upset and Hex. Head Cap Screws

1/2 in. and under, .80 and 10 to 80, 10 and 10 per cent off list

9/16 in. to 1 in., .80 and 10 to 80, 10 and 10 per cent off list

Upset Set Screws

1/4 in. and under, .80, 10 and 5 to 85 per cent off list

9/16 in. to 1 in., .80, 10 and 5 to 85 per cent off list

Milled Square and Hex. Cap Screws

All sizes, .75 and 10 to 80 per cent off list

Milled Set Screws

All sizes, .70, 10 and 10 per cent off list

Rivets

Large structural and ship rivets, \$2.00 to \$2.10
Large boiler rivets, 2.10 to 2.20
Small rivets, .75 and 10 off list

Wire Rods

No. 5 common basic or Bessemer rods to domestic consumers, \$36, chain rods, \$36; screw stock rods, \$41; rivet and bolt rods and other rods of that character, \$36; high carbon rods, \$43 to \$46, depending on carbons.

Railroad Spikes and Track Bolts

Railroad spikes, 9/16-in. and larger, \$2 to \$2.10 base per 100 lb. in lots of 200 kegs of 200 lb. each or more; spikes, 1/2-in., 3/4-in. and 7/16-in., \$2.15 to \$2.25 base, 5/16-in., \$2.15 to \$2.25 base. Bolt and barge spikes, \$2.15 to \$2.25 base per 100 lb. in carload lots of 200 kegs or more, f.o.b. Pittsburgh. Track bolts, 3c. base per 100 lb. Tie plates, \$1.75 per 100 lb. Angle bars, \$2.40 per 100 lb.

Terne Plates

Prices of terne plates are as follows: 8-lb. coating, 200 lb., \$9.30 per package; 8-lb. coating, 1 c., \$9.60; 15-lb. coating, 1 c., \$11.80; 20-lb. coating, 1 c., \$13; 25-lb. coating, 1 c., \$14.25; 30-lb. coating, 1 c., \$15.25; 35-lb. coating, 1 c., \$16.25; 40-lb. coating, 1 c., \$17.25 per package, all f.o.b. Pittsburgh, freight added to point of delivery.

Iron and Steel Bars

Steel bars, 1.40c. to 1.50c. from mill. Refined bar iron, 2c. to 2.10c.

Welded Pipe

The following discounts are to jobbers for carload lots on the Pittsburgh basing card:

Butt Weld			Iron		
Inches	Steel	Black	Inches	Black	Galv.
1/4 to 3/4	54 1/2	28	1 1/2 to 2 1/2	36 1/2	+22 1/2

1 1/2 to 2	55	41 1/2	5 1/2 to 6 1/2	30 1/2	18 1/2

To the large jobbing trade the above discounts are increased by one point, with supplementary discounts of 5 and 2 1/2 per cent.

Boiler Tubes

The following are the discounts for carload lots f.o.b. Pittsburgh:

Lap Welded Steel		Charcoal Iron	
Inches	Discount	Inches	Discount
1 1/2 in.	26 1/2	1 1/2 in.	5
2 to 2 1/2 in.	41	1 3/4 to 1 1/2 in.	15
2 1/2 to 3 in.	52	2 to 2 1/4 in.	25
3 1/4 to 13 in.	57	2 1/4 to 3 in.	30
		3 1/4 to 4 1/2 in.	32

To large buyers of steel tubes, a supplementary discount of 5 per cent is allowed.

Standard Commercial Seamless Boiler Tubes
New discounts have been adopted on standard commercial seamless boiler tubes, but manufacturers are not yet ready to announce them for publication, and for that reason we publish no discounts this week.

Sheets

Prices for mill shipments on sheets of standard gage in carloads, f.o.b. Pittsburgh, follow:

PERSONAL

Charles F. Smith, chairman of the board of directors of the New Britain Machine Co., New Britain, Conn., recently resigned.

Vincent S. Whitney has become sales manager of Bridgeport sales for the Shea Foundry & Machine Co., Bridgeport, Conn.

Louis W. Arny, secretary of the Leather Belting Exchange, Philadelphia, addressed the Meriden, Conn., branch of the American Society of Mechanical Engineers, on leather and leather belting, at a meeting held at the Home Club, Meriden, March 16.

Albert Turner recently joined the engineering department of the Heald Machine Co., Worcester, Mass. Mr. Turner was formerly with the Norton Co., Worcester, where he was engineer for 19 years.

M. M. Marcus, E. M., Met. E., and general superintendent Rhode Island Malleable Iron Works, Hills-grove, R. I., on March 14 spoke before the Providence Engineering Society, Providence, R. I., on certified malleable iron castings, describing the modern scientific practice in the manufacture of malleable iron castings.

Harry V. Hayman, sales manager Automatic Machine Co., Bridgeport, Conn., recently resigned, has accepted a position as sales manager of the Wellman-Seaver-Morgan Co., Cleveland. Mr. Hayman was with the Automatic Machine Co. for 13 years.

John C. Neale, vice-president in charge of sales of the Midvale Steel & Ordnance Co., Philadelphia, accompanied by Mrs. Neale, has left on a business trip to the Pacific Coast.

Webster D. White has resigned from the position of secretary and treasurer of Kemsley, Millbourn & Co., Ltd., 90 West Street, New York, and Robert R. Appleby has been appointed in his stead.

George E. Learnard, president International Combustion Engine Co., New York, sailed March 21 on the Aquitania for London. Mr. Learnard will be engaged part of his time on business of the company in London and will spend some time on the continent.

W. J. Paul has been appointed by the General Drop Forge Co., Inc., Buffalo, as Eastern district representative, with offices in the Woolworth Building, New York. He will also have charge of the Philadelphia offices in the Drexel Building.

W. A. Thomas, former president of the Brier Hill Steel Co., has been elected a director of the General Fireproofing Co., Youngstown, Ohio, succeeding R. M. Bell, resigned. The latter continues as secretary-treasurer.

William Ochse, for the past two years sales representative Manning, Maxwell & Moore, Inc., at Chicago, has resigned to become efficiency engineer the Ohio Machine Tool Co., Kenton, Ohio, manufacturer of shapers and planers, effective April 1. Before joining the sales organization of Manning, Maxwell & Moore, Mr. Ochse was for 20 years with Gould & Eberhardt, manufacturers of shapers and automatic gear and rack cutting machinery, Newark, N. J., latterly having charge of their planning and tool design department.

J. R. Camm has been appointed assistant to C. J. Sturgeon, manager of the Cleveland office of the Kearney & Trecker Corporation, milling machines, Milwaukee, and will cover the southern part of Ohio, with residence at Dayton. Mr. Camm is a brother of John A. Camm, sales manager of the Kearney & Trecker Corporation, and has been connected with the Milwaukee office for the past two years.

Nils Anderson, president Debevoise-Anderson Co., Inc., was elected a director of the Queen's Run Refractories, Inc., Lock Haven, Pa., at the annual meeting of latter company, in Boston March 14.

John J. Brant, for 20 years identified with the accounting department of the Youngstown Sheet & Tube Co., who retired Jan. 1 as general auditor, has been appointed secretary of the Sinking Fund Commission of Youngstown, Ohio.

Joseph G. Butler, Jr., is slowly convalescing at his home in Youngstown from injuries sustained last year when he was struck by a motor truck. Mr. Butler receives friends and business callers each day at his residence, 525 Wick Avenue and transacts business from his home. Almost every day he visits the McKinley Memorial building at Niles, Ohio, which he was instrumental in building.

Charles A. Sargeant has been elected president of the Domhoff & Joyce Company, pig iron merchants, Cincinnati, to succeed his father, the late Col. John Sargeant, who died on March 4. Mr. Sargeant has also been appointed a colonel on the staff of Governor Edwin P. Morrow of Kentucky, the honor being conferred as a tribute to himself and to the memory of his father. Mr. Sargeant is one of the youngest men to ever receive such an honor.

W. J. Metcalf has been chosen as assistant to the president of the Yale & Towne Mfg. Co., Stamford, Conn., and Richard G. Plumley, has been made manager of the order department, as per announcements just made by President Walter C. Allen.

William H. Hulick, Jr., son of William H. Hulick, president Warren Foundry & Machine Co., 11 Broadway, New York, has joined the sales force of that company. He was formerly with the Frederick Snare Corporation, 8 West Fortieth St., New York.

Horace S. Peck, comptroller, S-K-F Industries, Inc., New York has resigned through reorganization of the personnel of the company and has been succeeded by T. W. Dinlocker, formerly assistant comptroller. Both Mr. Peck and Mr. Dinlocker had been associated with the company for about two years.

Prof. J. H. Moffett, formerly metallurgical engineer at the University of Cincinnati, but at present in charge of foundry practice in the department of mechanical engineering at the University of Minnesota, Minneapolis, is carrying out a research on the Relative Rates of Elimination of Oxidizable Elements in Cast Iron.

Norman L. Snow has resigned as vice-president and active head of the Terry Steam Turbine Co., Hartford, Conn., to become president and treasurer of the Diamond Power Specialty Corporation, Detroit, a new company which has purchased the business and plant of the Diamond Power Specialty Co., a copartnership, the members of which are retiring from the soot blower business in the western hemisphere.

W. C. Allen, former manager of the Philadelphia branch of the Black & Decker Mfg. Co., Baltimore, and subsequently special representative, has been made branch manager of the Black & Decker Chicago territory.

The New Spanish Tariff

WASHINGTON, March 18.—While in some instances the changes are only slight, the general trend of duties carried in the new Spanish tariff as it affects iron and steel products and machinery is decidedly upward. The new tariff as explained by Henry Chalmers, Chief Division of Foreign Tariff, Bureau of Foreign and Domestic Commerce, continues the two scales of duty known as the "First" and "Second" tariffs. While Spain has abrogated most of her commercial treaties preliminary to this revision of the tariff, the products of most countries, including the United States, are being temporarily granted most-favored-nation treatment, including the rates of the "Second," or lower tariff, which are the only ones here shown. The rates of the "First" tariff are, as a rule, two to three times as high as the "Second," and are to be applied to such countries as do not within a reasonable period open negotiations for reciprocal favored-nation treaties with Spain.

OBITUARY

EDWARD M. BARR, manager of the Chicago office of Chisholm-Moore Mfg. Co., died March 15. Mr. Barr had complained of not feeling well for several days and dropped dead suddenly while downtown in Chicago. He had been with the company 11 years, in charge of the Chicago office, and has a wide acquaintance in the Chicago district. Mr. Barr was born and raised in Milwaukee and lived there until he went into business about 20 years ago. He was the son of J. M. Barr, formerly assistant to President A. J. Earling of the Chicago, Milwaukee & St. Paul Railroad, and one of the pioneer railroad men in the West. He leaves his wife and one son.

MRS. HENRIETTA ELIZABETH BROWN died last week at Newton Center, Mass. She was the daughter of the late Henry J. R. Farnum, senior partner of the Davis & Farnum Mfg. Co., Waltham, Mass., iron founders. In 1877 she was married to Frank H. Brown, manager of the same concern. He died four years ago, and, since that time, the widow served as vice-president of the company and took an active interest in its affairs.

JAMES A. DOUGHTY, president Torrington Mfg. Co., Torrington, Conn., died of heart failure at his home March 15. Mr. Doughty was very well known in industrial activities of the New England States, and held official positions with several concerns. He also served as an official of the American Brass Co., Waterbury, Conn., for a number of years. He was 71 years of age.

GORDON M. MCGREGOR, of Windsor, Ont., vice-president and general manager of the Canadian Ford Motor Co., who died last week, was a prominent industrial figure of Canada. When his father died in 1903, he succeeded to the presidency of the Walkerville Wagon Works, a rather unprofitable concern, and it was from this nucleus that Mr. McGregor developed the Canadian branch of the Ford Motor Co., which became one of the most extensive and profitable manufacturing companies in the Dominion. The new company was started with a capitalization of \$125,000, of which Mr. McGregor raised \$40,000 himself by selling stock. Henry Ford received 51 per cent of the stock in return for his patents and a contract reserving Canada for the new company. In 1911 the capitalization was increased to \$1,000,000, and in 1916 to \$10,000,000.

HARRY DEAN BUSH, general superintendent of the Carnegie Steel Co., Baltimore, died on March 15 at his home in Baltimore, aged 64. Mr. Bush was born in Springfield, Mass. He began his career as a civil engineer with the old R. F. Hawkins bridge plant at Springfield, and at the end of two years became bridge engineer for the Northern Pacific Railroad. He also served for a year as assistant engineer in the office of George S. Morrison, New York, and later became superintendent for the Dominion Bridge Co., Ltd., Montreal. In 1903 Mr. Bush became vice-president and manager of the Baltimore Bridge Co., Baltimore. He was a member of the American and Canadian Societies of Civil Engineers and the Engineers' and Whitehall Clubs of New York.

CHARLES H. BOLLES, aged 90, of Bolles, White & Co., Hartford, Conn., hardware dealers, died March 9, at his home in Charlestown. Mr. Bolles was born in Hartford in 1831, going to Boston in 1861, where he engaged in the hardware business, later becoming a member of the firm of Benjamin Callender & Co. This company later became Bolles, White & Co. Mr. Bolles had not taken an active part in the business for the past 15 years.

Management, "looking backward and forward," is to be discussed at a meeting of the Providence Engineering Society on the evening of April 4 by Carle M. Bigelow, of the Cooley & Marvin Co., accountant, appraiser and engineer, Boston.

ORE RATE CONTROVERSY

Railroads File Tariffs of New Rates Opposed by Buffalo Furnaces

WASHINGTON, March 21.—Railroads have filed tariffs with the Interstate Commerce Commission proposing reductions, effective April 17, of 20 per cent in ore handling charges and in ore rates from lower Lake ports to interior furnaces. The tariffs are in accordance with those which were specified in the Cleveland report of THE IRON AGE last week. The new schedules began to arrive on March 16, the first being those of the Buffalo, Rochester & Pittsburgh Railroad, which provided lower rates and charges from Buffalo on traffic to DuBois (Adrian furnace), Josephine, Lindsey, and Punxsutawney, Pa., and are typical of the others that have been filed as they relate to the percentage of reductions in rates and handling charges.

The following table shows the present and proposed line haul rates over the Buffalo, Rochester & Pittsburgh Railroad, together with the charge for handling ore from vessels to the car and the aggregate:

Rates on Traffic Originating in the United States From Buffalo (B., R. & P. Tracks)

To	Present Rates			Effective April 17, 1922		
	Line Haul	Vessel to Car	Aggregate	Line Haul	Vessel to Car	Aggregate
DuBois (Adrian Furnace)	98	8 1/2	106 1/2	78	7	85
Josephine	119	8 1/2	127 1/2	95	7	102
Lindsey	98	8 1/2	106 1/2	78	7	85
Punxsutawney						

As pointed out in THE IRON AGE of last week, Buffalo iron and steel makers have protested against the reduced rates and have asked that they be suspended.

Previous to their decision to make the 20 per cent cuts, executives of the Eastern carriers held a conference with executives of the Northwestern railroads carrying ore from the mines in the Lake Superior region to upper docks. The representatives of the Eastern lines suggested that the Northwestern carriers make a 25 per cent reduction in the rates from the mines to the upper docks. Apparently this was done both to placate the Buffalo district producers and have them withdraw their protest and to have the Lake Superior ore shippers withdraw their complaint in the so-called Adriatic Mining Co. case against rates on ore from Lake Superior mines to upper ports. It has been stated that even if this reduction had been proposed, it would not have been acceptable to either the Buffalo iron and steel producers or the ore interests in the Lake Superior district. The former are urgently seeking lower coal and coke rates before agreeing to reduced ore rates from lower Lake ports and also contend that ore rates already are relatively lower than fuel rates to Buffalo. At the same time, ore interests in the Lake Superior district not only are asking for reduced rates, but are also asking for restoration of the old relationship of rates between the Minnesota mines on the one hand and the old range mines on the other.

The upper Lake lines themselves strongly opposed any reductions and flatly refused to make them. Their representatives expressed the opinion that a 25 per cent reduction would not satisfy the complainants in the Adriatic case and they emphasized the fact that these complainants were also seeking restoration of the old relationship of rates. They also expressed doubt as to the ability of the Eastern carriers to persuade the Lake front furnace interests to withdraw their opposition simply by showing them that it would be to their advantage if a cut were made in rates from mines to upper docks, though the Buffalo producers are asking that this be done, but do not stop there. The executives of the Northwestern carriers also claimed that such a cut would be to the advantage of the interior furnaces and consequently leave unsolved the question of relationship between rates on ore from the lower Lake ports to interior furnaces and the rates on coal and coke from the mines and ovens near the interior furnaces to Lake front furnaces.

*Refinery quotation.

New York

NEW YORK, March 21.

The markets are only moderately active and prices are steady to firm. Buying of copper has been in good volume but prices are no higher. The tin market has been exceedingly dull with prices fairly steady. Lead consumption continues in steady volume. The zinc market is fundamentally unchanged but prices are a little stiffer.

Copper.—Despite the fact that according to various estimates sales of copper thus far this month have been between 70,000,000 and 100,000,000 lb., prices have not advanced. It is still possible to buy electrolytic copper for any delivery through May at 13c., delivered, or 12.75c., refinery. Inquiries and sales are not quite as numerous this week as last, but the volume is good with both domestic and foreign sales involved. Some producers are unwilling to sell at present prices, but the market in general is fairly broad.

Tin.—The market for Straits tin has been extremely quiet with hardly one day of real activity in the past week. Prices have hovered around 29c., New York, for spot Straits with the quotation to-day at 29.12½c., New York. Consumers are apparently well provided despite the pronounced activity in the tin plate market. Prices in London to-day were about £1 per ton higher than a week ago, with spot standard at £143 7s. 6d., future standard at £144 17s. 6d. and spot Straits at £145 17s. 6d. Arrivals thus far this month have been 5375 tons with 6165 tons reported afloat.

Lead.—Buying of lead continues in a volume apparently equal to production and there has been substantially no change in prices, except a slightly stronger market at St. Louis. The leading interest still quotes 4.50c., St. Louis, or 4.70c., New York, with wholesale lots for early or April delivery, while independents are selling on a basis of 4.40c. to 4.45c., St. Louis, sales being noted at both these levels, and 4.70c. to 4.75c., New York and Eastern points.

Zinc.—The gradual advance in prices for prime Western zinc, which has been going on for some weeks, continues and quotations are slightly higher at 4.72½c., St. Louis, or 5.07½c., New York, for wholesale lots for March-April delivery, although spot delivery can be obtained at 4.70c., St. Louis, or 5.05c., New York. The apparent strength of the market is due more to the attitude of sellers than to any marked increase in demand.

Old Metals.—Business is more active and values are firmer. Dealers' selling prices are as follows:

	Cents Per Lb.
Copper, heavy and crucible.....	12.50
Copper, heavy and wire.....	11.50
Copper, light and bottoms.....	9.50
Heavy machine composition.....	9.50
Brass, heavy.....	7.25
Brass, light.....	5.75
No. 1 red brass or composition turnings.....	8.00
No. 1 yellow red brass turnings.....	6.25
Lead, heavy.....	4.25
Lead, tea.....	3.25
Zinc.....	3.00

Antimony.—The market is unchanged at 4.20c., New York, duty paid, for wholesale lots for early delivery.

Aluminum.—The leading interest continues to quote

Chicago

virgin metal, 98 to 99 per cent pure, for early delivery in wholesale lots at 19c. to 19.10c., f.o.b. plant, depending on the quantity and the same grade from foreign sources is quoted by importers at 17c. to 18c., duty paid.

MARCH 21.—Although there has been more buying in small lots, the market is on the whole very quiet. Lead and zinc have advanced slightly. The old metals are unchanged. We quote in carload lots: Lake copper, 13.25c. to 13.50c.; tin, 30.50c.; lead, 4.55c.; spelter, 4.80c.; antimony, 6c., in less than carload lots. On old metals we quote: Copper wire, crucible shapes and copper clips, 9.50c.; copper bottoms, 7.50c.; red brass, 7.50c.; yellow brass, 6c.; lead pipe, 3.25c.; zinc, 2c.; pewter, No. 1, 22c. tin foil, 23c.; block tin, 25c.; all buying prices for less than carload lots.

St. Louis

MARCH 21.—The market for lead and zinc is slightly better. We quote lead at 4.35c. to 4.45c., car lots, and slab zinc, 4.65c. to 4.75c. On old material we quote: Light brass, 8.50c.; heavy red brass, 7c.; light copper, 7c.; heavy yellow brass, 4c.; heavy copper and copper wire, 7.50c.; pewter, 15c.; tin foil, 16c.; tea lead, 2c.; aluminum, 9c.

Some Improvement in February Fabricated Steel Business

In February 78,700 tons of fabricated structural steel work was contracted for throughout the United States, against 72,100 tons in January and 71,500 in December. The improvement of February over January is not quite 10 per cent, while the average February bookings for the preceding decade have averaged 13½ per cent over the January bookings for the same ten years. In short, the average February tonnage booked for the years 1912 to 1921, inclusive, has been 94,000 tons and the corresponding figure for January 82,800 tons.*

The tabulation of the volume of business taken by the bridge and structural shops of the country was made by George E. Gifford, secretary of the Bridge Builders and Structural Society, 50 Church Street, New York. It indicates that 43½ per cent of shop capacity was covered, the total monthly capacity being put at 180,000 tons. The volume of business in January was 40 per cent of capacity. Incidentally, as a possible commentary on the large fabricating capacity of the country, it may be added that for all of the preceding decade the average amount of business did not take more than 55 to 60 per cent of the capacity of the country's shops.

Rehearing Asked in Hardwood Case

WASHINGTON, March 21.—Motion for rehearing or modification of the United States Supreme Court's decree in the American Hardwood case will be made by L. C. Boyle, general counsel, this week. He will ask the highest tribunal to more definitely state whether its judgment in the so-called open-competition case means absolute prohibition or inhibition on gathering industrial statistics and the distribution of this data to memberships of various trade organizations. The court will also be requested to determine whether such activity is prohibitive only when used in connection with other factors of the trade association work which reflect agreement or understanding as to fixed prices or curtailed production. The outcome of the Supreme Court action in this matter will be of utmost importance to all lines of industry. The trade associations are manifestly uncertain as to methods of procedure in view of the hardwood decision. Secretary of Commerce Hoover is cognizant of the situation and as a consequence, has called a meeting of various trade bodies in this city on April 12, for the purpose of discussing trade association work and devising lines of operation in accordance with the views of the Department of Justice and the Department of Commerce.

IRON AND INDUSTRIAL STOCKS

Trend of Values Indicates Confidence Among Investment Public

The investment security market has shown little uneasiness over the pending scheduled coal strike. Industry has had ample time to secure adequate supplies of bituminous to tide it over several weeks. The firmer undertone of prices as quoted in such basic industries as the steel and pig iron, together with recoveries in grain and cotton values, indicates a strengthening of buying power, and, with continued ease in the money market in the face of larger outstanding loans, explains in a large measure the confidence felt in security investment circles. Individual developments like the passing of the Crucible Steel dividend temporarily check the movement, but the trend of stock values in general continues upward. The stability of stocks like United States Steel common, General Electric and Union Pacific is a sustaining influence on investment sentiment.

The range of prices on active iron and industrial stocks from Monday of last week to Monday of this week was as follows:

Allis-Chal. com.	46 1/4 - 47 1/4	Lima Loco. com. 101	- 104 1/4

Industrial Finances

The Ohio Body & Blower Co., Cleveland, in its annual report for 1921 shows an operating loss of \$391,568. Deductions for interest charges, depreciation, etc., brought the total net loss up to \$558,000, leaving a net surplus Dec. 31 of \$909,317.

The Youngstown Sheet & Tube Co., Youngstown, Ohio, has declared the regular quarterly dividends of 50c. per share on common stock and \$1.75 on preferred, both payable April 1 to holders of record March 20. The common dividend is the same as has been paid quarterly since June 30, 1921.

In common with the machine tool industry, the small tool suffered last year as a result of the business depression, as is shown by the 1921 report of the Chicago Pneumatic Tool Co. That document gives the net income, after providing for Federal taxes and depreciation, as \$158,107, contrasted with \$1,869,093 for 1920. There was a balance before dividends of \$118,364 and a deficit after dividends of \$499,286, whereas after paying larger dividends in the previous year there was a surplus of approximately \$335,000.

The Union Tank Car Co. reports net earnings for 1921, after deductions for depreciation, amortization and taxes, of \$1,002,625, as compared with \$3,393,063 in 1920. After dividends on the common and preferred stock there was a deficit of \$677,375, against a surplus in 1920 of \$2,049,620. Surplus at the close of 1921 stood at \$10,815,177, against \$11,492,552 at the end of 1920.

The Vanadium Corporation of America for the year ended Dec. 31, 1921, had a net loss after all charges and depreciation of \$427,546. The previous report covered 15 1/2 months ended Dec. 31, 1920, and showed net income of \$2,573,930, equivalent to \$6.62 a share earned on the 378,334 shares of capital stock of no par value in the previous year.

The report of the Harbison-Walker Refractories Co. for the year ended Dec. 31, 1921, shows net profits, after charges, depreciation and Federal taxes, of \$1,751,444, as compared with net profits of \$2,869,996 in the previous year.

The J. I. Case Threshing Machine Co. has issued its annual

report for last year, showing net loss, after all charges, inventory adjustments and depreciation, of \$2,883,431. This compares with net profits of \$1,936,963 earned on the \$13,000,000 outstanding common stock in the previous year.

The Westinghouse Air Brake Co.'s annual report for the year ended Dec. 31 shows net income after charges and inventory adjustments of \$705,546, equal to \$1.21 a share (\$50 par value) earned on the \$29,144,300 capital stock outstanding. This compares with net income of \$5,330,403, or \$9.15 a share in the previous year.

The Alliance Machine Co., Alliance, Ohio, has increased its capital stock from \$500,000 to \$2,000,000.

The Sterling Brass Co., Cleveland, has increased its capital stock from \$100,000 to \$3,000,000.

The sale of the plants of the Allen Motor Co., at Columbus, Fosteria, and Bucyrus, Ohio, has been ordered by the court and will take place at the Court House at Columbus, April 18. The court has fixed the minimum price for the sale of the plants at \$500,000.

Crucible Passes Dividend

The directors of the Crucible Steel Co. of America have passed the quarterly dividend on the common stock. Horace S. Wilkinson, chairman Crucible Steel Co. of America, issued a statement in part as follows:

"I am of the opinion that long drawn out depression in the steel business is nearing the end and that from now on we shall have a gradual return to more normal business. I believe it will not be long before the company will be able to resume the payment of the dividend on its common stock.

"On March 1, 1922, the company had surplus of \$24,032,121, which may be applied to payment of dividends, but we do not believe this surplus should be reduced at this time, except in payment of dividends upon preferred stock. It will be the policy of the management to resume a reasonable disbursement for dividends on the common stock as soon as the earnings and business conditions improve sufficiently to justify same. Within the last week we have started some of our furnaces and have started to use some of new construction, which have cost us \$15,000,000, and which we completed about the time depression began."

The report of the Chicago Railway Equipment Co. for last year shows earnings for 1921 at \$350,699. Deducting \$150,000 for depreciation and \$232,741 for dividends, leaves \$318,242 as the net profits. President Leigh opposes reductions in freight rates until labor costs have been adjusted downward and he says that to reduce rates before reducing labor costs would be to court disaster, not only to the railroads, but to other industries. On Dec. 31 last the company paid its 101st consecutive dividend.

Report of Receiver of Standard Parts Co.

The Standard Parts Co., Cleveland, has made a profit, before depreciation and adjustment, during its sixteen months under the direction of Frank A. Scott as receiver, according to the annual statement filed in the Federal Court in Cleveland. Net sales for 1921 were \$7,223,033, or about one-third of those of the preceding year. This business resulted in a profit, before depreciation and inventory adjustment, of \$316,289. Depreciation for the year was \$398,341 and adjustments \$204,348, resulting in a loss of \$286,400. Including the last four months of 1920, total net sales for the sixteen months to Dec. 31, 1921, were \$10,451,881, and after allowance for depreciation and adjustment resulted in a loss of \$494,825, or, if omitting the depreciation charge, a gain of \$146,360.

Ohio Steel Co. Inventory Write-off

The annual report of Otis Steel Co., Cleveland, for the year ended Dec. 31, 1921, shows net loss after depreciation, interest charges and inventory adjustments of \$5,189,543. This compares with net income of \$1,141,088 the previous year. Decline in inventory values was a great handicap to the company in 1921, points out President George Bartol in his statement to stockholders. As a result of this, he says, the deficit would have been larger if mills had not been operated at all, as a large part of operating loss could have been properly charged off to inventory depreciation. Mr. Bartol said in part:

"On account of rapid decline in value of stocks since Dec. 31, 1920, inventory was written down as of April 1, 1921, and again as of Dec. 31, 1921, in each case to a fair market value. As the material out of stock was charged to operating at

inventory prices, a considerable part of the operating loss is properly chargeable to inventory depreciation, and approximate estimates indicate that a greater loss would have been made by shutting down completely and writing down the material charged to operation to Dec. 31, 1921, values.

"Our production for the year was only 15 per cent of total capacity. The new sheet mill plant at Riverside works was completed and put into operation during the year and it has fully come up to expectations."

Replogle Steel Co. Deficit

The Replogle Steel Co. reports for the year ended Dec. 31 last net income of \$84,029, compared with a loss of \$102,267 in the previous year. After depreciation, etc., there was a deficit of \$163,768, contrasted with a deficit of \$287,854 in 1920. The income account follows:

Net earnings, \$58,029; depreciation, etc., \$248,797; deficit, \$163,768; interest, \$354; inventory adjustment, \$709,450; total deductions, \$709,804; deficit, \$873,572; previous surplus adjusted, \$386,231; total surplus, \$512,659.

The report states that the only income last year came from railroad earnings and interest on securities owned. A small volume of business was offered to the company, which, if taken, would have resulted in a loss, so that operations were not started.

Stocks at Youngstown

YOUNGSTOWN, March 21. Under influence of dividend payments April 1, preferred stocks of industrial issues are slightly firmer. Common stock of the Youngstown Sheet & Tube Co. has been fluctuating from \$63 to \$64 on the Cleveland and Youngstown exchanges, which compares with a recent trading level of \$60.

Common of the Brier Hill Steel Co. is held at \$17.50, while the junior issue of the Trumbull Steel Co. is listed at \$19.50.

Dividend declarations by the Sheet & Tube Co. for the first quarter will mean a distribution of \$575,000 April 1. The company has \$10,000,000 of preferred stock outstanding and 800,000 shares of non-par value common.

Receiver for Defiance Company

The Defiance Machine Works, Defiance, Ohio, has been placed in the hands of a receiver as a result of proceedings brought in the Federal Court in Toledo by the Chicago Screw Co., acting for itself and other creditors. E. M. Hammer, manager of the company, was named receiver. The complaint states that the company had a number of machinery orders amounting to about \$1,000,000, but that the business depression resulted in a cancellation of many of these orders, leaving the company with large inventories and claims against companies in financial troubles on which it could not collect. It further stated that the machine works has assets in excess of its debts.

Superior Steel Report

The annual report of the Superior Steel Corporation for 1921 shows a net loss, after all expenses and depreciation, of \$273,395. In 1920 the company showed profits, after all expenses, depreciation, inventory adjustments and Federal taxes, amounting to \$1,022,820. The operations for last year showed a deficit, after sinking fund and dividend requirements, amounting to \$1,113,373, as compared with a surplus of \$205,547 in 1920.

Gulf States Steel Loss

The report of the Gulf States Steel Co. for the year ended Dec. 31, 1921, shows a deficit after expenses, charges, and dividends of \$731,915. This compares with a surplus of \$606,174 in 1920.

The income account compares as follows:

	1921	1920
Gross loss	\$242,821	*\$1,153,089
Depreciation Federal tax	348,915	401,869
Net loss	591,915	*751,229
First preferred dividend	140,000	140,000
Second preferred dividend		5,046
Deficit	731,915	†606,174

*Profit. †Surplus.

The Underpinning & Foundation Co., 290 Broadway, New York, has acquired land in the Deynon Terminal district, Brooklyn, totaling 77,500 sq. ft., for the erection of a three-story plant to manufacture special tools and instruments.

TRADE CHANGES

The headquarters of the American Supply & Machinery Manufacturers' Association is now located in the Gotham National Bank Building, 1819 Broadway, New York.

The Detroit offices of the Trumbull Steel Co., Warren, Ohio, have been moved from the fifth to the tenth floor of the Ford Building. The new office numbers are 1010-11-12. W. J. Hanna is district manager, with headquarters in Detroit.

The Orton & Steinbrenner Co., Chicago and Huntington, manufacturer of locomotive cranes, clam shell and orange peel buckets and coal crushers, has made arrangements with J. Ross Bates, formerly connected with Wonham Bates & Roode Trading Corporation of New York and Boston, to represent it in the New England States and New York. Mr. Bates has offices at 136 Liberty Street, New York, and 128 School Street, Watertown, Mass.

The Diamond soot blower business has been purchased by new interests in the form of the Diamond Power Specialty Corporation of Detroit, a new company which has taken over the business and plant of the Diamond Power Specialty Co., a copartnership, the members of which are retiring from the soot blower business in the Western Hemisphere.

The C. W. Hunt Co., Inc., West New Brighton, S. I., announces the re-establishment of its New York office at 143 Liberty Street. It has taken over all the sales and engineering work which has heretofore been carried on by its subsidiary company, the C. W. Hunt Engineering Corporation, for the past 18 months, as the business of this latter corporation has now been consolidated with the C. W. Hunt Co., Inc.

The Barto-Phillips Co., Inc., engineer and builder, formerly located at 280 Madison Avenue, New York, has removed offices to 52 Vanderbilt Avenue, New York.

The Aluminum Die Casting Corporation is a successor to the Acme Die Casting Corporation, New York. The business will be moved to Garwood, N. J., on or about May 1.

Gropler Brothers, representing manufacturers of metal cutting tools, will be located at 16-22 Hudson Street, New York, after April 1. They have a separate sales organization selling to jobbers and dealers only.

The Tool Sales Co. announces that after April 1 its new address will be the Hudson-Read Building, New York. It sells tools and specialties to the hardware and automobile supply trade, and would be glad to hear from manufacturers desiring sales service in the metropolitan district.

The Mitchell Specialty Co., Philadelphia, manufacturer of automobile body hardware, announces the reorganization of the company and the election of J. H. Mitchell to the office of general manager and treasurer. Mr. Mitchell brings to his new connection years of experience as a successful executive in organization and finance. The officers are: E. R. Mitchell, president; J. H. Mitchell, treasurer and general manager; J. J. Seitz, vice-president and manager of production.

The Shelton Tool & Machine Co., 235 Canal Street, Shelton, Conn., has voted to change the name to the Shelton Cutlery Co. The personnel of the firm remains the same.

Plans of New Companies

The Auto Trimmers Supply Co. and Iron Products Co., both Michigan corporations, were absorbed by the S. L. Jackson Co., incorporated for \$100,000 with \$75,000 paid in. Officers are as follows: S. L. Jackson, president and general manager; J. D. Burke, vice-president; F. L. Sutherland, secretary and treasurer. The location of the office and warehouse is 500 to 516 Congress Street, West, Detroit. The company handles a complete line of automobile upholstery and top materials, automobile top and body hardware and also everything in the way of cap screws, semi-finished nuts, bolts, washers, wood screws, etc.

Handley Brothers, Inc., buffer and plater, 82 Myrtle Street, Meriden, Conn., recently incorporated, has organized with the election of George Handley, as president; John Handley, as secretary and treasurer. Directors are the two above mentioned, and F. V. and N. Handley. The business was formerly carried on as Handley Brothers at the same address.

The A. C. Chesley Co., 704 East 133d Street, New York, manufacturer of hollow metal and metal-covered fireproof doors, sash, etc., is taking bids for the erection of an addition to its plant. P. J. Murray, Tuckahoe, N. Y., is architect.

Machinery Markets and News of the Works

LARGE CRANE ORDER IS PLACED

Wheeling Steel Corporation Buys 21 for Its Various Plants

Improvement in Machine-Tool Orders and Prospects Is Noted in Some Markets

The Wheeling Steel Corporation, Wheeling, W. Va., has placed an order with the Morgan Engineering Co. for 21 cranes for its various steel plants, the largest order of its kind since the war. The crane business shows more life than the machine-tool trade, and there is a number of very promising prospects. The Steel Corporation has obtained prices for estimating purposes on 35 cranes and other steel companies in the Pittsburgh district which contemplate plant improvements are also expected to come into the market soon.

In machine tools a moderate degree of improvement is reported from Chicago, Cleveland and Cincinnati, but in New York and New England conditions are substantially unchanged. Large industrial companies are conspicuous in their absence from the market, and the bulk of the buying is being done by small or intermediate companies. Orders and inquiries are largely for single tools and a considerable

share of the activity in all markets is in used tools.

Two promising prospects in the Cleveland district are noted, one inquiry from a Cleveland manufacturer calling for \$100,000 worth of tools for a new line of products, while an inquiry from a neighboring State covers 25 new or used machines.

In Chicago the demand for tools is slowly expanding. Railroads are doing practically no buying against recent inquiries. The Santa Fe is expected to put out additional inquiries for tools for a proposed boiler shop at Albuquerque, N. M. About \$50,000 worth of machine tools and allied equipment was destroyed in the recent Chicago fire and several of the companies whose shops were destroyed or damaged are looking for machinery for replacement.

The H. H. Franklin Mfg. Co., Syracuse, N. Y., has bought tools for the manufacture of its new four-cylinder car and is expected to close shortly on 14 drilling machines. Two boring machines were bought of a Cleveland builder. The Universal Portland Cement Co., Chicago, is understood to have bought some of the tools it recently inquired for. The Ward Baking Co., New York, has bought against a recent list to equip a motor truck shop.

In foundry equipment an outstanding order is that placed by the Ford Motor Co., covering 72 tumbling barrels for its River Rouge, Mich., plant. The company is also in the market for nine foundry cupolas.

New York

NEW YORK, March 21.

The local machine-tool market continues very dull. Scarcely any business is being placed except in used tools. The Ward Baking Co., New York, is reported to have bought most of the tools for which it recently inquired, the equipment being for a motor truck shop.

An export company is in the market for two tool room lathes for Japan.

Activity in cranes the past week centered about the placing of several inquiries for overhead cranes that have been pending for some time. At present inquiries for large cranes seem to predominate. Bidding has practically been closed on the 110-ton power house crane for the West Penn Power Co., Pittsburgh, being purchased by Sanderson & Porter, 25 William Street, New York. Estimates were recently requested by the Foundation Co., 120 Liberty Street, New York, on a 150-ton power house crane, but it is not expected that purchase will be made for some time. Bids are also being submitted by about seven crane builders on another 150-ton overhead traveling crane. C. L. Cadle, superintendent of public works, Albany, N. Y., is receiving bids until April 11, on contract 122, calling for two 5-ton electric gantry cranes for the Barge Canal terminals at Syracuse and Rochester, N. Y.

Among recent purchases are: Stone & Webster for Flax Rock, Mich., a 10-ton, 18-ft. 10-in. span and 15-ton, 33-ft. 8-in. span, overhead traveling cranes; the Flockhart Foundry, Newark, N. J., a 5-ton, 50-ft. span, overhead traveling crane, and Russell, Birdsell & Ward, Portchester, N. Y., two 2-ton, 55-ft. 6-in. span, overhead traveling cranes from the Pawling & Harnischfeger Co.; F. L. Smith & Co., 50 Church Street, New York, for the Glens Falls-Portland Cement Co., Glens Falls, N. Y., a 10-ton, 65-ft. span bucket crane with 3-yd. Hayward bucket from the Cleveland Crane & Engineering Co., and M. W. Kellogg & Co., Jersey City, N. J., a 15-ton, 61-ft. span, 2-motor, overhead traveling crane from the Niles-Bement-Pond Co.; International Trading Corporation, 60 Broadway, New York, two 30-ton locomotive cranes for the Imperial Government Railways, Japan, from the Industrial Works.

Edward V. Galen, 14 Irving Place, New York, desires information and prices regarding belt-driven bench grinding heads, equipped with tool rests, chisel holder, drill and shear grinding guides; also taper shank for buffing and polishing work; size of wheels desired to use 6 to 8 in. diameter, 1 to 1½-in. face.

The International Nickel Co., New York, has decided to discontinue certain of its manufacturing operations at its Bayonne, N. J., plant, and some of the equipment there is being shipped to its new plant at Huntington, W. Va., and some to the Canadian plant. A part of the equipment is to be offered for sale.

The Barnet Weinstein Iron Works, 53 Boorum Street, Brooklyn, has awarded a contract to Levering & Garrigues, 552 West Twenty-third Street, New York, for a two-story building at Stewart and Meserole avenues, Brooklyn, 100 x 280 ft., to cost about \$65,000.

A four-story cold storage and refrigerating plant to cost \$200,000, with equipment, will be constructed by the Brooklyn, N. Y., Retail Butchers' Corporation, care of Henschien & McLaren, 1637 South Prairie Avenue, Chicago, architects.

Parker Axles, Inc., Fifteenth Floor, Gotham National Bank Building, Broadway and Fifty-ninth Street, New York, manufacturer of automobile axles, has awarded contract to H. K. Ferguson, 25 West Forty-third Street, for a one and two-story plant at Poughkeepsie, N. Y., 100 x 160 ft.

Bids are being taken until April 4 by the Bureau of Supplies and Accounts, Navy Department, Washington, for a 100-hp. vertical fire tube boiler for use at the Brooklyn Navy Yard.

The Municipal Gas Co., Albany, N. Y., furnishing electrical service in this district, is planning for extensions and improvements in its power house and electrical system to cost \$955,000, including new equipment. Application has been filed with the Public Service Commission for permission to issue bonds in this amount and carry out the work.

The L. B. Lynd Mfg. Co., Canal Street, Mechanicsville, N. Y., manufacturer of hardware and other metal products, is having plans prepared for rebuilding its three-story factory, 70 x 90 ft., recently partially destroyed by fire.

The Watertown Battery & Electric Co., 1313 State Street, Watertown, N. Y., is planning for the installation of

new equipment for the manufacture of electric storage batteries and other electrical products.

The Savage Arms Corporation, 50 Church Street, New York, with plants at Utica, N. Y., and Pittsburgh, for the manufacture of firearms and ammunition, is arranging to manufacture a line of refrigerating machinery and electric washing machines and parts. One or both of the plants will be converted, in part, to accommodate the new branch of manufacture. The company recently took over the former plant of the Westinghouse Electric & Mfg. Co., at Chicopee, Mass.

The Eastern Malleable Iron Co., Naugatuck, Conn., has plans under way for a one-story foundry at Watervliet, N. Y., 50 x 250 ft.

W. W. Farley, 79 Chapel Street, Albany, N. Y., has had plans prepared for a three-story automobile machine and service works, 75 x 122 ft., at Chapel and Orange streets, estimated to cost \$100,000 with equipment. H. Rogers, 443 Broadway, Albany, is architect.

A vocational department will be installed in the two-story high school, 160 x 230 ft., to be erected at Elmira, N. Y., for which bonds for \$550,000 have been voted. Pierce & Rickford, 118 Lake Street, are architects.

The Sinclair Consolidated Oil Corporation, 45 Nassau Street, New York, has disposed of a bond issue of \$45,000,000, the proceeds to be used in part for plant acquisitions, extensions and improvements. During the past twenty-four months the company has expended about \$60,000,000 in plant and expansion work.

The Port Jefferson Shipyard Corporation, Port Jefferson, L. I., has taken title to the local plant of the New York Harbor Dry Dock Corporation for \$168,000. The new owner will operate the yard for building merchant vessels and for repair work.

Through Kuhn, Loeb & Co., 52 William Street, New York, bankers, the Paris-Lyons-Mediterranean Railroad Co., Paris, France, is disposing of a bond issue of \$30,000,000, the proceeds to be used for the electrification of certain sections of the system, power plants and equipment, new rolling stock, shops and machinery, and other extensions and improvements.

The Deep Drawn Metal Corporation, 30 Church Street, New York, has acquired the three-story factory at 61-67 Navy Street, Brooklyn, for a local plant. It is now operating a factory at 195 Plymouth Street.

A vocational department will be installed in the two-story high school to be erected at Bridgeton, N. J., estimated to cost about \$225,000. Ritter & Shay, North American Building, Philadelphia, are architects.

Fire, March 15, destroyed the plant of the Fischer-Sweeney Bronze Co., 1301-11 Grand Street, Hoboken, N. J., manufacturer of bronze, aluminum and other metal castings, with estimated at \$200,000, including equipment.

A vocational department will be installed in the three-story high school to be erected at Clifton, N. J., estimated at \$750,000. H. Barrett Crosby, 125 Ellison Street, Paterson, N. J., is architect.

An ice-manufacturing and refrigerating plant will be erected by the Montclair Rink & Ice Co., care of George W. Backoff, 9 Clinton Street, Newark, N. J., architect, to be used in connection with a skating rink, 125 x 350 ft., estimated to cost \$200,000.

Effective with the closing of the foundry and machine shop of the Bethlehem Shipbuilding Corporation, at Redington, Pa., April 1, the company will transfer all of this work to its Moore plant at Elizabeth, N. J. The production will include pumps, fittings and kindred equipment, for use at all of the shipyards of the company.

Phillip Woolf, 50 Columbia Street, Newark, N. J., manufacturing jeweler, has had plans prepared for a new factory, 25 x 85 ft., at 412 South Twelfth Street. Nathan Siegler, 164 Market Street, is architect.

Buffalo

BUFFALO, March 20.

C. L. Cadle, superintendent of Public Works, Albany, N. Y., will take bids until April 11 for two 5-ton electric gantry cranes for the Barge Canal Terminals at Rochester and Syracuse, N. Y., respectively.

The Malone Light & Power Co., Malone, N. Y., has filed application for permission to build new electric power plants at Dickinson and Waverly for light and power service in these districts.

The Board of Education, Boonville, N. Y., will purchase machine tools and other mechanical equipment for installation in the manual training department at the high school.

The A. & J. Mfg. Co., Water Street, Binghamton, N. Y., manufacturer of wire goods, is planning for the erection of

an addition, 60 x 120 ft., at Water and Eldredge streets, to cost about \$45,000. E. H. Johnson is president.

The Lang Mfg. Co., Olean, N. Y., recently organized, is planning for the establishment of a factory to manufacture a re-winding machine for motion picture service and other kindred equipment. Carl Lang, Olean, inventor of the machine, is president of the company.

A one-story power house addition will be erected by the Board of Directors of the City Hospital, South Quarry Street, Ithaca, N. Y.

An appropriation of \$4,500,000 has been made by the City Council, Buffalo, for a new filtration plant, to include electrically-operated pumping plant, filtering machinery and other equipment. George D. Andrews, City Hall, is city water commissioner. Clark D. Parsons is engineer for the Department of Public Works.

G. F. Hausner, 939 Northampton Street, Buffalo, is planning for the installation of new sheet-metal working machinery at his factory.

A vocational department will be installed in the new high school to be erected by the Salina School District, Liverpool, N. Y., estimated to cost \$150,000, to replace the present school on Second Street. M. D. Green, Liverpool, is in charge.

A cold storage and refrigerating plant will be installed at the Gowanda State Homeopathic Hospital, Collins, N. Y., by the State Hospital Commission, Albany. Lewis F. Pilcher, Capitol Building, Albany, is State architect.

The Acme Cylinder Grinding Co., Rome, N. Y., is planning for the installation of new grinding and other equipment. M. J. Kernan is head.

The City Council, Batavia, N. Y., has called a special election on April 6 to vote bonds for \$450,000 for the erection of a three-story high school with vocational department, 145 x 200 ft. E. E. Joralemon, 482 Delaware Avenue, Buffalo, is architect.

Benjamin Spielberg, 28 Brinkerhoff Street, Plattsburg, N. Y., has plans under way for a new two-story machine shop, 60 x 90 ft.

The Northern New York Utilities, Inc., 58 Public Square, Watertown, N. Y., will soon break ground for a hydroelectric generating plant at Browns Falls, near Watertown, to cost about \$100,000.

Philadelphia

PHILADELPHIA, March 20.

The Pennsylvania Equipment Co., 1420 Chestnut Street, Philadelphia, is in the market for a second-hand passenger coach with rattan seats, suitable for workmen's train; also a second-hand, standard gage, four-driver, saddle tank locomotive, weight 50 tons.

The U. M. C. Garage, Fifteenth and Locust streets, Philadelphia, has completed plans for a three-story repair and service building, 70 x 115 ft., to cost about \$125,000, including equipment. The Hoffman-Henon Co., Finance Building, is architect.

The Philadelphia Electric Co., Tenth and Chestnut streets, Philadelphia, Pa., will install electric power equipment for the municipal rapid transit system, including cables, controls, transformers, substation apparatus, etc., to cost \$150,000. It will soon commence the erection of an addition to its generating plant at Beach and Palmer streets for the installation of a new 30,000-kw. generator and auxiliary equipment.

The Electric Foundry & Equipment Co., Tacony and Bjeigh streets, Philadelphia, is arranging for the installation of electric furnaces, cranes and other equipment at its new plant, now in course of erection, to be used primarily for the production of steel castings. William P. Cunningham is president.

The John T. Lewis & Brothers Co., Lafayette Building, Philadelphia, will soon commence the erection of the superstructure for a two-story power house, 63 x 77 ft., at its paint manufacturing plant, to cost \$80,000. E. F. Beale is president.

The Douglas Mfg. Co., Philadelphia, manufacturing jeweler, has leased a floor in the new building at 45-47 North Eighth Street. Precision equipment, bench tools, etc., will be installed at once.

The Gulf Refining Co., Widener Building, Philadelphia, has purchased 70 acres in the vicinity of Girard Point, for extensions in its oil distributing works, to include pumping equipment, tanks, mechanical buildings, etc.

The Bureau of Supplies and Accounts, Navy Department, Washington, will receive bids until April 4 for one motor-driven precision bench lathe, one motor-driven emery grinder, one motor-driven watchmakers' lathe, one set of watch-

makers' tools, and one gage testing outfit, as specified in schedule 9522, for use at the Philadelphia Navy Yard.

Joseph Kalter, 1621 Ridge Street, Philadelphia, manufacturer of lighting fixtures, is planning for the installation of new lathes and other machine tools at his factory.

The Quaker City Cold Storage Co., 301 Delaware Avenue, Philadelphia, is perfecting arrangements for a one-story cold storage and refrigerating plant, 27 x 125 ft., on South Delaware Avenue, to cost about \$75,000.

The Commissioner of Education, State House, Trenton, N. J., is taking bids until March 28 for a power house and pumping plant at the New Jersey School for the Deaf, Trenton Junction. Arnold H. Moses, Temple Building, Camden, N. J., is architect.

George Shearman, 119 Pennsylvania Avenue, Atlantic City, N. J., has filed plans for the erection of a one-story machine shop, 35 x 66 ft. Haining & Palliser, Guarantee Trust Building, are architects.

The Sun Shipbuilding Corporation, Chester, Pa., has secured the exclusive rights of manufacture in this country of opposed piston Diesel oil engines, secured under British patents by Doxford & Sons, shipbuilders, England. Plant arrangements will be made for the manufacture of the new engine units and parts.

The Danville Iron & Steel Co., Danville, Pa., is planning for the erection of a new foundry in the spring. It manufactures machinery and parts.

A new power house, 100 x 130 ft., to cost about \$150,000 with equipment, will be erected by the Scranton Lacle Co., Albright Avenue, Scranton, Pa. Lockwood, Greene & Co., 101 Park Avenue, New York, are engineers.

The Luzerne County Gas & Electric Co., Plymouth, Pa., has arranged for a bond issue of \$1,000,000, a portion of the proceeds to be used for extensions and improvements in its power plant and system.

The Forbes Aluminum Products Co., Steele Building, Easton, Pa., will soon break ground for its new plant in the South Side section, estimated to cost about \$150,000 with machinery. A. D. Childsey, Jr., 341 Northampton Street, Easton, is architect. Ewing W. Forbes is president.

A vocational department will be installed in the new high school to be erected at Glenolden, Pa. Clarence W. Brazier, Crozer Building, Chester, Pa., architect, has been commissioned to prepare plans.

The Glen Rock Electric Light & Power Co., Glen Rock, Pa., has acquired the plant of the Deer Creek Light & Power Co., at Shrewsbury, Pa., and in the future will furnish service in this district. Extensions will be made to the present station and additional equipment installed.

A one-story machine shop will be constructed by the Arbogast & Bastian Co., Front and Hamilton streets, Allentown, Pa., in connection with extensions to its meat-packing plant. An addition will be built to the cold storage and refrigerating plant and new equipment installed.

A vocational department will be installed in the two-story and basement high school to be constructed by the Haverford Township School District, at Oakmont, Pa., 170 x 245 ft., to cost \$300,000. Royd, Abel & Glogert, Eatey Building, Philadelphia, are architects, and J. W. Huff, 6035 Lansdowne Avenue, Philadelphia, is secretary.

The Sempie Rubber Co., Trenton, N. J., manufacturer of inner tubes, has purchased the factory property on Murray Street, comprising a number of brick buildings, for \$40,000.

The Board of Directors, State Normal School, Slippery Rock, Pa., will take bids early in April for the erection of a two-story refrigerating plant at the institution.

The Martin-Parry Corporation, York, Pa., manufacturer of automobile bodies, is perfecting plans for new works at Lumberton, Miss., for assembling and finishing automobile body base and top units. A complete saw mill and cutting up plant will be constructed in the same district by the Edward Hines Lumber Co., 2431 South Lincoln Street, Chicago, which has taken a contract for material from the Martin-Parry company.

Cincinnati

CINCINNATI, March 20.

An improved tone to the machinery market was noted by a number of manufacturers the past week. Orders placed, however, were still at a very low point, the better feeling coming as a result of the complexion of the inquiries received. A local manufacturer who recently visited many dealers in new and second-hand equipment in the East, has returned to the city filled with optimism regarding the future. From his observations it would appear as though the number

One of the 54-ft., 220,000-volt snow-type steel towers, built by the Pacific Coast Steel Co. for use on the Pitt River line of the Pacific Gas & Electric Co. was installed in the Municipal Auditorium, San Francisco, at the California Industries Exposition. In the base of the tower was built a small booth representing an electrical kitchen. Around the outside were placed a number of small trees, the idea being to indicate that the tower was standing in a forest.

of used machine tools in good condition is diminishing rapidly and that prices are much firmer than they have been for some time. He reports having been able to place orders for 13 machines with dealers in the East. Some fair sized orders were closed during the week. A Dayton manufacturer is said to have placed an order with a Cleveland machine tool builder for turret lathes and automatic screw machines. The Wheeling Steel Corporation, in addition to placing an order for 21 cranes with the Morgan Engineering Co., is also said to have secured the machine tools recently inquired for, practically all of the machines being used tools. The Universal Portland Cement Co., has also closed on several tools. It is understood here that the Rock Island Railroad has decided to defer its purchases of machine tools for the present. A deal involving five machines is reported by a local manufacturer, but this is more or less in the nature of a trade—used machines being taken as part payment in exchange for new ones.

The J. A. Fay & Egan Co., Cincinnati, manufacturer of wood-working machinery, is having plans prepared for its new plant in the Bond Hill section, building operations to be under way within three or four months.

The Pioneer Auto Heater Co., Cincinnati, has been incorporated with a capitalization of \$50,000 to manufacture automobile heaters and other accessories. Its plant will be located at 2682 Madison Road and will be operated in connection with the tool business now being conducted by the Scott-Spencer Automatic Tool Co. T. J. Scott is president.

Officials of the American Laundry Machinery Co., Cincinnati, have issued a denial of the report that the company is to be amalgamated with the U. S. Hoffman Machinery Co., Syracuse, N. Y. The report originated through the fact that the Laundry company has granted rights to the Hoffman company to use certain of its patents.

Fire at the plant of the William Hamilton Sons Car Co., Newark, Ohio, on March 11 destroyed the boiler and engine room, with loss of approximately \$30,000. The power plant will be rebuilt at once.

Chicago

CHICAGO, March 20.

Demand is slowly expanding and it is notable that orders are principally for one or two tools and are coming from miscellaneous sources. The larger industrial companies are conspicuous for their absence from the market and the railroads have done practically no buying against the inquiries they have been issuing from time to time. The Santa Fe, which is regarded as the most likely to buy of any of the local railroads, is expected to put out an additional list covering the needs for a proposed boiler shop at Albuquerque, N. M. The Western Clock Co., LaSalle, Ill., which, as noted a week ago, placed an order for 24 automatic screw machines, has also bought one 14-in. x 6-ft. and one 16-in. x 6-ft. geared head motor-driven engine lathes, a geared head motor-driven 26-in. shaper, and three bench lathes with slide rests.

The disastrous fire which on March 14 destroyed the block bounded by Clinton and Canal streets, Jackson Boulevard, and the Metropolitan Elevated Railroad tracks, wiped out the shops of a number of companies which have already taken steps to replace their equipment. It is estimated that close to \$50,000 worth of machine tool equipment was destroyed. Among the companies which are now in the market as the result of the conflagration are the Monarch Mfg. Co., manufacturer of automobile specialties, Krone Sebek & Co., maker of die casting equipment and tools, the Utility Tool & Die Works, the Superior Tool Co., the Markle-Korff Gear Co., manufacturer of car wrapping machinery and gears, and the U. & J. Carburetor Co.

The Great Northern Railroad, St. Paul, F. A. Bushnell, purchasing agent, has sent out inquiries for the following shop equipment:

One 400-ton full hydro-pneumatic 52-in. car wheel press including 7½-hp. motor, 3 phase, 60 cycles, 440 volts complete with starter having overload and no voltage release, also one recording gage.

One 42-in. Bullard (or similar) vertical turret boring mill, direct connected to and including 15-hp., 60 cycle, 3 phase, 440 volt motor and starter.

One set standard tool equipment for above mill.

One 36-in. heavy duty upright common drill press. Spindle to have No. 5 Morse taper including motor and starter of 60 cycle, 3 phase, 440 volts.

One 30-in. Lodge & Shipley (or similar) 7 ft. between centers, selective head and taper attachment, high duty lathe, direct connected to and including suitable motor and starter of 60 cycle, 3 phase, 440 volts, including four-jaw independent chuck and full set of tool holders.

One 600-ton full hydro-pneumatic, slanting head, driving-wheel press with 13-in. throat, direct connected to and including one 15-hp. 60 cycle, 3 phase, 440 volt motor and starter.

One throatless shear to be direct connected to and including suitable motor of 60 cycle, 3 phase, 440 volt characteristic and starter, to have a capacity to shear 3/16-in. sheet

Two pneumatic riveting hammers suitable for driving ¼-in. rivets.

One 1½-in. Acme double head bolt cutter (or equal) to be direct connected if possible and driven by suitable 440 volt, 60 cycle, 3 phase squirrel cage induction motor with starter, to be furnished with full set of dies.

One Oster pipe threading machine (or equal) to cut pipe from ¼-in. to 2 in. direct connected to and driven by suitable squirrel cage induction motor of 440 volts, 3 phase, 60 cycle with starter to be furnished with full set of dies.

One Webber crank pin turning tool.

One No. 5 Landis (or equal) cylinder grinding machine capable of grinding cylinders from 3 in. to 8 in. to be belt driven and including counter shaft and grinding wheels.

One 15-hp. 60 cycle, 3 phase, 440 volt squirrel cage induction motor with starter.

One 30-in. Lodge & Shipley selective head lathe 7 ft. between centers (or equal) to be direct connected to suitable squirrel cage induction motor of 440 volt, 3 phase, 60 cycles with starter and one 18-in. four-jaw independent chuck and full set of 10 Armstrong tool holders to suit lathe to be furnished with taper attachment.

The Great Northern Railroad Co., Railroad Building, St. Paul, Minn., has plans nearing completion for the construction of a new one-story car repair shop, 84 x 300 ft., at Minot, N. D., to cost about \$50,000. A. H. Hogeland is chief engineer.

• The Ford Motor Co. has placed orders for 72 tumbling barrels for its River Rouge, Mich., plant, 36 each being placed with the Whiting Corporation and the W. W. Sly Mfg. Co. The Ford company is also in the market for nine cupolas.

The U. S. Sample Co., printer, 801 South Wells Street, Chicago, is receiving bids through Alfred S. Alschuler, 28 East Jackson Boulevard, on a six-story printing plant, 125 x 125 ft., at Jackson Boulevard and Laflin Street, to cost \$300,000.

Alfred S. Alschuler, architect, 28 East Jackson Boulevard, Chicago, has let contracts for a three-story automobile salesroom and service station, 100 x 390 ft., on Michigan Avenue between Twenty-second and Twenty-third streets, for the Hudson Motor Car Co.

The Paasche Air Brush Co., 1219 West Washington Boulevard, Chicago, has let a contract through Frank D. Chase, Inc., architect, for a two-story factory, 108 x 125 ft., at 1909-15 Diversey Parkway, to cost \$100,000.

Holton, Seelye & Co., builders, 140 South Dearborn Street, Chicago, have let contract for a one-story factory for the manufacture of jewelers' boxes, at 4431-43 West Lake Street, to cost \$18,000.

The construction of two units of the new Cadillac Malleable Iron Co. plant, Cadillac, Mich., is expected to start soon. The foundry will be ready to commence operations by the middle of the summer, it is hoped.

Elmer Moore has opened a general machine shop and garage at 518 Erie Street, Storm Lake, Iowa.

The Automatic Traffic Regulator Co., Inc., Andrews Building, 163 West Washington Street, Chicago, recently organized to manufacture an automatic traffic signal or regulator to take the place of the human signal at street intersections, is letting its manufacturing work by contract for the present. The officers are R. E. Blick, president; P. A. Baulsair, treasurer, and F. C. Hawkins, secretary.

Forbes-Babcock, Inc., 4113 West Irving Park Boulevard, Chicago, recently incorporated with \$5,000 capital stock, will engage in the manufacture of radio telephone receiving sets complete. Factory space will probably be leased and it has not yet been decided whether machines will be manufactured or assembled. The officers are Allan C. Forbes, president; Samuel Rubinkam, vice-president and Robert S. Babcock, secretary-treasurer.

The Universal Electric Sign Co., 4854 West Kinzie Street, Chicago, has been incorporated with \$12,000 capital stock to manufacture electric signs. It has leased a plant, 60 x 90 ft., at the above address and has purchased the needed metal-working machinery. The officers are R. I. O'Connor, president; S. M. Moses, vice-president; and G. Thompson, Jr., secretary-treasurer.

V. B. and V. L. Parker have purchased and taken possession of the Howard Brothers Sheet Metal Co.'s business at 713 West State Street, Rockford, Ill. They will remodel the plant and do all kinds of sheet metal and furnace work.

The Pope Machine Co., Kankakee, Ill., has been incorporated to manufacture textile machinery. T. W. Prosser, superintendent Paramount Hosiery Form Drying Co., Kankakee, is a stockholder. No announcement of the immediate plans of the company has been made.

G. J. Kramer, 487 Aurora Avenue, St. Paul, Minn., has taken bids on a one-story garage, 125 x 127 ft., at University and Farrington avenues, to cost \$40,000.

The Ster-o-Lock Mfg. Co., 417 South Dearborn Street, Chicago, has been incorporated with \$50,000 capital stock to manufacture automobile accessories and machine shop equipment and has equipped a plant for manufacturing operations. The officers are Bertram W. Coltman, president; Joseph E. Krass, secretary and general manager, and Edward J. Krass, treasurer.

The National Stamping & Electrical Works, 424 South Clinton Street, Chicago, has awarded contract to McKeown Brothers, 112 West Adams Street, for a new one-story plant 3238-50 West Lake Street, 130 x 150 ft., estimated to cost about \$60,000.

C. R. Berglund, 2630 Wentworth Avenue, Chicago, is taking bids on a general contract for a one-story plant, 100 x 125 ft., at South Park Avenue and Sixty-seventh Street, to manufacture automobile bodies. It will cost about \$45,000 with equipment.

A vocational department will be installed in the two-story high school to be erected by the Board of Education, Waseca, Minn., estimated to cost \$200,000. C. H. Rader is clerk of the board.

The Red River Power Co., 27 South Third Street, Grand Forks, N. D., is planning for extensions and improvements in its electric power plant and system to cost about \$150,000, including machinery. A new turbine unit will be installed. W. G. Brown is general manager.

Fire, March 9, destroyed a portion of the plant of the

Elaborated Ready Roofing Co., Forty-fourth and La Salle streets, Chicago, manufacturer of roofing products, with loss estimated at about \$45,000, including equipment.

The Illinois Oil Co., Rock Island, Ill., has plans under way for a new three-story plant, 40 x 150 ft., estimated to cost about \$165,000, including equipment. Cervine & Horn, 310 Safety Building, are architects. F. J. Welsh is president.

The Gopher Machinery Co., New Prague, Minn., will install an electric traveling crane at its new plant, 80 x 100 ft., estimated to cost \$50,000, plans for which are being prepared by J. C. Meyer, 648 Endicott Building, St. Paul, Minn.

The Elgin & Marengo Railroad Co., Marengo, Ill., has plans for a new electric power plant, 45 x 105 ft., and will proceed with the work at once.

The Board of Water and Light Commissioners, Austin, Minn., has plans in progress for a new electric power plant for municipal service, 60 x 80 ft., comprising in part the rebuilding of a former station, estimated to cost about \$100,000, including equipment. A. L. Pillsbury, 1200 Second Avenue, South Minneapolis, Minn., is engineer. William Todd is superintendent for the board.

The Rozum Motor Co., 400 East Fourth Street, Mitchell, S. D., is planning for the erection of a two-story repair and service works at Fifth Avenue and Main Street, to cost approximately \$50,000. A. J. Rozum is head.

New England

Boston, March 20.

Machine tool orders the past week were practically at a standstill, a few individual low-priced machines furnishing most of the business. Considerable looking about in the used machinery market by prospective customers is noted, but actual sales are few and far between. One Massachusetts municipality is expected to close within a few days on three South Bend lathes and a shaper, which will constitute the largest sales for the week in this district. Stone & Webster, Boston, have purchased a 15-ton Western made crane, with 33-ft. span and three motors, for a Ford, Flat Rock, Mich., project.

Machine-tool manufacturers are beginning to circulate among shops in New England to get views of users as to how their metal-working equipment can be improved for certain kinds of work. Screw machine representatives report little inquiry for machines but a decided improvement in the demand for screw machine products, especially from automotive equipment manufacturers.

Plans are being drawn for a one-story locomotive repair shop for the Boston & Maine Railroad at Concord, N. H. The estimated cost is \$307,900.

Frank Perrone, 9 Boardman Street, East Boston, contemplates the construction of a one-story, 75 x 150 ft. garage and service station on Bennington Street to cost \$40,000. Plans are being drawn.

Bids are being asked on a two-story and basement factory, 82 x 113 ft., by the New England Machine & Electric Co., 31 Bagley Street, Pawtucket, R. I.

The old casting shop, Torrington, Conn., formerly owned by the American Brass Co., is being razed to make way for a new rolling mill, to be erected by the Anaconda Copper Co., which recently acquired the American Brass Co.

The Bush Mfg. Co., Hartford, Conn., truck, tractor and airplane radiators, will erect a one-story, 50 x 250 ft. plant on Wellington Street at an estimated cost of \$40,700.

The Stamford Foundry Co., 115 Canal Street, Stamford, Conn., stove manufacturer, is having plans drawn for an addition and other improvements. Emmens & Abbott, Washington Building, Stamford, are the architects.

The Vaast Brothers Garage & Taxicab Co., 17 Chestnut Street, South Norwalk, Conn., are planning to erect a garage and repair shop, two stories, about 80 ft. sq.

Bids will be opened in Washington about April 15 by the Bureau of Yards and Docks, Navy Department, for the construction and equipment at the South Boston Navy Yard of a substation, distributing system and first add station, as provided in specification No. 4550. The work will involve about \$100,000 and will call for the erection of an annex to the pump house to conform to the present building. The equipment will include a three-unit motor generator set, 355-kw., 2300-volt, alternating current to 140-volt direct current, a 2300-volt alternating current to 250-volt direct current, an exciter set and a nine-panel switchboard, together with accessories. It had been erroneously published that the bureau was planning for a new dry dock and power house at the South Boston yard.

The Gilbert & Bennett Mfg. Co., Georgetown, Conn.,

manufacturer of wire cloth and other wire goods, has completed plans for a three-story and basement addition, 50 x 150 ft. Greenwood & Noerr, 347 Main Street, Hartford, Conn., are engineers. It will also build a one-story addition to its plant at Wireton, near Blue Island, Ill., 25 x 125 ft., estimated to cost about \$25,000. L. G. Hallberg & Co., 116 South Michigan Avenue, Chicago, architects, will prepare plans for the latter work.

A two-story power plant, 45 x 60 ft., and one-story machine shop, 25 x 45 ft., will be erected by the Colwell Worsted Co., Providence, R. I., in connection with its new plant on Hartford Avenue, for which the general contract has been awarded to the C. I. Bigney Construction Co., 357 Westminster Street.

The Wireless Specialty Apparatus Co., 493 C Street, South Boston, manufacturer of radio equipment, has leased a five-story, reinforced-concrete plant on Atherton Street, Jamaica Plains, Boston, and will remove its present factory to this location in April. About twice the present amount of floor space will be utilized at the new plant.

The Melser Press Mfg. Co., 944 Dorchester Avenue, Boston, manufacturer of printing presses, screw machine products, etc., has awarded contract to the Tredennick Co., 10 High Street, for a one and two-story addition, 160 x 300 ft., and 40 x 80 ft., to cost about \$250,000, including machinery. McNaughton & Cleverdon, 19 Congress Street, are architects.

A one-story power house will be erected by the American Hosiery Co., Park Street, New Britain, Conn., 40 x 50 ft. Motors and other electrical equipment will be installed in different departments of the mill. Reed & Thorpe, 60 Prospect Street, Hartford, Conn., are engineers.

The Boston Elevated Railway Co., 108 Massachusetts Avenue, Boston, has plans nearing completion for an addition to its power plant on First Street, estimated to cost about \$900,000, including machinery. Contract has been awarded to McDonald & Imhof, Roxbury, Mass., for a car inspection shop, 60 x 300 ft., at Forest Hills, estimated to cost about \$150,000. The latter building will be supplemented by a one-story car repair shop, 350 x 350 ft., and other mechanical buildings, estimated to cost in excess of \$2,000,000. Dwight P. Robinson & Co., 61 Broadway, New York, are engineers.

The W. F. Concannon Shear Co., 42 Depot Street, Milford, Conn., recently organized, is arranging for the establishment of a plant at Bridgeport, Conn., to manufacture steel shears, scissors, etc. William F. Concannon heads the company.

The Union Specialty Co., 138 Hurd Avenue, Bridgeport, Conn., manufacturer of metal products, will soon commence the erection of the superstructure for a two-story and basement plant, 50 x 125 ft., to cost about \$50,000.

The W. J. Hyland Mfg. Co., 151-3 Dwight Street, Springfield, Mass., manufacturer of piping, plumbing equipment, etc., will soon break ground for a three-story, brick and steel plant, 48 x 85 ft., on Liberty Street, estimated to cost about \$45,000.

Cleveland

CLEVELAND, March 20

The improvement in demand for machine tools noted earlier in the month continues and sentiment in the trade is more optimistic than it has been for many months. While no round lot sales are reported, dealers are getting a fair volume of single tool orders, the demand being largely for small tools and a considerable share of the activity being in used machinery. A few new inquiries have come out that look promising. One is from a Cleveland company that is considering the purchase of approximately \$100,000 worth of equipment for making a new line of products and another is from a company in an adjoining state for about 25 new or used machines.

Manufacturers of turret lathes report that some inquiries which have been pending for several weeks show signs of resulting in orders shortly. A representative of a local manufacturer of drilling machinery, who has just recently made a trip to the railroad shops in the East and South, has returned with a few definite prospects for early sales. The H. H. Franklin Automobile Co., Syracuse, N. Y., is purchasing equipment to manufacture a new four-cylinder motor car. It has placed orders with a Cleveland manufacturer for two boring machines and is expected to purchase 14 drilling machines shortly.

The Wellman-Seaver-Morgan Co., Cleveland, has just taken an order for three hydraulic turbines of 35,000 hp. capacity each for the new Big Creek plant of the Southern California Edison Co., Los Angeles, Cal.

The Zeder Motor Co. has been incorporated and plans to begin the manufacture of the Chrysler motor car at the plant of the Cleveland Tractor Co., Cleveland. The Elizabeth, N. J., plant of the Willys Corporation was equipped for the

manufacture of this car. The Cleveland Tractor Co. will continue the manufacture of farm tractors and it is not known as yet what additional equipment will be required for the manufacture of the motor cars.

Bellefontaine, Ohio, is planning extensions to its municipal power plant which will include a 600-kw. turbo generator unit with additional boiler and condenser capacity and other power plant equipment, involving the expenditure of approximately \$91,000. A special election will be held April 4 to secure authority to issue the necessary bonds.

The Lorain Steel Foundry Co., Lorain, Ohio, recently incorporated with a capital stock of \$250,000, has taken over the plant of the Aetna Steel Casting Co., Lorain, and is making improvements. W. W. Davidson is president, W. D. Jones, vice-president and secretary and C. M. Hartzell, treasurer and sales manager.

The Fisher Ohio Body Co., Cleveland, has leased the plant of the Briggs Mfg. Co., Cleveland, for additional manufacturing capacity.

Baltimore

BALTIMORE, March 20.

The Universal Heater & Mfg. Co., Charlotte, N. C., is building a plant for the manufacture of heaters, sheet metal work, etc. C. W. Sexton is president.

The Richmond, Va., plant of the Chicago Nipple Co., manufacturer of pipe nipples, etc., has acquired a building at First Avenue and Ninth Street, Baltimore, and will move to that location as soon as necessary alterations can be made. D. C. Williams is president of the company.

The Thornhill Wagon Co., Lynchburg, Va., is in the market for a second-hand vertical reaming or boring machine that will bore tempered cast iron cylinders $2\frac{1}{2} \times 8$ in. to $3\frac{1}{2} \times 11$ in. About $1/16$ in. will be cut out of the inside diameter. The company also wants a furnace or cupola to melt one ton of gray iron castings, either blast or electric type.

The Wilmington Sugar Refining Co., Christians Avenue and B Street, Wilmington, Del., will build a one-story power house, 95×150 ft. W. J. Wayte, Inc., 125 East Forty-sixth Street, New York, is engineer.

The Continental Can Co., Keyser Building, Baltimore, is planning for extensions and improvements in its plant at Highlandtown, to cost about \$18,000.

The Empire State Ice Co., Inc., care of William R. Moore, traffic manager, Chamber of Commerce, Cumberland, Md., is arranging for the erection of a new cold storage plant to cost about \$400,000, including equipment.

The Mexican Petroleum Corporation, 120 Broadway, New York, will build a new pumping plant and steel tankage distributing works on First Street, Baltimore, to cost about \$100,000.

The Natural Abrasive Mining Co. of America, Waynesboro, N. C., is planning for a new grinding mill and operating at Willets, N. C., estimated to cost about \$100,000. Initial works will be extended later, bringing the investment to about \$300,000. Frank R. Hewitt is treasurer.

The Western Maryland Railway Co., Baltimore, will construct 75 storage bins at its grain elevator at Port Covington, Baltimore, with conveying and other mechanical equipment and extensions, estimated to cost about \$525,000.

The Patuxent Clay Products Co., 210 Equitable Building, Baltimore, has selected a site at Patuxent for the erection of its new plant to manufacture hollow tile, etc., to cost about \$100,000, including equipment. I. P. Mills is in charge.

The City Council, Clifton Forge, Va., has arranged for a bond issue of \$240,000 for the construction of a municipal electric power plant. Plans will be drawn at once.

A machine and repair shop, with automobile service department, will be constructed by the Salvation Army, 521 Thirteenth Street, N. W., Washington, at its Industrial Home, to cost about \$200,000, including equipment. A wire baling department will also be installed.

The Bureau of Yards and Docks, Navy Department, Washington, has completed plans for the superstructure of a new machine shop at Pearl Harbor, H. T., for the local navy yard and will call for bids under specification 4518.

The Sandhill Packing Co., Aberdeen, N. C., is planning for extensions in its plant for the establishment of a department to manufacture tin cans and containers.

The Georgia Railway & Power Co., Atlanta, Ga., has arranged for a bond issue of \$150,000, a portion of the proceeds to be used for extensions and improvements in power plant and system.

A vocational department will be installed in the two-story high school to be erected by the Board of Education, Southport, N. C., to cost about \$55,000.

The Atlantic Iron Works, Norfolk, Va., is planning to rebuild its machine shop and other departments, recently destroyed by fire with loss estimated in excess of \$100,000, including equipment.

The Southern Power Co., Charlotte, N. C., is arranging for the immediate erection of a new hydroelectric generating plant in the vicinity of Mountain Island, Catawba River, with initial capacity of about 80,000 hp, estimated to cost in excess of \$2,000,000, including generating equipment and transmission system. It is also completing plans for a hydroelectric power plant at Great Falls, N. C., with capacity of about 60,000 hp, to cost approximately \$1,000,000.

The Palmetto Sheet Metal Works, P. O. Box 1, Florence, S. C., recently organized, has acquired a factory and will take immediate possession, specializing in the manufacture of roofing, skylights and general sheet metal products. B. G. Gregg is president and B. G. Gregg, Jr., secretary and general manager.

Pittsburgh

PITTSBURGH, March 20.

By far the largest individual crane order which has been placed in this district since the war, recently was closed. It calls for 21 cranes and a special trolley, the buyer being the Wheeling Steel Corporation, the entire order going to the Morgan Engineering Co., Alliance, Ohio. The award includes two 125-ton, 50-ft. span, double trolley, four-girder ladle cranes; one 30-ton with 10-ton auxiliary, 38-ft. 9-in. span, blooming engine room crane; one 30-ton with 10-ton auxiliary, 97-ft. 10 in. span, to serve the continuous mill; one 40-ton with 10-ton auxiliary, 84-ft. span to serve the blooming mill; one 20-ton with 5-ton auxiliary, 40-ft. span for the power house; two 25-ton with 10-ton auxiliary, 110-ft. span; for the slab yard; two 25-ton with 10-ton auxiliary, 75-ft. span, for the sheet bar yard, and a special trolley, all for the Steubenville, Ohio, plant. (LaBelle Iron Works.) For the Portsmouth, Ohio, works, there is one 5-ton, 77-ft. span to serve the rod storage yard; one 5-ton, 88-ft. span for the galvanizing department; one 5-ton, 23-ft. 6-in. span for the nail mill; one 5-ton, 125-ft. span for the wire mill; one 5-ton, 72-ft. span for the annealing building; one 5-ton, 24-ft. span bucket crane for the gas house; one 15-ton, with 5-ton auxiliary, 42-ft. span for the sub-station and one 15-ton, with 5-ton auxiliary, 66-ft. 9-in. span for the rod mill. The order also includes one 5-ton 71-ft. span crane, one $7\frac{1}{2}$ -ton, 54-ft. span and one 5-ton, 42-ft. span, 4-motor overhead revolving type jib crane for the galvanizing plant at the Beach Bottom, W. Va., works. This order not only provides the Morgan Engineering Co. a substantial backlog, but means business for those providing parts not made by this company.

The crane market, aside from this business, shows much more life than in some time. The U. S. Sanitary Mfg. Co., Zellenople, Pa., has closed for two 5-ton cranes with the Northern Engineering Works, Detroit, which also has taken another order for a 2-ton hoist for the Pennsylvania Rubber Co., Jeannette, Pa. The Coshocton Iron Co., Monongahela City, Pa., has not yet acted on its recent inquiry for four cranes, but an award is expected shortly and also on a 110-ton crane for the new power plant of the West Penn Power Co., at Windsor, W. Va. For the latter plant the General Electric Co., recently was awarded two 30,000-kw. turbines and several boilers were placed with the Babcock & Wilcox Co. A 30,000-kw. turbine for the Springdale, Pa., plant was awarded the Westinghouse Electric & Mfg. Co. The John F. Casey Co., Union Arcade, Pittsburgh, has asked for bids on four 2-ton cranes and a 5-ton crane in connection with a sewage project in Ohio, on which it is bidding. The Pittsburgh Supply Co., 2 Ross Street, Pittsburgh, is inquiring for two 10-ton overhead cranes. Altogether there are 30 cranes in the active or semi-active stage. In addition, a large number will some time be wanted in connection with modernizing several of the plants of the Steel Corporation. Prices for estimating purposes have gone in against about 35 cranes and much rolling mill equipment. A number of other steel companies are figuring on the replacement of obsolete equipment.

The machine tool market is over-shadowed by the activity of cranes and other equipment. Business, as has been the case for months, is merely of a pickup character and with so much used or second-hand machinery available the trade does not look forward to much activity in new tools in the near future. Government war purchases still are bothersome and the failures in machinery using industries are bringing upon the market much equipment at prices which make a strong appeal to intending buyers. A case in point is the recent sale of the machinery of the Owens Magnetic Motor Car Co., Wilkes-Barre, Pa. It is currently stated that the bulk of these tools were taken by the Wheeling Steel Corporation for its new rod and wire mill at Portsmouth.

Ohio. Because of these purchases, among which were some machines which had not been uncrated, the list of that company, which originally called for 20 tools, has dwindled to two or three items. There is no sign of railroad buying in this district.

The Keystone Power Co., Kane, Pa., is arranging for enlargements in its electric plant, with the installation of two new generating units. One of the generators will be placed during the year, and the other early in 1923.

The Sharpsburg Foundry Co., Sharpsburg, Pa., is planning for the installation of a new cupola and other equipment.

J. C. Forster & Son, 2519 Penn Avenue, Pittsburgh, manufacturers of dies, tinware and other metal products, have awarded contract to R. E. Murray, 310 Iron Exchange Building, for a new two-story plant, 50 x 100 ft., estimated to cost about \$42,000.

A one-story electrically-operated pumping plant will be constructed by the Board of Water and Light Commissioners, Tarentum, Pa., for the municipal waterworks.

The Ray-Burdette Coal Co., Delaware and Hall streets, Charleston, W. Va., is planning for the installation of a new gas engine and other power equipment at its works.

The City Council, Parkersburg, W. Va., will soon call a special election to vote bonds for \$300,000 for the erection of a new high school with vocational department. The Board of Education is in charge.

The Young Brothers Foundry Co., Charleston, W. Va., recently organized, has plans under way for the erection of a one-story foundry to manufacture iron and steel castings. R. M. and Walter Young, Charleston, head the company.

The Lunsdale Coal Co., Lunsdale, W. Va., has preliminary plans under way for a new tippie at its properties at Three Forks. It will also install considerable electrical and mining machinery in different departments of the plant. The entire project is estimated to cost close to \$1,000,000. George M. Jones is general manager.

A vocational department will be installed in the high school to be erected by the School Board, Hundred, W. Va., for which bonds for \$75,000 have been voted.

The Wheeling Machine Products Co., 1920 Main Street, Wheeling, W. Va., is arranging for the installation of a new power plant.

The Pennsylvania-Ohio Power & Light Co., Sharon, Pa., is planning for the installation of equipment at its new power house addition at Lowellville. It is expected to have the plant unit ready for operation late in May.

The Board of Education, McKeesport, Pa., has approved plans for an addition to the technical and vocational high school to cost about \$300,000. T. B. and Lawrence Wolfe, Century Building, Pittsburgh, are architects.

St. Louis

ST. LOUIS, March 20.

The Union Electric Light & Power Co., St. Louis, has acquired fifty acres of land on the Illinois side of the Mississippi River immediately south of the city limits of East-St. Louis, Ill., as a site for a power plant to supply the rapidly increasing demands for electrical energy in St. Louis and environs. Much of the present power is received from the large water power plant of the Mississippi River Power Co. at Keokuk, Iowa, and from the company's own Ashley Street steam power plant. The cost of the power plant and equipment will be upward of \$6,000,000. McClellan & Junkersfeld, 45 William Street, New York, have been engaged as engineers.

The Hall & Brown Woodworking Machinery Co., 1913-33 North Broadway, St. Louis, is planning to call for bids early in April, for the erection of an addition to cost about \$50,000.

The Press Sign Co., 202 South Seventeenth Street, St. Louis, manufacturer of metal signs, has arranged with the Modoc Realty Co., St. Louis, for the erection of a new two-story plant, 120 x 135 ft., estimated to cost about \$35,000, to be occupied under lease.

The Carbur-Ald Garage & Machine Co., Poplar Bluff, Mo., is planning for the erection of a new two-story machine works addition, estimated to cost about \$40,000.

The St. Louis & San Francisco Railroad Co., St. Louis, is perfecting plans for the enlargement of its locomotive shops at Springfield, Mo., to include the installation of new machine tools and other equipment, estimated to cost about \$200,000.

The Lecoutour Brothers Stair Mfg. Co., 4523 Shaw Avenue, St. Louis, has plans under way for rebuilding its two-story factory, recently damaged by fire, to cost about \$50,000. New equipment will be installed. Emil H. Nieman, 3318 Shaw Avenue, is architect.

The Chicago, Rock Island & Pacific Railroad Co., La Salle

Street Station, Chicago, has plans in progress for new locomotive repair works at Little Rock, Ark., estimated to cost about \$250,000, including machinery. C. A. Morse is chief engineer.

Fire, March 6, destroyed a portion of the plant of the Kanok Metal Co., Crestline, Kan., with loss estimated at \$45,000, including equipment.

A vocational department will be installed in the two-story high school to be erected at Thonias, Okla., estimated to cost about \$70,000. A. J. Love & Co., 205 Richards Building, Tulsa, Okla., are architects.

The Muskogee Refining Co., Muskogee, Okla., is planning for extensions in its oil refinery on South Cherokee Street to cost about \$250,000, including equipment.

The American Public Service Co., Okmulgee, Okla., is disposing of a bond issue of \$1,000,000, a portion of the proceeds to be used for extensions and improvements in electric plants and system.

The Charleston Mining & Mfg. Co., Charleston, S. C., is planning to rebuild its grinding plant at Mt. Pleasant, Tenn., recently destroyed by fire with loss estimated at \$150,000, including equipment.

The City Council, Fulton, Mo., has plans in progress for the installation of additional machinery at the municipal electric light and power plant.

The Harlan County Motor Co., Harlan, Ky., will call for bids at an early date for the erection of a new one-story branch machine shop and service building at Lynch, Ky. R. P. McGeekin, Lynch, is architect.

The Wilhoit Oil Co., Webb City, Mo., is planning to rebuild the portion of its refinery destroyed by fire March 13, with loss estimated at close to \$75,000.

The Triangle Machine Works, Central City, Ky., has completed plans for a new two-story and basement factory, 75 x 100 ft., estimated to cost approximately \$30,000. W. B. Mix is head.

The Carbon Coal Co., Jackson, Ky., recently organized with a capital of \$120,000, is planning for the construction of an electric power plant at its local properties. It will also install considerable equipment for operating the mines, including motors, shaker screens, etc. Emory Cain is president and general manager.

The Kansas Gas & Electric Co., Topeka, Kan., has arranged for a bond issue of \$8,000,000, a portion of the proceeds to be used for extensions and improvements in power plants and system. Preliminary plans are under way for the installation of new generating equipment and extensions in other power departments and distributing system. F. G. Sykes is vice-president.

The Standard Oil Co. of Kentucky, Louisville, has called a special meeting April 3 to approve an increase in its capital from \$6,000,000 to \$12,000,000, a portion of the proceeds to be used for extensions in its oil refineries and mechanical plants. C. T. Collings is chairman of the board.

Detroit

DETROIT, March 20.

The Barton Auto Top Co., 4445 Woodward Avenue, Detroit, is completing plans for a new three-story factory, 62 x 160 ft., at 60 West Canfield Avenue, estimated to cost \$50,000. Albert Barton is president.

The Cartwright Die & Tool Co., 2962 Hart Avenue, Detroit, is planning for the installation of new die-manufacturing and other equipment at its plant.

The Stearns & Niles Co., Detroit, is arranging facilities to provide for the manufacture of the Knight superheater for automobiles.

A complete machine shop and manual training building will be erected by the Board of Education, Saginaw, Mich., in connection with a new junior high school in the East Side section, estimated to cost about \$1,200,000. Henry Witters is president of the board.

The Precision Tool Co., 5465 Lincoln Avenue, Detroit, is planning for the installation of new bench tools and machine shop equipment at its plant.

The Michigan Porcelain Tile Works, Ionia, Mich., has been organized with a capital of \$100,000 to construct a factory for the manufacture of tile products. Plans have been drawn for a one-story and basement works, 120 x 160 ft., estimated to cost about \$50,000, with machinery. Harry E. Kidder is general manager. P. Lindhout, fifth floor, Michigan Trust Building, Grand Rapids, Mich., is architect.

A vocational department will be installed in the two-story and basement high school, 95 x 130 ft., to be erected at Grosse Isle, Mich., to cost about \$30,000. Malcomson, Higginbotham & Palmer, 404 Moffat Building, Detroit, are architects.

The Detroit Edison Co., Detroit, has arranged for a cap-

ital stock issue to provide in part for the proposed expenditures for plant extensions and improvements, estimated at close to \$3,000,000. The work will include the installation of new generating and line equipment, with auxiliary operating machinery. Alexander Dow is president.

The Michigan Tool Co., 403 East Jefferson Avenue, Detroit, will soon begin construction of a new factory at Mack Avenue and the Detroit Terminal Railroad.

Milwaukee

MILWAUKEE, March 20.

Business the past week was not much, if any, above the average of the last four to six weeks, but inquiries were more numerous, particularly from the automotive and farm equipment industries. The latter trade is just entering a new epoch of production, although it probably will require some time to wipe out surplus stores. Passenger automobile trade is active once more. Railroad buying is increasing slowly and some business was placed during the week in this line. Manufacturers of steam and hydroelectric generating equipment, who are at present engaged in executing some large orders, have considerable new business in sight. Other divisions of the metal-working industries are also moving steadily into a stronger position.

The Ironwood & Bessemer Railway Co., with headquarters at Ashland, Wis., has been granted authority to issue \$233,000 of preferred stock for additions and extensions to its property and plant. The major expansion will be made at the steam generating plant on the Chequamegon Bay front in Ashland. Details, however, will not be available until later.

The S. W. Miller Piano Co., Sheboygan, Wis., has been obliged to abandon temporarily its plan of erecting a new factory and warehouse, its site having been condemned by the city for park and bathing beach extensions. The company, however, has purchased the American theater building, which it will remodel for occupancy May 15 as a temporary factory. It is seeking another site upon which to carry out its original new plant construction project. W. H. Ackerman is treasurer and general manager.

The Franklin Motor Car Co., Syracuse, N. Y., has addressed an inquiry to the Milwaukee Association of Commerce with reference to the proposed establishment of a new factory estimated to cost \$1,000,000. A similar inquiry has been received from the Halladay Motor Corporation of Newark, N. J. Two manufacturers of power farm machinery, whose identities are not divulged, are negotiating with the new industries division of the Association of Commerce for suitable buildings or sites for new buildings.

The Wisconsin Castings Co., Sheboygan, Wis., has been incorporated with a capital stock of \$125,000 by Harry W. Bolens of Port Washington, Wis., who recently bid in the property of the Globe Metal Products Co., founder and manager, Sheboygan, at receiver's sale for \$65,800. Mr. Bolens is president and general manager of the Glison Mfg. Co., Port Washington, and several other metalworking industries, being in the manufacture of gas engines and farm machinery equipment. The plant of the former Globe company consists of a gray iron foundry and machine shop erected about two years ago. Mr. Bolens intends to place both shops in operation at once.

The S. Heller Elevator Co., 250 Milwaukee Street, Milwaukee, has plans for a new four-story factory to be erected at a cost of \$75,000 to \$100,000 at Milwaukee and Buffalo streets. It manufactures electric, hydraulic and manual freight and passenger elevators. Work will begin about April 1. Siegfried Heller is president and treasurer.

The Milwaukee Boiled Ham Co., 901 Holton Street, Milwaukee, will build a new packing plant, with cold storage and warehouse, at Well Street and Garfield Avenue, at a cost of about \$50,000. Inquiry is being made for engines, boilers, ice machine, etc. John J. Czala is general manager.

The Ashland Light & Power Co., Ashland, Wis., has placed the general contract with the L. E. Meyers Co., 53 West Jackson Boulevard, Chicago, consulting and contracting engineer, for the construction and equipment of a new hydroelectric generating plant costing \$3,500,000 on the Flambeau River near Tony, in Rusk County, Wis. The principal items of equipment will be three 5000-hp. turbo-generating units. Approximately 105 miles of transmission lines will be constructed.

Harry A. White, Marinette, Wis., has engaged Theodore Klauer, Jr., architect, 1861 Dunlap Avenue, local, to prepare plans for a garage and service station, 118 x 120 ft., one story and basement, estimated to cost \$30,000, including equipment, etc.

The Bucyrus Co., South Milwaukee, Wis., has awarded the general contract to Paul Riessen's Sons Co., 1018 Humboldt Avenue, Milwaukee, for a new gray iron foundry, 60 x 276 ft., of brick and steel. It also will build a new machine and

erecting shop at its plant in Evansville, Ind., contract for which has been let to the Worden-Allen Co.

The Madison Gas & Electric Co., Madison, Wis., will take bids within a few days for an addition to its steam generating plant to produce 5000 kw. additional energy. The work is in charge of Mead & Beasone, consulting engineers, Madison. Equipment requirements include a 1000-hp. Sterling boiler, automatic stoking equipment, coal handling machinery, bunkers, etc.

The Chippewa Valley Auto Co., Chippewa Falls, Wis., has plans for a new public garage, sales and service building, 100 x 200 ft., estimated to cost \$75,000 complete. Fred A. Bigler is president and general manager.

The R. J. Schwab & Sons Co., 283 Clinton Street, Milwaukee, iron founder and manufacturer of furnaces, boilers, etc., will erect two brick additions, 30 x 72 and 40 x 50 ft., to provide larger production capacity.

The Board of Education, Ashland, Wis., is taking bids until April 10 for a manual arts building as an addition to the central high school. It will be 65 x 100 ft., three stories and basement, and with full equipment will cost about \$130,000. The architects are Kelley & Scheffnick.

The Domestic Foundry Co., North Milwaukee, Wis., has been incorporated with a capital stock of \$10,000 to manufacture gray iron castings. The incorporators are John Toennesen, J. L. Orth, H. W. Connell and Martin Schottler, 105 Wells Street, Milwaukee, attorney. A statement concerning the company's plans will be made later.

The American Steel Corporation, Milwaukee, has filed articles of incorporation to manufacture iron and steel products. The capital stock is \$100,000. The incorporators are A. J. Vollbrecht, George A. Affeldt, attorney, and B. Glenn Tarkington, 740 Thirty-third Street, sales manager Pittsburgh Furnace Co. The incorporators expect to be ready soon to detail plans of the enterprise.

The Gulf States

BIRMINGHAM, March 20.

The Continental Box Corporation, Brewton, Ala., has acquired the local plant of the T. R. Miller Mill Co., specializing in the manufacture of wire-bound boxes, and will operate the factory. Extensions and improvements are planned.

E. J. Owen, Sixth Street, Gadsden, Ala., has preliminary plans under way for a new one-story foundry to manufacture iron and other metal castings.

The American Public Service Co., Baird, Tex., will build a new cold storage plant, estimated to cost about \$75,000.

The Robstown Gln & Ice Co., Robston, Tex., will install a new generator and other equipment at its power house. The company is arranging to electrify its cotton ginning branch and will install motors and other electrical apparatus. Extensions and improvements will also be made in the local cold storage plant.

The City Council, Fernandina, Fla., has called a special election on April 4 to vote bonds for \$37,000 for extensions and improvements in the municipal electric light and ice plant. New equipment will be installed.

The Brooks Supply Co., 799 Franklin Street, Beaumont, Tex., manufacturer of oil well supplies and equipment, is planning the erection of a one-story machine shop addition. A number of machine tools will be installed.

The Humphreys Oil Co., Mexia, Tex., is being formed by a merger of the Humphreys-Texas Co., and the Humphreys-Mexia Co. It will have a capital of \$15,000,000 and plans extensive operations. A new refinery will be erected at a Gulf point, with pipe line, now in course of installation, from the Mexia field. The entire project will cost approximately \$1,000,000. Col. A. E. Humphreys is president.

The Common Council, Delray, Fla., will commence the immediate construction of a one-story municipal electric lighting plant.

The Fluker Gravel Co., 203 Roumain Building, Baton Rouge, La., recently organized with a capital of \$100,000, will equip a new sand and gravel working plant in the vicinity of Fluker, La. The installation will include drag lines, buckets, two complete washing plants, cars, electrical and other equipment. O. O. Orden is president and general manager.

The Common Council, Paris, Tex., will build an electrically operated pumping and filtration plant in connection with a new waterworks system. Bonds for \$1,000,000 have been sold. Major J. B. Hawley, Fort Worth, Tex., consulting engineer, has plans.

The Houston Electric Co., Houston, Tex., is planning for the purchase of 85 new street cars and other operating equipment, estimated to cost about \$375,000.

The Common Council, Clearwater, Fla., is arranging for the erection of a municipal electric light and power plant.

The ice-manufacturing plant of the Sabine Ice Co., Bronson, Tex., with cotton gin adjoining, has been acquired by I. D. Sparks and E. Cousins, Bronson. The new owners will make additions and improvements and install new equipment. Plans are also being considered for the establishment of an electric power house.

Copeland Brothers, Tuscaloosa, Ala., have acquired timber lands in the vicinity of McSham, Ala., and have plans under way for a new saw mill, planing mill and other buildings, estimated to cost in excess of \$50,000.

A vocational department will be installed in the new high school to be erected at Greenville, Tex., estimated to cost about \$100,000. Bonds have been voted.

The Cantonment Merchantile Co., Cantonment, Fla., will build a new ice-manufacturing and refrigerating plant, in connection with its canning factory. H. R. Root is secretary and treasurer.

Indiana

INDIANAPOLIS, March 20.

A vocational department will be installed in the two-story and basement high school to be erected at Cannelton, Ind., estimated to cost about \$65,000. Breton Minor is secretary.

The Northern Indiana Gas & Electric Co., South Bend, Ind., has secured permission to purchase the plant and property of the Lafayette Service Co., Lafayette, Ind., at a chancery sale for \$120,000. The new owner plans extensions and improvements in the power plant and system.

The D. V. Reedy Elevator Co., Indianapolis, manufacturer of passenger elevators, will soon commence the erection of the superstructure for its new two-story plant on South New Jersey Street, estimated to cost close to \$50,000, including machinery. D. V. Reedy is president.

A vocational department will be installed in the two-story and basement high school to be erected by the Franklin School Township Board, Georgetown, Ind., at Lanesville, Ind., estimated to cost \$80,000. George C. Doolittle, Corydon, Ind., is architect.

The J. H. Kripke Co., 512 West Franklin Street, Evansville, Ind., is planning for the erection of a metal and iron-working shop on West Franklin Street, to cost about \$25,000.

Motors and other electrical and mechanical power equipment will be installed in the new printing plant to be erected by the R. R. Donnelly Co., 731 Plymouth Court, Chicago, at Crawfordville, Ind., to cost about \$275,000.

A vocational department will be installed in the two-story and basement high school to be erected at Albion, Ind., estimated to cost \$75,000.

The Elwood Foundry, Elwood, Ind., has been sold by the trustee in bankruptcy to Abe Levi, Elwood, for \$5,500. A new company is being organized to operate the foundry, which will make traffic signs and other devices for which the former concern had contracts. Clayton Cooper is interested.

The new foundry of the C & G Potts Co., 316 Washington Avenue, Indianapolis, has been completed at a cost of \$60,000. It is 90 x 145 ft., of brick and steel, part two-stories, and will have an output of 18 to 20 tons of gray iron and semi-steel castings a day.

The Pacific Coast

SAN FRANCISCO, March 14.

The Armstrong Brothers Tool Co., 335 North Francisco Avenue, Chicago, has acquired water front property at Astoria, Ore., as a site for a new plant for Pacific Coast and Far Eastern trade. It is planned to commence erection late in the spring.

The Long Beach Crystal Ice Co., Long Beach, Cal., recently organized with a capital of \$100,000, has plans nearing completion for a new factory at 2870 American Avenue, Willowville, estimated to cost \$60,000, including machinery.

The Board of Public Works, Municipal Building, San Francisco, will call for bids in April for the proposed municipal hydroelectric power plant at Moccash Creek, estimated to cost about \$1,000,000, with machinery.

W. E. Higman and H. B. Mason, Atascadero, Cal., have organized a company and are completing plans for a new cold storage and refrigerating plant, 100 x 300 ft., estimated to cost \$200,000 with equipment.

A manual training and domestic science building will be erected by the Board of Education, Calipatria, Cal., in connection with a new group of high school buildings, esti-

mated to cost in excess of \$150,000. Donald E. Wells, El Centro, Cal., is architect.

A vocational department will be installed in the new high school to be erected at Corona, Cal., for which \$150,000 in bonds have just been voted. Plans will be prepared at once.

The Great Western Power Co., 14 Sansome Street, San Francisco, will commence the immediate erection of a new two-story power house at El Cerrito, Contra Costa County, estimated to cost about \$150,000.

The Ever-Ready Heater Co., Inglewood, Cal., recently organized with capital of \$500,000 to manufacture heaters and heating equipment, has acquired about five acres of land near the plant of the Hicks Dovetail Lath Co., and plans the erection of a new factory. John B. Reeves is president.

The Pacific Power & Light Co., Portland, Ore., is considering plans for the erection of a new hydroelectric generating plant on the Deschutes River, with initial capacity of about 30,000 hp. Guy W. Talbot is president.

Canada

TORONTO, March 20.

Both manufacturers and dealers report a decided improvement in the demand for machinery and tools. Many manufacturers have recently increased operating capacity and are producing on a larger scale than at any time during the past year and a half. Dealers' orders are mostly for one or two machines, with an occasional order for six or a dozen tools. Buying has not yet started on an extensive scale, but there is a steadily increasing number of users who are entering the market for machines for replacement purposes. In Montreal, where business has been very dull for the past year or more the demand for equipment is showing improvement and sales of various lines of machinery are slowly picking up. Small tools continue active.

The Board of Education, Guelph, Ont., is receiving bids for the erection of a collegiate institute which will contain wood-working and machine shops, electrical department, etc.

The Toronto Transportation Commission, Toronto, will build a machine shop in Hillcrest Park at an estimated cost of \$100,000. Equipment has not yet been purchased. It is also receiving bids for 8000 tons of steel rails.

The Standard Stone Co., Windsor, Ont., will erect a factory and install the necessary machinery.

The governors of the General Hospital, Brantford, Ont., are contemplating equipping an auxiliary power plant to provide against storms, etc.

The Northern Ontario Light & Power Co., Cobalt, Ont., is considering the development of 7000 hp. at Sturgeon Falls, Ont., to cost between \$350,000 and \$600,000.

N. K. Lund, Forestburg, Alta., is making arrangements for the erection of electric lighting plant.

The Red Star Refineries, Ltd., Montreal, recently incorporated, is preparing to erect an oil refinery and has secured a site in the east end of the city with railroad and harbor facilities and is ready to proceed with the erection of the first unit with capacity of 1000 bbl. per day. It will ultimately have a daily capacity of 10,000 bbl. The President of the company is Senator N. A. Belcourt, Ottawa, Ont.; vice-president and general manager, T. A. Kilburn, and the directors include F. W. Stewart, H. W. Austin, J. S. Stanford, J. McNaughton and J. S. Giles.

The Kasutline Co., Ltd., formerly of 28 Eastern Avenue, Toronto, has moved to Dundas, Ont., where it has acquired control of the Dominion Welding Products Co. The latter company commenced manufacturing steel tanks for water, gasoline and storage as well as welded smoke stacks last July.

The Enterprise Foundry Co., Sackville, N. B., has recently completed an addition, 50 x 150 ft., for making bodies for steel and gas ranges and a wing, 30 x 50 ft., for japanning. A new development at the plant is the installation of a large air compressor for sand blasting and other foundry work.

The chairman of the Hydro Commission, 75 Laurier Avenue, Ottawa, Ont., is receiving bids for meters, transformers, wire and general supplies. J. E. Brown is manager.

The Fedders Mfg. Co., Black Rock, N. Y., has purchased the plant of the Lantz Marble Works on Lewis Street, Bridgeburg, Ont., and will equip it to manufacture automobile radiators, aeroplane accessories, etc.

The Canadian Automobile Corporation, 197 Sparks Street, Ottawa, has started work on the erection of a factory in West Hull Township to cost \$50,000. Charles A. Fox, 394 Harvard Street, Montreal, is architect.

The Manitoba Rolling Mill Co., Winnipeg, Man., is in the market for a 36-in. lifting magnet for handling scrap; also a 100,000-lb. testing machine.

Current Metal Prices

On Small Lots, Delivered from Merchants' Stocks, New York City

The following quotations are made by New York City warehouses.

As there are many consumers whose requirements are not sufficiently heavy to warrant their placing orders with manufacturers for shipment in carload lots from mills, these prices are given for their convenience.

On a number of articles the base price only is given, it being impossible to name every size.

The wholesale prices at which large lots are sold by manufacturers for direct shipment from mills are given in the market reports appearing in a preceding part of THE IRON AGE under the general heading of "Iron and Steel Markets" and "Non-ferrous Metals."

Iron and Soft Steel Bars and Shapes

Bars:	Per Lb.
Refined iron bars, base price.....	2.53c.

VOL. 109, No. 13

Mechanical Molding a Success at Council Bluffs— Griffin Plant Equipped Throughout with Labor-Saving Devices

BY GILBERT L. LACHER

CONSTRUCTION of the Council Bluffs, Iowa, plant of the Griffin Wheel Co., Chicago, introduces a new epoch in the manufacture of chilled iron car wheels. In contrast with existing car wheel foundries, all of which were laid out for hand molding, the new Griffin plant was designed and equipped for the mechanical handling of practically all operations and, what is more important, this innovation in practice has proved not only feasible but economical.

That success has been achieved in solving the problem of mechanical molding of car wheels is hardly more surprising than that it was undertaken at all, in view of the discouraging experience of others who have tried it in the past. Necessity, however, is generally the compelling reason for risking radical deviations from established practice. In this case, necessity lay in the labor situation, which was rendered particularly acute by the world war. In times of labor scarcity it is always exceedingly difficult to induce men to take up the arduous work of a wheel foundry and, even when labor is more plentiful, it is not easy to fill the ranks.

Manual molding of car wheels calls for a physique which will stand heavy lifting and long hours in an

atmosphere of variable temperature, often aggravated by the presence of steam and gas. In shops producing more than 175 wheels per cupola, the hours during which the labor necessarily must be performed are unattractive. This is because all molds must be made up prior to the time at which pouring begins, for the conditions are such that a molder cannot work intermittently, molding and pouring. Hence it is necessary to begin operations at 3 or 4 a. m., so that the men who receive iron first will be ready at 8 or 9 a. m.

Because everything connected with it is heavy, the work is laborious. A molder and helper handle about eight tons of sand; this must be tempered, cut over two or three times, shoveled into the molds, tamped, shaken out again, and left in proper shape to condition over night. Ten tons of metal must be poured by the same two men, and the wheels shaken out at the proper time. Car wheels are unlike other castings, which may remain indefinitely in the molds, for, if allowed to remain overtime for even a few minutes, the wheels are spoiled. This requires the maximum exertion during the time of shaking out, which at most seasons of the year is very hot work, developing profuse perspiration and putting the molder in such condition that he cannot

EMBODYING revolutionary methods of handling the heavy molds incident to the making of railroad car wheels, the new Griffin plant in Council Bluffs, Iowa, is confidently expected to show reduced production costs. The outstanding innovations are described and illustrated in this article; the Council Bluffs methods of handling other foundry problems will follow in the second installment. With plants active in Boston, Chicago, Denver, Detroit, Kansas City, Kensington, Los Angeles, St. Paul and Tacoma, the best ideas from all these sources have been gathered into the new unit and whipped into one harmonious whole. Operations under these auspicious beginnings will be watched with great interest by foundrymen the country over, but more particularly by those who have similar obstacles to overcome.

go back to work in a cool atmosphere. The only thing that attracts men to this work is the wage, which is universally on a piece-work basis. There is no union, and the rate paid is always materially higher than that paid union molders.

On account of the unattractive character of the work, there is never a surplus of molders. Most molders now employed are well along in years and restrictions on immigration limit the manual labor available from abroad. Moreover, the younger generation in this country will not take up so strenuous vocations as their fathers. Hence the labor problem confronting the car wheel manufacturers is a difficult one. Whenever an increase in output is required, it is necessary to break in new men as helpers and promote the old helpers to molders; and very often this process is so rapid that a long period must be passed through before molding operations are stabilized. In adding to the working force, it is usually necessary to start in at least ten new men before one is found who will remain permanently. Thus the rate of labor turnover is increasing and the average efficiency of wheel foundries is held down.

The importance of finding a solution of the problem can best be appreciated by considering the magnitude of the car wheel industry. Fully 95 per cent of the 25,000,000 railroad car wheels in service in the United States and Canada are of chilled iron. In addition, chilled-iron wheels are used for street cars, interurban cars, industrial cars, locomotive tenders, cranes, etc. As the average life of a railroad car wheel is about eight years, the renewal requirements amount to 3,000,000 wheels per annum. These are supplied by 25 chilled-iron wheel manufacturers in the United States and Canada, whose plants are located near points where the largest number of wheels are put into use.

During the past two decades several attempts made replace labor with mechanical molding devices all proved dismal failures, notwithstanding the large sums of money use in experiments. Not until 1919, when the Griffin Wheel Co. conducted an experiment at its Kansas City plant, was a successful car wheel molding machine perfected. This was followed by the Brown Car Wheel Co., Buffalo, N. Y., in a modified form for a similar purpose, where it has been successfully applied since the beginning of 1921. This was described briefly at page 847 of THE IRON AGE, Sept. 15, 1921.

That the Council Bluffs plant is the first car wheel foundry to be designed and built expressly for mechanical handling of all molding operations. While the company had already decided to erect a new plant to meet the growing demand for its product, the successful experiment at Kansas City led it to discard old practices entirely, in favor of mechanical methods of operation

throughout the yard, charging room and molding room.

In the molding room of the Griffin plant an outstanding feature is the method of handling molds from the molding machines to the cupola and thence to the shake-out grates. The molding room is divided into two complete units which are the converse of each other. There are four molding machines, two for each half of the room. As soon as the drag mold is made it is conveyed to the second molding machine, where the cope is superimposed upon it and the finished mold is advanced to the pouring station. Thence the mold is conveyed to the shake-out grates, whereupon the cope and drag portions of the flask are returned to the molding machines for further use.

As the process is a continuous one, the conveying equipment is so designed and constructed as to make maintenance costs low and breakdowns unlikely. It consists of two rectangular tracks, one for each half of the molding room. Each side of the rectangle is filled with cars having square platforms. At each corner of the rectangle, a hydraulic pusher cylinder operates to put the series of cars in motion, the square platform of one car pushing that of the car ahead.

On one car is placed the drag half of the flask, consisting of bottom board and nowel, immediately after the mold has been shaken out. The car then progresses to a position adjacent to the drag molding machine, where the bottom board and nowel are lifted off by jib crane, and rammed and faced in the machine. The completed drag is then deposited by the machine on a conveyor car which carries it to a point next to the cope molding machine, where a cope is superimposed upon it.

As it takes longer for the cope half of the flask to cool, it is handled differently from the bottom board and nowel. After the mold is shaken out, a jib crane transfers the chiller and cope to a square top car of the same type as those on the rectangular conveyor track. This car, however, rests on a transfer car by means of which it may be transferred to any one of a series of tracks running longitudinally on the inside of the rectangle formed by the conveyor. There are eight of these longitudinal tracks, six of which are used for storage purposes and two for the return of the empty cars to the transfer track adjacent to the shake-out grates. A second transfer track at the other end of the storage yard is used for transferring the loaded cars from storage to two short tracks serving the cope molding machine and then for returning them, after they have been unloaded, to the two longitudinal tracks which carry them back to the shake-out grates. On the storage tracks the cars move by gravity. The two transfer cars are operated by cable from motor-driven winches, while the empties are returned to the shake-out grates by hydraulic pusher cylinder.

Cope Molding Machine in Fore-ground; Drag Machine Is Similar. Each consists of a vertical hydraulic cylinder from which three horizontal arms radiate. The arms are lifted and turned hydraulically, while, at one point in the circumference of rotation of the arms, a pneumatic jolting machine is stationed for ramming. The sand chute appears above

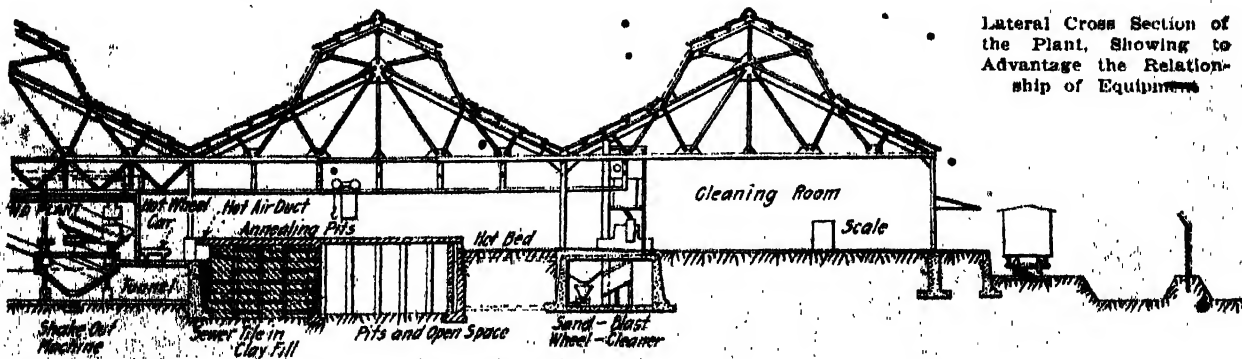

As soon as a cope has been rammed and faced on the cope molding machine, cope and drag are clamped together and the completed mold progresses to a point near the cupola, where the metal is poured from a ladle suspended from a 3-ton crane directly above the car. In this manner molds are poured consecutively as rapidly as the cars are moved forward on the conveying system. The hydraulic pusher cylinders which furnish the motive power for the conveyor are actuated in unison, the control being handled by the same employee who operates the drag molding machine. At each corner of the conveyor is a turntable which is rotated 90 deg. by the pusher on its return stroke. Hence, when a turntable is empty it is turned to position for the receipt of a car from the incoming side of the rectangle. When it is loaded it is rotated to position for the delivery of the car to the outgoing side of the conveyor.

The cope and drag machines are of similar construction, consisting of a vertical hydraulic cylinder from which three horizontal arms radiate. The lifting and turning of the arms is handled hydraulically, while at one point in the circumference described by the rotation of the arms, a pneumatic jolting machine is stationed for ramming purposes.

There are three separate stations in the rotation of the drag machine where certain stages in the molding operations are performed. At Station 1 the core print is placed, the number set, the pattern brushed and the nowel placed on the pattern. Then one riddle full of facing is shaken through a No. 4 riddle and

tucked into the pockets on the brackets. These operations require 35 sec. At Station 2 a measuring ring is placed on the nowel, heap sand is drawn and excess heap sand is struck off. The drag is then placed on a ramming plate, given five jolts, after which the ramming plate and measuring ring are removed. The molder then strikes off and applies bottom board and clamps. These operations take 55 sec. To reduce further the time of this operation it is proposed to use a bar drag, which will eliminate the bottom board and striking off. A bar drag consists of a nowel with bars through it. By packing the sand between these bars, the need for a bottom board will no longer exist. At Station 3 the drag is turned over on its trunnions and lowered to the mold conveyor, where the clamps are knocked off and the pattern is drawn. These operations require 20 sec. Four men perform all of the operations of the drag molding machine, one of whom operates the valves controlling the raising, lowering and turning of the machine. The operation of the machine per complete revolution takes 12 sec. After the drag has been placed on the conveyor the pan core and center core are set and the chaplets are placed.

There are also three stations at the cope machine. At Station 1, the pattern is brushed, following which the dry sand dish, the head block and sprues are inserted. Then the facing ring is placed and one riddle of facing is applied, after which the cope and chiller (handled as one piece, being bolted together) are placed. These are not cast in one piece because the chiller wears out faster than the cope. Following the

Lateral Cross Section of the Plant, Showing to Advantage the Relationship of Equipment

placing of cope and chiller two riddles of sand are applied through a No. 4 riddle, a shovelful of sand is placed in the dish and peened around the dish core. All of the operations at Station 1 are performed in 55 sec. At Station 2 the operator draws sand, gives two jolts and strikes off at a level with the cope bars. He then applies a ramming plate and gives seven jolts, removes the ramming plate and vents the dish. These operations take 55 sec. At Station 3 the operator raises the cope, turns it over, swabs the chiller, applies the dust, turns over again and closes the mold. The average time required at Station 3 is one minute. The time in turning and raising the machine averages 12 sec. per complete operation.

Owing to the fact that the three stations at each machine are operating simultaneously, the time for the completion of a flask, cope or chiller averages only 1 min. 15 sec. For the convenience of the molders a molding sand hopper and a facing sand hopper are located above each machine. The machines, designed by the Griffin Wheel Co., were constructed by the Omaha Steel Works.

Mechanical shakers provided for shaking out are as ingenious as those used for molding. The shake-out floor is connected by a swing crane which is elevated and lowered vertically, while it is swung radially from its pivot column by motor. The beam of the crane may also be turned on its own axis by motor. Molds are transferred by a jib crane from the rectangular conveyor to a jolt machine in the shake-out room, where the sand is shaken out of the flask. The shake-out crane is then swung adjacent to the jarring machine and is turned so that the wheel may be pushed into a jaw on the end of the crane beam. Upon the return of the jaw to the vertical position so that the wheel cannot roll out, a laborer knocks off the header.

Then the crane swings the wheel to another jolter,

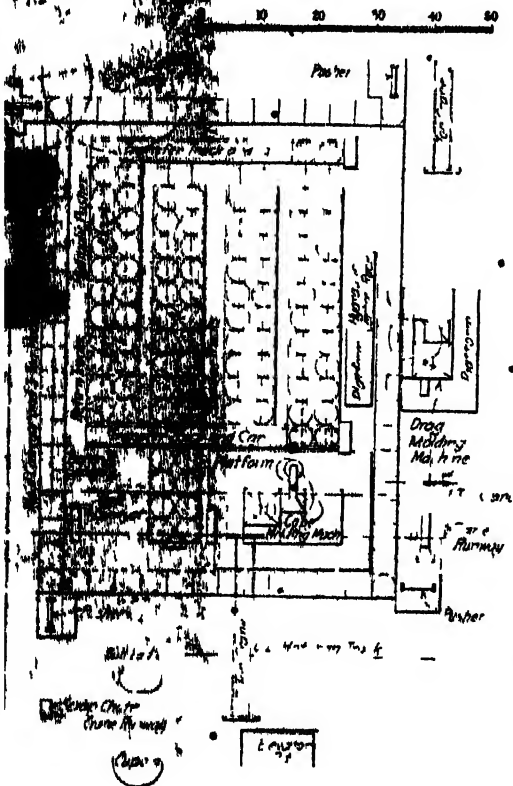

where the crane beam is again turned so the jaw is in a horizontal plane and the wheel rests flat on the table of the machine. Here further jolting shakes any remaining sand off the surface of the wheel and a pin in the center of the machine knocks out the bore core. Thereupon lifting tongs are inserted into the bore of the wheel and it is transferred, by the swing crane, to a car on the hot wheel track which runs between the shake-out floor and the cooling pits. This car, operated by motor-driven winch, is moved to a point opposite the cooling pit into which the wheel is to be lowered. The wheel is transferred from car to pit by one of four cranes which operate the entire length of the four rows of soaking pits. In this case also the lifting is effected by inserting tongs into the bore of the wheel.

The hydraulic swing cranes on the shake-out floor were designed by the company's engineering staff and constructed by the Omaha Steel Works. There are two of these machines, one for each half of the molding room. The jolting machines on the shake-out floor, as well as those used for molding, were furnished by the Herman Pneumatic Machine Co., Zellenople, Pa. There is a difference of opinion on the proper characteristics of a jarring machine. Some foundry engineers prefer a short drop and a quick jolt, producing a vibration effect, while others favor a longer drop and fewer jolts. The machines in this plant are of the latter type, having a drop of 2 in. and producing 80 jolts per min.

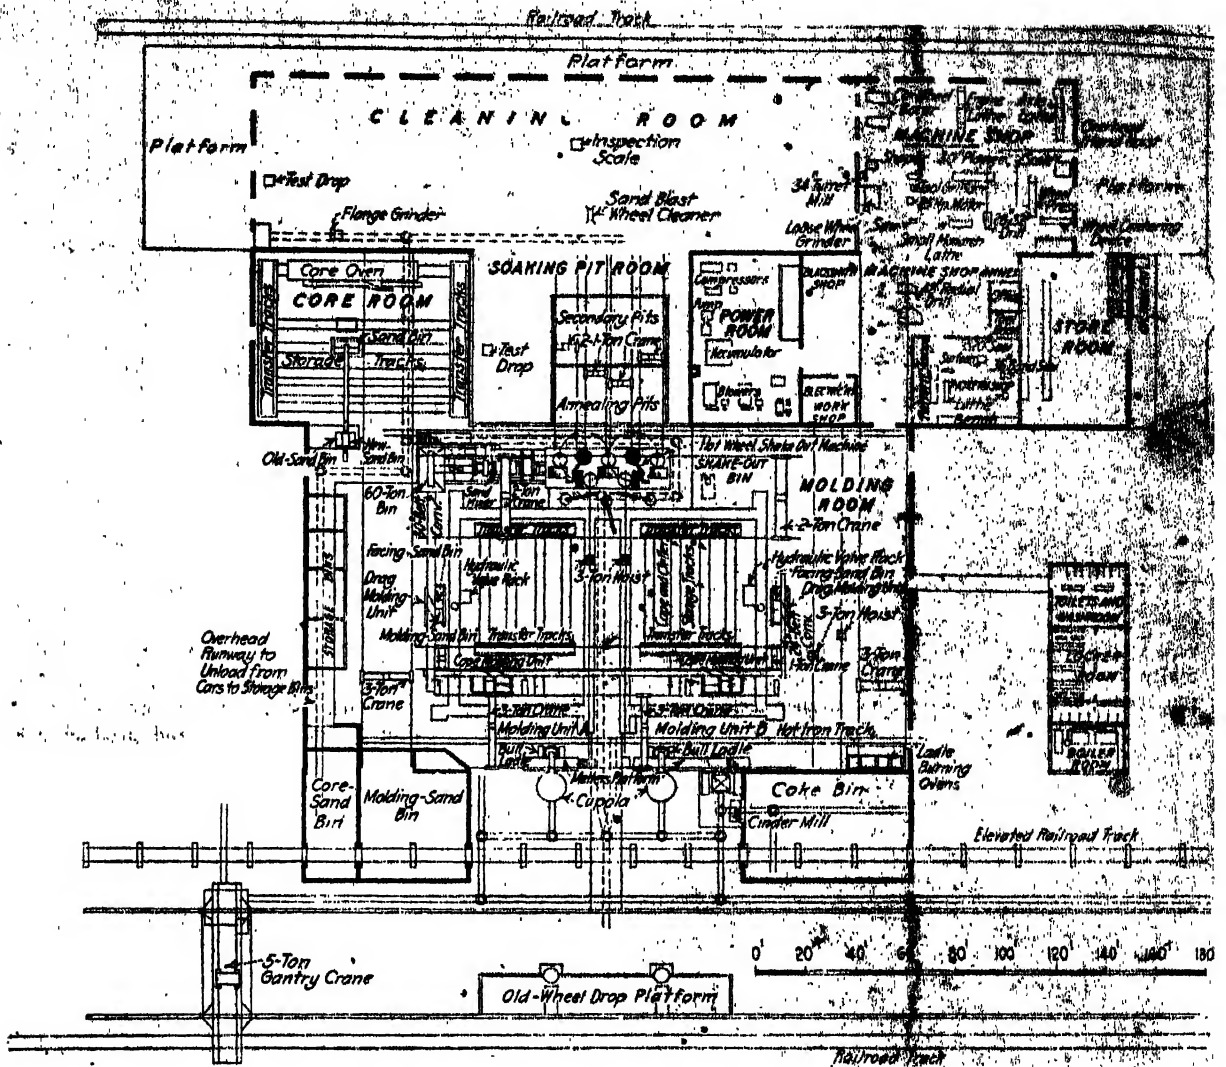

Under the well-planned method of routing of materials, there are no unnecessary movements in the progress of the work. This scheme of direct-line handling of materials is evident in the design of the entire plant and that so well-thought-out a plan is highly important is evident from the tonnage handled per day. The foundry was constructed for a capacity of 700 wheels per 8-hr. day. The daily tonnage of raw materials required includes 250 tons of iron, 30 tons of coke, 20 tons of sand, besides a large number of smaller items. It is therefore essential that the heavy tonnage should be unloaded in the storage yard conveniently to the cupola, and that it should move in direct line successively from the yard to the cupola, to the pouring station, to the pits, to the cleaning room and to the shipping track. The plan of the Council Bluffs foundry meets all these requirements.

It will be noted that the pouring station is in close proximity to the bull ladle, that the core room is near the spot where the cores are used, and accessible to the new sand storage and the old sand is returned from the cleaning room, that the castings department for the manufacture of chillers, copes, nowels, bottomboards, etc., is convenient for pouring and also for delivery to the machine shop for machining; and that the machine shop, which in a wheel foundry is used principally for mounting wheels on axles, is conveniently located in relation to the cleaning room, from which the wheels are received for boring, and also to the store room for receiving supplies. Inasmuch as the machine shop foreman also has charge of the pattern shop and power room, these also are adjacent to the machine shop. Thus the whole plant is a well organized unit with proper relationship between all its component parts. All departments are under one roof and there is no yard storage for any material except pig iron and scrap.

Handling of the molten iron deserves mention. The cupolas are tapped into bull ladles, stationed directly in front of them in the molding room. The rated capacity of each bull ladle is 15 tons, but actually this may be varied between 10 and 15 tons, according to how the ladle is lined. Pouring ladles are filled from the bull ladle and conveyed by 2-ton overhead traveling cranes directly over the mold conveyor, all de-

Unit B of the Rectangular Mold Conveying System is Symmetrical About the Axis at Left, with Unit A. Each handles the products of one cupola and one set of molding machines, consisting of one cope machine and one drag machine. The hot wheels at top of unit carry molds to the jolt shake-out machine, where the hot wheels are transferred at once to the annealing pits.

Compactness and Freedom from Lost Motion Are Essential Features of the Plant Layout. This illustration covers the entire plant except the transformer house and main office building, both of which lie at the right (east) of the upper part of the cut.

scribed before. As a protection against interruption in operations, in case the mold conveying system should break down, an overhead monorail system has been well distributed throughout the molding room. This is equipped with 2- and 3-ton hand-operated Shepard hoists.

In a bay extending the whole length of one end of the molding room is a floor devoted entirely to the molding of chillers, copes, nowels, bottom-boards, etc. Iron is brought to this floor from the bull ladles on a hot iron track. A 3-ton overhead traveling crane, used for conveying the ladle to the molds for pouring, also carries the completed castings directly into the machine shop to be turned. Swinging doors have been provided where the crane passes into the machine shop, so that the two departments may be shut off from each other completely, except when the crane is passing through.

At the same end of the molding room, next to the hot iron track, are oil-heated ladle drying ovens. Here the ladles are given a preliminary heating the day they are lined, and every day subsequently before going into service they are heated until the lining is red.

Facilities provided for handling the car wheels after they leave the shake-out grates are fully as complete in their mechanical features as the equipment in the molding room. There are two sets of soaking pits, those next to the hot wheel track being used for primary cooling and the others for secondary cooling. This system of two-stage pitting was adopted for the reason that the primary pits must be kept at a high tempera-

ture for incoming wheels. The wheels remain for 24 hr. in the primary pit and for 24 hr. in the secondary pit. Each pit has a capacity of 20 wheels and the cover of the pit is removed by inserting the same scissors-like tongs which are used in handling the wheels. There is sufficient reserve space in the cooling pit room so that the soaking capacity can be practically doubled.

The soaking pit room connects with the cleaning room, which is a large department, 70 x 24 ft., with ample space for the storage of wheels prior to shipment. After leaving the pits the wheels are rolled into a sand blast, where sand is blown against the surface for a period of about 15 sec., after which the wheels are rolled out and stored on the cleaning room floor. The sand blast, designed by the sufficing so far as sand at here that the sand from the shaken out.

The dust generated in by exhaust fan and deposited in an excavated port sand drops into a tunnel it is hoisted by bucket elevator from which the sand plus sand from the sand car through the tunnel to chine, where it is mixed with exhaust fan similar to the although developing a mu nested with hose used for Several tests required b

culation rules are conducted in the cleaning room. The drop test requires the wheel to stand a certain number of blows without fracturing. A 650-lb. wheel must drop 9 ft. ten times without breaking, a 700-lb. wheel 10 ft. twelve times, a 750-lb. wheel 12 ft. twelve times, and an 850-lb. wheel 12 ft. fifteen times. The fracture test is taken to determine the amount of chill. A wheel is deliberately broken for this purpose and the determination of whether the chill is too high or too low

rests with the judgment of an inspector. The thermotest consists of pouring a ring of molten iron around the wheel, causing the periphery of the wheel to expand, while the hub remains cold. If the wheel does not fracture within a period of two minutes, it passes the test. The failure of a wheel in any one of these tests results in the rejection of all wheels of the same cast.

(To be concluded)

Gasoline Powered Industrial Lift Truck

The elevating platform truck shown in the accompanying illustrations is an addition to the line of the Clark Tractor Co., Buchanan, Mich. It is known as the Truklift, and among the advantages claimed are low initial cost, ease of maintenance, flexibility and continuous 24-hr. service.

The truck is intended for use in transporting material in departmental and interplant haulage and also for charging core and annealing ovens. It is designed to climb a 10 per cent grade with a 4000 lb. load. Two speeds in each direction are provided. The length of the machine is 107 in., the width 35½ in., height 51 in., and the weight 2500 lb.

The loading platform is 26 by 54 in., and will elevate its load of 4000 lb. from 11 in. minimum to 16 in. maximum, from the floor, in 8 sec. Automatic stops provide for both up and down limits and the elevating can be stopped at any point by the hand control lever.

The lifting mechanism is operated by hydraulic pressure. Power for locomotion and elevating the load

to wherever possible so that the machine can be serviced by any automobile or truck mechanic. A feature emphasized by the maker is the provision made for accessibility, the hinged hood permitting ready inspection of the engine, and, when necessary, the machine can be stripped down to the chassis in less than 20 min.

U. S. Cast Iron Pipe & Foundry Co. Makes Small Profit

The annual report of the United States Cast Iron Pipe & Foundry Co. shows that for the year 1921 the net profit was \$100,841 compared with \$851,592 for 1920. President Lemoine says that when one considers the serious depression in iron and steel so much in evidence throughout 1920 with drastic readjustments so patent in many directions reflected by heavy losses reported by many corporations, it is pleasing to record even this small net for the year. He adds that with the turn of the year the general situation improved and the outlook is brighter.

"Perhaps the most notable event of the year holding promise for the future," says President Lemoine, "was the acquisition

Lift Truck for
Departmental and
Interplant Haulage

is from a 15-hp., 4-cylinder tractor engine with a 3½ in. bore and 4½ in. stroke. A three-point suspension is used, the steering wheel forks being supported in a ball casting which is pivoted at the center of the frame on a chrome-nickel steel pin 2 in. in diameter. The drive is through a bevel gear axle which is equipped with ball and roller bearings and located under the loading platform. Driving wheels are of cast steel with pressed-on rubber tires, 10½ by 5 in., and steering wheels are of cast steel, disk type, also with rubber tires, 16 by 8½ in.

Driving and elevating controls are mounted on the side of the engine compartment. The operator drives the truck with the steering lever pedal being under his foot and the hand control lever being under his right hand. The truck stops automatically if the operator releases the hand control lever while the machine is running.

and maintenance construction has been adhered

during the latter part of 1921 of the sole rights for the United States to the de Lavaud process (for casting centrifugally cast iron pipe), which has attracted much attention in this country and abroad. In some respects the process is revolutionary. Its development offers opportunity for expansion into fields hitherto untouched by and without the realm of ordinary cast iron bell and spigot pipe. By this process it is possible to produce a lighter and stronger pipe adapted to service in natural gas, oils and irrigation lines, to say nothing of piping for high pressure gas and water, the piping of power houses and buildings, etc. It is now planned to equip

gradually, as the demand warrants, for sizes 4" to 12 in. diameter, allowing larger sizes to come as a possible development. It is not expected that this pipe will immediately, though it may ultimately, replace the smaller sizes of ordinary sand cast bell and spigot pipe. It is thought, however, that it will find its way into the wider fields referred to in which the lighter and stronger pipe is desirable."

At the annual meeting of the Colorado Fuel & Iron Co., Kingston Gould and E. H. Wetzel were made directors, succeeding D. H. Taylor and W. J. Gould of New York. Mr. Taylor was the Gould representative on the board. Mr. Wetzel of Pueblo is general manager. The other directors were re-elected. There were no changes in the principal officers.

Regenerator and Flue Calculations for Frictional Resistance to Passage of Air and Gases— Summation of Losses

FRICTIONAL resistance in the checkers can be approximated by the formula of Mojarow, which is also used in arriving at the frictional resistance of the flues and other passages through which the air and gas pass. This formula is:

$$F = m \frac{SL}{A} v_1 p_1$$

μ = the frictional resistance expressed as inches of water or if the metric system is used, millimeters of water or kilograms per square meter;
 m = coefficient of friction as determined by Mojzmar = 0.002076 (or, for metric values, 0.016). This coefficient was determined by observation on Copper stoves. Marge determined a coefficient for lining galleries of one-third this value, or 0.001038.

tion examined.

The value for the coefficient of friction determined by Mojarow, in his investigation of the Cowper stove, is probably too high when used for large, comparatively straight gas passages. Murge found the coefficient of friction in mine galleries, at ordinary temperatures, to be but one-third that determined by Mojarow. The values of Murge are probably more accurate, as an extended series of observations was available. A further verification of the conservatism of these values, is given by the fact that the investigation of some furnaces gives negative results, that is to say, the computations indicate the necessity for forced draft. Nevertheless, the furnaces are in operation without forced draft, but in a more or less defective manner, for they give operating trouble and their campaign or run is shorter than normal.

Manufacture of Stainless Steel Cutlery*

Forging, Heat Treatment, Grinding and Finishing—Proper Chemical Composition—Stainless Tests

I HAVE read a great mass of information compiled by several engineers as to the general characteristics of stainless steel for cutlery. I shall not attempt to discuss their opinions upon this particular steel for cutlery as they see it, but I will give instead the information as it has been worked out successfully at the fire and wheel.

I have found great difficulty in studying the data, as submitted by different authorities, as there seems to be a great divergence of opinion as to practically all essential points, including the exact chemical specifications, and a very wide range of opinion as to the subsequent handling and heat treatment of this steel.

Proper Chemical Composition

In enumerating these experiments, I shall not attempt to segregate them under separate headings but simply give them to you in abstract form. As to the analysis for cutlery, I would recommend the carbon content to be between 0.30 and 0.45 per cent and the chromium between 13 and 15 per cent. Dr. Hatfield recommends 13 per cent. The Brearley patents call for chromium between 9 and 16 per cent, while Elwood Haynes has covered in his patents up to 16 per cent. It is, however, the opinion of the writer and others that nothing is gained in stainless characteristics or corrosion by exceeding 15 per cent chromium. Phosphorus and sulphur should be below 0.03 per cent with silicon and manganese about 0.30 and 0.50 per cent respectively.

The steel generally used for cutlery is bought in round rods in convenient lengths to handle according to methods used in its manufacture. Some companies work this steel from the bar while others fabricate it to the desired lengths. The writer prefers the latter method because of its convenience and its economy as to scrap.

Great care should be used in this method with reference to the tools used in the fabrication because the cutlery troubles begin at this point. The steel should always be kept well annealed and, if the tools are kept sharp, there should be no difficulty in cutting to the desired lengths. Dull tools at this point have a tendency to tear off the steel whereby small cracks are started in the end of some of the pieces, which generally lead to seamy portions in the blades. Steel

manufacturers are often blamed for seamy stock when in reality the trouble has been due to dull tools. I might say right here that, in the early stages of this steel for cutlery, great difficulty was experienced at the mills in manufacturing this steel free from seams, but to-day I believe this has been reduced to a minimum.

The Drop Forging Operation

After the steel is cut into the desired lengths it is taken to the drop forging room, where it is forged into the desired shape, and from there it passes on to the rolls where the blade is rolled out. Great care must be taken in these operations to keep the heat at proper forging temperature, especially at the roll, cause at this point a part of the blade has nearly reached its desired thickness while the remainder of the piece is still in its original round shape. The heat generally used at these stages of the manufacture ranges from 1650 deg. to 1750 deg. Fahr.

The work must be kept as free as possible from oxidation because any scale rolled into the steel at this time may form a seat of corrosion even after the blade has been finished. When working with small thin sections, never allow it to cool on a damp, cold floor, on account of the air hardening qualities of the steel. Strains will be set up which will later develop into cracks, thus rendering the blade useless.

The next step in the manufacture is the annealing operation. The work is usually put into a receptacle and brought slowly up to about 1380 to 1400 deg. Fahr. generally in a muffle furnace, after which it is allowed to cool slowly. From here the blades are blanked out into the desired shapes and great care should be used at this point to see that the tools are kept sharp at all times, thus reducing the possibilities of cracks. These cracks caused by dull tools are not seen at the particular point, and sometimes do not show up until considerably more labor has been expended.

Hardening and Tempering

The next step is the hardening operation, which is one of the most difficult in the making of the whole knife. The hardening and tempering of stainless steel have much to do with its stainless characteristics, so great emphasis should be placed on its proper handling.

Stainless steel may be hardened in air, oil or water, the quenching temperature really depends on the method used. In my opinion, it should always be done in oil from a temperature ranging between 1650 to 1900 deg. Fahr., depending on the carbon and chromi-

*From a paper read at the first sectional meeting of the American Society for Steel Treating in New York, March 8. The author, R. C. Hall, is research engineer, R. Wallace & Sons, Ltd., Watlington, Conn.

content of the steel. Most low carbon steels in a hardened and undrawn condition have a low elastic limit and one rather indefinite. It is only after drawing that a definite elasticity is established. Tests have shown that the elastic limits increase for a time with the drawing temperature in stainless steel and then begin to fall off like any other steel as the drawing temperature increases. Time limit enters into this phenomenon to a very large extent. A properly hardened blade must be drawn long enough to relieve the internal strains, but this change must not be too speedy.

The tempering colors appear in stainless steel at about twice the temperature of ordinary steel and are not altogether reliable, so I am firmly convinced that the temper should be drawn to a definite temperature in a salt bath or an electric furnace.

The Grinding Process

The blades thus hardened and tempered are taken next to the grinding machines to be ground to the desired thickness and then tapered properly. Here extreme care should be taken not to force this operation on account of the steel being unusually fine grained, thus being very susceptible to that characteristic which the cutters call the grinder's scorch. This particular kind of scorch polishes off very easily, but at the same time renders the steel, directly under the scorch, quite susceptible to stain, which characteristic must be avoided at all times.

If any oxidation has taken place during previous operations, care should be taken at this point to see that it is thoroughly ground out, for, as I have said before, any scale, no matter how small, will form a seat of corrosion which will invariably pass the inspectors and seldom show up until after the knives have been in use for a period of time. Following the grinding operation, the blades are tested for temper or in other words must stand an elastic limit of 1 to 5 in. Stainless steel to be used for cutlery and to be in the most perfect condition should show a Brinell hardness between 525 and 530.

After the tempering test, the blades are glazed to remove all coarse grinding marks, and this operation, while simple, requires an extra amount of work with different grade of emery from that required for ordinary carbon steel. The knives are next taken to the inspection room, where they are inspected to see the glazers have removed all coarse grinding marks.

The blades are then sent to the finishing room, where the blades are mounted in handles. Here the racks, rims, points, bolsters and necks are finished. The blade is then given the final glaze and any other finishing touches needed to make it a first-class knife.

Tests for Stainless Qualities

The knife then goes to be tested for stainless qualities and if the blade is found to stain or copper plate after a two-minute test with a concentrated solution of copper sulphate, the knife is rejected. After passing this test they are etched and passed to the stock room ready for shipment.

The reagents for grading stainless steel are as follows:

1. *Copper Sulphate*
4 grams CuSO_4 ,
18 grams H_2SO_4 ,
90 grams H_2O
Time: 6 minutes.
2. *Ordinary Writing Ink,*
Pomerooy and Signet
Time: 3 minutes.
3. *Nitric Acid.*
Specific gravity 1.20.
Time: 2 minutes.

It might be interesting to some to show the results of some of the different stainless steels which have found their way into the market. I have endeavored to take steel with wide differences in their chemical composition as to the two principal elements, carbon and chromium. These samples were all forged at about 700 deg. Fahr. and were hardened at different quenching heats according to their analysis, the quenching being from 1500 to 1900 deg. Fahr. These samples were confirmed by three tests made up of concen-

trated solutions of acetic, tartaric and hydrochloric acids. The tests are as follows, viz:

Steel No.	Carbon	Chromium	Stained in Minutes	Cutting Efficiency
1	0.30	11.93	25	O. K.
2	0.26	12.21	35	Fair
3	0.10	13.60	13	O. K.
4	0.31	15.90	75	O. K.
5	1.10	23.32	43	Very Good

While there are some 40 operations through which these blades pass during their manufacture, I have simply endeavored to touch the high spots, which I trust will give you some idea of how this latest development in cutlery is manufactured.

In summarizing, it will be seen that the manufacture of a stainless steel blade, while not materially different in shape or size from that of an ordinary carbon steel blade, in that the wear and tear on tools, furnaces, fires, extra operations, and rejections together with the extra price of stainless steel, which is seven or eight times the price of good carbon steel, makes the blade a very costly article.

Improvement in Bridgeport District

Thirty-one manufacturing companies in Bridgeport, engaged mostly in metalworking lines, which report to the Manufacturers' Association of Bridgeport, have shown a steady gain in activity since early in January. The improvement really dates from Oct. 1, 1921, but there was a falling off in the early part of January, probably due to shutdowns for inventory at that time.

For the week ended March 11 the reports show that the 31 manufacturing plants were working at an average of 54.9 per cent as regards the number of employees and at 48.5 per cent as regards the number of man hours. The basis taken as 100 per cent was not the maximum number of men employed during the war boom, but what the various manufacturers estimated they would be doing to-day under normal condition of business.

The estimated normal number of employees for the 31 factories is 25,318, working an average of 49 hr. per week, or a total of 1,240,582 man hours. During 1921 the highest point reached was in the week ended March 5, when 71 per cent of the normal number of employees were engaged and the percentage of man hours was 60.4. From that date there was a steady decline, the low point being reached in August and September. While the first three months of this year, so far as recorded, are about on a par with the last three months of 1921 as to the number of workmen engaged, there has been an increase in the number of man hours, the week ended March 11, for example, showing a gain of 3 per cent in this respect over the preceding week.

Similar data collected by the Manufacturers' Association of Connecticut, Inc., relating to the manufacturing districts of Ansonia, Derby, Shelton, Seymour, Bridgeport, Bristol, Danbury, Hartford, Middletown, New Britain, New Haven, Southington, Stamford and Waterbury, has not yet been completed for February, but the January figures show an average industrial activity of 63.6 per cent (calculated in man hours) for that month, while the number of workmen engaged was 72.5 per cent of the normal number. It is noted that the average weekly operating schedule during a normal period is 52.3 hr. per week, while in January the average schedule was 45 hr.

Joint Meeting of Machinery Dealers and Manufacturers

In connection with the Birmingham convention of the Southern Supply and Machinery Dealers' Association, and American Supply and Machinery Manufacturers' Association, it has been decided to hold a joint executive session of the two associations on the morning of Tuesday, April 25, for discussion of business subjects of mutual interest.

The dealers have requested that the following subjects be listed for consideration at the session: Business Situation, Freight Allowances, Standardization, Terms, Standardization.

The Manufacture of Brass Forgings

Called Also Die Pressing or Hot Forging—Details of a Process Developed in the United States During the War—Physical and Other Properties

BY C. T. RODER*

THE method of forging brass was developed in Germany and Great Britain about 1900. The procedure is called stamping, although the work is formed under a power press. In this country the term forging or die pressed casting is used, as our interpretation of stamping is something cut from sheet metal by the use of a die.

It was not until the early stages of the war that brass forgings were commercialized in the United States. Our Government realized the unnecessary and costly wastage of cutting and machining shrapnel parts such as time, graze and percussion fuses from raw stock, and therefore called upon American manufacturers for assistance. Many responded to the call, among which were the Mueller Metals Co., Port Huron, Mich., and also its sister plant, the H. Mueller Mfg. Co., Sarnia, Ontario. Thus, in the development of

there is a furnace tender who regulates the heat and keeps the furnace filled with pills. The ordinary small shapes are forged under 100,000 lb. pressure. However, presses are used having capacities up to 400 and 600 tons. With a 200-ton capacity press it is not practical to undertake the forging of a shape over 4 in. in diameter. With the continuous operation of a press and a skillful operator, large production can be obtained and one press can average 5000 and up to 10,000 forgings per day.

Types of Presses Used

Two types of presses are used, single and double action. Small forgings of simple design, where the metal does not have to flow far, are produced in a single action press. Where the shape is unusually intricate and where it is necessary for the metal to flow

Fig. 1. A Collection of Brass Forgings Showing the Possible Range of Work

brass forgings, a tremendous saving was effected for both the Government as well as the manufacturer.

It can be said that the forging of brass is the highest type of the metal craftsman's skill. There are some machined parts which can accomplish their purpose only when forged. Requisites, such as high tensile strength and metallic density, as required in oxygen gas valves, are found only in brass forgings, due to their resistance to great pressure.

Description of the Process

The process of forging brass is to heat a pill or slug, which has been cut from extruded rod to a suitable shape, in a specially constructed furnace which is open at both ends. The pill is heated to a cherry red heat, which on the average is approximately 1300 deg. Fahr. The temperature of the pill varies depending upon the size and construction of the piece to be forged.

The presses are usually operated continuously and require one operator at the press, while a tender or helper feeds the pill into the press. In addition to this

over a long distance, double action presses are used. The functioning of the first stroke of the press is merely the closing of the lower die which holds firmly the heated blank and prevents more or less fin or flash. The second stroke might be termed an extrusion operation, and its function is to produce the completed forging.

The accompanying illustrations of forgings, which have been successfully manufactured by the Mueller Metals Co., indicate the possibilities of commercial work by this process. Fig. 1 shows a collection of forgings illustrating the wide range of work possible. Fig. 2 shows a group of parts arranged to illustrate the three stages of forging operations. Insert "A" is the blank metal, pill or slug; second, the shape of forging as it leaves the die, a portion of which is surrounded with what is known as flash, a characteristic in forging; third, the completed rough forging after having gone through a trimming operation in a trimming press.

It sometimes is practical to extrude a specially shaped pill or slug, which in its crude form is an approach to the finished shape of the forging to be made, as in inserts "F" and "G," in Fig. 2. The special ex-

truded shape has a great similarity to that of the finished forging.

Brass forgings are 80 per cent stronger than sand castings, the physical properties comparing as follows:

	Brass Forgings	Sand Castings
Tensile strength, lb. per sq. in.	55,000	30,000
Yield point, lb. per sq. in.	28,000	15,000
Elongation, per cent	30	20

The writer knows of instances where forgings have been made to equal a tensile strength of 105,000 lb. per sq. in., this being accomplished by a special mixture of metals. Dimensions can be held to 0.005 in. on diameters and 0.010 in. on lengths. Such operations as buffing, polishing and nickel plating are held to a minimum on account of the smooth surfaces and freedom from scale. Tools last much longer and turning speeds on machines are faster than is possible on sand castings. On account of the great pressure under which they are made, the result is a metal fine grained as tool steel.

Probably the most noteworthy advantage secured in forgings is the saving of high priced metal and the elimination or minimizing subsequent machine work, which represents a great saving in labor costs. It is readily seen that the process of forging provides a density through which there can possibly be no seepage, no porosity; the metal also has additional strength.

Construction of the Dies

The most important and fundamental element involved in the forging brass is die construction. The general design, workmanship and composition of steel used are the underlying features in the utility of such a die. Economy lies in the use of a high-speed tungsten steel for the actual section of the forming die, due principally to the high temperature under which they operate. Other portions, such as the die block or subsidiary parts, usually are made from a cheaper grade of carbon steel and, in many cases, machine steel. Some manufacturers have adopted a non-shrinking die steel but, as it is more or less experimental, it is not used to any extent.

The life of the die varies depending upon the shape of the piece. Some dies can be used for 10,000 to 20,000 forgings and others up to 50,000 and 60,000. The most skillful tool and die makers must be used in forging die

construction, as an error in the laying out or even a slight difference in design results in success or failure. One of the important points in construction is allowances for shrinkage and proper venting to eliminate air pockets.

The latter is very important, as its functioning deals with the free flowing of the metal. Very small holes are usually used, which permits the escape of air and, while small tips or flash result from same, they are easily broken off or are forced out through pressure of the succeeding stroke. Considering the heat to which dies are subjected through the continuous insertion of the heated pill or plug, also the cooling which takes place, it can be easily seen that the die is subjected to extreme wear. However, with the continual application of oil to each stroke, this condition is held to a minimum.

It is obvious that the forging process will, in a decade or two, supplant practically all parts now being cast in sand or machined from bar stock, providing such parts are used in quantities. It, of course, is not advisable to adopt the use of forgings unless the requirements are such as to warrant the initial outlay for die and tool equipment, which is usually two or three times greater than pattern equipment.

Probably the largest users of forgings to-day are automobile manufacturers. The reader must appreciate that the process is comparatively new. In a few years brass forgings will be in great demand, particularly those consumers who require the assets of a forging which cannot be secured in sand casting.

There has been considerable discussion as to the correct application of the term, brass forgings, to this new and important process. A great many writers term it as die-pressing or hot forging, either of these two being more logical as a title than brass forgings, for the reason that the finished part is brought about from the use of an extruded rod or shape, it being hot forged or die pressed. The term die-pressed casting is misleading and unfair to manufacturers of this product. In speaking of the word "forging," one thinks of metal being shaped under blows of a hammer, and as this is not the true process, the question remains in doubt as to what would be a correct title, which is left entirely to the discretion of the individual.

NEW YORK CENTRAL OPENING

Railroad Receives Bids on Large Number of Steel Products

The New York Central Railroad had a public opening of bids on steel products on Wednesday, March 22, at the office of W. C. Bower, general purchasing agent in New York. The material advertised for included several thousand tons of plates, shapes, bars, sheets, bolts, track material, axles, fabricated bridge material, seamless tubes, etc. Some of the bids submitted by various companies follow:

Interstate Iron & Steel Co., Chicago.—Standard wire nails, \$2.80 per 100 lb. keg, base, Chicago; galvanized fence staples, \$3.45 per 100 lb., Chicago; polished fence staples, \$2.95 per 100 lb., Chicago; steel bars, 1.65c., base, Chicago.

Pittsburgh Forge & Iron Co.—Car and tender axles, rough turned, 2.25c.; car axles for axle light system, rough turned, 2.35c.; driving and trailer truck axles, 2.25c.; front engine truck axles, 2.75c., all per lb. f.o.b. Youngstown.

Falcon Steel Co.—Black sheets No. 28 gage, 3c.; galvanized, No. 28 gage, 4c.; blue annealed, No. 10 gage, 2.15c., No. 14 and lighter, 2.25c., all per lb. f.o.b. Youngstown.

Bourne-Puller Co.—Track bolts, oval neck, not heat treated, 2.75c.; heat treated, 3.75c.; another type of oval neck bolts, 4.65c. for non-heat treated and 5.65c. for heat treated; square neck track bolts, 2.75c. for non-heat treated and 3.75c. for heat treated, extras on the first item, \$1 per 100 lb. for lengths under 4 in., on second item, 50c. per 100 lb. for lengths under 4 in., and on the third item no extra; black sheets, No. 28 gage, 3.10½c.; galvanized sheets, No. 28 gage, 4.10½c.; blue annealed, 2.35½c.; bars and shapes, 1.60½c. all per lb. f.o.b. Cleveland; billets, \$36. Cleveland.

Jones & Laughlin Steel Co.—Bars, shapes and plates, 1.60½c. per lb., Youngstown; standard wire nails, \$2.40 per 100 lb. keg; galvanized fence staples, \$3.05 per 100 lb.; polished fence staples, \$2.55 per 100 lb., delivered Youngstown; steel billets, \$35, Youngstown; track spikes, 2.10c. and 2.20c., according to specification, no extras; bridge material, 5.28c. per lb., delivered Lowville, N. Y.; 7.04c. per lb., delivered Philadelphia; 5.37c. per lb., delivered Bay View, N. Y.

Penn Bridge Co.—Bridge material, 7.87c. per lb., delivered Philadelphia; 4.85c. per lb., delivered Bay View, N. Y.

Cambria Steel Co.—Angle bars, 2.65½c., Youngstown, bids were submitted on driving and truck tires varying from 5c. to 7½c. per lb., delivered Newberry Junction; axles, from 2.20½c. to 3.40½c. delivered Youngstown, and from 2.24½c. to 3.44½c. delivered Mahaffey, Pa.; standard wire nails, \$2.50½ per 100 lb. keg, Youngstown, \$2.57½, Mahaffey; bars, shapes and plates, 1.50c. per lb., base, Pittsburgh; billets, \$34.10, Youngstown, \$34.94, Mahaffey, carbon extra \$1.

Oliver Iron & Steel Co.—Track bolts, 2.37c. per lb. not heat treated, and 3.57c. per lb. for heat treated on both oval neck and square neck bolts; extra 15c. per 100 lb.

Carnegie Steel Co.—Angle bars, 2.60c. per lb., Pittsburgh; blank splice bars, 2.60c. per lb., Youngstown; axles, from 2.10½c. to 3.55½c. per lb., Youngstown; bars, shapes and plates, 1.50½c. per lb., Youngstown.

Railway Steel Spring Co.—Tires, from 5c. to 7½c. per lb., Youngstown, according to specification, with an extra of ¼c. per lb. if finished bored.

American Steel & Wire Co.—Standard wire nails, \$2.40, galvanized fence staples, \$3.05; polished fence staples, \$2.55, all per 100 lb., Farrell, Pa.

Buffalo Bolt Co.—Track bolts, both oval neck and square neck, heat treated only 3.69c. per lb., no extras, f.o.b. North Tonawanda, N. Y.

Illinois Steel Co.—Track bolts, oval head and square head, either heat treated or not heat treated, 3.30c., base, delivered Toledo, Ohio; track spikes, 2.30c., base, delivered Toledo; angle bars, 2.456c., Chicago; blank splice bars, 2.456c., Chicago; axles, 2.05c. to 3.50c., according to specification, per lb., Chicago; bars, shapes and plates, 1.50c., base, Chicago; billets, \$33, base, Chicago, with \$1 extra for carbon.

Erie Forge Co.—Axles, 3.30c. per lb. f.o.b. Cleveland.

Pittsburgh Steel Products Co.—Seamless tubes, 2 in., 12.25c. per ft.; 2½ in., 13.78c.; 3 in., 28.56c.; 5½ in., 43.86c.; 5½ in., 45.88c.; 4 in., 28.09c.; 3½ in., 22.10c.; 3 in., 20.93c.; 1½ in. x 1 13/16 in., 26.79c.; 1½ x 2½ in., 44.82. (The variation in two prices on 3 in. tube was due to slightly different specifications.)

Edgewater Steel Co.—Tires, 5.55c. to 6.55c. per lb., according to specifications, with an extra of ¼c. per lb. if finished bored. Prices f.o.b. Homestead, Pa.

McClintic-Marshall Co.—Bridge material, 6.50c., delivered Lowville, N. Y.; 7c. per lb., delivered Philadelphia; 4.36c. per lb., delivered Bay View, N. Y. The first two items cover structural steel, castings and rollers and the third item structural steel only.

Lackawanna Steel Co.—Bars, 1.50c.; shapes, 1.60c. and plates, 1.60c., delivered West Seneca, N. Y.; billets, \$33 delivered West Seneca; track bolts, 2.65c. per lb. heat treated or not heat treated, delivered West Seneca; track spikes, 2c. per lb., West Seneca, extra for copper, angle bars, 2.40c. per lb.; blank splice bars, 2.40c.

Republic Iron & Steel Co.—Billets, \$31, Youngstown; bars and plates, 1.50c. per lb., Youngstown; black sheets, 3.30½c. per lb., galvanized, 4.0½c. and blue annealed, 2.30½c., all per lb., base, Youngstown.

National Bolt & Nut Co.—Track bolts, 2.85c. per lb. for non-heat treated.

Wheeling Steel Products Co.—Black sheets, 3.10½c., galvanized, 4.10½c., blue annealed, 2.35½c., all per lb., base Youngstown; billets, \$36.36, delivered Toledo, Ohio.

Alan Wood Iron & Steel Co.—Blue annealed sheets, 2.61c. per lb., base, delivered Newberry Junction; plates, 1.86c. per lb., delivered Newberry Junction.

Phoenix Bridge Co.—Bridge material, 6c. per lb. for structural steel, castings and rollers delivered Lowville, N. Y.; 7c. per lb. for structural steel, castings and rollers delivered Philadelphia; 5c. per lb. for structural steel, delivered Bay View, N. Y.

Mount Vernon Bridge Co.—Bridge material, 7½c. per lb. for structural steel, castings and rollers, delivered Lowville, N. Y.; 7½c. per lb. for structural steel, castings and rollers delivered Philadelphia; 5½c. per lb. for structural steel, delivered Bay View, N. Y.

Reeves Mfg. Co.—Black sheets, 3c., galvanized sheet 4c., f.o.b. Minerva, Ohio.

Cruden Forge Co.—Axles, 3.70c. per lb., delivered Newberry Junction.

Wheeling Corrugating Co. (Whitaker-Glesner Co.)—Black sheets, 3.10½c.; galvanized, 4.10½c., blue annealed, 2.35½c., all per lb. f.o.b. Youngstown.

Donner Steel Co.—Bars, 1.50c.; small shapes, 1.50c. per lb. f.o.b. Buffalo, billets, \$33, Buffalo.

Globe Seamless Steel Tube Co.—Seamless tubes, 2 in., 12.57c., Cleveland, 12.83c., Elkhart Ind.; 2½ in., 14.15c., Cleveland, 14.11c., Elkhart; 3 in., 29.36c., Cleveland, 29.86c., Elkhart; 3½ in., 22.62c., Cleveland, 23.09c., Elkhart; 3 in., 21.48c., Cleveland, 21.90c., Elkhart; 1½ x 1 13/16 in., 36.95c., Cleveland, 37.43, Elkhart; 1½ x 2½ in., 61.92c., Cleveland, 62.76c., Elkhart. The two prices on 3 in. are due to slightly different specifications. All prices are per ft.

Detroit Seamless Tube Co.—Seamless tubes, 2 in., 12c. 2½ in., 13.50c.; 3 in., 28c.; 5½ in., 43c.; 5½ in., 45c.; 4 in., 27.45c.; 3½ in., 21.60c.; 3 in., 20.50c.; 1½ x 1 13/16 in., 26.3c.; 1½ x 2½ in., 44c. All prices per ft., delivered New York Central tracks. Variation in prices of 3 in. due slightly different specifications.

National Tube Co.—Seamless tubes, 2 in., 12.25c.; 2 in., 13.79c.; 3 in., 28.57c.; 5½ in., 43.87c.; 5½ in., 45.89c.; 4 in., 28.09c.; 3½ in., 22.1c.; 3 in., 22.97c.; 1½ x 1 13/16 in., 36.35c.; 1½ x 2½ in., 60.84c. All prices per ft., with delivery at Youngstown. Variation in prices on 3 in. due slightly different specifications.

Pittsburgh Seamless Steel Tube Co.—Seamless tubes, 2 in., 12.25c.; 2½ in., 13.75c.; 3 in., 27.50c.; 5½ in., 43c.; 5½ in., 45.75c.; 4 in., 25.50c.; 3½ in., 22c.; 3 in., 22c.; 1½ x 1 13/16 in., 25.50c.; 1½ x 2½ in., 44.75c. All prices per ft., delivery at Youngstown. Variation in prices on 3 in. due to slightly different specifications.

American Sheet & Tin Plate Co.—Black sheets, 3.10½c., galvanized, 4.10½c.; blue annealed, 2.35½c., all per lb., base, delivery at Porter, Ind., or Youngstown.

Pittsburgh Steel Co.—Standard wire nails, \$2.40 per 100 lb. keg, Pittsburgh.

Sheildan Steel Hoop Co.—Black sheets, 3c.; blue annealed, 2.25c., per lb., base, Youngstown.

Standard Forgings Co.—Axles, 1.95c. per lb. to 3.50c. per lb., according to specifications. Delivery at Indiana Harbor Ind.

Dilworth, Porter & Co.—Track spikes, 2.10½c. to 2.25½c. no extras, delivery at Pittsburgh.

Superior Sheet Steel Co.—Black sheets, 3c.; galvanized, 4c., per lb., base, Pittsburgh.

Trumbull Steel Co.—Black sheets, 3.06½c.; galvanized, 4.06½c.; blue annealed, 2.31½c., all per lb., base, Youngstown.

United Alloy Steel Corporation.—Black sheets, 3c.; galvanized, 4c.; blue annealed, 2.25c.; Canton, Ohio, freight equalized with Pittsburgh.

Bethlehem Steel Co.—Bridge material, 5.71c. for structural steel, castings and rollers, delivered Lowville, N. Y.; 6.48c. for structural steel, castings and rollers, delivered Philadelphia; 4.51c. per lb., structural steel, delivered Bay View, N. Y., all per lb.; steel bars, 1.85½c.; shapes, 1.81½c.; plates, 1.81½c. for ¼ in. and heavier and 1.96½c. for up to ¼ in.; track bolts, 3.41c. per lb. not heat treated and heat treated, 4.36c. per lb.; angle bars, 2.77c.; blank splice bars, 2.77c.; black sheets, 3.32c.; galvanized, 4.32c.; blue annealed, 2.57c.; axles, 3.35c. per lb.; billets, \$37.32. All

the above prices, except where otherwise indicated, are for delivery at Newberry Junction.

Lukens Steel Co.—Plates, 1.82c. per lb., base, delivered at Newberry Junction.

American Rolling Mill Co.—Billets, \$32, base, Cleveland, carbon extra, \$1 per gross ton; black sheets, 3.10½c.; galvanized, 4.10½c., and blue annealed, 2.35½c., per lb., base, Youngstown.

Lake Erie Bolt & Nut Co.—Track bolts, 3c. per lb. for non-heat treated, heat treated, 4c. Extras at 15c. and 30c. per 100 lb.

King Bridge Co.—Bridge material, 7½c. per lb. on structural steel castings and rollers for delivery at Lowville, N. Y., 9½c. per lb. on structural steel castings and rollers, for delivery at Philadelphia, 42c. per lb. on structural steel for delivery at Bay View, N. Y.

Standard Steel Works Co.—Tees, 5½c. to 8c. per lb., Pittsburgh, according to specifications. Extra of 3c. per lb. if finished bored. Axles, 4.40c. per lb., Pittsburgh.

Schenck Iron & Steel Co.—Black sheets, 3c. per lb., Buffalo.

Mesta Machine Co.—Axles, 4.70c. per lb., rough turned, f.o.b. West Homestead, Pa.

Canton Sheet Steel Co.—Black sheets, 3.12½c.; galvanized, 4.12½c.; blue annealed 2.37½c., all per lb., base, Alliance, Ohio.

Cleveland Steel Co.—Blue annealed sheets, No. 10 gage, 2.02c. Nos. 11 and 12, 2.10c., per lb., Cleveland; steel plates, 1.60c. per lb., base, Cleveland.

Inland Steel Co.—Track bolts, oval neck, 2.25c., for non-heat treated, heat treated, 3.50c. per lb.; track spikes, 2.25c. to 2.35c. per lb.; angle bars, 2.40c. per lb.; black sheets, 3.35c.; galvanized, 4.38c.; blue annealed sheets, 2.68c.; bars, shapes and plates, 1.50c., all f.o.b. Indiana Harbor, Ind.

Brier Hill Steel Co.—Black sheets, 3c.; galvanized, 4c.; blue annealed, 2.25c., all per lb., base, f.o.b. Pittsburgh, plus freight to Youngstown.

Uses and Abuses of Molding Sands*

Typical American Sands and Their Composition— Sand for Various Metals—Discussion

SAND for foundry use is a subject about which very little information can be obtained from books or technical papers. This probably is due to the fact that each foundryman requires a material best suited to the class of castings he is to produce. Different methods of molding—floor molding, bench molding, and rammed and air pressed machine molding—require different grades, as also do heavy and light castings, castings which require a fine finish and those in which finish is unimportant.

Steel, malleable iron, cast iron and brass, melted at different temperatures in the order named, require different refractory conditions in the sand. Gases generated in different lines require varying conditions of porosity. Both conditions are governed by the silica content of the sands selected. As the silica content is increased the sand is weakened. In castings where there are deep pockets or close corners to be lifted, a water bond is required. This bond is controlled by varying alumina or iron oxides. The predominance may be noted by the color, iron giving the yellowish shades.

Up the foregoing, there are but two required: Bond and porosity, alumina and silica. In simpler words, clay and sand; for example, almost entirely silica, and clay for brick molding purposes, mainly alumina, neither being suitable for molding. Other oxides appear to have no particular value for molding purposes, lime in particular being detrimental to the finish of the casting in some cases. The finish is controlled by the texture or grain of the sand. The fineness is determined by running the sand through a series of sieves ranging from 10 mesh to 100 mesh.

There does not appear to be any set place or condition of mining. Good molding sands exist in almost every State, freight rates being the determining factor as to price in most foundries. It is sometimes taken from the hill tops, again from the prairies and sometimes in very deep banks in the hills with gravel pits below. From some of our Illinois farms it occurs in layers from 1 to 3 ft. deep. After the topsoil is removed, the No. 1 grade or finer sand comes from the top layer, usually 12 to 20 in. deep, the No. 2 grade below being a little coarser, with the No. 3, still coarser next, followed by a clay soil.

In parts of Wisconsin different grades of sand varying in texture appear at the surface 100 to 500 ft. apart, and not in layers as above explained. It appears in some cases that certain grades of sand are the results of glacial deposits. It has always appeared to me that our fine sands in the West could be traced by drawing a line from the lower central part of Wis-

consin southeast, curving through central Illinois, central Indiana and northern Kentucky to the Virginias. In the hills of Kentucky turning over the sod sometimes shows the finest of molding sands. Along the line mentioned can be found sands equivalent to the French prepared sands or the equal, if not the superior, of the Albany sands which are so well known throughout the country. The fame of the Albany sands dates from the time when our original foundries were located in the East. At that time, as now, water transportation was much in the public mind. Then, however, they did not have railroads at all; so the molding sands were sent down the Hudson and along the coast.

It is noticeable that all Eastern sands are high in silica and very open and can be rammed very hard without harm to the casting, whereas the same treatment of our Western sands would result in loss. But their sands will not retain the bond as long as ours. Freight rates prevent a greatly desired interchange of sands between the East and the West, each having that which the other needs for blending purposes. Blended or milled sands are furnished by some dealers and samples shown are always attractive because of their uniform texture, but there is nothing to show that they are suitable for the class of castings to be produced, and in some cases the blending only serves to cover up features which would otherwise be objectionable.

No foundryman should confine himself to one grade of sand. At least two grades should be carried, one high in bond or alumina, the other high in silica for use in opening up sands when losses occur from blow, etc., and for facing purposes on heavier lines of work. The high alumina sands are to be added to the molding sand as a binder when it has been weakened by constant use or from other causes.

A good molding sand is often condemned on account of abusive practices by the foundryman. The excessive addition of new sand will invariably cause loss, both of castings and sand. Where sand is too strong or new it burns on the casting, causing waste. Excessive use of sea coal facing very often weakens the sand, the unburned portion in the molds after a short time destroying the bond by coating each grain with carbon. The sand becomes a deep black, whereas the natural color of burned sand is red. This condition can only be overcome by addition of a bonded sand.

Another weak condition comes from constant use of a sand for heavy castings, the bond being carried away with the casting and renewal being necessary. When an excess of core sand drops from the castings into the heap, increasing the silica, the sand is weakened and an increased bond is needed. As said before, silica is a weakener of sand, but is very necessary in the mold to create porosity to carry away the gases.

*Paper read before Chicago Foundrymen's Club, March 1. The author, Eugene W. Smith, is with the Crane Co., Chicago.

When castings are taken out of the sand and the sand is not sufficiently well knocked off the very best portion of the riddled sand is carried away and wasted. A common practice of pouring surplus metal into sand heaps causes a waste both of sand and of labor handling the metal. It is far better to furnish ingot molds for this purpose. Still another common practice of burning out, thawing or drying out new sand by pour-

has had one meeting thus far, while various sub-committees have met several times. The first step in the investigation, the preparation of a bibliography, has been completed. This was done by the secretary of the committee, R. E. Kennedy, who is also assistant secretary the American Foundrymen's Association. He not only listed all articles which have been written on the subject of sand and sand tests, but has abstracted

A Few American Molding Sands

ing metal into it is extremely wasteful both of metal and sand.

Sometimes a sand is highly recommended by one foundryman to another as having given him wonderful results. Its appearance being favorable, a supply is ordered without considering that his own work is heavier, the result being that the sand is soon burned out and weakened, with a consequent loss of product. Thus it is very apparent that one standard will not suit all lines of work.

Herewith I give a few sands taken at random from different States, showing variations in the elements and composite fineness of most of them. I intentionally omit names and brands of sands. A study of the table should show the variation met with in all molding sands. It would be a very desirable feature if all sands sold could be accompanied by a standard analysis. This should particularly apply to blended or milled sands where the texture has been changed and sometimes an otherwise unsuitable sand is made to appear satisfactory.

The present practice of selling and purchasing molding sands appears very crude. Small spoonful samples are shown by the salesman and are supposed to represent the contents of carloads to be shipped. The purchaser squeezes it into a ball to test the bond and finish by "feel," and sometimes puts it to his ear and rubs it to test its openness by "sound." All that is left for him to do is to taste it. If the Bureau of Standards, universities and technical men can devise some form of table, such as is presented here in an incomplete shape, it would prove a great help both to the producer and consumer.

Discussion

Among those who participated in the discussion were R. A. Bull, research director the Electric Steel Founders' Research Group, Chicago, and chairman the Joint Molding Sand Research Committee of the American Foundrymen's Association and the National Research Council; C. S. McNeal of the Garden City Sand Co., Chicago, and H. S. Vrooman. Mr. Bull outlined the broad scope of the work undertaken by his committee and told of the progress which had been made

all information which might be of use to the committee.

The importance of the work undertaken by the committee is indicated by the fact that \$7,500,000 was spent in 1920 for molding sand alone. Mr. Bull stated that the problem confronting the investigators was particularly difficult because no standards have been established by which to gauge the quality and suitability of various sands for different purposes and no satisfactory tests have been devised for ascertaining such standards. The next step in the work, he said, would be on the subject of tests. The committee has found, for instance, that even tests for fineness are not uniform. Sieves may have the same number of meshes per square inch, but owing to the fact that there is a difference in the diameter of the wires, the results of different tests are not conclusive. The personal equation in sifting also prevents accuracy in fineness testing.

It is difficult also to determine the percentage of moisture in sand, and even when it is determined it does not always have the same significance. It has been found, for instance, that it is better to store high bond sand in a moist atmosphere than to permit it to dry out and then to restore the moisture subsequently. The reason for this is not yet clear.

A satisfactory test for bond is also lacking. One method is to push a bar of sand over the edge of a table and measure the length of the portion which drops off. Others take the weight of the portion which drops, but in either case much depends upon the surface of the table top, the speed at which the bar is moved and the friction between the bar and the table.

These are just a few of the problems confronting the committee. Mr. Bull stated that one important result of the investigation would be to make available to the foundry industry many sand deposits which have not yet been exploited. A number of important sources of supply, he stated, would soon be exhausted, and heretofore there has not been much investigation of new deposits. When suitable standards have been devised, however, State geologists will be able to locate new deposits suitable for molding use. The meeting was unusually well attended.

Heavy Duty Offset Drilling Attachment

What is called a maximum duty, minimum space offset drilling attachment for drilling, milling, counter-sinking and counterboring port holes and grooves in air tools, such as rock drills, pneumatic hammers, drills and riveters, has been placed on the market by the H. E. Harris Engineering Co., Bridgeport. It is made to fit any standard drill press.

The attachments are made to reach into the main bore and drill or mill the vents or ports from the inside and their use permits drilling to a specified depth, counterboring or milling circular, transverse or longitudinal slots. Because of the small space in which the tools must work and the comparatively long overhang, there are no clearances, the offset or horizontal arm being made as large as the bore of the air chamber and the depth of the drilling or milling will permit.

The Offset Drilling Attachment is Shown in the Illustration. Driving spindle appears at extreme left.

The entire patented transmission and the offset arm are made from tool steel and are accurately ground and lapped after heat treatment.

There is no lost space inside the arm itself, all internal clearances being kept to a very small margin, which is possible by grinding and lapping. This is intended to retain all the metal that can add to the strength of the arm and contributes to the extreme rigidity of section required.

The special shank drills, mills and counterbores are ground and lapped to fit the special spindle in the outer end of the arm and run true. These are readily changed and have a limited adjustment for depth to allow for grinding and setting.

At the extreme right in the illustration one of the heavy-duty attachments is shown mounted in a special bracket on the vertical slide of a Becker vertical milling machine. To the left of this is shown another offset attachment with a smaller arm which is for use on smaller work. This is interchangeable in the special bracket with the arm shown in the bracket. The driving spindle is also shown. This has a taper shank fitted to the machine spindle and at the lower end it is squared to drive the offset attachment. It will be noted that this is necked down in diameter between the squared end and the taper shank. This is intended to give increased elasticity and also provide a point of failure to prevent jamming of drills, mills or fixtures due to accident. The lower end is of cold rolled steel and is sweated into the taper shank with half and half solder; it is easily and inexpensively replaced.

The attachments may be used also for other purposes requiring inside drilling or milling, such as oil

grooves, straight or spiral holes for holding babbitt in bearing boxes, end milling blind keyways to retain a feather or key in a hub sliding on a shaft, and other uses.

Coke Production Increased

Uniontown, Pa., March 25.—Seven hundred and fifty ovens are being added to-day and Monday (March 27) to the active list by the H. C. Frick Coke Co. This will bring the total of ovens fired during the past week to more than 1200 and will bring the coke production of the Frick company up to approximately 44 per cent. Included in the list of plants affected by increased coke production are the two Heclas and the Oliphant plant and the Whitney plant of the Hostetter-Connellsville Co., which has been idle for six months to a year.

Coke business in the region is firm and is showing a steady increase. Prices are firm at \$3.25 and \$3.50 for furnace grades and 75c. to \$1 higher for foundry grades, although little foundry coke is being shipped. Independent coke production also is showing a substantial increase.

The increase in coke business, observers believe, is little affected by any threatened strike of miners in the union fields. Furnace production throughout the country is showing steady increase and this is being reflected in the Connellsville field.

Coal production during the past week has shown a substantial increase although the prices have softened. There is every indication here that the strike in the union fields will be a protracted one, but operators see no sensational price flurries on coal until reserve stocks accumulated by consumers during the past several weeks near exhaustion. Best grade Pittsburgh coal is quoted at around \$1.50, mines.

Cutter Grinder for Re-Turning Tool

The crankpin re-turning tool made by the Sawyer-Weber Tool Mfg. Co., Los Angeles, previously described, is now equipped with an electric cutter grinding attachment, as shown. It is intended to permit rapid sharpening of the tool bit and can be attached conveniently without altering the re-turning tool. The cutter is ground in from 2 to 5 min.

A ½ hp., 10,000 r.p.m. motor is used. The end thrust of the motor shaft is adjusted by the same collet which holds the wheel. The cutter to be ground is passed in the groove of the guide blade with the fingers, micrometer adjustments being made by the hand wheel

Crankpin Re-Turning Tool with Cutter Grinding Attachment

and dial of the re-turning tool. Simplicity of adjustment is emphasized as a feature.

The tool itself when in operation rides around with the crank-pin, the handle resting on the bed of the lathe. The cutting tool is fed into the pin by means of the handwheel at the end of the re-turning tool shown in the illustration. The wheel has a dial below it that is graduated in thousandths of an inch. The dial is locked in any position by a set screw, which is intended to facilitate turning the pins to exactly the same size. The cutter is clamped securely in a V-slot and is parallel to the back plate at all times, thus generating a true circle. Graduations on the V-plate are used in setting the block for different diameter pins.

New Badger Grinder

The accompanying illustration shows the new No. 2 grinder added to the line of the Badger Tool Co., Beloit, Wis.

Various forms of equipment are applicable to this machine, the illustration showing the right end equipped with 16-in. disk wheel, faced with the company's new Diacarbo abrasive disk, which is $\frac{3}{8}$ in. thick. This disk is served with the universal lever feed table, as shown. The left end of spindle is extended to receive 12-in. solid grinding wheel, which is served with adjustable work rest.

A General Electric Co. 3-hp. motor is used and fitted with special end frames and SKF ball bearings, both radial and thrust. The motor is fully inclosed

The Universal-Lever Feed Table Serves Disk, as Shown

with forced ventilation passing down through the machine pedestal. A push button station and automatic starter are provided. The weight complete is 1300 lb.

German Machine Tool Exports

WASHINGTON, March 28.—An analysis by the industrial machinery division of the Department of Commerce, based on the latest figures received from Germany, indicates that there has been a considerable decrease in the volume of Germany's machine-tool exports during 1921, as compared with 1920 and the pre-war year 1913.

Exports for the seven months, May to November, 1921, were 39,046 metric tons. Exports for the full twelve months of 1920 were 94,921 metric tons. Taking the total of 39,046 metric tons for the seven months of 1921 and employing the same ratio for the missing months, 1921 would give a total of approximately 67,000 metric tons, a falling off in volume of 27,921 tons and 23,279, as compared with 1913.

Not Afraid of Coal Shortage

YOUNGSTOWN, March 28.—Little or no concern is voiced by leading steel interests over a possible coal shortage in event the threatened coal miners' strike materializes, unless it should be prolonged beyond all expectations.

Both large and small industrial plants have sufficient reserves on hand to meet their requirements for several weeks, even though union mines were to completely suspend. One large independent in the Mahoning Valley, for instance, has piled over 100,000 tons of coal, while other plants are fortified equally as well. So large are their accumulations that some interests are now buying only in a moderate way, and prices of both coal and coke are characterized as soft, on account

of this condition. Trunk line railroads have large fuel supplies, as well as public utilities and waterworks plants, insuring uninterrupted operations.

Improves Crane Magnet Cable Drum

The Pawling & Harnischfeger Co., Milwaukee, has developed a new feeder cable retriever intended as an improvement over ordinary types of cable take-up drums which have positive-gear or chain-sprocket drives for both hoisting and lowering directions.

The new design, shown in the illustration as applied to a 5-ton crane, has been developed on the principle of keeping the cable taut at all times. A fixed but moderate tension in the feeder cable is maintained, the cable winding up and paying out without slack or undue strains. The cable drum is driven only in the hoisting direction. The drive consists of gearing from one of the shafts of the hoisting mechanism, the final drive to the drum being by friction. The gearing is proportioned to drive the drum at a peripheral speed greater than the speed at which the magnet is being hoisted. This arrangement is intended to cause the friction drive to slip, producing moderate tension in the magnet cable which may be adjusted by tightening the thrust spring of the friction drive.

The cable drum is not driven in the lowering direction, a pawl and ratchet wheel attached to the driving friction preventing it from revolving. The cable is then unwound, due to the pull of the cable while the magnet is lowered. Raveling or too rapid unwinding is said to be prevented by the resistance of the stationary friction against the cable drum which produces the same tension or pull on the cable in the lowering direction as in the hoisting.

Large flanges are provided on both sides of the drum and all bearings are bronze bushed. Collector rings and brushes are of the same construction as slip rings of the alternating current motor, the brushes being of the carbon type with a constant pressure on

The Drum Is Driven Only in the Hoisting Direction

the rings. The collector is enclosed in a housing and mounted at the end of the shaft, a hinged cover providing access to the parts.

The magnet cable leads are securely attached and no electrical contacts left exposed.

More than 1,000,000 tons of sheets have been rolled on the sheet mills of the Youngstown Sheet & Tube Co., Youngstown, Ohio, since the plant was originally operated 20 years ago, in April, 1902. A fair average of the product has been sheets of No. 24½ gage. The original plant consisted of six mills which rolled chiefly puddled iron sheets. The first of these were used for roofing buildings in the new plant and some are still in good condition. There are now 15 units,

Portable Crane for Heavy Lifting

The crane truck shown in the accompanying illustration, a development of the Elwell-Parker Electric Co., Cleveland, is similar in design to machines of that company previously described.

It is intended for heavy-duty use in stacking materials in yards and warehouses and in the assembly of heavy or bulky units in machine shops. The machine is essentially an electric truck having a carrying capacity of 3000 lb. with a revolving counter-balanced crane mounted on it. The crane will handle loads up to 3000 lb., picking up 1000 lb. at 8 ft. outreach at the

With Outriggers in Position, as Shown, the Crane Will Lift 3000 Lb. at 6 Ft. Reach

or end of the platform. With the outriggers in position, as shown, the crane will lift 3000 lb. at 6 ft. reach. The boom may be lowered to permit entry through doorways. The outriggers are quickly adjusted and when not in use are folded and swung in beside the column.

In this design a heavy vertical steel column having a bearing in the steel pedestal which is bolted in the steel platform of the truck, supports a 12-ft. boom. The boom may be racked in or out by the operator without leaving the driving position. The hoist is operated by a separate motor direct connected to an inclined hoist mechanism, the controller being located on the dash in front of the operator. The hoist is mounted on a steel frame which houses the battery, the battery, hoist and motor being arranged to act as counterbalance. A special trip switch mounted on the front of the battery box stops the inward motion of the boom as set.

A single battery furnishes power to propel the truck, as well as operate the crane. Large wheels permit using the truck in yards and all four wheels steer. A coupler is provided on the rear to permit use of the unit for intermittent tractor service. Motors, differential worms, wheels and crane pillar column are fitted with ball bearings.

Further Improvement in Business

In a preliminary summary of March business conditions, the Department of Commerce finds that "business is gradually working its way back toward normal. This movement is not always evenly distributed among the different industries, but, having regard to those fundamental industries which constitute the backbone of American business, there is a marked improvement over the conditions recorded a few months ago."

The most fundamental change in recent weeks is the improvement in agricultural products. There is an increase of 20 per cent in cotton consumption, compared with a year ago, in spite of present widespread labor troubles in New England. Both pig iron and steel ingot production show recent increases. Coal production has continued to increase. Building contracts are showing substantial gains. Transportation and unemployment conditions have improved. All of these factors have been reflected in a slight increase in wholesale price index numbers, and in an upward movement in the stock market.

New Full Automatic Cylindrical Grinder

A recent new offering in machinery for cylindrically grinding machine parts on centers is represented in the full automatic machine shown in the accompanying illustration, a development of the Warren F. Fraser Co., Westboro, Mass.

Increase of production from 200 to 400 per cent over the usual grinder is claimed for this machine, the output of piston pins of average size, $\frac{1}{2}$ in. in diameter by $\frac{3}{4}$ in. long, at the rate of 5 per min. being given as an example. It is intended for grinding shafts, shackle bolts, king bolts, valve tappets, telephone receivers, fountain-pen barrels and caps and a diversity of other machine parts from $\frac{1}{2}$ in. diameter upward. The maximum length of grind is 6 in., the maximum length between centers being 10 in.

The wheel head is heavily constructed and the spindle designed to carry a grinding wheel 18 in. in diameter and up to 6 in. face. Bearings are lubricated by

Full Automatic Cylindrical Grinder for Parts $\frac{1}{2}$ In. Up

Maximum Length of Grind is 6 In. Between Centers 10 In.

forced feed. The machine is self contained and driven by a 15 hp. motor with $4\frac{1}{2}$ in. belt. It may also be arranged for drive from overhead shaft. The weight is 7000 lb.

A smaller machine weighing 4000 lb. which will be ready for the market soon, will be for work $\frac{1}{2}$ to $1\frac{1}{2}$ in. in diameter, up to 2 in. in length of grind and 8 in. between centers.

The Hendee Mfg. Co., Springfield, Mass., motorcycles, will increase its output to 1400 machines, contrasted with 600 each this and last month. Incoming orders warrant the increased production.

The General Electric Co., Schenectady, has received an order for \$1,000,000 of electrical equipment from the Southern California Co., Los Angeles. Half of this business will be filled by the company's Greenfield, Mass., plant in the form of transformers.

"Non-Metallic Impurities in Steel" was the subject of an address by F. W. Miller, Rochester Welding Works, Rochester, N. Y., before the monthly meeting of the Rochester Chapter of the American Society for Steel Treating, March 23.

Bench Type Pattern Shop Speed Lathe

A new 12-in. alternating current motor headstock lathe for use in pattern shops and vocational schools has been placed on the market by the J. G. Blount Co., Everett, Mass. The lathe is regularly for use on a combination bench although long legs are provided if desired.

The headstock is of $\frac{1}{2}$ hp. capacity, fully inclosed and equipped with SKF ball bearings. The spindle is

Motor Headstock Lathe. The cabinet shown is not part of regular equipment

of 45 point carbon steel with a hole $\frac{5}{8}$ in. in diameter bored the entire length and provided with a Morse No. 2 large taper. The spindle nose is $1\frac{1}{4}$ in. outside diameter, 10V-threads per in., the rear end of the spindle having the same diameter, with left hand thread. An outside face plate and pulley combined, 8 in. in diameter, can be used for belting to auxiliary equipment. The bed has a flat top and is cross braced. The lengths supplied are 4, 5 and 6 ft., the maximum distance between centers being 25, 37 and 49 in. respectively.

The controller has four running positions for spindle speeds of 575, 1160, 1750 and 3450 r.p.m. It is placed within the headstock end, a set of bevel gears connecting the controller with the handle shown in the accompanying illustration. A safety switch, used in connection with the controller, is located on the end of the bench and easily thrown on or off by the foot.

The tailstock has a broad flat base $6\frac{1}{2}$ by $7\frac{1}{2}$ in. The bearing for the spindle is 8 in. long and the rear handwheel 8 in. in diameter. A Morse No. 2 large taper is used for the center. The rest holder is large and clamps by means of a binding handle threaded to a stud; is quick and positive and extends from side of the rest. For clamping the rests a binding screw is located conveniently on the right side of the rest holder.

The machines are regularly equipped with one spur and cup center, 3 tee rests, $5\frac{1}{2}$ in. face plate with holes for wood screws, a 3-in. screw chuck, a $2\frac{1}{2}$ by 4 in. right angle rest, a knockout rod for center and a wrench. Other equipment shown in the illustration is extra.

The Sioux Falls Corrugating Co., sheet metal products, has awarded a contract to the Carlson & Snitkey Construction Co., Sioux Falls, S. D., for a one-story factory building 145 x 150 ft. of brick and steel, work to start at once.

Six Months' Reduction in Steel Prices

In response to the request of a correspondent, the following table showing the prices of the articles named, in mid-September of 1921 and mid-March of 1922, has been prepared. It will be noted from the last column that the largest percentage of reduction has occurred in bars, beams and plates; these have since advanced. Following these, wire nails and open-hearth rails show large reductions. Tin plate, Bessemer rails, pig iron and billets follow in the order named.

	Sept. 13, 1921	March 13, 1922	Percentage of Decrease
Pig Iron (Composite)	\$19.81	\$18.25	7.9
Billets	29.00	28.00	3.5
Open-Hearth Rails	47.00	40.00	14.9
Bessemer Rails	45.00	40.00	11.1
Bars	1.60	1.35	18.2
Beams	1.50	1.35	18.2
Plates	1.60	1.35	18.2
Wire Nails	\$2.90	\$2.40	17.2
Tin Plate	5.71	4.60	12.4

Work of Engineering Standards Committee

The activities of the American Engineering Standards Committee have developed to such an extent that work is now underway on 79 distinct projects, such as industrial lighting, structural steel shapes specifications for fire tests, a safety code for abrasive wheels, ball bearings, a safety code for compressed air machinery, a safety code for foundries, gears, a safety code for machine tools, a safety code for power presses and specifications covering non-ferrous and ferrous metals. In its work, 160 bodies of national importance are cooperating, these having designated more than 500 individuals as official representatives to serve on sectional committees working under the auspices of the committee. An account of the work of the committee is given in a 32-page pamphlet published by the committee at 29 West Thirty-ninth Street, New York, Dr. P. G. Agnew, secretary.

Gap Turret Lathe

A departure from the standard design of turret machinery is represented in a new gap turret lathe

Gap Turret Lathe. The gap provides for 28-in. maximum swing of bed. Length of gap from end of spindle is 9 $\frac{1}{2}$ in.

brought out by the Acme Machine Tool Co., Cincinnati.

The dimensions of the machine are in general the same as those of the 20-in. Cincinnati Acme turret lathe, except that the gap provides for 28-in. maximum swing of bed. The length of gap from the end of the spindle is 9 $\frac{1}{2}$ in. The machine has been equipped with an air chuck and also power feed to cross travel, to cut-off rest, and power feed to longitudinal travel of the turret; but any combination can be provided.

In this machine the minimum distance from end of the spindle to the turret face is 14 $\frac{1}{2}$ in. and minimum from end of the spindle to the inside edge of the cross slide, 8 $\frac{1}{2}$ in. The feeds to the cross slide are 40, 70 and 120; those to the turret 24, 48, 78 and 123. The cross movement of the cross slide is 7 in. and the lateral movement 4 in. The maximum distance from the inside of cross slide to end of the spindle is 12 in.

Portable Engine Lathe

The Lehmann Machine Co., St. Louis, is offering a portable type of its geared-head engine lathe, intended particularly for railroad and other shops doing large work where it is frequently necessary to bring the tool to the job.

The lathe is shown in the accompanying illustration. It is built in two sizes, 16-18½ in. and 18-20½ in. swing. Direct motor drive through belt and idler is employed, the motor running at 1800 r.p.m. It is mounted in the cabinet leg at the head end, as shown, the pulley, belts and other parts being adequately safeguarded.

The headstock gives 16 spindle speeds in almost geometrical progression, with the use of 10 gears. The headstock forms an airtight casing enclosing all run-

Portable Geared-Head Engine Lathe for Shops Doing Large Work and Where Bringing the Tool to the Job Is an Advantage. The motor is mounted in the cabinet leg at the head end, as shown

ning parts. Shafts in the headstock run on ball bearings with the exception of the spindle, which is of alloy steel, hardened, and runs in phosphor-bronze bearings amply lubricated. The spindle nose has two diameters, both hardened and ground. These give two bearings for face and chuck plate, one in front and one behind the threads on the spindle nose.

Forward and reverse to the spindle is obtained through patent friction clutches, running in oil, with control handles located at the apron and at the head end of the lathe. It is claimed that the clutches require no adjustment at any time and will always pull a little more than the load imposed.

In addition, the new portable lathe includes the features of the company's machines, such as the quick-change mechanism, tailstock spindle lock-device, rod and screw shift and others.

Production of Fire Clay Brick Reported Slowly Increasing

PITTSBURGH, March 27.—The monthly report of the Refractories Manufacturers' Association, based upon reports from the membership of that organization, for the month of February shows that at the end of that month the production of fire clay brick had reached 44 per cent of monthly economical producing capacity, as against 38 per cent at the end of January; shipments during the month were 38 per cent, as compared with 40 per cent in January and the stock on hand at the end of February was equal to 187 per cent of capacity, against 176 per cent one month before. New orders for February were equal to 46 per cent of capacity, against 41 per cent in January, while unfilled orders at the end of February were 39 per cent of capacity against 30 per cent a month previously. In 1921, 100 per cent of economical monthly producing capacity was stated as 27,305,500 9-in. equivalents.

The report shows that production of silica brick for February was 24 per cent of monthly economical producing capacity, the same rate as in January. Shipments were 27 per cent of capacity, against 30 per cent in January; stocks 181 per cent, as compared with 133 per cent; new orders 36 per cent, against 35 per cent in the previous month and unfilled orders 41 per cent

of capacity, compared with 37 per cent in January. In 1921, 100 per cent equalled 78,645,942 9-in. equivalents.

Marketwise, refractories do not show much change. Improvement in the steel business is fairly closely reflected in the demand for the various kinds of refractories, but the complaint still is heard that the makers of iron and steel are inclined to keep their purchases down pretty close to actual requirements and there are apparently as many deviations from quoted prices now as there were recently. Quotations of \$28 per 1000 for Pennsylvania silica brick have not entirely ceased and on high duty Pennsylvania fire clay brick there are still some makers who are willing to take business at \$30 per 1000. These prices are \$2 per 1000 below what most makers are trying to get. Most of the recent business is magnesite brick has been at \$53, Baltimore, but there are reports that less than that has been done.

Similarly, although \$40 per net ton is supposed to be minimum on chrome brick, business has been lost at that price.

We quote per 1000 f.o.b. works:		
Fire Clay	High Duty	Moderate Duty
Pennsylvania	\$32.00 to \$35.00	\$30.00 to \$32.00
Ohio	30.00 to 35.00	28.00 to 30.00
Kentucky	32.00 to 35.00	30.00 to 32.00
Illinois	32.00 to 35.00	30.00 to 32.00
Missouri	32.00 to 35.00	28.00 to 32.00
Silica Brick		
Pennsylvania		30.00
Chicago		35.00 to 37.00
Birmingham		40.00
Magnesite Brick		
Standard size per net ton (f.o.b. Baltimore)		53.00
Grain magnesite per net ton (f.o.b. Baltimore)		28.00
Chrome Brick		
Standard size, per net ton		40.00 to 42.00

The secretary of the engineering section of the Society for Technical Aid to Soviet Russia, 110 West Fortieth Street, New York, sends out a letter saying that the section has been appealed to by the Russian scientific and engineering societies for books, bulletins, pamphlets and current literature on the scientific and industrial progress in the United States, particularly since 1914. Individual members have donated toward a fund created by the engineering group in order to send such literature to Russia. The demand, however, is so great that the New York organization cannot meet it and an appeal is made to others to supply the literature wanted, the Russian societies promising to reciprocate with copies of their new publications.

To try out the Roberts type ovens on high volatile Pennsylvania coal, the Granite City plant of the St. Louis Coke & Chemical Co., operated on 100 per cent of that fuel for one week ending March 25. The results of the experiment were gratifying. The average coking time was 12 hr. for 30 tons of coal per oven per day. This is believed to be the largest tonnage of this kind of coal put through a coke oven in a day. The record of one of the larger Eastern coking plants using the same coal is 17 hr. for 19 tons per oven per day. The Eastern high volatile coal contains about 2 per cent less volatile than Illinois coal while its moisture content averages 8 per cent as against 3 to 3½ per cent for Illinois coal.

Increased Efficiency in Many Steel Plants

Fewer Workers Necessary Than During the War—Exclusive Surveys in the Mahoning Valley—Operating Organizations Improved

YOUNGSTOWN, OHIO., March 28.—Since the war there has been an appreciable increase in efficiency of workmen in iron and steel plants, say Valley operating managers. As a consequence, as units approach normal operations, employers find that the number of workers necessary to carry on production, is substantially less than during the war. Improved mechanical appliances are constantly being installed in steel plants, likewise, thereby reducing manual labor, quickening operations and enlarging production.

More efficient methods adopted by the mills are also responsible for this situation, which in the aggregate, is proving a substantial factor in cutting costs to the minimum. Exhaustive surveys have been conducted by Valley steel industries in an effort to promote efficiency, eliminate waste and reduce production costs. As a result of these efforts men have been eliminated wherever possible, without impairing efficiency.

At first, foremen, superintendents and production managers were inclined to complain and to resent the action. But workmen in the mills responded to changed conditions with alacrity, especially as operations grew slack and they realized it was a matter of the survival of the fittest. In some instances, results were achieved in this respect which exceeded expectations of executives.

Keen Competition for Jobs

Individual efficiency and production likewise advanced as competition for even ordinary jobs in the mills became keener. The careless, inefficient, lazy workers were simply eliminated. Operating organizations were combed and combed again under the pressure of reducing costs to meet keen competitive conditions in the steel market.

In consequence of this process of elimination, operating organizations of plants in this territory are at a high rate of efficiency. Managers are likewise alert for new mechanical developments which may aid in reducing costs. One large plant each month awards prizes to its workmen for suggestions to promote economy and reduce waste, and many valuable ideas have been evolved in this manner. For instance, last month a prize was given the suggestion of an oil sprayer which an employee constructed on an automatic thread milling machine. Another suggestion which was similarly rewarded was that steel bushings be installed in the spindles on concrete fence machines.

A Valley independent has been conducting intensive experiments with an advanced type of open-hearth furnace, and reports favorable results have been achieved in reducing the time required per heat and in other respects.

Metallurgists have been engaged experimenting to produce a better type of refractory, which will last longer and exhibit greater resistant qualities to intense heat applications.

Shipments of fuel and steel by water have received attention of the industry in its efforts to lower costs. A suggestion now receiving consideration is that barges which haul products down the Ohio River and return empty be employed to haul fluorspar from the mines in Kentucky on the return trip. Such a plan would effect a saving in transportation charges of several dollars a ton, states the traffic manager of a steel plant. Fluorspar destined for open-hearth steel plants in the Pittsburgh and Youngstown districts could be shipped to advantage in this manner, it is contended.

Economy of Cleanliness

The economy of cleanliness constituted the subject matter of a recent statement to employees of a large machine-building interest with plants at Pittsburgh,

Youngstown and Canton, by a department head. "During the war work was pushed ahead at such a rapid rate of speed that each department was strained to the limit," says this operating official. "During this time workmen, superintendents, owners in fact, all—careless little about expense as long as it was not exorbitant. 'Produce' was the cry of the hour. Strictness gave way to swiftness, economy gave way to extravagance, bank accounts were big and buying was bulgy. What happened during these 'soft' times? Some of our departments became so busy that wherever a 'bottle neck' occurred we squeezed and squeezed through it, as long as we possibly could without widening it."

"This 'bottle neck' can be taken to mean a great many things. Let us start with the outside yards where our bulky raw materials are handled. These materials came upon us with such haste that within a short time our yards were in such a condition that one thing was piled upon another in no neat manner."

"We did the best we could, to be sure, but the burden was too heavy to be neatly handled. With production setting a new world's speed record, our foot became huge sand piles at times and our finishing departments looked like the dumping grounds for tire production, especially when cars were difficult to obtain for shipment. Workmen dropped their tools with the whistle, in order to have them on the job next day. Sometimes they were and sometimes they

Materials Wasted

"For instance, if we needed what we would estimate as one pound of nails to complete a job, we got a pound, to make sure we would have enough. We would need two feet of pipe, we took the first pipe laid hands on even though it was six feet long. We became of the other pound of nails and the foot of pipe? They stayed close to the job until the rusty, rarely were they returned to their proper place."

"If a job was completed which left a pile of bricks, sand, chips or refuse of any kind, it remained where it lay until it had to be removed. I use illustrations because they are memories, and vivid. How will cleanliness prove economy? In this place, a clean plant creates a better satisfied employee. He gets an appetite for work, just as his stomach creates a keener appetite for food when he eats in a clean, savory restaurant."

"A neat and clean plant is an efficient plant. Material should be stocked in an orderly manner, so no time is lost in trying to find it. Materials should be placed in such a manner or in such a place that their handling is easily facilitated without interfering with other work. Take pride in the appearance of your work bench or character of your work."

"There is always a better way to do some thing, no matter how highly perfected one might believe the present state of affairs."

Operations of Plants at Niles, Ohio

All eight mills are being operated by the Steel Co., Niles, Ohio, a sheet interest, with orders sufficient to engage its capacity into June. Falcon Tin Plate Co., controlled by the same interest is operating six of nine tin plate mills at its plant, acquired from the Carnahan Tin Plate & Co. It is also rolling some specialty sheet at Canton for enamel ware. General offices of both companies are housed in a modern brick building at the entrance to the Niles property.

A four-mill addition to the plant at Niles is considered by the company, but an official state-

undetermined whether construction will proceed this year, depending altogether on the situation in the sheet market. The additional capacity is desirable, an official points out, because a 12-mill plant could be operated as economically in many respects as an 8-mill plant, with no additional overhead.

Virtually all of the operations carried forward at the Niles property are done mechanically, the mills ranking among the most modern in the country in this respect. Manual labor has been reduced to a minimum. Running full, the company is able to produce 7000 tons of blue annealed, black and galvanized sheets per month. Its plant consists of seven sheet mills and one jobbing unit, with roughing mills, cold mills, pickling and galvanizing equipment. It has three galvanizing pots.

The two companies purchase their sheet bar requirements in the open market and are covered by long-time contracts.

The Falcon Tin Plate Co. is adding new connections in addition to the regular customers of the old Carnahan company and its business is gradually growing. Its plant consists of a roll train of nine hot mills and one cold mill, driven by two steam engines, and four tandem cold mills, electrically driven. It has black and white pickling departments and ample annealing capacity. It will produce between 40,000 and 45,000 tons of tin plate per year, or between 800,000 and 900,000 base boxes.

The Niles plant is entirely electrically driven. At Niles the company owns a 114-acre tract, and 13 acres at Canton.

Sales of both companies are being handled at present by Lloyd Booth, president and treasurer and by Paul Wick, vice-president and secretary. Both were formerly connected with the Trumbull Steel Co. at Warren in official capacities.

Serious Labor Troubles in China

WASHINGTON, March 28.—Prime importance is attached by Commercial Attache Arnold, at Peking, in a cable to the Department of Commerce summarizing in China as of March 19, to the strike settlement in the Chinese Seaman's Union and the ship-owners. The strike itself paralyzed foreign shipping in South China, partially stopped ocean-traffic, excepting junk trade, also inflicted losses on shipowners engaged in river traffic, and on merchants and producers at Canton and Shanghai. The strike settlement, accomplished through arbitration, brought about a recognition of the right of labor through the granting by the Hongkong and Shanghai government of the privilege of registration of labor organizations as members of the union, the granting of reasonable but higher wages, and the assurance that in the future the union would resort first to arbitration on all questions of remedy for any substantial grievances.

High Wages in Australia

Trade Commissioner Sanger cables to the Department of Commerce from Melbourne that the Newcastle Steel Works of the Broken Hill group will close completely in the near future. The reason for the closing is given, by Commissioner Sanger, as the high wages paid in Australia, that it is part of a general campaign on the part of employers to reduce labor costs, which have been repeatedly declared by the Broken Hill and other interests to be unduly high, in view of the depressed markets for metals and metal products. The Broken Hill mines have been working part time for a long while, and practically all the other mines in the commonwealth, except coal, have long been closed. This view of the cause of the Newcastle shutdown is strengthened by Mr. Sanger's cabled statement that the conference of representatives of capital and labor from the six States, called by the Prime Minister, has broken up without practical results, and that labor unrest and strikes are anticipated.

More Metal Workers at Higher Wages

Iron and steel plants, according to figures of the Bureau of Labor Statistics, show for February a gain of 10,545 employees in 108 establishments. This gain of 9.3 per cent was accompanied by a gain of 15.7 per cent in amount of payroll and a corresponding gain in the February pay envelope from \$40.20 to \$42.57, or 5.9 per cent.

In the automobile industry the gain in 49 establishments was 4.8 per cent in number of employees and 58 per cent in payroll total. This is probably a reflection of an increase in full time employment, rather than wholly an increase in wage rates. In car building and repairing there was a loss of 3 per cent in number of employees in 64 establishments, but a gain of 10.5 per cent in amount of payroll, due probably to increase in percentage of full time workers.

Wages in car building and repairing, due to the continuance of war time wages in railroad repair shops, are considerably higher than in the other industries mentioned. The excess in February over steel mill wages was 37.8 per cent, and over wages in automobile plants 8.1 per cent. Details are shown in the table.

Period	Number of Establishments	Number of Men	Half-Month Payroll	Average Pay Envelope
Iron and Steel				
January, 1922...	108	113,656	\$4,568,269	\$40.20
February, 1922...	108	121,201	5,286,929	42.57
February, 1921...	109	144,679	9,393,391	64.93
Automobiles*				
January, 1922...	19	85,524	3,335,828	39.00
February, 1922...	49	89,647	4,863,720	54.25
February, 1921...	48	58,536	2,762,104	47.19
Car Building and Repairing				
January, 1922...	61	58,787	3,025,456	51.47
February, 1922...	64	57,006	3,343,661	58.65
February, 1921...	63	62,878	4,220,035	67.12

*Payroll figures are reported as "weekly"; they have been made "semi-monthly" by multiplying by 2 1/6.

Gratifying Accident Reduction

"Every employee in our mills is to be congratulated on the excellent showing made in accident reduction during 1921," states J. M. Woltz, safety director of the Youngstown Sheet & Tube Co., Youngstown, Ohio, in a message to workers. "It is gratifying to the safety department because it proved what we have shown before, that accidents can be cut down if a real effort is made by all hands to do so. It has saved hours and days of suffering, physical pain and has relieved our employees and their dependents many hours of mental stress."

During 1920 there were 11 fatal accidents at the company's plants, and but one in 1921. So far this year there has been none.

"Let every man in the company strain each nerve, let him be ever vigilant, let him condemn in unmeasured words the chance-taker that may endanger his own or other's life," admonishes Mr. Woltz.

Less Unemployment in Pennsylvania

Reports of all of the employment offices of the Pennsylvania State Department of Labor and Industry, covering the first two weeks of March, show a fairly good decrease in the number of idle workmen. According to the estimates, the unemployed decreased 575, or approximately 5 per cent. The total number of unemployed in the State is now estimated at 262,965, as compared with 278,540 two weeks ago. The Pittsburgh district reports the biggest increase in the number of men returning to work, with a total of 2950. Johnstown, McKeesport, New Kensington and Altoona, where conditions during the winter were considered bad, report an approximate increase of employed of more than 4000. Civic co-operation in Erie has reduced the number of unemployed; the estimated number idle is now placed at 15,490, a decrease of 610 in two weeks. Philadelphia reports 148,000 idle as compared with 153,400 two weeks ago, while both Harrisburg and Williamsport also show decreases in idleness.
